There were seven entries for the amateur championship trophy, offered for the best thirty-six blooms, distinct, and here there was a close battle, but the president, and longtime champion, Mr. E. B. Lindsell, Bearton, Hitchin, again secured the coveted award, scoring with a handsome set of Overhofgartner Tenks, Ulrich Brunner, Dean Hole, Comtesse de Nadaillac, White Maman Cochet, Marie Baumann, Alfred Colomb, Bessie Brown, Edouard Andre, Alice Lindsell, S. M. Rodocanachi, Mrs. John Laing, Her Majesty, Souvenir de Pierrre Notting, Marquis of Dufferin, Fisher Holmes, Maman Cochet, Mdme. Delville, Mildred Grant, Mrs. J. Bateman, Frau Karl Druschki, Cleopatra, Beauty of Waltham, Lady Moyra Beauclerc, Mrs. Mawley, Louis Van Houtte, Florence Pemberton, Horace Vernet, Countess of Gosford, Duchess of Portland, Marchioness of Londonderry, A. K. Williams, Queen of Spain, Souvenir d'Elise Vardon, and Helen Keller. Rev. J. H. Pemberton, Havering-atte-Bower, Essex, was second prize winner with a good set of blooms, but his dark varieties were a trifle small. The third award fell to Mr. F. Dennison, Rosecroft, Kenilworth; and the fourth to Mr. Conway Jones, Hucclecote, Gloucester.

There were five competitors in the class for two dozen blooms, distinct, Mr. Mease, gardener to A. Tate, Esq., Downside, Leatherhead, leading with very bright blooms of Mrs. T. Roosevelt, J. B. Clarke, Countess of Derby, Florence Pemberton, Ulster, Ulrich Brunner, etc.; Mr. E. B. Lindsell took second place, and Mr. F. Dennison was placed third.

Out of seven competitors in the class for a dozen trebles, Mr. E. B. Lindsell again led with a pretty set of Bessie Brown, Ulrich Brunner, Florence Pemberton, Mrs. J. Laing, Duchess of Portland, Dean Hole, White Maman Cochet, Mildred Grant, Alice Lindsell, Her Majesty, Ulster, and Marchioness of Londonderry; Mr. E. J. Holland, Sutton, Surrey, was a capital second, but two or three of his flowers were badly bruised.

No fewer than seventeen competitors entered for the Ben Cant Memorial Prize for a dozen blooms, distinct, in the section for growers of fewer than 750 exhibition roses. Mr. W. Upton, Claremont Street, Belgrave, Leicester, led with a very fine box of Dean Hole, Mildred Grant, Innocente Pirola, Wm. Shean, Mdme. Jules Gravereaux, White Maman Cochet, Countess of Caledon, and Bessie Brown. Mr. H. Robins, Margaretting, Ingatestone, second, and Dr. T. E. Pollett, Earl's Colne, Essex, third. In this same section Mr. G. Moules, Hitchin, led for five blooms of a tea or noisette rose; Mr. F. Bostock, Springfield, Northampton, second; and Viscountess Enfield, Dancer's Hall House, Barnet, third. For six trebles, similar conditions, Dr. C. Lamplough, Kirkstall, Alverstoke, Hants, was a capital first; Mr. Joseph Wakeley, Moor Street, Rainham, Kent, second; and Dr. Pollett third.

In the section for growers of fewer than 500 roses, Mrs. E. Horne, Park House, Reigate, was first for nine blooms; Mr. H. C. Baker, Bayfordbury, Hertford, first for six blooms; Mr. Vivian Rolt, Brook House, Storrington, Pulborough, first for five blooms in a vase.

The President's prize for a dozen blooms, distinct, open to all growers of fewer than 1,000 plants, brought out a splendid competition, no fewer than fourteen entrants. The coveted award was won by Mr. C. F. H. Leslie, Epcombe, Hertingfordbury, Herts, who had a good set of Frau Karl Druschki, Ulrich Brunner, Bessie Brown, Her Majesty, Maman Cochet, Mildred Grant, White Maman Cochet, Prince Arthur, Beauty of Waltham, Florence Pemberton, Lady Moyra Beauclerc, and Mdme. Jules Gravereaux; Rev. H. S. Arkwright, Binfield Rectory, Bracknell, second, and Mr. Mahlon Whittle, Belgrave Avenue, Belgrave, Leicester, third.

Growers of fewer than 350 exhibition roses made a good display, and sent some excellent flowers; Mr. E. F. Brown, Sussex Place, Slough, scored for nine blooms, and also for five blooms in a vase, with Florence Pemberton; Mr. A. Searle, Ashton Lodge, Burnett, second. The best four trebles came from Mr. H. C. Baker, Bayfordbury, Hertford, who was followed by Mr. W. Upton and Mr. K. H. Gifford, Edensor, Slough, in the order named.

In the section for growers of fewer than 200 plants, the leading prizewinners were Mr. C. G. Baron, Charmwood, The Avenue, Hitchin; Mr. W. G. Pedley, Hoddesdon Herts; Mr. W. Bentley, Lombard Street, E.C.; Mrs. F. Pridliam, Heron's Gate, Rickmansworth; Rev. J. T. Kershaw, Warminster; and Dr. Alfred K. Williams, The Moat, Harrow.

For roses grown within eight miles of Charing Cross, Mrs. A. E. Clark, The Hurst, Mottingham, led with very fair blooms, with Mr. A. F. Booth, Woodside Park, N., second; Mrs. Clark thus becomes the amateurs' suburban champion. Mr. W. D. Conz, Magdalen Road, Wandsworth Common, S.W., scored in another class for London roses, and Mr. A. Wilkinson, St. Olave's, Granville Road, North Finchley, came second.

In the novices' classes the leading prizewinners were Mr. J. Hart, Little Heath, Potter's Bar, who led for twelve blooms; Mr. H. Peerman, Glenross, Nantwich, second. Mr. Darling, Clare House, Tonbridge; Mr. G. H. Heaton, St. Vincent Road, Westcliff-on-Sea; and Mr. R. M. Munro, Millfields, Nantwich, were other leading prizewinners.

EXTRA AMATEURS' CLASSES.

In an extra class for amateurs, Mr. Mahlon Whittle, Leicester, won the piece of plate offered as first prize for two dozen blooms, distinct, but he had not a good set; Mr. Eversfield, Denne Park, Horsham, was second; and Mr. G. A. Hammond, Burgess Hill, Sussex, third. The Harkness Cup for a dozen blooms, distinct, was well won by Mr. E. J. Holland, who had very fine specimens of Florence Pemberton, Mildred Grant, Maman Cochet, Mrs. T. Roosevelt, Wm. Shean, etc.; Mr. E. B. Lindsell second, and Mr. W. Leggett third.

Mr. A. Hill Gray, Beaulieu, Newbridge, Bath, was easily first for nine tea and nine H.T. roses, with a beautiful box of lovely blooms of Auguste Compte, Mdme. Melanie Soupert, Mdme. J. Gravereaux, Florence Pemberton, Maman Cochet, Comtesse de Nadaillac, Souv. de Pierre Notting, Mdme. Cusin, etc.; Mr. W. Leggett, Roseville, Malden Road, Colchester, second, and Mr. E. M. Eversfield, Denne Park, Horsham, third. Mr. E. J. Holland had the best six new roses, amateurs, winning with Mrs. Myles Kennedy, Yvonne Vachet, Mrs. T. Roosevelt, Mrs. J. Bateman, Wm. Shean, Mdme. Melanie Soupert; Mr. F. Dennison, Kenilworth, second.

Mr. H. Darlington, Park House, Potter's Bar, had the best collection of seven varieties of roses, winning with some fine flowers of Madame Ravary, Antoine Rivoire, La Tosca, Caroline Testout, etc.; Mr. E. M. Wightman, Bengeo, Herts, second; and Dr. Freeland, Delamare, Snodland, Kent, third.

AMATEURS' TEA ROSES.

The tea rose championship, amateurs', is this year held by Mr. A. Hill Gray, Beaulieu, Newbridge, Bath, who led from five other competitors with the following eighteen varieties, all finely shown: Maman Cochet, Souv. de P. Notting, Bridesmaid, Madame C. Soupert, Madame J. Gravereaux, White Maman Cochet, Lady M. Curry, The Bride, Comtesse de Nadaillac, Muriel Grahame, Madame Cusin, La Boule d'Or, Souv. d'un Ami, Madame Vermorel, Boadicea, Madame J. Dupuy, Jeanne Proudfoot, and Dr. J. Guyon; Mr. O. G. Orpen, West Berg-

holt, Colchester, was second; and Mr. Conway Jones, Hucclecote, Gloucester, third.

The Prince Memorial Prize, for a dozen blooms, fell to Mr. Mease, gardener to A. Tate, Esq., Downside, Leatherhead; Mr. E. M. Eversfield, Horsham, second. Mr. A. Hill Gray also had the best eight trebles, teas and noisettes, his best varieties, in a [illegible] box, being Madame J. Dupuy, Mrs. Mawley, White Maman Cochet, and Maman Cochet; Rev. F. R. Burnside, Great Stambridge Rectory, Essex, second; and Mr. Conway Jones, third.

Mr. Hill Gray was also successful in the class for seven blooms of one variety, leading with White Maman Cochet in fine condition; Mr. E. M. Eversfield, second, with Madame Jules Gravereaux. Mrs. B. Fortescue, Dropmore, Maidenhead, led for twelve teas and noisettes, followed in order by the Rev. J. B. Shackle, Dropmore Vicarage, Maidenhead; and Dr. Pallett, Earls Colne. [illegible] Mahlon, Whittle, Leicester, led in a class for four trebles with Madame Jules Gravereaux, White Maman Cochet, Maman Cochet, and Caroline Kuster, all well shown; Dr. F. H. Cooke, Birch, Colchester, second; and Mr. J. Wakeley, Rainham, third. Mr. A. Hammond, Burgess Hill, beat Mr. E. M. Eversfield, Horsham, for nine varieties, three blooms of each, in vases.

Mr. Eversfield and Mr. Orpen were first and second for tea roses in vases, but by the time we reached them the flowers were suffering [illegible] from the heat. Dr. Pallett scored [illegible] varieties, three blooms of each, in vases, and Mr. E. R. Smith, Muswell Hill, was a good second.

DECORATIVE CLASSES.

There were fourteen competitors in the class for a table decoration of roses, ladies only, and here the premier award fell to Mrs. O. G. Orpen, who had a cool, elegant, and altogether delightful and simple design in the big single Irish Elegance rose; Miss B. Langton, second, with Irish Elegance and Jersey Beauty, in silver vases; Mrs. W. Munt, Stagenhoe Park, Welwyn, Herts, third.

Mrs. O. G. Orpen, Colchester, had the finest bowl of roses, and showed the variety Mrs. O. G. Orpen superbly; Miss J. Langton second with Dawn and Una. In a class for a bowl of exhibition roses first place was won by Miss J. Langton, Hendon, with Killarney, very beautiful; Mrs. H. E. Molyneux, Brantwood, Purley, second; and Lady Wil[illegible], Benfield Grove, Bracknell, third. Miss [illegible] Langton led for a vase of roses with a charming exhibit of Clara Watson, An[illegible]e Rivoire, and Madame de Watteville; Mrs. E. Mawley, Berkamstead, second; and Lady Wilmot third.

The best basket of roses was a lovely design by Mrs. O. G. Orpen, but Mrs. F. H. Cooke's basket of Madame Abel Chatenay must have run it closely; this gained second place, and Mrs. W. Munt, third. Mrs. O. G. Orpen had the best bowl of a Wichuraiana rose, and Mrs. Duckworth, Elmstead, London Road, Twickenham, was second. In another bowl class Mrs. J. B. Shackle, Dropmore Vicarage, scored with Madame Abel Chatenay, and Mrs. C. Brown, Hatfield Peveril, Essex, came second with Maharajah.

In the open classes Mr. J. Mattock, Headington, led for buttonhole bouquets with charming designs; Mr. O. G. Orpen second; in many cases the flowers were useless at the end of three hours after judging. In the ladies' section the best bowl of roses was evidently the one set up by by Mrs. A. Bide, Farnham, who had Hiawatha sprays, but only gained second prize.

AMATEURS' DECORATIVE ROSES.

Mr. A. Tate, Leatherhead, had the finest set of decorative roses, and won the Girdlestone Memorial Prize therewith; Rev. J. H. Pemberton, second. Mrs. Perkins, Holmwood, Surrey, had the best twelve bunches of decorative roses, and showed well. Mrs. E. Mawley scored for six bunches of decorative roses, and Lady Sutton. Berham Valance, Newbury, scored for six bunches of Sweet Briar Roses in a good competition.

Miss B. H. Langton and Mr. H. Darlington also secured first prizes in other classes for decorative roses. Rev. J. H. Pemberton scored for five distinct varieties of decorative roses shown in bamboo stands, and his set consisted of Trier, Red Provence, Lady Curzon, the Garland, and Claire Jacquier; Mr. O. G. Orpen second, and Miss B. H. Langton, Hendon, third.

NICKERSON ROSES CLASSES.

In another part of the present issue we make special reference to the ballot for the best dozen roses suitable for garden decoration, instituted by Mr. Nickerson, of Cambridge, Mass., U.S.A. In connection with the finding of this ballot classes were arranged for the best, second best, and third best dozens of roses, as follows:

The best set of twelve roses that headed the poll for the best roses for garden decoration, in competition for the Nickerson cups, was the one set up by Mr. John Mattock, Headington, the varieties being Crimson Rambler, Madame Ravary, Dorothy Perkins, Climbing Mrs. W. J. Grant, W. A. Richardson, Alister Stella Gray, Caroline Testout, Climbing Aimee Vibert, Frau Karl Druschki, Hugh Dickson, Abel Carriere, and Ards Rover; Mr. George Mount second.

Of interest also was the class for the twelve roses that secured second place in the ballot for garden roses. Mr. G. Prince, Longworth, was first, the varieties being Ulrich Brunner, Blush Rambler, Climbing Caroline Testout, Una, Madame Abel Chatenay, Claire Jacquier, Marie Van Houtte, Reine Olga de Wurtemburg, Gruss an Teplitz, Gloire de Dijon, Felicite Perpetue, and White Maman Cochet; Mr. J. Mattock second, and Mr. G. Mount third.

For a group of twelve roses that occupied the third position in the recent ballot for garden roses, Mr. J. Mattock was first, the varieties being Aglaia, Souv. de Pierre Notting, Madame Jules Gravereaux, Bennett's Seedling, La France, Longworth Rambler, Macrantha, Viscountess Folkestone, and Papillon; Mr. G. Mount second, and Messrs. Paul and Son, Cheshunt, third.

MEDAL BLOOMS.

The best blooms in the show i.e., those to which silver medals were awarded, were as follows: Amateurs.—Best H.P. rose, Her Majesty, shown by Mr. E. J. Holland, Sutton, Surrey; best H.T. rose, Dean Hole, shown by Mr. E. B. Lindsell, Hitchin; best T. rose, White Maman Cochet, shown by Mr. Conway Jones, Hucclecote, Gloucester. Nurserymen.—Best H.P. rose, A. K. Williams, shown by Mr. George Mount, Canterbury; best H.T. rose, William Shean, shown by Messrs. A. Dickson and Sons, Newtownards; best T., Mrs. Myles Kennedy, shown by Messrs. G. Cooling and Son, Bath.

NON-COMPETITIVE.

There were numerous non-competitive displays, chiefly in the corridor and out of doors, and the leading exhibitors were Messrs. Barr and Sons, Covent Garden; Messrs. Hugh Low and Co., Enfield; the Misses Hopkins, Shepperton; Mr. Williams, Oxford Road, Ealing; and Mr. Howard Crane, Highgate.

Holland Park Show.

The summer show of the Royal Horticultural Society, held by permission of Mary Countess of Ilchester, in Holland Park, Kensington, on July 7 and 8, was a great success. Five big marquees were well filled, and there was a small tent for most of the novelties, as well as numerous displays out of doors. On the first day there was a large attendance of visitors, and though the tents were often very crowded, there was ample room outside for people to sit or walk about in comfort, and listen to the band. Roses were well shown, but the amateurs showed so poorly that the Sherwood Cup was not awarded.

FLORAL COMMITTEE.

Roses were beautifully shown by Messrs. Frank Cant and Co., Colchester, who had grand blooms of Duchess of Portland, Mdme. Melanie Soupert, Dean Hole, Liberty, and other lovely varieties, all finely staged. Mr. W. Chaplin, Joyning's Nursery, Waltham Cross, had fine Frau Karl Druschkis in his group of cut roses. Messrs. A. Dickson and Sons, Newtownards, co. Down, had a display of roses that was always a centre of attraction. Their new varieties—Mrs. David Jardine (A.M.), Mrs. John Waud (A.M.), Florence Ethel Coulthwaite (A.M.), and Molly Sharman Crawford (A.M.), a lovely cream tea rose, were the great attractions in a wonderful group of fine roses.

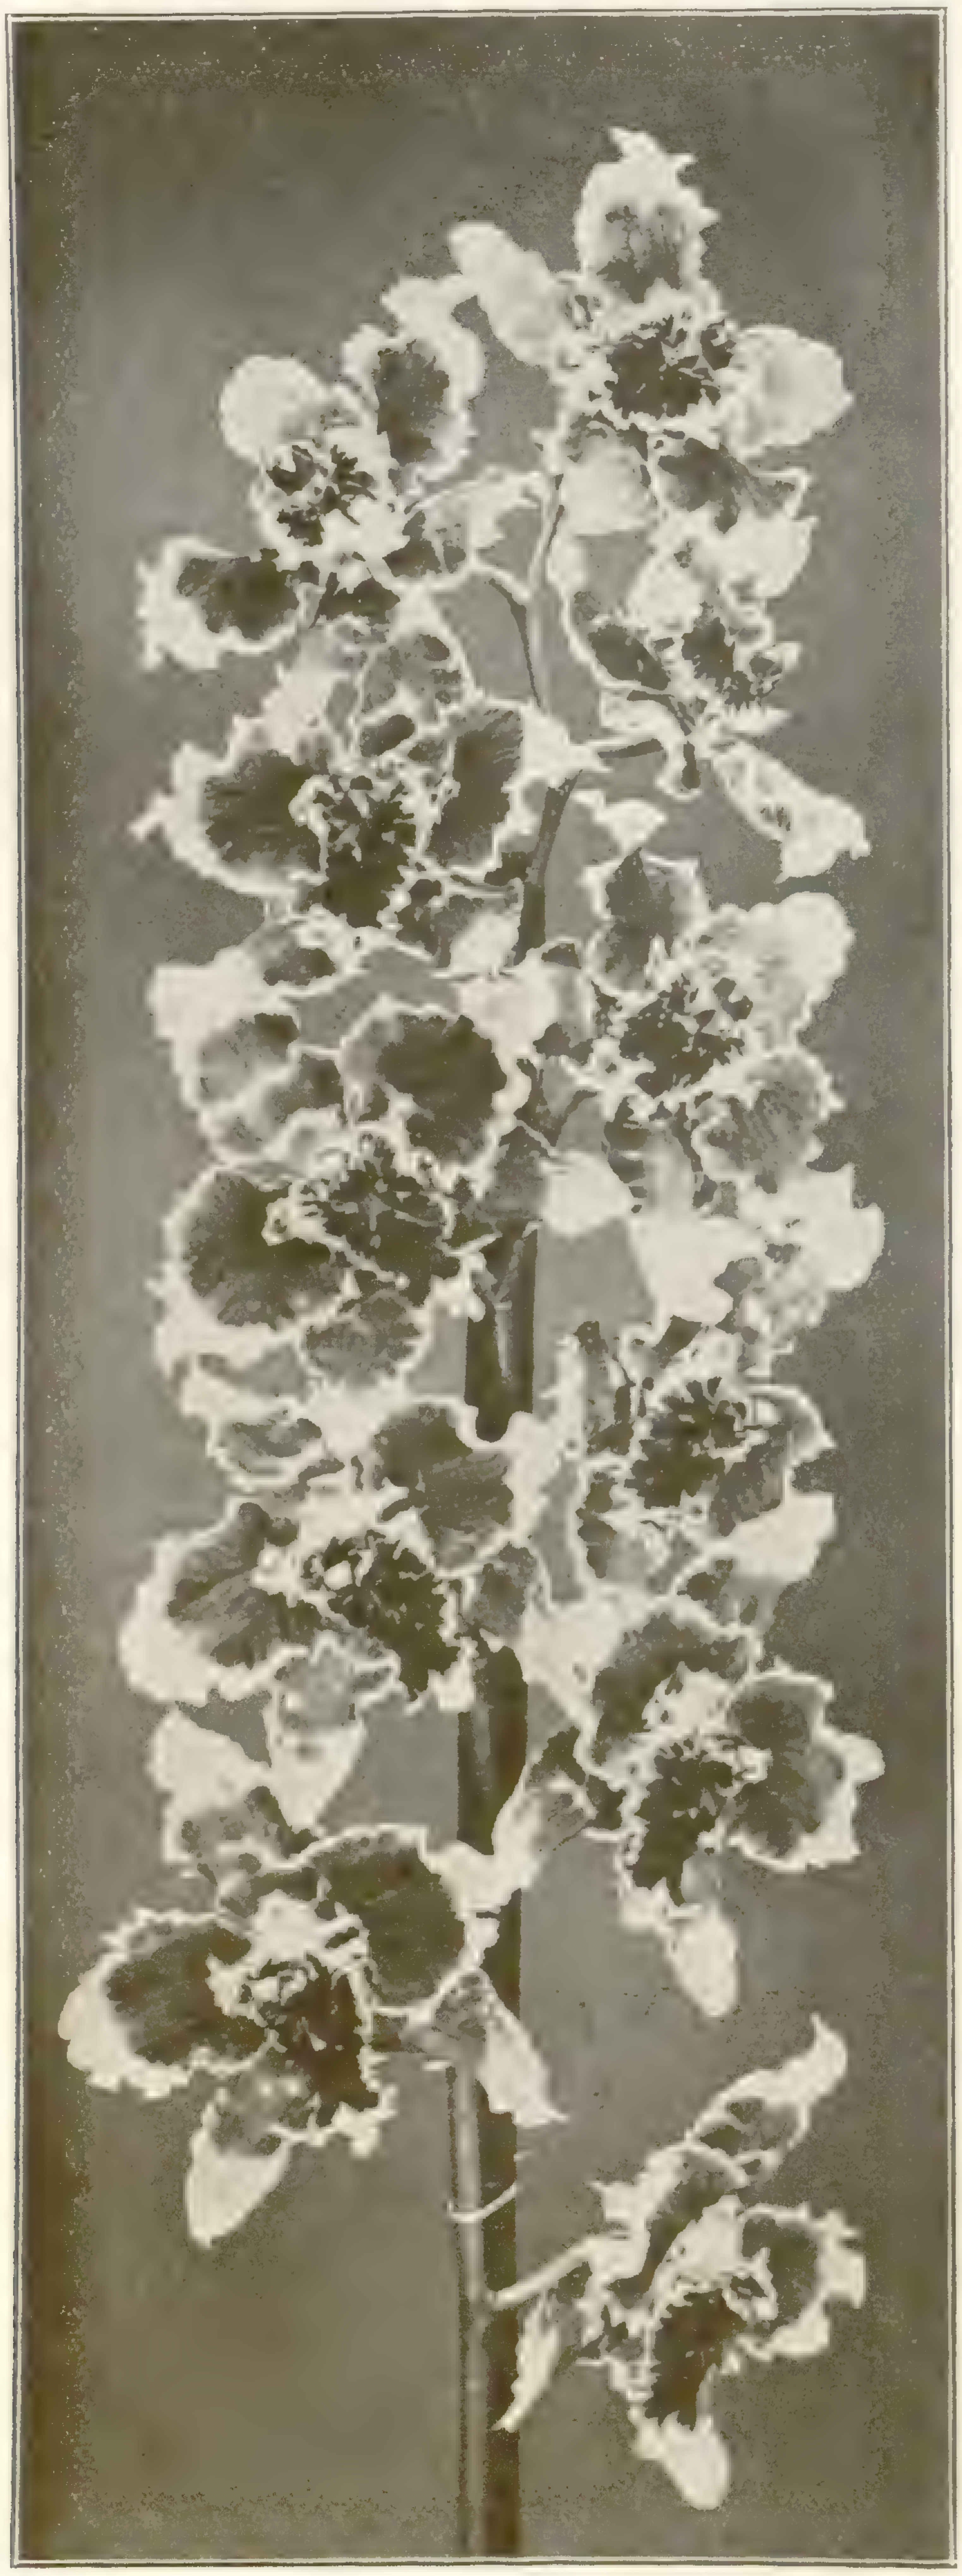
Sweet peas were largely shown by Messrs. Jones and Son, Shrewsbury, who had bright but rather small flowers, and, with them, staged carnations. Mr. W. Chaplin, Waltham Cross, had a small set of very bright sweet peas. Messrs. E. W. King and Co., Coggeshall, had a very fine lot of sweet peas, and these were set up handsomely on arches, baskets, and in vases; Mrs. Wm. King, Henry Eckford, and a number of seedlings attracted attention. Mr. Horton, Seaford, Sussex, sent a few sweet peas. Mr. M. Prichard, Christchurch, displayed hardy flowers to great advantage, and his water garden, with water lilies and surrounding breadths of Kæmpfer irises, spiræas, eremuri, and phloxes was a success.

Sweet peas were largely exhibited by Messrs. S. Bide and Sons, Farnham, who had a group of small flowers. Mr. R. Sydenham, Birmingham, also exhibited these fragrant blooms. Messrs. Sutton and Sons, Reading, had an extensive sweet pea display, showing popular sorts, a number of pretty seedlings, and a fine set of Sutton's Queen, a lovely pink variety. The lovely Queen Alexandra and Peach Blossom spiræas were finely shown by Mr. Wm. Profittlich, Twickenham, agent for Messrs. G. Van Waveren and Kruyff, Sassenheim, Holland. Mr. R. C. Notcutt, Woodbridge, was a large exhibitor of showy and popular hardy flowers. The Misses Hopkins, Shepperton, contributed a rock garden and a few cut herbaceous flowers.

A very beautiful exhibit of lovely carnations, set up in very large vases by Mr. W. H. Page, Hampton, was a great success. All the popular varieties were on view, and with them were splendid bunches of lilies, and all were over maidenhair ferns. Messrs. H. Merryweather and Sons, Southwell, Notts, contributed a lot of roses, but crowded their bunches somewhat. Messrs. Gunn and Sons, Olton, Birmingham, had a glorious lot of the finest phloxes, set up in big vases and stands of a variety; Coquilicot, Magician, Ironie, and Iris were all good.

Splendid banks of hardy flowers and carnations were set up boldly by Messrs. T. S. Ware, Lim., Feltham. Messrs. William Bull and Sons, Chelsea, showed varieties of Gladiolus Colvillei. Mr. G. Mount, Canterbury, contributed a handsome lot of roses, well set up, the Joseph Lowe variety occupying the place of honour in a big group. Messrs.

Hobbies, Lim., Dereham, had a large and pretty display of pillar roses, Hiawatha being very largely staged over arches, pillars, etc., these, with other sorts, making an elegant exhibit.



ODONTOGLOSSUM ILLUSTRE KING OF ENGLAND.
F.C.C., Holland Park Show, July 7. Shown by H. S. Goodson, Esq., Fairlawn, Putney. Flowers, mauve-purple and white.

Messrs. J. R. King and Sons, Coggeshall, submitted finely-grown sweet peas in variety. Mr. Charles Turner, Slough, staged big bunches of garden roses, but his box of White Maman Cochet was the feature of the group; the same exhibitor had a set of border carnations. Some of the finest sweet peas in the show were those exhibited by Mr. Hopkins, gardener to F. Wellesley, Esq., Westfield, Woking, who had grand spikes and flowers of Constance Oliver, Clara Curtis, Mrs. H. Sykes, Miss M. A. Linzee, St. George (grand), and Nora Unwin. The Misses Kipping, Hutton, Essex, had a neatly-turnished rock garden. Messrs. Richard Smith and Co., Worcester, had a miscellaneous display of stove plants, carnations, water lilies, and hardy flowers. Messrs. R. H. Bath, Lim., Wisbech, brought up sweet peas in variety and bold groups of roses, stately delphiniums, and beautiful carnations.

A bank of border carnations, all excellent varieties, was staged in fine style by Mr. James Douglas, Edenside, Great Bookham. Mr. C. W. Breadmore, Winchester, sent up a magnificent group of sweet peas, all beautifully set up, and all of fine quality. This was a great attraction, especially the varieties Audrey Crier, J. T. Taylor, Constance Oliver, Helen Lewis, and Gordon Ankentel. Mr. J. Kerr, Loudwater, Rickmansworth, contributed a small group of carnations in pots. Hardy flowers in great variety, together with a very fine selection of gaillardias and pinks, were set up by Messrs. B. Ladhams and Sons, Shirley, Hants. Messrs. B. R. Cant and Sons, Colchester, submitted a collection of the newer roses, Richmond, Mrs. Myles Kennedy, Hugo Roller, and Killarney figuring conspicuously.

Messrs. James Carter and Co., High Holborn, had a most artistic exhibit of sweet peas arranged in baskets, on arches, and in vases, and with these were splendid culinary peas, in dishes, representing varieties for which the name of Carter is famous. Very brilliant were the sweet peas shown by Messrs. G. Stark and Son, Great Ryburgh, their Lord Nelson, St. George, Nell Gwynne, George Stark, Frank Dolby, and Enchantress being very fine.

The Guildford Hardy Plant Company showed a great variety of hardy flowers. Mr. Vincent Slade, Taunton, had a brave show of zonal pelargoniums, these making a rare blaze of colour. Mr. H. C. Pulham, [illegible]ham, Essex, showed hardy flowers and alpines, and a collection of border flowers was set up by Mr. G. Hart gardener to H. P. Burrell, Esq., Brooklands, Alton, Hants. Messrs. Jarman and Co., Chard, sent their charming sweet sultans, Bride, Bridegroom, and Bridesmaid. Mr. Howard Crane, Highgate, showed dainty violas and violettas in variety. Wonderfully fine perpetual and Malmaison carnations were well set up by Mr. A. F. Dutton, Iver, Bucks, who, as usual, showed the leading varieties in grand form. Messrs. Bell and Sheldon, Guernsey, were also large exhibitors of very fine perpetual carnations, the blooms of Lady Bountiful being very large. Mr. H. Burnett, Guernsey, contributed a lovely lot of carnations, and set these charming flowers up in a most elegant manner, the beautiful Mrs. H. Burnett showing up well.

Mr. Ernest E. Grimson, Sutton, Surrey, had a pretty amateur's collection of two dozen bunches of roses, his Maman Cochet, White Maman Cochet, and Killarney being the best varieties. Brilliant varieties of Gladiolus Colvillei were well shown by Messrs. Lilley and Co., Guernsey, who also showed Kæmpfer irises. A broad stretch of pansies and violas, flanked by hardy flowers, made up the exhibit from Messrs. W. Artindale and Son, Nether Green, Sheffield.

Dwarf Japanese trees from Messrs. [illegible] and Sons, Covent Garden, proved attractive to many visitors, but most people were more interested in their hardy flowers and water lilies.

Four magnificent banks of glorious blue delphiniums from Mr. Amos Perry, Enfield, were as great an attraction as his cool and charming bog and water garden, with its irises, spiræas, sagittarias, bold Gunneras, [illegible]bra, bamboos, and lovely water lilies. Mr. Perry filled one half of the centre of one big tent, and made up a display of greatest beauty and interest, as well as educational value. It was one of the finest exhibits ever put up at a show. In the big tent Messrs. R. Wallace and Co., Colchester, had a fine display of the lovely Japanese or Kæmpfer irises bedded in damp moss. With these a pool of water lilies, surrounded by grasses, spiræas, etc. The whole idea was a little path through an iris swamp, leading [illegible] (by stepping stones) the pool, and up the [illegible] rockery hill in the distance—a very [illegible] picture.

Very artistic and effective was the fine display of caladiums, crotons, greenhouse rhododendrons, nepenthes, new ferns, dracænas, and choice carnations, staged by Messrs. James Veitch and Sons, Chelsea. The same firm had, on the opposite side of the tent, a bold exhibit of perpetual, border, and Malmaison carnations in great beauty and variety. Messrs. Paul and Son, Cheshunt, had one of their large and beautiful exhibits of roses in pots and baskets, their rambling and tea varieties being particularly good. Messrs. W. Artindale and Son, Sheffield, had an artistic display of hardy flowers in the big tent, where, with a pool of water and a rustic bridge as centrepiece, they had roses, liliums, irises, and spiræas in great variety. Messrs. T. Cripps and Sons, Tunbridge Wells, were responsible for an effective and interesting group of Japanese maples, etc.

A very handsome group of perpetual and Malmaison carnations from Messrs. Hugh Low and Co., Enfield, was notable for the yellow varieties, Amber, Sunset, Cecilia, and C. P. Little, which it contained. The pink Irene, Malmaison variety, was also very fine. Roses and hydrangeas were also shown by this firm. Messrs. Wm. Bull and Sons, Chelsea, had a bold group of stove foliage plants in the big tent. A large and very beautiful group of roses, set up in baskets, tall stands, and vases, and shown as growing, in pots, was boldly and beautifully arranged in one corner of the big tent by Messrs. Wm. Paul and Son, Waltham Cross, who made a speciality of roses of their own raising, and had their new Refulgence in good order.

Messrs. George Mallett and Co., Cheddar, set up a big lot of hardy flowers that included a glorious lot of Lilium candidum and L. auratum. Gaillardias and delphiniums were well shown by Messrs. Kelway and Son, Langport, Somerset; their gaillardia Glory is a lovely and brilliant thing. Dr. Freeland, Snodland, Kent, brought up a few good roses, and Colonel Hesseltine, 196, Queen's Gate, also showed these queenly flowers.

Messrs. H. B. May and Sons, Edmonton, had verbenas, zonal pelargoniums, and choice hardy ferns. From Messrs. Wm. Cutbush and Son, Highgate, came a blaze of liliums, verbenas, rambling roses, and carnations, the whole combining to make up a most pleasing display. Mr. G. Reuthe, Keston, Kent, had choice hardy flowers, including hosts of liliums and eremuri. Drooping, long-tubed fuchsias, descended from F. triphylla, were well shown by Messrs. H. Cannell and Sons, Swanley, the varieties Mary, Perle, and H. Henkel being very graceful and beautiful. Messrs. G. Jackman and Son, Woking, sent up a gorgeous lot of hardy flowers and a collection of roses. Roses were also extensively shown by the King's Acre Nursery Company, Hereford.

The group of verbenas, heliotropes, and roses set up by Messrs. W. and J. Brown, Peterborough, faced a bold exhibit of well-grown hardy flowers, arranged by Messrs. G. and A. Clark, of Dover. Messrs. J. Peed and Son, West Norwood, were responsible for groups of caladiums and gloxinias. Tuberous begonias in great variety, including the orange-tinted Mrs. Maurice Glyn, and the lovely pink Mrs. A. P. Bland, came from Messrs. T. S. Ware, Lim., Feltham. Messrs. J. Laing and Sons, Forest Hill, also sustained their reputation with tuberous begonias. Mr. A. L. Gwillim, Cambria Nurseries, Eltham, contributed a group of choice and well-developed tuberous-rooted begonias. Messrs. Blackmore and Langdon, Bath, had some glorious delphiniums, and a bank of lovely tuberous begonias that included some charming crimped-edged and frilled varieties, notably the pink Frilled Queen (A.M.).

One corner of the big tent was filled with bold stove foliage plants by Mr. L. R. Russell, Richmond, the alocasias figuring well. Big specimen Malmaison carnations, clothed in blooms, were sent by Mr. Fitch, gardener to Sir G. Faudel Phillips, Bart., Ball's Park, Hertford. Sir Daniel Gooch, Hylands, Chelmsford, was also a large exhibitor of Malmaison carnations, in pots. The big group of cannas set up by Messrs. H. Cannell and Sons, Swanley, was a blaze of colour, and drew forth many exclamations of surprise and admiration.

The caladiums from Messrs. J. Laing and Sons, Forest Hill, and the carnations from Messrs. J. Peed and Sons, West Norwood, and the fine display of choice and new exotic ferns from Messrs. H. B. May and Sons, Edmonton, were three bold groups in the big tent. Pillar roses, staged over dwarf roses, liliums, and spiræas, with the graceful Humea elegans, rising over all, made up a handsome group from Messrs. R. and G. Cuthbert, Southgate.

ORCHID COMMITTEE.

Messrs. Charlesworth and Co., Heaton, Bradford, who gained the Gold Medal for orchids, had a fine show of these flowers, and their Lælio-cattleya Canhamiana Fire King, Cattleya Warneri alba, C. Mossiæ Wagneri, Miltonia Hyeana, Odontioda Charlesworthi, etc., were notable in a choice lot of good plants. An artistic exhibit of orchids set up by Messrs. J. W. Moore and Co., Rawdon, Leeds, contained fine examples of Cattleya gigas, miltonias, cypripediums, brassias, etc.

Messrs. Sander and Sons, St. Albans, were large exhibitors, as, in addition to their new plants, previously described in connection with the Temple Show, they had a bold exhibit of orchids that included fine Cypripedium bellatulum, Lælio-cattleya Martineti, miltonias, Vanda cœrulea, Cypripedium Rothschildeanum, etc. The orchids shown by Messrs. Stanley and Co., Southgate, contained excellent selections of Cattleya Warner, C. Mendeli, C. Mossiæ, C. gigas, and a few oncidiums, etc. M. Claes, Brussels, showed the lovely Cattleya Mendeli Claes var., with the purple colour edging all round the white lobes of the lip. Messrs. Hugh Low and Co., Bush Hill Park, Enfield, set up a large group of orchids, the cattleyas, Cœlogyne Dayana, Cypripedium niveum, and oncidiums being all very attractive.

Lælio-cattleya Clive magnifica (F.C.C.),very fine, was well shown by Mr. Alexander, orchid grower to Lieut.-Colonel Holford, Westonbirt, Gloucester, who also sent the pretty, spotted Odontoglossum Eleanor Westonbirt var. (A.M.). Odontoglossum illustre King of England (F.C.C.), a bold and beautiful variety of O. ardentissimum descent, was well shown by Mr. H. S. Goodson, Fairlawn, West Hill, Putney.

FRUIT AND VEGETABLE COMMITTEE.

A wonderful display of vegetables was made by Mr. E. Beckett, V.M.H., gardener to the Hon. Vicary Gibbs, Aldenham House Gardens, Elstree. It was one of Mr. Beckett's best efforts, and remarkable in such a season. There were over a hundred dishes of splendid produce. The cherries in pots, grandly cropped, shown by Mr. G. Camp, gardener to S. Heilbut, Esq., Holyport, Maidenhead, were a great source of interest and attraction to visitors, and growers were loud in their praise of the good culture they evidenced.

A very fine exhibit of fruit trees in pots, showing this mode of culture in its best style, was made by Messrs. James Veitch and Sons, Chelsea; the figs, peaches, nectarines, standard gooseberries, and white and black grapes were all finely cropped and very tempting. Fruit trees in pots, notably peaches, nectarines, plums, and cherries, were largely and well exhibited by Messrs. G. Bunyard and Co., Maidstone, who also had hardy flowers in great beauty and variety.

Splendid Queen pineapples came from Mr. T. Coomber, gardener to Lord Llangattock, The Hendre, Monmouth, and with them was staged a grand lot of strawberries, notably Waterloo, Trafalgar, Leader, Givon's Late Prolific, the pale Louis Gauthier, The Bedford, and Royal Sovereign. Mr. W. Peters, gardener to H. P. Sturges, Esq., Givons, showed several new strawberries, including a new one named Marmaduke.

From the Horticultural College, Swanley, came a display of melons, peaches, tomatoes, and good Beauty of Bath apples. Strawberries were grandly shown by Messrs. Laxton Brothers, Bedford, who had magnificent fruits of Laxton's Latest, Givon's Late Prolific, Cropper, Laxton's Reliance, Fillbasket, The Bedford, Reward, Waterloo, and other fine kinds, all shown in large baskets. Splendid Hero of Lockinge and other melons, with fine Hanwell Victory tomatoes and some cucumbers demonstrated Mr. S. Mortimer's ability as a grower of these subjects.

OUTDOOR EXHIBITS.

A quite large number of exhibits were arranged outside the tents. Messrs. Castle's Man-o'-War garden seats were greatly appreciated and used. Mr. J. Forbes, Hawick, sent a wonderful lot of fine phloxes, delphiniums, and pansies. Messrs. Liberty and Co., Regent Street, showed garden pottery and pergola pillars. Messrs. Jas. Veitch and Sons, Chelsea, showed a collection of hardy fuchsias. The Potteries Art Guild, Compton, Guildford, contributed garden pottery of good style. Messrs. H. Scott and Sons, Woodside, S.E., showed summer houses extensively, and Messrs. W. Walters and Co., Water Lane, E.C., showed elegant trelliswork. Messrs. Shanks and Co., Cannon Street, E.C., had a fine display of their lawn mowers. Coniferous trees and shrubs were submitted by Messrs. H. Lane and Son, Great Berkhamsted. Mr. Riley Scott, of Herne Hill, was a large exhibitor of rustic summerhouses, and Messrs. Inmans and Co., Stretford, Manchester, had a display of these useful garden accessories. Lawn mowers were largely shown by Messrs. Ransomes, Sims, and Jefferies, of Ipswich. Seats and hammocks were sent by Messrs. G. and W. Buswell, Torquay, and Messrs. Duncan Tucker and Sons, Lim., Tottenham, put up examples of their greenhouses and conservatories. Messrs. Headley and Edwards, Cambridge, showed iron trelliswork, etc. Japanese maples and other elegant hardy shrubs were shown extensively by Messrs. Fromow and Sons, Chiswick, and near by Messrs. J. Stiff and Sons, Lambeth, had garden pottery with the vases filled with gay flowers.

A very fine exhibit of coloured ivies and of other bright-leaved ornamental trees and shrubs was made outside by Mr. L. R. Russell, Richmond. Messrs. J. Cheal and Sons, Crawley, Sussex, had a pretty pergola exhibit outside, and furnished with rambling roses, clematises, vines, etc. Messrs. Thos. Green and Son, Lim., Leeds and London, showed their excellent motor and other mowers.

HORTICULTURAL SUNDRIES.

As is usual at the Holland Park Show, one big tent was devoted to horticultural sundries, though these, in many cases, as already indicated, overflowed to the grounds outside.

The leading exhibitors were Messrs. Wood and Son, of Wood Green, whose display seemed to lack nothing necessary for garden work and use, from wood wool to spraying machines, and pot-washers to summer-houses. Messrs. C. Toop and Son, Stepney Square, E., sent examples of their heating apparatus for small greenhouses. Messrs. W. Voss and Co., Lim., Millwall, showed spraying machines and insecticides, and excellent syringes. Messrs. Wakeley Bros. and Co., Lim., Bankside, S.E., sent samples of hop manure. Mr. J. Pinches, Crown Buildings, Crown Street, S.E., contributed a large assortment of imperishable labels, and Messrs. H. Pattison and Co., Greyhound House, Streatham, showed their excellent horse lawn boots. Messrs. W. Herbert and Co., Hop Exchange, S.E., staged garden sundries in variety, and Mr. F. Hickson, South Hill Park, Hampstead, made a display of Gishurst Compound, Vall's Beetlecute, etc. Mr. M. Johnston, New Park, Cranleigh, Guildford, contributed samples of good yellow loam, and Mr. J. George, Redgrave Road, Putney, sent samples of peat and mushroom spawn.

Messrs. Abbott Brothers, High Street, Southall, showed their folding table trays, beehives, etc. Mr. R. Anker, Queen Victoria Street, E.C., showing pumping machines. Messrs. de Luzy Freres, Knatchbull Road, Camberwell, S.E., showed various knapsack and other sprayers. Horticultural pottery was displayed by Messrs. D. Dowell and Son, Hammersmith, W. Various artificial manures were sent by the Anglo-Continental Guano Company, 15, Leadenhall Street, E.C., and Messrs. Fenlon and Son, 8, Tudor Street, showed heating apparatus, while Messrs. Lloyd, Lawrence, and Co., Worship Street, E.C., displayed their useful Pennsylvania lawn mowers.

CERTIFICATES AND AWARDS.

First-Class Certificate.—To Lælio-cattleya Clive magnifica, exhibited by Lieut.-Colonel G. L. Holford, Westonbirt, Tetbury, Glos.; to Odontoglossum illustre King of England, exhibited by H. S. Goodson, Esq., Fairlawn, West Hill, Putney.

Awards of Merit.—To Odontoglossum Eleanor Westonbirt var., exhibited by Lieut.-Colonel Holford; to viola Ernest Needham, exhibited by Messrs. W. Artindale and Son, Sheffield; to begonias Duchess of Cornwall and Frilled Queen, from Messrs. Blackmore and Langdon, Bath; and to delphinium statuaire, from the same firm; to Tunica saxifraga fl.-pl., from Mr. G. Reuthe, Keston, Kent; to roses Florence Edith Coulthwaite (H.T.), George C. Waud (H.T.), and Mrs. David Jardine (H.T.), and Molly Sharman Crawford, from Messrs. A. Dickson and Sons, Newtownards; to Delphinium Progression; and to hybrid berry Low Junior, from Messrs. H. Low and Co., Enfield, N.

MEDALS AND CUPS.

Gold Medal.—To the Right Hon. Lord Llangattock, The Hendre, Monmouth (gardener, Mr. Coomber); the Hon. Vicary Gibbs, Aldenham House, Elstree (gardener, Mr. E. Beckett); Messrs. Frank Cant and Co., Colchester; Messrs. Charlesworth and Co., Heaton, Bradford; Mr. A. F. Dutton, Iver, Bucks; Messrs. Hobbies, Lim., Dereham; Messrs. H. B. May and Sons, Edmonton; Messrs. Paul and Son, Cheshunt; Messrs. William Paul and Son, Waltham Cross; Mr. Amos Perry, Enfield; Messrs. J. Veitch and Sons, Lim., Chelsea; Messrs. R. Wallace and Co., Colchester.

Silver Cups.—To Mr. C. W. Breadmore, Winchester; Messrs. James Carter and Co., High Holborn; Messrs. Wm. Cutbush and Son, Highgate; Messrs. R. and G. Cuthbert, Southgate; Mr. L. R. Russell, Richmond; Messrs. G. Bunyard and Co., Maidstone; Messrs. G. and A. Clark, Dover; Messrs. Sander and Sons, St. Albans, Mr. M. Prichard, Christchurch, Hants; Messrs. H. Cannell and Sons, Swanley; Messrs. T. Cripps and Sons, Tunbridge Wells; Messrs. Blackmore and Langdon, Twerton Hill Nursery, Bath; Messrs. W. Artindale and Son, Nether Green, Sheffield; Mr. W. H. Page, Hampton; S. Heilbut, Esq., Holyport, Maidenhead; Messrs. Alex. Dickson and Sons, Newtownards; Messrs. B. R. Cant and Sons, Colchester; Messrs. Bell and Sheldon, Guernsey; Messrs. J. W. Moore, Lim., Rawdon, Leeds; Messrs. T. Green and Son, Lim., Southwark Street, S.E.; and Messrs. W. Bull and Sons, Chelsea.

Silver-gilt Flora Medal.—To Messrs. T. S. Ware, Feltham; Messrs. Barr, Covent Garden; Messrs. Jackman and Son, Woking; Messrs. J. Peed and Son, West Norwood; Mr. W. R. Chaplin, Waltham Cross; Mr. G. Mount, Canterbury; Messrs. Cheal and Son, Crawley; and Messrs. Wood and Son, Wood Green.

Silver-gilt Knightian Medal.—Messrs. Laxton Bros., Bedford.

Silver-gilt Banksian.—To the Misses Hopkins, Shepperton; Mr. G. Reuthe, Keston; Messrs. R. H. Bath, Lim., Wisbech; Mr. C. Turner, Slough; Messrs. E. W. King and Co., Coggeshall; and Mr. H. Burnett, Guernsey.

Silver Knightian Medal.—To Mr. Mortimer, Farnham; Swanley Horticultural College; Messrs. R. Jackson and Co., Piccadilly; and Miss C. E. Martin, New York, U.S.A.

Silver Flora Medal.—Mr. R. C. Notcutt, Woodbridge; Messrs. J. Laing and Sons, Forest Hill; Mr. Lilley, Guernsey; Messrs. Gunn and Sons, Olton; Mr. A. Ll. Gwillim, New Eltham; Messrs. Bide and Sons, Farnham; Messrs. Stark and Son, Great Ryburgh; Mr. H. C. Pulham, Elsenham; Messrs. Jones and Son, Shrewsbury; Mr. John Forbes, Hawick; Messrs. Lane and Son, Berkhamsted; Messrs. Merryweather and Son, Southwell; Messrs. B. Ladhams, Lim., Southampton; The King's Acre Nurseries, Hereford; Messrs. Fromow and Sons, Chiswick; Sir G. Faudel-Phillips, Hertford; Messrs. Sutton, Reading; Messrs. Stanley and Co., Southgate; Mr. G. W. Riley, Herne Hill; Messrs. H. Scott and Sons S. Norwood; Messrs. Inmans and Co., Stretford; Potters' Arts Guild, Compton; Messrs. Pulham and Son, Newman Street, W.

Silver Banksian.—Messrs. R. Smith and Co., Worcester; Messrs. G. Mallett and Co., Cheddar; Messrs. Kelway and Son, Langport; H. P. Burrell, Esq., Horton; Dr. Freeland, Snodland; E. E. Grimson, Esq., Sutton, Surrey; Colonel Heseltine, 196, Queen's Gate; Messrs. J. K. King and Sons, Coggeshall; the Misses Kipping, Hutton, Essex; Mr. V. Slade, Taunton; Mr. A. R. Upton, Guildford; F. Wellesley, Esq., Woking; Messrs. W. and J. Brown, Stamford; Patent Ladder Company, Peterborough; Castle Ship Breaking Company, Millbank; Messrs. de Luzy Freres, Camberwell; Mr. A. Hamilton, 11, Conduit Street, W.; Messrs. Liberty, Warwick Street; Messrs. Ransomes, Sims, and Jeffries, Ipswich; Mr. E. Westmacott, Leadenhall, St. James; and Messrs. Lloyd, Lawrence, and Co., Worship Street.

Bronze Banksian.—Messrs. Headley and Edwards, Cambridge; Mr. James George, Putney; Messrs. Dowell and Son, Hammersmith; Messrs. Fenlon and Son, Tudor Street, E.C.; Messrs. W. Herbert and Co., Hop Exchange, S.E., Messrs. T. Syer and Co., Wilson Street, Finsbury; Messrs. A. Shanks and Son, Bush Lane House, E.C.

Southampton.

JUNE 30 and JULY 1.

The annual summer show was held on the County Cricket Ground, and was a great success. The arrangements were, as usual, in the experienced hands of Mr. C. S. Fuidge.

Eighteen classes were provided for roses, including a competition for the handsome challenge cup provided by the president and vice-presidents, for the exhibitor making the most points in the three leading open classes.

Generally the roses were of fair size and quality, the exception being the tea varieties, amongst which were many handsome blooms. The leading class was for forty-eight, distinct, single blooms, and here six competed, making a good display. After a close survey the judges awarded the premier position to Messrs. Frank Cant and Co., Braiswick Nurseries, Colchester, for a set of somewhat small blooms, yet possessing much quality and freshness. The leading varieties were Dean Hole, J. B. Clark, Florence Pemberton, Ulster, Mrs. Theodore Roosevelt, Ben Cant, Lady M. Beauclerc, Mdme. J. Gravereaux, Hugh Dickson, Lady Ashtown, Mildred Grant, Robert Scott, Maman Cochet, Alice Grahame, Victor Hugo, Frau K. Druschki, Star of Waltham, and Mrs. C. J. Grahame; Messrs. B. R. Cant and Sons, Colchester, were a close second, with a brighter stand of blooms; and Messrs. D. Prior and Sons, Colchester, were third. For twelve triplets, five entered, the best coming from Mr. H. Drew, Longworth, Faringdon, Berks, who had really good examples of Bessie Brown, White Maman Cochet, Dean Hole, Florence Pemberton, Lady Ashtown, and Lady Mary Fitzgerald; Messrs. F. Cant and Co., second, with smaller specimens; and Messrs. B. Cant and Sons, third.

Exceptionally fine were the blooms in the tea or noisette class for twelve, distinct, and here Messrs. B. Cant and Sons had the best of five sets, a grand lot, of such varieties as Boadicea, Cleopatra, Souvenir de P. Notting, The Bride, Mrs. M. Kennedy, Mrs. E. Mawley, Ernest Metz, Souvenir d'Elise Vardon, Maman Cochet, White Maman Cochet, and Mdme J. Gravereaux; Mr. Drew second, with the Messrs. Prior a close third. Messrs. B. Cant and Sons thus won the president's cup with a total of six points in the three classes.

In the class for six blooms, any one dark variety, Messrs. D. Prior and Sons won with substantial blooms of J. B. Clark, in a small entry. Mildred Grant won easily for Messrs. Frank Cant and Co., the premier place for six of any one light variety, Messrs. B. Cant and Sons following with Bessie Brown, and Mr. Drew securing the third place with Comtesse de Nadaillac in capital order.

Garden or decorative varieties were sparsely shown. For six bunches, Mr. H. Childs, gardener to Mrs. Macrae, Meonstoke House, Bishop's Waltham, was an easy first, with typical examples of Queen Alexandra, Perle d'Or, Gardenia, Gruss an Teplitz, Comte de Calla, and Leonie Lamesch; Mr. C. Smith, gardener to the Rev. J. T. H. Du Boulay, Shawford, Winchester, second. For six bunches of single roses, Mr. H. Mattingley, gardener to Admiral Sir J. Hopkins, Greatbridge, Romsey, secured the premier place with an interesting exhibit; Mr. Childs followed for second place. The premier bloom in the show was one of Mildred Grant, belonging to Mr. Drew; and the premier T. was one of Mdme. J. Gravereaux in Messrs. B. Cant and Sons' second-prize stand of forty-eight.

Nine classes were provided for gardeners and amateurs. A challenge cup was offered for eighteen distinct blooms, and seven competed. With an excellent set, Mr. W. Neville, gardener to F. W. Flight, Esq., Cornstiles, Twyford, Winchester, secured the coveted award. The leading blooms were Florence Pemberton, Mildred Grant, White Maman Cochet, Maman Cochet, Dean Hole, Lady Ashtown, and William Shean. Dr. Charles Lamplough, Kirkstall, Alverstoke, was a good second. The last-named won for six triplets, distinct, with a fair exhibit, as also he did for twelve blooms, distinct. Mr. Neville staged an even set of medium-sized blooms of good quality in the class for twelve teas or noisettes, and won easily with Princess of Wales, Mrs. Mawley, Boadicea, and Mdme. J. Gravereaux; Dr. Lamplough second.

Sweet peas made a remarkable display, and they were of fine quality. The habit of including more than one variety in a vase is, however, to be deprecated. For instance, vases of what should have been Dorothy Eckford contained flowers with waved standards, and in various other varieties the same irregularity occurred. Had the judges treated such vases in the proper manner, much disqualification would have ensued. Messrs. Toogood and Sons, Southampton, offered the prizes for six bunches, distinct, and for which twenty exhibitors entered. Mr. Usher, gardener to Sir R. Baker, Bart., Ranston House, Blandford, was easily first with a magnificent set of typical blooms of John Ingman, Etta Dyke, Primrose Spencer, Minnie Toogood (new), Helen Lewis, and Prince of Asturias; Mr. G. Hawkins, Violet Cottage, Alverstoke, second with a capital exhibit; and Mr. J. Mattingley third. Mr. Usher also won the leading prize in the classes provided by Messrs. Breadmore, Webb, and Carter, with similar exhibits; Mr. H. H. Lees, Warblington Cottage, Havant, was second in Messrs. Webbs' class, Mr. Mattingley occupying a like place in Mr. Breadmore's class, in which there were ten competitors. Messrs. Sutton and Sons offered substantial prizes for a single bunch of their Queen and Marbled Blue varieties, which produced a good competition, and Mr. Usher was here again successful.

Hardy border flowers were numerous and good. For twelve bunches, distinct, Messrs. B. Ladhams and Son, Shirley Nurseries, Southampton, were first with huge sheaves, nicely arranged, of Gaillardia superba, Heuchera superba, Scabiosa caucasica, Coreopsis grandiflora, Iris Kæmpferi Kuroki, Campanula coronata alba, Chelone barbata coccinea, Delphinium Belladonna, Campanula rotundifolia, and Gaillardia Vivian Grey.

Plants were but few in number; Mr. T. Hall, gardener to Lord Swaythling, South Stoneham House, Southampton, had the best specimen foliage plants, palms, and ferns. Mr. C. Hosey, gardener to Mr. J. C. E. D'Estene, Elmfield, Southampton, had some freely-flowered zonal pelargoniums, easily securing premier place for six. Mr. Ellwood had the best table plants—quite a desirable able collection.

Fruit was scarce. Mr. M. Foskett, gardener to Mrs. Ubsdell, New Milton, had the best two bunches of black grapes. Mr. W.

Palmer had the best peaches, and Mr. H. C. Siezoun, gardener to C. H. Farman, Esq., [illegible]hams, had the best nectarines. Strawberries were finely shown, and Mr. T. Hall was first for two dishes with Royal Sovereign and Bedford Champion, the latter very fine.

Vegetables were numerous and excellent. Thirteen competed for Messrs. Toogood's prizes for six dishes, and Mr. G. Ellwood, gardener to W. H. Myers, Esq., Swanmore Park, Bishop's Waltham, was easily first with superb examples of White Mammoth onion, Tremendous peas, Masterpiece cauliflowers, Intermediate carrots, Best of All tomatoes, and Royal Kidney potatoes; Mr. B. Hollis, gardener to Major Chichester, Embley Park, Romsey, second; and Mr. T. Hall third.

For Messrs. Sutton's prizes five entered, Mr. E. Beckett, gardener to the Hon. V. Gibbs, Aldenham House, Elstree, Herts, being a distinct first prizewinner with choice examples of Leviathan onions, Duke of York potatoes, Centenary Marrowfat peas, Perfection tomatoes, Magnum Bonum cauliflowers, and Intermediate carrots; Mr. Ellwood second. The latter also won Messrs. Carter's and Webb's premier prizes for six dishes with admirable examples.

Non-competitive exhibits came from Messrs. Toogood and Sons, who had sweet peas, and gained a gold medal; Mr. E. Wills, The Nurseries, Winchester Road, Shirley, who had miscellaneous plants and floral designs, for which a gold medal was worthily awarded; Messrs. Ladhams and Sons, who had a charming group of herbaceous flowers and pinks; Mr. Godfrey, Exmouth Nurseries, who had a huge bank of Solanum Wendlandi, pelargoniums, and poppies; and Messrs. Rogers and Son, Southampton, who had a bank of roses in pots, mainly of the Wichuraiana type.

Newcastle.

July 1, 2, and 3.

This show was held in connection with the Royal Agricultural Show, on the Newcastle Town Moor, in beautiful summer weather. It was perhaps one of the finest floral displays that has been seen in connection with this show for many years, but the competition was not nearly so keen as is usually the case, being confined to twelve open classes and six special classes. The working men's classes, which have been always such an attraction, were altogether left out of the schedule. Those who have visited the show in previous years have generally spoken highly of the marvellous specimens of stove and greenhouse plants in particular, and the fine vegetables the pitmen produce; however, what was lacking in this respect was fully compensated for by the manner in which the horticultural trade displayed their produce.

For a group of foliage and flowering plants, occupying a space of 300 sq. ft., Mr. J. Sharp, Valley Nurseries, Huddersfield, was first with finely-coloured crotons and beautifully-flowered roses, effectively arranged; Mr. T. Bell, gardener to A. E. Bainbridge, Esq., Lynwood, Jesmond, second, with an effectively arranged group, the orchids being particularly fine; Messrs. Ord Brothers, South Shields, third. For the best collection of orchids in flower Mr. H. A. Innis, Croft Spa, Yorkshire, was first with Cattleya Mossiae, C. Mendeli, Lælia tenebrosa, and numerous cypripediums and oncidiums in variety; Mr. W. Lawrenson, Gallowgate, Newcastle-on-Tyne, second, with a group consisting principally of Odontoglossum crispum and Cattleya Mendeli. The best collection of carnations came from Mr. C. F. Waters, Deanland Nursery, Balcombe, Sussex, who had a beautifully arranged and attractive group, Britannia being particularly brilliant in this display, though the whole of the flowers were fine in form and substance; Mr. W. Lawrenson, second; and Mr. H. A. Innis, third.

Tuberous begonias were best shown by Messrs. Blackmore and Langdon, Bath, who had a grand display of finely-flowered plants, and blooms of splendid quality; Messrs. Ord Brothers second. The best collection of sweet peas came from Mr. R. Bolton, Warton, Carnforth; the arrangement in this group was very fine, there being pyramids of Countess Spencer, Helen Lewis, John Ingman, Clara Curtis, St. George, and Henry Eckford; Mr. C. W. Breadmore, Winchester, second; and Messrs. G. and A. Clark, Lim., Dover, third. For a collection of herbaceous plants Messrs. Harkness and Sons, Bedale, were first, the delphiniums and Papaver Princess Louise being particularly attractive; Messrs. Gibson and Co., Leeming Bar, second.

The best collection of hardy foliage and flowering plants came from Mr. W. Lawrenson, whose liliums and roses were a most attractive feature; Messrs. Ord Brothers second. For a collection of roses Mr. F. M. Bradley, Peterborough, had the only exhibit, and gave a fine display, which was awarded first prize.

For a dining table arranged with flowers and fruit Mr. J. Tullett, Raby Castle, Darlington, was first; Mr. F. Edmondson, Westerhope, second; and Mr. Mark Purvis, Binton, third. For six dishes of fruit, distinct kinds, Mr. J. McPherson, gardener to Lord Londesborough, Market Weighton, was first, showing Black Hamburgh and Muscat of Alexandria grapes, Queen pine, Hale's Early peaches, Lord Napier nectarines, and Royal Sovereign strawberries, all being of good quality; Mr. J. Tullett, second; and Mr. Thomas Pattison, West Hartlepool, third.

Messrs. Sutton's chief special prize, for six kinds of vegetables, was won by Mr. T. H. Bolton, Powderham Castle, Exeter; Mr. J. Henderson, Christon Bank, second; and Mr. E. Keith, Wallington, Morpeth, third. For a bunch of Sutton's Queen sweet pea Mr. E. Keith was first, and Mr. Bolton second.

In the class for a rockery, showing alpine and water gardening, Messrs. Backhouse and Son were the only exhibitors, and they were awarded the first prize. This was a most attractive display, with a background of ornamental trees and shrubs. The rocks were very tastefully arranged, and the flowering plants were attractively displayed; the water and aquatic plants were also a great attraction. The Royal Horticultural Society's gold medal was also awarded by the R.H.S. deputation.

Among the non-competitive displays Messrs. Hugh Low and Co., Enfield, showed the largest group in the show, this consisting of orchids, carnations, and a miscellaneous collection of flowering and foliage plants. Among the orchids were finely-flowered plants of Cattleya Mendeli, C. Mossiæ, and Lælia tenebrosa, odontoglossums in variety, and a plant of the rare natural hybrid, O. Williamsianum. The carnations where shown in fine form in a space of about 50ft. by 4ft. Messrs. W. Cutbush and Son, Highgate, N., sent a grand display of fine cut carnations, Spiræa Queen Alexandra, banks of verbenas in variety, and dwarf begonias. Messrs. G. and A. Clark, Dover, had a display of delphiniums and cut sweet peas. Messrs. R. H. Bath, Lim., Wisbech, sent cut hardy plants. Messrs. W. H. Hardy, Lim., Gosforth, had an extensive group of tree carnations and miscellaneous foliage and flowering plants. Messrs. Little and Ballantyne, Carlisle, sent stove and greenhouse flowering and foliage plants. Messrs. Dobbie and Co., Rothesay, exhibited a large stand of sweet peas, pansies, and violas. Messrs. Jarman and Co., Chard, Somerset, sent a fine table of cut roses and sweet sultans in variety.

Messrs. Laing and Mather, Kelso, had a fine display of ornamental trees and shrubs. Messrs. Dicksons, Chester, sent a large exhibit of cut hardy flowers. Messrs. J. Backhouse and Son, Lim., York, had a group of Malmaison carnations and flowering and foliage plants. Mr. E. Edmondson, Granger Arcade, Newcastle, had a grand display of floral designs, which was a fine feature of the show. Messrs. Ord Brothers had a group of ferns. Mr. W. Lawrensen had a large group of stove ferns and foliage plants and numerous greenhouse flowering plants. Messrs. W. and J. Brown, Peterborough, made a fine display of cut roses, hardy perennials, and greenhouse flowering plants. Messrs. Kent and Brydon arranged, in the open, a remarkable group of ornamental trees and shrubs, and a collection of topiary work in tubs. Messrs. Little and Ballantyne had, in addition to the inside group, a fine display of ornamental trees and shrubs in pots. Messrs. R. Smith and Co., Worcester, were awarded the R.H.S. gold medal for an attractive and miscellaneous group of very finely-grown ornamental trees and shrubs, the golden yews being a remarkable feature. Messrs. Laxton Brothers had a very fine display of strawberries in baskets.

The following medals were awarded by the Royal Horticultural Society's deputation:—Gold medals to Mr. J. Sharp, Messrs. R. Smith and Co., Mr. F. M. Bradley, and Messrs. Backhouse and Sons. Silver-gilt Knightian to Messrs. Laxton Brothers, for strawberries, and Mr. McPherson. Silver-gilt Flora to Messrs. Backhouse and Son, Mr. T. Bell, Messrs. Hugh Low and Co., Mr. Edmondson, and Mr. Tullett. Silver-gilt Banksian to Messrs. Ord Brothers, Mr. C. F. Waters, Messrs. Dobbie and Co., Messrs. W. and J. Brown, Messrs. R. H. Bath, Mr. J. Robson, Messrs. Harkness and Co., and Messrs. W. Cutbush and Son.

Norwich Summer Show.

A success. Yes, we can vote this from all points; the attendance was 1,500 better than the previous year, the exhibits were better, and the weather was ideal. Roses, which years ago formed the primary feature at this show, were not so largely shown as one would wish to have seen. The collection of 48 sent by Messrs. B. R. Cant and Sons, took premier position, but the blooms showed evidences of the hot scorching sun of the previous days in the open. The best teas undoubtedly were those from Messrs. J. Burrell and Co., their freshness attracted one to them. In classes confined to amateurs and residents in the county one saw splendid blooms from Mr. R. Steward and the Rev. J. A. L. Fellowes, the former winning two silver challenge cups with his grand blooms.

When we went to the tent of cut flowers we found the local growers much in evidence. The display of 48 bunches of hardy perennials, staged by Mr. Lewis Smith, gardener to Robert Fellowes, Esq., Shotesham, stood out first and foremost. They were in bold, massive bunches, splendidly arranged, and, as might be expected, of the best varieties. 'Twas a pity there was no other competitor in this class. Mr. W. Chettleburgh, gardener to Colonel Rous, Worstead, had made a decided improvement on his previous year's staging, and won first for 36 bunches. Mr. H. Goude, gardener to E. Reeve, Esq., The Grange, Catton, was a new exhibitor in this department, and staged a meritorious group of twenty-four bunches, and for which he received the coveted first. There were classes for iris, antirrhinums, pelargoniums, exotic flowers, and such like, all of which were keenly contested. Mr. W. Allan, Gunton Park Gardens, set up some of his fine tree carnations, and Mr. Henley, gardener to Sydney Morris, Esq., Wretham, had a fine batch of border carnations.

In the pot plant section Mr. W. Rush, gardener to F. P. Hinde, Esq., Thorpe, did great things. His greenhouse ferns were pictures of health, and the colourings of his coleus were well brought out. In this section Mr. H. Rider Haggard sent a batch of orchids, mainly cypripediums, for which he received a special prize.

Sweet pea growers had a new feature, viz., a tent all to themselves, and right well they filled it, proving the popularity of this flower to-day. Messrs. Stark and Son, Ryburgh, had some fine new seedlings, and so did Mr. Robert Holmes, Tuckswood Farm, Norwich. The best competitive exhibit of peas came from Mr. T. Notley, gardener to E. Gurney Buxton, Esq., Thorpe, other good collections being staged by Mr. W. Chettleburgh, Mr. G. Baker, gardener to B. E. Fletcher, Esq., Marlingford; and Mr. W. Laws, gardener to E. G. White, Esq., Eaton.

The fruit section had a much larger number of entries than had been witnessed for several years, and was the scene of some close fights. Mr. W. Shingler, gardener to Lord Hastings, Melton Constable (who will be remembered as the winner of the great grape prize at Shrewsbury), set up a splendid collection of six varieties, his peaches and nectarines being far in advance of any others in the show. Mr. L. Smith, gardener to R. Fellowes, Esq., came first in a strong competition for strawberries. Grapes of both white and black kinds were much in evidence, and provided some keen struggles. Mr. Hilsdon, gardener to Sir F. Adair, gained most prizes in the several classes for these. There was furthermore a large array of vegetables, peas, beans, tomatoes, and potatoes predominating. Add to this some fine groups of nursery exhibits from such firms of repute as Messrs. Daniels Bros., Lim., Norwich, and R. C. Notcutt, Woodbridge. Every gardener seemed in good humour. There was much handshaking to be done, and stories to be related. Such annual gatherings do good socially as well as educationally.

FORTHCOMING ENGAGEMENTS.

The Editor is always glad to receive intimation of exhibitions, and copies of schedules.

MONDAY, July 13.—Baltic Rose and Sweet Pea Show, at the Shipping Exchange, St. Mary Axe.
TUESDAY, July 14.—Saltaire Rose Show.
Gloucester Rose Show.
Trowbridge Horticultural Society.
WEDNESDAY, July 15.—Woodbridge Horticultural Society.
Chippenham Rose Show.
Luton Sweet Pea and Rose Show.
Formby Horticultural Society.
Thornton Heath Horticultural Society.
Birmingham Flower Show, at Edgbaston.
Women's Agricultural and Horticultural Produce Exhibition, at the Royal Botanic Gardens, Regent's Park.
THURSDAY, July 16.—Potter's Bar Horticultural Society.
Brentwood Horticultural Society; two days.
Chipping Norton Rose Show.
Helensburgh Rose Show.
FRIDAY, July 17.—Ulverston Rose and Sweet Pea Show.
TUESDAY, July 21.—Royal Horticultural Society; committees meet at 12 o'clock; lecture at 3 p.m.; Scientific Committee at 4 o'clock.
National Rose Society, at Manchester.

ANSWERS TO CORRESPONDENTS.

IMPORTED ORCHIDS.—R. B. C., Northampton: We cannot do better than refer you to the notes on how to deal with imported orchids, given by Mr. H. J. Chapman in our "Work for the Week" columns in the present issue. If you need any further particulars please write us again.

LIFTING DAFFODILS.—W. A. W., Lechlade: Lift the bulbs at once, and store them in a cool dry shed in flat boxes, where they can be sorted, cleaned, and placed in their various sizes as soon as convenient. If left longer in the ground the bulbs may begin to root again if a spell of wet weather comes, and then lifting would cause a check.

HANDY BOOK ON GARDENING.—C. F., Leighton: If we judge your needs aright then the "Alphabet of Gardening" will be just the work you require. It describes in very simple fashion the various gardening operations, and their why and wherefore. The book is 1s. 9d., post free (2s. 3d. in cloth), from W. H. and L. Collingridge, 148, 149, Aldersgate Street, E.C.

TREE ROOT ROT.—J. D. H., Swansea: There is little doubt but that the tree is suffering from an attack of the dreaded Tree Root Rot (Armillaria mellea). We published an account of this fungus a couple of years ago, as issued by the Board of Agriculture, and we now give again the portion that is of most importance to you. When the leaves of a tree droop and turn yellow owing to the presence of the fungus, curative measures are hopeless, as the mycelium has by this time completely girdled the trunk. Nevertheless, it is very important at this period to adopt measures against an extension of the disease. When a tree has been killed the black rhizomorphs surrounding its root extend in all directions about three or four inches below the surface of the ground in search of living roots. When such are encountered, the tips of the rhizomorphs pierce the bark and give origin to the white mycelium, which eventually kills the tree. These underground rhizomorphs travel for an unlimited distance in the ground, and, unless checked, constitute a continual source of danger to trees surrounding the one attacked. When a tree is attacked a portion of the bark at the collar should be removed, and if the white mycelium is found to have passed up the trunk the case is hopeless, and the wisest course is to cut down the tree, remove as much as possible of the root, which should be burned, and not used for ornamenting some other portion of the garden, as is too frequently the case. When this is done, dense masses of toadstools appear in due course, and the underground rhizomorphs spread on every side. If the mycelium has not entered the trunk, but is confined to certain branches of the root, these should be removed, as much as possible of the root exposed, and covered with a mixture of equal quantities of quicklime and powdered sulphur. This mixture should also be placed round the base of the trunk before the soil is filled in. Whether a diseased tree has been removed, or treated in the hope of recovery, a trench about eight inches deep and six inches wide should be made all round the site of the tree, at a distance well outside the spread of the branches. The object of the trench is to intercept the spreading rhizomorphs. If in a situation where an open trench can be allowed to remain, this is all that is required to be done. If in a place where an open trench would be objectionable, planks about six inches deep, well coated with gas-tar, may be let into the ground. In making the trench it is important that the soil removed be spread over the ground enclosed by the trench. When the toadstool appears at the base of a trunk, it should be collected and buried; crushing it underfoot is worse than useless, as this only aids in the dispersal of the spores. Great care should be taken not to injure the base of the trunk or exposed roots, as the spores can only enter the tree through a wound. The grass-cutting machine is responsible for many wounds through which this and various other fungi parasitic on trees first gain an entrance.

CASTOR OIL PLANT. — Amateur, Redditch: Your gardener friend is right, the plant you have is not a castor-oil plant, but a member of the aralia family. It is commonly called Aralia Sieboldi, but its correct botanical title is Fatsia japonica.

SPITTLE-FLY.—N. M. S., Steyning: The little pests that hide themselves in a spittle-like froth are frog-hoppers. They are not very harmful, but they should be got rid of by hand-picking or by syringing affected plants with a tobacco solution, or even with clear water, so as to disperse the froth. The froth is a natural protection, without which the pest cannot long live.

SWEET PEAS. — M. M., Sandown: The raisers of the varieties are as follows: Romolo Piazzani—H. Eckford, Wem; Nymphæa—C. Morse and Co., San Francisco; Paradise — Miss Hemus, Upton-on-Severn; Florence Molyneux—Dobbie and Co., Rothesay; E. J. Castle—W. J. Unwin, Histon; Etta Dyke—C. W. Breadmore, Winchester; George Gordon—H. Eckford; Purity—R. Bolton, Carnforth; and Rosie Adams—Thos. Stevenson, Woburn Place Gardens, Addlestone.

HOT-WATER AS AN INSECTICIDE.—T. M. H., Gloucester: It is not so generally known as it should be that water at a temperature of 150 deg. Fahrenheit, is a very fine insecticide, and a safe one. For green-fly and red-spider it is first-rate. But the great difficulty in connection with the use of water at this temperature is that a supply of boiling water must be kept close at hand wherewith to keep the water used at the proper degree of heat. Unless this is done the heat declines quickly, and the "hot-water cure" is ineffective. A thermometer should be kept in the dipping tub or bucket to indicate the temperature of the water.

SCALDED VINE LEAVES.—C. M., Loughton: The leaves of the vines have been badly scalded, and scalding is due to faulty ventilation. All too frequently ventilation is regarded as merely a means of reducing temperature, and the ventilators are opened more or less widely when the thermometer indicates an uncomfortable degree of heat. Proper ventilation, as a means of supplying the plants with fresh air, should begin in a small way early in the day, especially in the case of vines. There are two ways in which scalding occurs. In the one case ventilation is not given early enough to permit the moisture that has condensed on the leaves during the night, to evaporate, and the sun gaining strength shines with force through the glass and through the globules of moisture which become veritable burning glasses, and thus holes are burned or scalded through the leaves. In the other case the ventilators are opened wide when the temperature has become unbearable, and the moisture on glass and leaves evaporates so quickly that the tender tissues of the leaves are badly injured or killed by the heat of the sun. There is no remedy for scalding, but it may be prevented by a judicious use of the ventilators. A gardener should learn to anticipate the weather, with the help of thermometer and barometer, and if there is a prospect of warm and bright weather he should commence to ventilate first thing in the morning, gradually increasing the ventilation as the day advances and the heat increases. By this means the condensed moisture disperses gradually and early, and the leaves receive no injury.

NAMES OF PLANTS.

D. T., Epsom.—Escallonia Philippiana.

C. G. H., Bristol.—1, Dendrobium moschatum; 2, Cocos Weddelliana.

R. R., Leeds.—1, Strobilanthes Dyerianus; 2, Veronica teucrium; 3, Helxine Solieroli.

W. T. J., Histon.—1, Ligustrum chinensis; 2, Zygadenus elegans; 3, Campanula garganica; 4, Genista dalmatica.

G. O., Redcar.—1, Veronica incana; 2, Sedum album; 3, Lilium davuricum; 4, Phlox glaberrima; 5, Stachys grandiflora.

P. C., Maldon.—1, Campanula glomerata; 2, Gentiana saponaria; 3, Hesperis matronalis; 4, Geranium sanguineum album; 5, Tilia europæa; 6, Gingko biloba.

MARKETS.

COVENT GARDEN.

Flowers.

Flowers are very abundant; roses, carnations, and sweet peas are cheap and good. Business good, but slackening a little.

NOTES OF THE WEEK.

Fasciation.

The curious form of growth which we see exemplified as a fairly constant varietal feature in Celosia cristata or cockscomb, and which is known as fasciation or a bunching together, is due to an abnormal multiplication of those growing points which ordinarily would be few in number, and would each produce a single independent shoot. The close proximity in which these are produced deprives them of sufficient space for individual development, and as a consequence all are cemented together, as it were, into one mass. In the cockscomb the normal tendency of each shoot is to expand at its summit into a feathery mass of flowers, and in the curiously serpentine, almost sponge-like, masses of the so-called comb, the tendency to expand and flower finds expression by such a formation in an ever-increasing thickening and widening of a frilled fan, on the surfaces and edges of which an imperfect inflorescence appears and gives the brilliant colours they present. In lilies a similar growth is often seen, but the flowers although reduced in size in proportion to the great increase of number, are generally perfected, only the multiplied main stems being conglomerated. Given mere formation of stalk and no inflorescence, we may see, as in the common asparagus, long, thick ribbon-like growths of even width from base to summit, and several feet long, all these cases showing that the shape assumed is entirely correlated with the normal process of growth. In Asparagus plumosus there is a so-called crested variety, in which fasciation occurs in both main shoots and laterals, and, indeed, pervades the plant, though appearing most markedly at the terminals so as to form tassels very much on the lines of crested ferns. This would, however, appear to be only a superficial resemblance, for on examination it is seen that the stems widen appreciably on true fasciate lines long before the expanded terminal is reached, which is very rarely the case in ferns. The crest or tassel of a fern is not fasciate, since although the growing points are abnormally multiplied they almost invariably branch away separately, and although by doing this again and again a bunch-like tassel is formed, it is not centrally massive as in Asparagus plumosus, it is indeed ramification instead of fasciation. So far as our present knowledge goes we have no idea at all of the cause of these phenomena. Fasciation crops up here and there in very diverse plants, and that the tendency can be inherited is proved by the fixed cockcomb strains in many colours, and by the so-called mummy pea, which bears fasciated bunches of flowers and comes quite true from seed. These departures from usual lines are of extreme interest. How plants grow has been the favourite study of innumerable botanists and biologists, and through their research we know that every part of a plant, like the plant itself in its infant stage, is built up cell by cell on a definite plan, a mother cell as it is termed, heading, as it were, the procession, and splitting up as it proceeds, throwing out other mother cells for lateral growths, and so on until all the complex formation of the full-grown plant is perfected. In fasciated growths, however, we must assume a phalanx of such mother cells marching many abreast instead of a single pioneer. Each one is doing its level best to act on the old lines, but it cannot, it can only push forward in a straight line with its neighbours and enter into the general compromise by which alone they can grow at all. In cauliflower and broccoli we see an apparent floral fasciation, but this is rather due to multiplication of flowers to so great an extent that the plant cannot possibly carry them all to perfection. It is easily seen that they are not fasciated, but separated, and in the same family of Brassicas it is also easy to see that the turnip-like kohl rabi is merely a thickened stem, and not a fasciated one, the leaves around it being normal, and the terminal growth single. At the recent meeting of the Linnean Society Mr. W. C. Worsdell, F.L.S., exhibited a large series of scarlet runner beans seedlings, in which fasciation had been induced by cutting away the plumule or axis of growth at an early stage, a result probably due to a proliferous bud production at the site of the wound, which, perforce, assumed a fasciated form for lack of space for individual development.

MR. ERNEST J. EDWARDS,
Chairman of Committee, National Sweet Pea Society.

Mr. Ernest J. Edwards, whose portrait we have much pleasure in publishing this week, is one of the celebrities of the sweet pea world. For many years Mr. Edwards has been a vice-president of the National Sweet Pea Society, and when, for the present year, the turn came for an amateur to hold the post of chairman of committee, Mr. Edwards was unanimously elected to the position. Although a busy man, Mr. Edwards finds time to fulfil the duties of chairman; and, moreover, he has given evidence of his enthusiasm and generosity by presenting to the National Sweet Pea Society a handsome silver trophy, to be competed for at the society's provincial exhibition at Dublin in August. Mr. Edwards is a great lover and skilful cultivator of sweet peas, and encourages their exhibition at local exhibitions. At his pleasant home at Haydon Hall, Eastcote, Middlesex, he grows most of the novelties each year, and his own influence, coupled with that of his fragrant flowers, has been the means of adding many new members to the National Sweet Pea Society.

Foreign Fruits in British Markets.—One of the most interesting points in the imports of fruits during June was the big drop in the quantities of apples and pears. In the corresponding month of last year the imports of apples amounted to 108,716 cwt., of the value of £115,296, but last month the aggregate was only 87,263 cwt., of the value of £84,338. Apricots and peaches show an increase in quantity of 9 cwt., and in value of £13, the total being 122 cwt., of the value of £308. Banana imports were in excess of those of June, 1907, the total having been 690,631 bunches, of the value of £196,671. The imports of cherries aggregated 112,887 cwt., of the value of £178,333, or an increase in quantity of 37,538 cwt., and in value of £78,577. Currants were also imported in largely increased quantities, the total having been 6,445 cwt., of the value of £9,294, against 3,187 cwt., of the value of £6,177, in the corresponding month of last year. Gooseberries, on the other hand, were imported in lessened quantities, the total having been 18,116 cwt., of the value of £10,837. Grapes also show a decrease, the aggregate having been 507 cwt., of the value of £2,571, or a decrease in quantity of 80 cwt., and in value of £2,306. In the imports of lemons there was a large increase, while oranges were imported in smaller quantities. Pear imports dropped from 3,282 cwt., of the value of £4,605, in June, 1907, to 141 cwt., of the value of £182 last month. Of plums the imports were 169 cwt., of the value of £255, and of strawberries the imports aggregated 26,137 cwt., of the value of £33,757. Unenumerated fruits were about 1,000 cwt. down, the total being 9,531 cwt., of the value of £15,225. The value of the fruit imports for the month was £780,515, or an increase of £87,851. For the six months ending June 30, the value of the fruits imported was £4,588,364, or an increase of £46,108, as compared with the first half of last year.

Chrysanthemum Congress at Tours.—The French National Chrysanthemum Society will hold its thirteenth annual congress at Tours from November 3 to 5 next. In conjunction with this congress there will be an exhibition of chrysanthemums which will be organised by the Tours Horticultural Society. The congress will be opened at 2.30 p.m., on the first day, and the sitting will be continued from 9 a.m. to 12.30 p.m. on the second day. The subjects arranged for discussion comprise grafting chrysanthemums, the systematic application of manure to chrysanthemums growing in the open, the best method of packing plants and cut flowers, and the best means of producing and fixing sports. Several of these subjects have been discussed at previous congresses.

New Rambling Rose Lady Godiva.—In the note accompanying the illustration of this exquisitely beautiful rambling rose, which appeared in our issue of the 11th inst., the colour of the flowers is inadvertently described as pale yellow, instead of pale blush. We are especially anxious this correction should be made note of by rose growers because Lady Godiva is a most valuable addition to the rambling roses with blush-coloured and light pink flowers. This variety originated with Messrs. Paul and Son, of Cheshunt, who also are the raisers of the fine single climbing rose Una, which obtained the second place in the ballot for the Nickerson Cup for the best white climbing rose flowering more or less singly.

The Imports of Vegetables in June last were considerably less than in the corresponding month of last year, the principal falling-off being in potatoes. Of these the imports were 1,761,259 cwt., of the value of £671,293, or a decrease in quantity of 699,609 cwt., and in value of £174,920. Germany sent 4,612 cwt.; France, 766,465 cwt.; Channel Islands, 884,766 cwt., and other countries, 105,416 cwt. The imports of tomatoes aggregated 127,793 cwt., of the value of £93,477, and of onions 536,850 bushels, of the value of £60,327, the figures for the last-named representing an increase in quantity of 154,136 bushels, and in value of £4,210. Unenumerated vegetables imported during the month were of the value of £40,474, a decrease of £3,177, as compared with June, 1907. The imports of potatoes for the six months ended June 30 were 5,508,789 cwt., of the value of £1,657,532; onions, 4,075,645 bushels, of the value of £490,492; tomatoes, 521,298 cwt., of the value of £427,165, and unenumerated vegetables, of the value of £253,444.

National Sweet Pea Society.—From a circular letter, signed by Mr. W. Cuthbertson, Marks Tey, Mr. E. Sherwood, 152, Houndsditch, E.C., and Mr. Leonard Sutton, Reading, we have received, we learn that steps are being taken with a view to the presentation of a testimonial to Mr. C. H. Curtis, hon. secretary of the National Sweet Pea Society, on the occasion of the annual exhibition. Attention is directed in the circular letter to the remarkable growth of the society within recent years, the consequent increase in the secretarial work, and the desirability of acknowledging the services Mr. Curtis has rendered the society. The hope is expressed that the testimonial will be general, and that therefore small sums will be welcomed.

Hedges of Roadside Gardens.—With reference to the suggestion of the secretary of the Motor Union that owners of gardens alongside roads should cut their hedges in rather closely, Mr. W. Verner, of Winchfield, writes as follows: "Four years ago I cut down the hedges and shrubs to a height of 4ft. for 30 yards back from the dangerous crossing in this hamlet. The results were twofold: The following summer my garden was smothered with dust caused by fast-driven cars, and the average pace of the passing motors was considerably increased. This was bad enough, but when culprits secured by the police pleaded that 'it was perfectly safe to go fast,' because they 'could see well at the corner.' I realised that I had made a mistake. Since then I have let my hedges and shrubs grow, and by planting roses and hops have raised a screen 8ft. to 10ft. high, by which means the garden is sheltered to some degree from the dust and the speed of many passing cars is sensibly diminished. For it is perfectly plain that there are a large number of motorists who can only be induced to go at a reasonable speed at cross-roads by considerations for their own personal safety. Hence the advantage to the public of automatically fostering this spirit as I am now doing. To cut hedges is a direct encouragement to reckless driving."

Rainfall in June.—Our readers will not need to be informed that June was a dry month, but it may be of general interest to state that in London there were eight rainy days, and that the total rainfall was 1.33 inches, of which nearly one-half was registered on the first day of the month. At Dungeness, Liverpool, and Stornoway, the rainfall closely approached the average, and at Aberdeen and Blacksod Point it was above the average; but at other stations it was considerably below

Examination in Horticulture.—The Executive Council of the British Gardeners' Association are making arrangements for holding an examination in horticulture in October next, and in the current issue of the association's journal, a set of questions is published as a guide to those who intend offering themselves for examination. The questions, of which there are thirty-six, have been prepared by Mr. Charles Foster, and should prove most useful as types of the questions that will have to be answered by those who take part in the examination.

Thibetan Caryophyllaceous Plants.—Although only eleven members of the order Caryophyllaceæ were formerly recorded from Thibet, that number has been raised to forty-three by the discoveries made during the recent military expedition to Lhassa. The route followed by the expedition was practically an unexplored one, hence, of the species recorded nineteen are entirely new ones.

Floral Freaks.—Miss H. C. Philbrick, of the Cedars, Halstead, Essex, sends us two curious flower spikes. One is a foxglove with the upper flower campanulate and the others very widely inflated, but this departure from the type is now fairly common. The other spike, of an antirrhinum, had one clear yellow-self flower, one purple self, several flowers with purple tubes and crimson lips, two flowers half yellow and half purple, the colours running longitudinally, and two yellow ground flowers, heavily striped and speckled with crimson and purple. A more curiously mixed spike of flowers we do not remember to have seen, and when we find so many colours and combinations in one spike we begin to understand the difficulties raisers find in fixing colour variations of highly-bred florists' flowers.

Potato Spraying in Ireland.—According to the report of the Inspector of the Irish Department of Agriculture in Connaught, the spraying of potatoes in the Counties of Galway, Mayo, and Roscommon is being proceeded with on a larger scale this season than in any year since 1904. Spraying was commenced earlier than usual, a point of interest, as indicating a fuller appreciation of the value of the Bordeaux mixture as a preventive. A larger proportion of the work is being done by machines than in any previous year, and in all cases the spraying is being done in a more efficient manner.

Foreign Flowers.—Notwithstanding the remarkable extension in flower production in the United Kingdom, foreign growers continue to send us large quantities of flowers. During the first half of the current year the value of the flower imports was £177,620. This amount is nearly £400 more than in the corresponding period of 1907, and nearly £1,000 less than in 1906.

The Cowper and Newton Museum, at Olney, Bucks, has been in existence eight years, and the trustees and committee are anxious to extend its usefulness. The museum is singularly rich in literary and human interest, but the two rooms devoted to the exhibits are so overcrowded that it would be an immense advantage to devote the whole of the house to the public, who would then be admitted to the "John Gilpin" and other rooms now occupied by the curator. The income of £18 a year is wholly insufficient to admit of the desired extension being made, and to provide the small endowment considered necessary, an appeal is being made for a sum of £2,200. Mr. Thomas Wright, Olney, Bucks, is the secretary. The garden of the museum presents very much the same appearance as it did in Cowper's time, and to visit this charmed spot can hardly fail to be a source of much pleasure to those well acquainted with the poet's works.

Horticultural Exhibitions at Turin in 1911.—Preparations for great International Exhibition of Industries and Labour to be held at Turin in 1911 to commemorate the fiftieth anniversary of the proclamation of the kingdom of Italy, proceed apace. We have now received the preliminary schedule of the special horticultural exhibitions to be held at Turin, exhibitions that are being organised by the Executive Committee with the co-operation of the Regia Società Orto-Agricola del Piemonte. The May show is for ornamental plants, floral designs, and forced vegetables. In September, trees and shrubs, conservatory plants, fruits, and vegetables will receive special attention, and at the end of October fruits and vegetables and chrysanthemums will provide the chief features, though ornamental plants and floral designs are to be provided for.

Insect Mimicry.—It appears that in the Argentine Republic there is a caterpillar that closely imitates the stems and leaves of Arauja sericifera. This caterpillar, says "Nature," which is rather more than 1in. in length, is the larva of Dilophonota lassauxi, and feeds on Arauja sericifera, to the stem and leaves of which it presents a most striking resemblance, both as regards form and colouring. Pale blue in colour, with three longitudinal stripes of fawn, this caterpillar has two of the anterior segments of the thorax transversely enlarged in such a manner that they closely simulate the nodes of the food plant. The most remarkable feature in the resemblance is, however, the development of a pair of white knobs on the second of these enlarged rings exactly matching the white knobs on the nodes of the plant, which mark the points of attachment of fallen leaves. The mimicry is one of the most remarkable that has ever come under our notice.

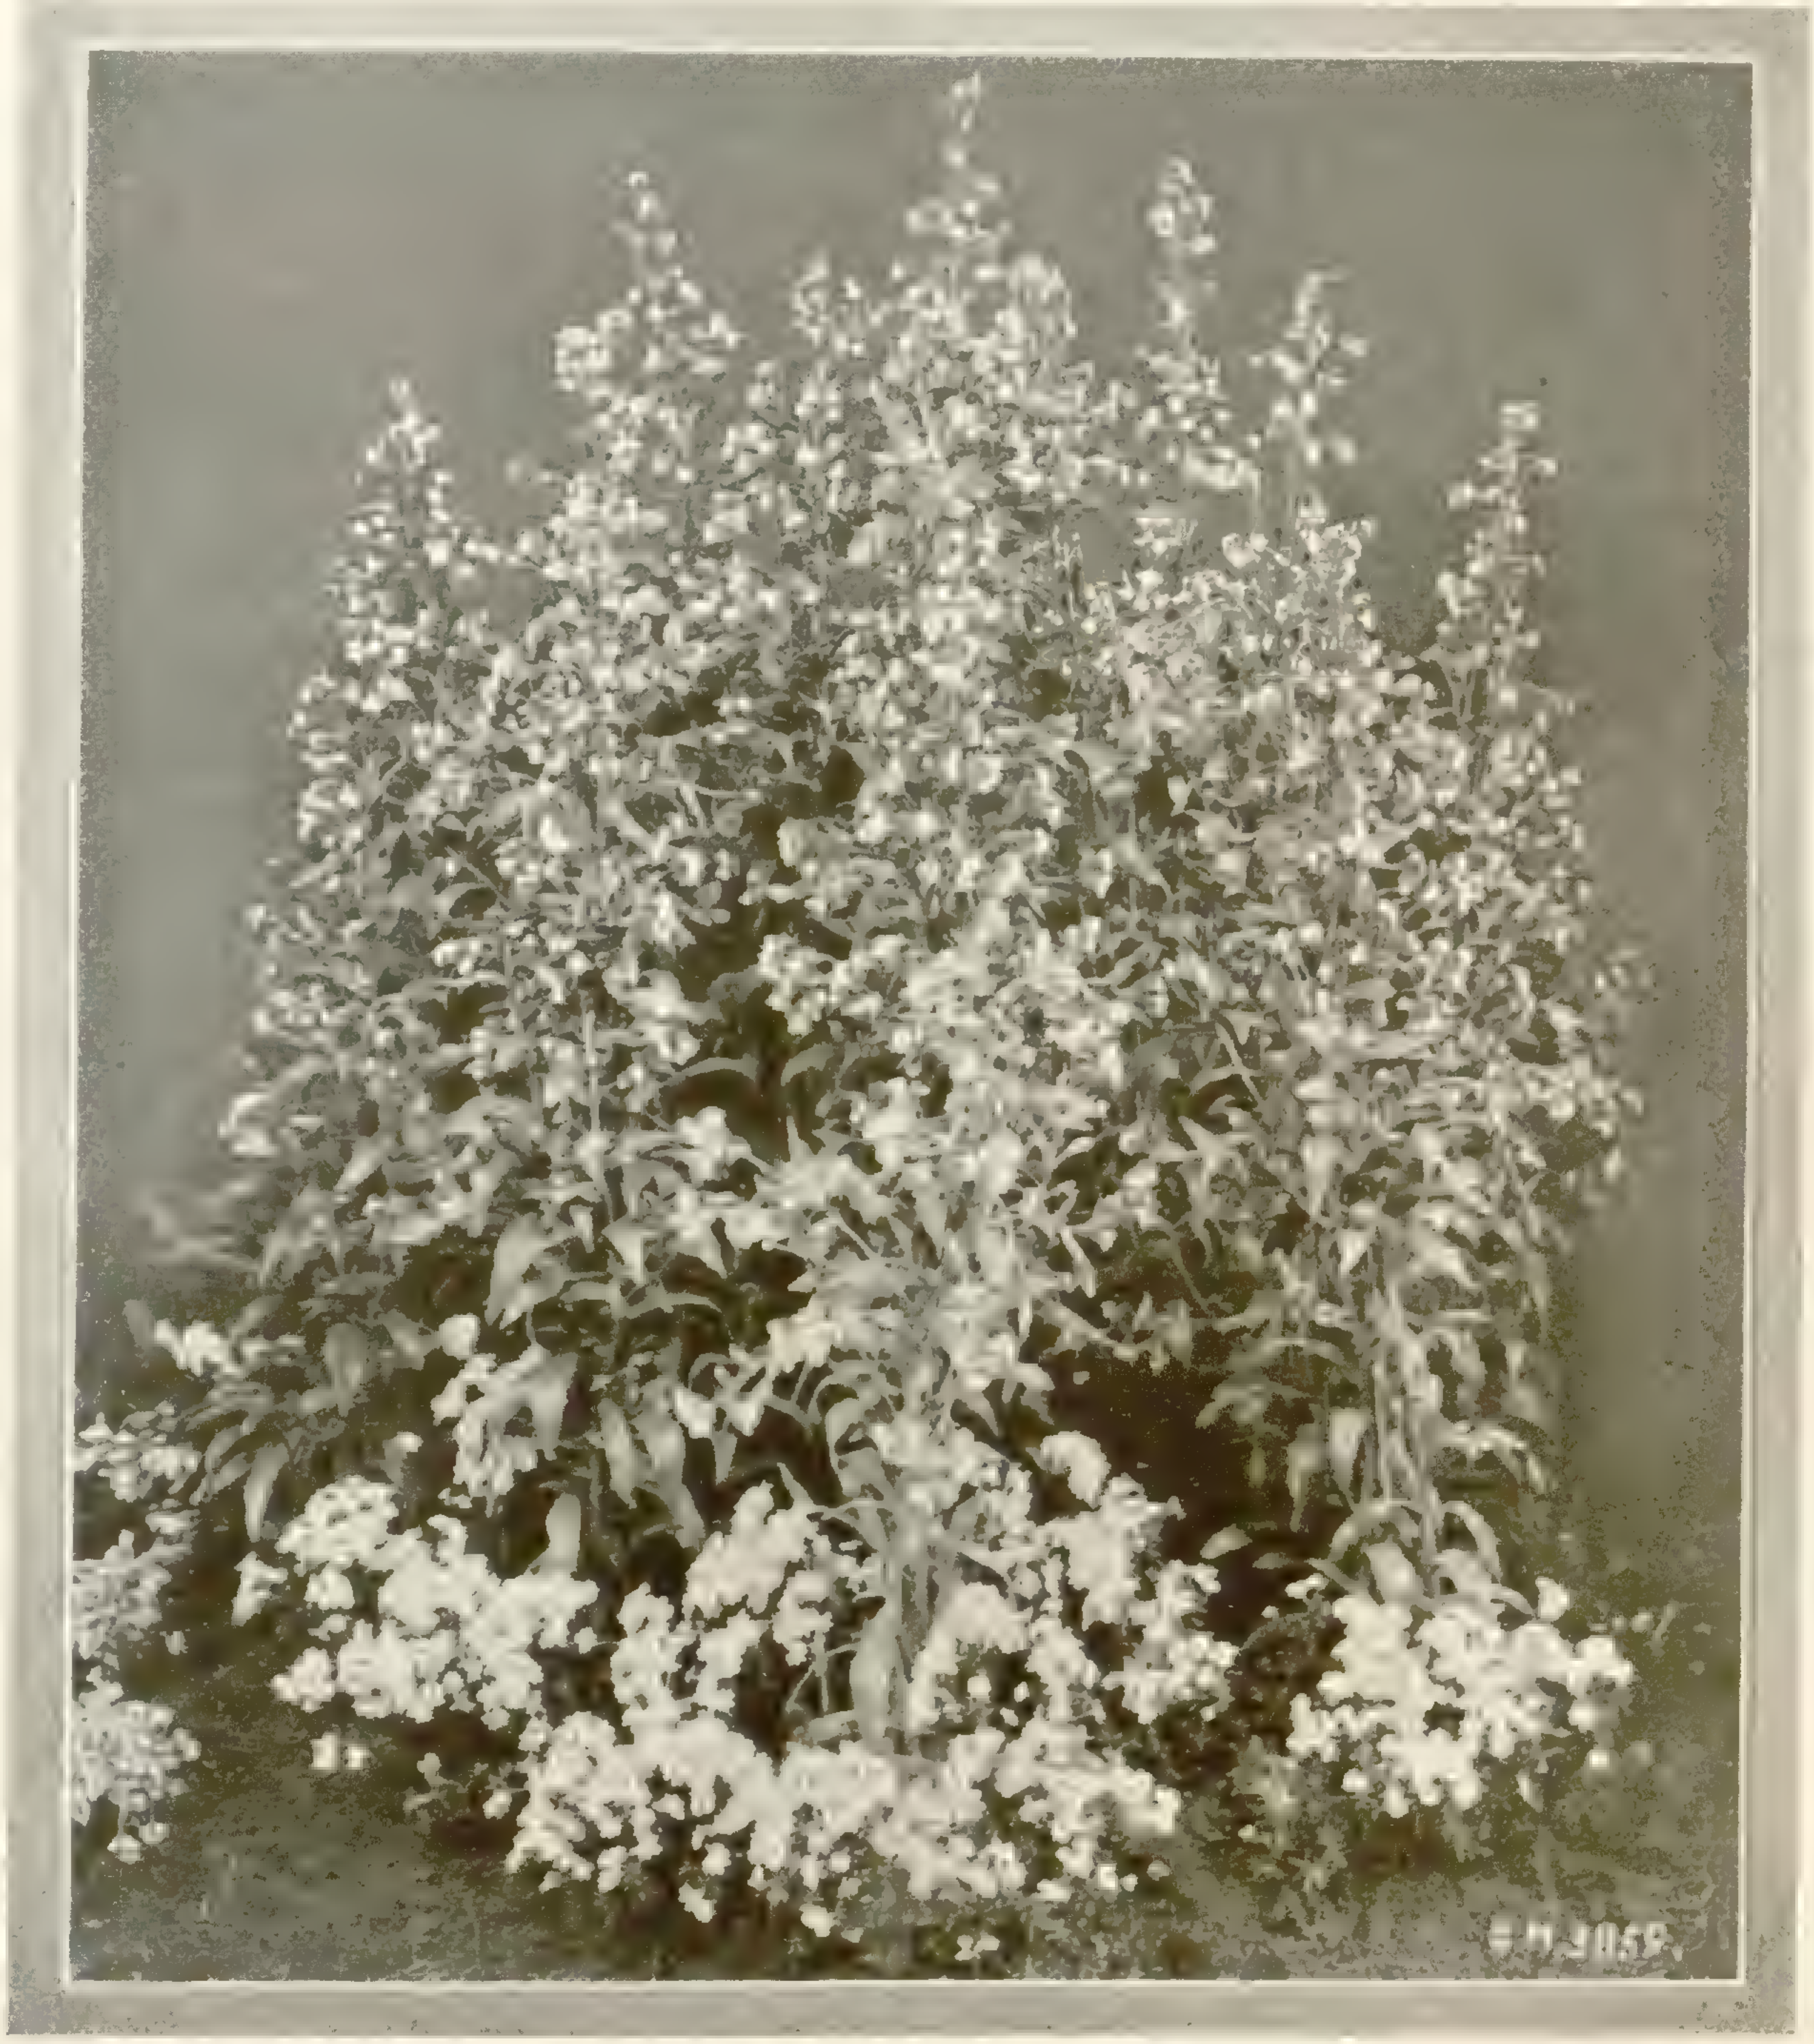
Rose Beetles and Fragrant Roses.—Mr. E. Thomasson, of Walsall, who is taking a keen interest in rose-growing, draws attention to the fact that in his garden the rose beetle does not affect Frau Karl Druschki, a scentless rose, and Caroline Testout, with but little fragrance, is also unscathed. This, he avers, shows that the rose beetle has no love for scentless roses. The beetles are pests on Richmond, Mdme. Ravary, Mdme. Abel Chatenay, Mrs. David McKee, and Melaine Soupert, all very sweet roses, while Mons. Joseph Hill and Mons. Paul Lede, both moderately scented, are proportionately damaged by the beetle. Cannot some one, he asks, discover a food that these pests like, so that we might trap them easily?

ANCHUSA ITALICA AND ITS VARIETIES.

Although Anchusa italica, or Italian Alkanet, has been in cultivation in British gardens since 1810, it has not assumed a prominent position there until within the last few years, when the introduction of some new varieties seemed to take the horticultural world by storm and revealed to it the possibilities before this fine perennial. Nothwithstanding this, the typical Anchusa italica is a pleasing border plant, sending up above its shining leaves a long-panicled raceme of handsome blue or purple flowers for a considerable time in summer, these reaching to a height of from three to four feet.

For a number of years no varieties of this plant existed in gardens, but some considerable time ago a fine variety, with larger and brighter flowers of a good blue appeared. It was called amœna, and was distributed, if my information is correct, from the then noted firm of E. G. Henderson and Son, who in their day enriched British gardens with many good plants. This fine form, although superior to the type, did not find general appreciation, as at that time a number of new flowers requiring less attention to maintain in health and vigour were introduced. It was, however, in favour with a select circle of exhibitors of hardy flowers in the North, and was up till lately, at least, cultivated to some extent by these growers.

But it is to the advent of what is known as the Dropmore variety of Anchusa italica that the real interest in A. italica and its possibilities is due. This has only been a short time in possession of the nursery trade, but in that time it has been well exhibited, and has taken hold of the public in a way few hardy flowers have done for some time. It is now pretty familiar to those who attend shows, frequent nurseries, or visit good gardens, and it always elicits great admiration by its good habit, its tall stature—about four feet—the size of its blooms, and its wonderfully beautiful colouring. The flowers are of a pleasing, rather light blue, and are about double the size of those of the typical A. italica, and at least a half more than those of A. i. amœna. It well deserved the award of merit it received from the Floral Committee of the Royal Horticultural Society.



GROUP OF ANCHUSA ITALICA OPAL.
As grown by Mr. B. Ladhams. Flowers pale blue.

A very beautiful variety, called Opal, has lately been introduced, and it will form an excellent companion to the Dropmore one, as its colour is lighter and more of a sky-blue than that of its sister flower, although the name Opal hardly conveys its distinctive colour. Its flowers are large also, and it sends up loose heads of fine blooms. The illustration of a group will give an excellent idea of the general character of A. i. Opal, better than any verbal description, although, of course, the colour must be imagined to complete the picture.

Among other forms of A. italica in the way of becoming known may be appreciatively mention that shown as A. i. Perry's variety. As exhibited it is apparently larger than the two preceding, and the flowers are of a very rich blue of great beauty, while the habit is also good. There is another splendid variety called superba, which is not, so far as I am aware, in commerce as yet, but which has originated in a famous garden. It is of large size, has very deep blue flowers, and is of excellent habit. There are probably several raisers at present working on this Alkanet, and in a few years there is every likelihood that there will be ample choice of improved varieties of this good flower.

It is when we come to the question of cultivation that the weak point of the Italian Alkanet is revealed. It cannot be called a really perennial plant everywhere, and if it is to be maintained in the best condition occasional propagation is necessary. Nay, one would prefer to say "regular" propagation, as the plants are liable to die off, especially in some soils, where they appear to flower so freely as to exhaust themselves, unless it may be that the species and its forms are not hardy enough to withstand our winters after the exhaustion of flowering. Even in the south it is found desirable to raise a stock of young plants from time to time, so as to have vigorous specimens in reserve. The average life of the best varieties is about three years that is, they are at their best in the third year.

While Anchusa italica can be raised freely from seeds, sown in spring under glass, and the seedlings pricked out in good time, the best varieties are most suitably propagated by means of root cuttings. Propagation by this method is familiar to the greater number of one's readers, so that it is needless to give details of the practice at present. It is sufficient to say that this is recognised as the most approved method of raising and retaining a stock of the lovely new varieties of Anchusa italica referred to.

It may be added that it is to be hoped that someone will take up the improvement of our charming naturalised or native—(which?)—plant, Anchusa sempervirens, which, although not so stately as A. italica, is a good border plant of considerable beauty. These Italian alkanets like a good soil, and prefer an open and sunny situation, but A. sempervirens will flourish in shade and in a poorer soil than they.

Dumfries. S. Arnott.

Primulas.—The main batch of plants, still in the boxes or pans in which they were pricked out early in May, will now require attention, as from such plants, which will flower during November and December, far better trusses of bloom may be expected than from either the earlier or later flowering lots. Some growers, in order to secure flowers in February and March, continue to pinch out the bloom stems from the time they show in autumn until the New Year, and although good stocky plants may be obtained in this way, the individual trusses are much inferior to those from plants which have never been pinched at all. Primulas are much like stocks in this respect; pinch out the first-formed or central trusses and you have side ones in quantity, but individually they will be poor. Primulas do best in fairly light, fibrous loam, but it must be free from wireworm, as these pests quickly bore through the base of the crowns and ruin the plants. A sixth part of leaf-mould and sufficient sand or grit to keep the compost open should be added. Although the plants require a certain amount of shade, I do not believe in the practice of growing them behind a north wall, preferring a south aspect, and whitening the lights to afford protection from excessive sunshine. Primulas will stand, and enjoy, more sunlight than many are aware of.—T. B. Field.

THE LOCAL COLOUR OF GARDENS.

"Every landscape has its predominant colour," wrote a great essayist, and it is certainly true that no scene, large or small, is without its distinguishing tints; they may, and probably will, vary according to the months of the year, but to recognise and arrange harmonies with them all is one of the gardener's chief arts.

Within one garden we may find many scenes; wherever a barrier crosses ground a new aspect is created, remember; in the same way wherever a mass of tree, shrub, or plant is placed there is a new colour effect; future plantings must be done after consideration of this feature, or the result cannot be successful except by chance.

A fine lawn I once knew ended in a stretch of rock-strewn ground beneath some copper beeches; the garden-owner, noting the original ruddy background thus gained intensified it by planting Berberis aquifolium as an undergrowth, with bracken fern for its glorious autumn colouring, and a series of pillar-supported ampelopsis rising in the open spaces. A couple of flower-beds at this end of the lawn were filled permanently, one with Lilium candidum and white Japanese anemones, the other with white chrysanthemums and white roses, the carpeting of both consisting of crimson pansies and violas. As a further improvement a clump of pampas grass was set between the two beds. Altogether this garden scene was one of unique charm, created by taking full advantage of the "local colour" of the copper beeches, and using it to show up white blossoms.

In many a lawn landscape, where shrubberies abound, the predominant colour effect will, of course, be green; to accentuate this is often advisable, and a square arbour made by training hops over green-painted lattice walls, is a satisfactory beginning, to be followed by a hut of green-painted deal climbed by ivy. Now, in the midst of this cool, leafy scene how gorgeous will be the show made by a large garden basket filled with scarlet pelargoniums. It may, however, be best, if the garden is a hot glaring one, to keep the green nook in it as a refreshing spot for the eye; in this case all other than green shrubs should be removed from the vicinity, and their places filled up suitably. Giant foliage plants, such as rheums and gunneras will prove useful also.

Where a portion of the garden is in the close neighbourhood of red brick this somewhat violent colour must infallibly be taken into account; to locate pink or crimson roses, for instance, there, is to produce a discordant appearance that no artistic person can admire, yet scarlet walls are frequently climbed by cherry-carmine Reine Marie Henriette and arches close by are wreathed in the vivid blossom-laden branches of Crimson Ramblers!

Sometimes we find that white flowers and silver variegated shrubs have been largely used near white walls; in this case I would advise the strengthening of the casual result; white bedding and bulbous plants, white plumed spiræas and grasses, with perennials of white foliage such as cerastiums, agrostemmas, and pinks, would soon create a distinctive white garden, aided by such shrubs as Acer negundo variegata, Cytisus albus, Viburnum opulus, and deutzias. White stone urns, and possibly a statue, or fountain also, would improve the scene.

It is often by adding to local colour that the most striking garden landscapes are formed. M. H.

BUDDING ROSES.

There are few amateurs, lovers of the Queen of Flowers, who do not like to point with pride to their successful efforts in the operation of budding roses, and as the season is near at hand for this interesting work a note on this subject may be acceptable, especially so after such a glorious display of roses which this season so far has produced.

There are several varieties of stocks which may be grown from cuttings, including the briar stock for dwarf roses. Cutting briars we find in our soil answers best for most varieties of the roses grown as dwarfs, while the briars procured from the hedgerows are the best for the budding of standard roses.

With the unusually hot weather experienced during the past month the wood of both stock and scion should be in good condition for budding, and with the welcome advent of much-desired rain, which need to be in copious showers, the sap will soon flow freely. It is almost useless to attempt budding until the sap is circulating so freely that the bark will part readily from the wood. It will take more than the average amount of moisture this season before this will be the case and the operation can be satisfactorily performed.

Take the buds from well-ripened shoots of this season's growth, but in removing the woody part care must be exercised that the bud is not injured in the basal part, or it will not grow after being inserted. In taking out the bud the leaf-stalk at the base should be left, as being useful when inserting the bud, and also forming some partial protection after insertion. The buds should be prepared for insertion, and placed in some moisture before cutting the bark of the stock to prevent any undue evaporation of sap. This is a most important matter, because if they are allowed to become dry before insertion, the results will not be satisfactory.

Having the buds ready, a T-shaped cut in the bark of the stock should be made. Then carefully raise the bark with the handle of the budding knife, and insert the bud. If many stocks have to be budded the work will be greatly expedited if an assistant follows behind and binds in the buds. This is best done with cotton or soft raffia. In binding in the bud care must be taken that the eye of the bud is quite free of the binding material when the operation is finished.

Dwarf stocks should be reduced to one good shoot on which to bud, and the bud should be inserted as low as possible by removing a little of the surface soil. When the budding is done low down the planter can cover the union when planting the roses without burying the roots too deeply.

Standard stocks should have buds inserted on several shoots, as a plant is formed more quickly. Divert the sap to the base of the bud by pinching or partly breaking off the shoot which has been budded. From two to three weeks after budding, according to the weather experienced, examine the binding, and should it appear to be too tight, loosen it, gradually removing it altogether after the bud is growing.

In the selection of varieties for budding each rosarian has his own especial favourites, and at the present time there is sufficient to satisfy the most fastidious in dwarfs, standards, half-standards and weepers, while the wealth of bloom this season has seldom been equalled.

Poltimore Park Gardens.

THE KALMIAS.

The genus Kalmia is included in the great natural order Ericaceæ, which is at once suggestive of lovely flowering shrubs, for it is remarkable what a large percentage of plants which are included in the order are of decorative value. Among the numerous groups which compose ericaceæ, kalmia certainly takes a foremost place, for, although the species are few in number, all are extremely ornamental when in flower, whilst some, especially K. latifolia and K. angustifolia, are well worth attention by reason of their evergreen foliage. The genus is essentially American, and the species are confined to the northern part of the continent.

Like other members of the Erica family, the kalmias are somewhat fastidious with regard to soil, requiring a light, sweet, open compost, which never becomes really dry. The very best material for their requirements is sandy peat, while they also thrive excellently in sandy soil into which a little peat has been dug. Although it is quite possible to grow them well in loam, it is highly necessary that the loam should contain no lime, or, if lime is present, it must be only in very minute quantities, and it is simply courting failure to plant them in ground highly impregnated with lime.

Though sometimes met with in good condition in positions exposed to full sun, the kalmias, like the rhododendrons, attain their greatest perfection in places where shade is provided during the hottest part of the day. When planting, care should be taken to keep the surface roots well up, and, instead of covering them with soil, give a dressing of half-decayed leaves. Round the sides of the root mass the soil should be trod quite firm, loose planting being very detrimental. Propagation of the smaller growing ones, K. angustifolia and K. glauca, is by division of the clumps and by layers, while the larger growing species is raised most successfully from seeds. The most objectionable item that can be raised against the kalmias is their slow rate of growth, for it takes a long period to raise really good examples of K. latifolia from seeds, hence its comparative scarcity and rather high price.

The species most often met with are K. angustifolia, K. glauca, and K. latifolia, and although one or two other species exist it is not possible to obtain them from trade establishments.

K. angustifolia is widely distributed from Canada to the Southern States, and is usually met with in swamps and bogs, though it is also found in rocky ground in the vicinity of mountain streams. Under cultivation it rarely exceeds a height of from 2 to 2½ feet, but forms a wide mass, adding annually to its diameter by means of underground stems. The leaves are evergreen, but are rather sparingly produced. They are small and narrow, being scarcely more than one inch long, and half an inch wide. The flowers are red, half to three-quarters of an inch across, and borne in axillary clusters from the end of May onwards for six to eight weeks.

Several varieties are in commerce which differ from the type, either in stature or colour of flowers. The most distinct are: K. a. glauca, distinguished by the bluish or glaucous tint of the foliage. K. a. nana is a variety of compact habit growing from 6 to 9 inches high. K. a. ovata, a form with larger leaves and more robust habit than the type. K. a. rosea.—This is, perhaps, the prettiest of all, the flowers being a pretty shade of rose, and the whole plant very floriferous. K. a. rubra is recognised by its deep red flowers. The common name of Sheep Laurel is sometimes applied to the species, the name, according to Loudon, having arisen through the branches and leaves being poisonous to sheep. Kalmia angustifolia was introduced about 170 years ago.

K. glauca was introduced about 1767, and was an early plant to be honoured by a plate in the "Botanical Magazine," the illustration occurring at tab. 177. The species is a dwarf grower, being more frequently met with below than above 2ft. in height. It is of rather dense habit, and bears small oblong leaves, with revolute margins and glaucous under-surfaces, the latter being the reason for the application of the specific name. The flowers are pale red in colour, about half an inch across, and borne in corymbose heads from the points of the branches. When in full flower during May and June it forms a very striking feature and impresses one with its virtues for a position on a lawn where a neat, free-flowering shrub is required. It is met with in many parts of N. America.

K. latifolia is, for many purposes, the most useful species of the genus, for, in addition to being very beautiful when in flower, its large firm leaves stamp it as a useful and ornamental evergreen. Under favourable conditions it attains a height of 10ft., but more frequently it is met with as a bush of half that height. Its distribution is very similar to that of K. angustifolia, being found from Canada southwards to Carolina. It has been in cultivation in English gardens for nearly two centuries, and Loudon reports that Mr. Peter Collinson was the first person to grow it successfully, whilst Mr. Catesby is said to have been the first person to flower it, this event occurring in his garden at Fulham in 1741. The leaves are rhododendron-like in appearance, more or less oval, and three to five inches long, with moderately long petioles. The flowers are white, delicately tinted, and spotted with pale pink, and are borne in large terminal heads in June and July. Several varieties have been given distinctive names, such as myrtifolia, with narrow leaves; polypetala, with many divided petals, and latifolia, with broad leaves.

Netherland Horticultural Federation.—At a recent meeting at Utrecht, at which all the principal horticultural societies of the Netherlands were represented, a new society, to be known as the Netherland Horticultural Federation, was founded. Upwards of fifty societies, representing the different branches of horticulture, with about 1,800 members, have joined the Federation, which will form the central representation of Dutch horticulture. Mr. R. P. Bonthus, The Hague, Holland, is the secretary.

STRAWBERRY TIME—1908.

At the time of writing the great interest of the community is absorbed in strawberries, not so much in its relation to name or kind, as fruit, brightly-coloured, large and even in berry, and temptingly served. To the gardener, however, strawberries are of much interest, although they do not appeal to his personal taste, because his office is to cater for that of others, in other words, his own tastes and palate are not officially recognised. In the matter of name and character the gardener finds often many points to interest him which the wayfarer does not stay to debate; thus varieties, whether they be new, unfamiliar, or old, are placed in their "line of inspection," and severely criticised at this season of the year. Only during their fruiting time can their merits or demerits be so satisfactorily noted for future guidance, and the enthusiast in strawberry matters now makes critical research in historical records, and decides there and then what varieties shall be given the greatest prominence in the strawberry plantations. It is true, since Royal Sovereign has taken up such large areas in field and garden there is not nearly the same enthusiastic interest in the roll of names there used to be prior to its introduction. At the same time, all gardeners do not sit down satisfied that they have everything in this regal strawberry. Evidently the Messrs. Laxton do not intend that this should be so, for they have still more names with which they hope to obtain the good opinion of their many patrons. Nor would it be fair to give credit to this well-known Bedfordshire firm for all the enthusiasm in the matter of novelty, for there are others engaged in the fascinating work of raising strawberries.

DAFFODIL FLORENCE PEARSON.

In perusing trade lists of strawberries one cannot disguise the fact that many names are chronicled that have but small—very small—following, especially among the old varieties, and the wonder is that they are included in strawberry lists, and, still more, that stocks should be propagated annually. With these, as with all other fruits, the familiar phrase applies, "Too many varieties." Not only are these old names retained, but new ones are added, with the result that the numbers may be described as legion. The public obtain an astonishingly lengthened season of supply from the great Royal Sovereign, drawn, as they are, from widely separated areas. In the home garden it would be otherwise were dependence placed on one variety only. The north border, the open bed, and the sheltered south aspect, may, we know, be utilised for the purpose of extending the supply over as long a season as possible, but this can be materially extended, even apart from favouring aspects, when a selection is made that includes varieties which ripen at different periods. Thus, while we have now exhausted the whole range of Royal Sovereign stocks, and, so far as that variety is concerned, we have no fruit, at the time of writing there are beds in which other varieties have only just opened their season. These, like Royal Sovereign, will necessarily have a shortened life, because of the extremely tropical nature of the passing summer. The latest fruits, instead of swelling, dry up, from the fact that there is insufficient moisture in the ground to support them.

One of the most useful of the later-ripening strawberries is Givon's Late Prolific, a dark, even-coloured, and sweet berry, which keeps up a supply some time later than the Sovereign type. It is, with us, small of growth, and not so very productive in yearling plants, but with increase of age and size of plant then its character, as defined by its title, is readily recognised. We regard this as one of the most commendable of late strawberries, as it embodies several good qualities useful in the private garden, and, we should say, the market field also. The Bedford proves a most acceptable midseason fruit this year, for when Royal Sovereign can hold out no longer this steps in and carries on the supplies. There is, in well-ripened fruits, a bright colour, and refreshing sweet flavour, that cannot fail to be appreciated after the acidulous Sovereigns are over. This has a good constitution, that can endure the heat and drought well, and, moreover, there is a marked freedom in cropping. Bedford Champion we have not yet fruited, but its trial favours an extension, and reviews made of Messrs. Laxton's fruit exhibits support the high opinion given it by the R.H.S. in the coveted Award of Merit.

In the private garden Fillbasket is popular because of the sweet sugary flavour of its berries, and the prodigious crops which it gives in normal seasons. On good ground a space of two feet becomes literally filled with advancing berries, so much so, that it was impossible to gather them without some portion being crushed under foot. We now allow thirty inches for this variety, which is none too much when the ground is good and fresh to strawberry crops. As a market variety, however, it is not favourably received, because of its pale colour and softness of flesh, especially following high day temperatures. We hold a high opinion of Dumbarton Castle, by reason of its intensely bright fruit, neat growth, and good constitution. In a gathered state this is a very attractive fruit, and in flavour superior to Royal Sovereign. Laxton's Latest of All has had a fairly lengthened trial and varied acceptance. Heavy, well-tilled ground is what is required to do justice to this fine variety; on thin, poor land it simply languishes for want of adequate support, and when in this state red spider attacks the leaves and crushes what little hope remained of advancement. From young plants come extra fine fruits, and in succeeding years good average samples are produced in greater quantities. Some confusion is likely to be felt in the adoption of the newer Laxton's Latest, jointly with this one. We have not had sufficient experience of it yet to form an opinion of its merits as a fruiting or market variety. The French Louis Gauthier would not, either in a natural or forced state, be received in the market, the colour of the berries not appealing to the public taste. It is vigorous in growth, and bears heavily, and by some private owners we know it is recognised as useful because it maintains a late supply. President Loubet, Progress, Laxton's Reward and The Alake each await their trial, without which no opinion can be expressed with regard to them. Cropper is claimed by the raisers to be an improved Fillbasket in size and colour, but unless there is an accompanying firmness of flesh, unpossessed by the older stock, it will certainly not oust the standard Sovereign in the market field. Certainly size and colour are distinct gains in an otherwise good strawberry, but firmness of flesh is just as desirable. In its earlier days Leader gave very fine berries, of rich colour, and a flavour certainly sweeter than the favourite of to-day, but in other respects more recent introductions are so superior that it now drops out of the race.

The once popular President, Sir Joseph Paxton, Vicomtesse H. de Thury, Dr. Hogg, British Queen, Eleanor, and James Veitch are names which the younger generation of gardeners scarcely recognise, they have all been eclipsed by the popular Royal Sovereign. Thus the newcomer, however good it may be, has to fight great odds in the race for supremacy, or even trial.

RANDOM NOTES ON DAFFODILS.

In a disastrous season like the past one it were well to recall, and be thankful for, such small mercies as we have experienced. In other words while the generality of daffodils have without doubt suffered from the extraordinary weather they had to put up with, yet there were certain varieties which were extra fine.

Among the latter none was more prominent than the one illustrated on this page, Prima Donna. It is one of Mr. Engleheart's latest productions which was purchased last year by my firm as a single bulb, the one bulb had a large offset and from the two we this season had three perfect blooms. The perianth is very firm and lasting, and measured four inches across, the colour is pale straw. The disc, which measures 1¼ inches across, is yellow, edged orange-red. I think it is quite the most remarkable flower I have yet seen; everyone seeing it for the first time has made an exclamation of surprise or delight.

Other varieties which have shown up well are Florence Pearson, a seedling of my own raising, the result of a cross between Emperor and Mme. de Graaff. It has come beautifully smooth, and very fine this year, and some blooms gathered when partly open and finished indoors have been very much admired. Pearl of Kent has been grand. I consider it to be the finest and largest white daffodil yet sent out. As grown here this year the flower was not nearly so drooping as when exhibited for its A.M. by the raiser, Rev. G. P. Haydon. The segments are as broad as those of Grandee, and are perfectly white, the trumpet is beautifully formed and prettily reflexed, and frilled at the edge. The whole flower opens almost pure white, and after a day or two indoors is absolutely perfect. The stalk is amply long enough, and the foliage is almost as strong as that produced by Emperor.

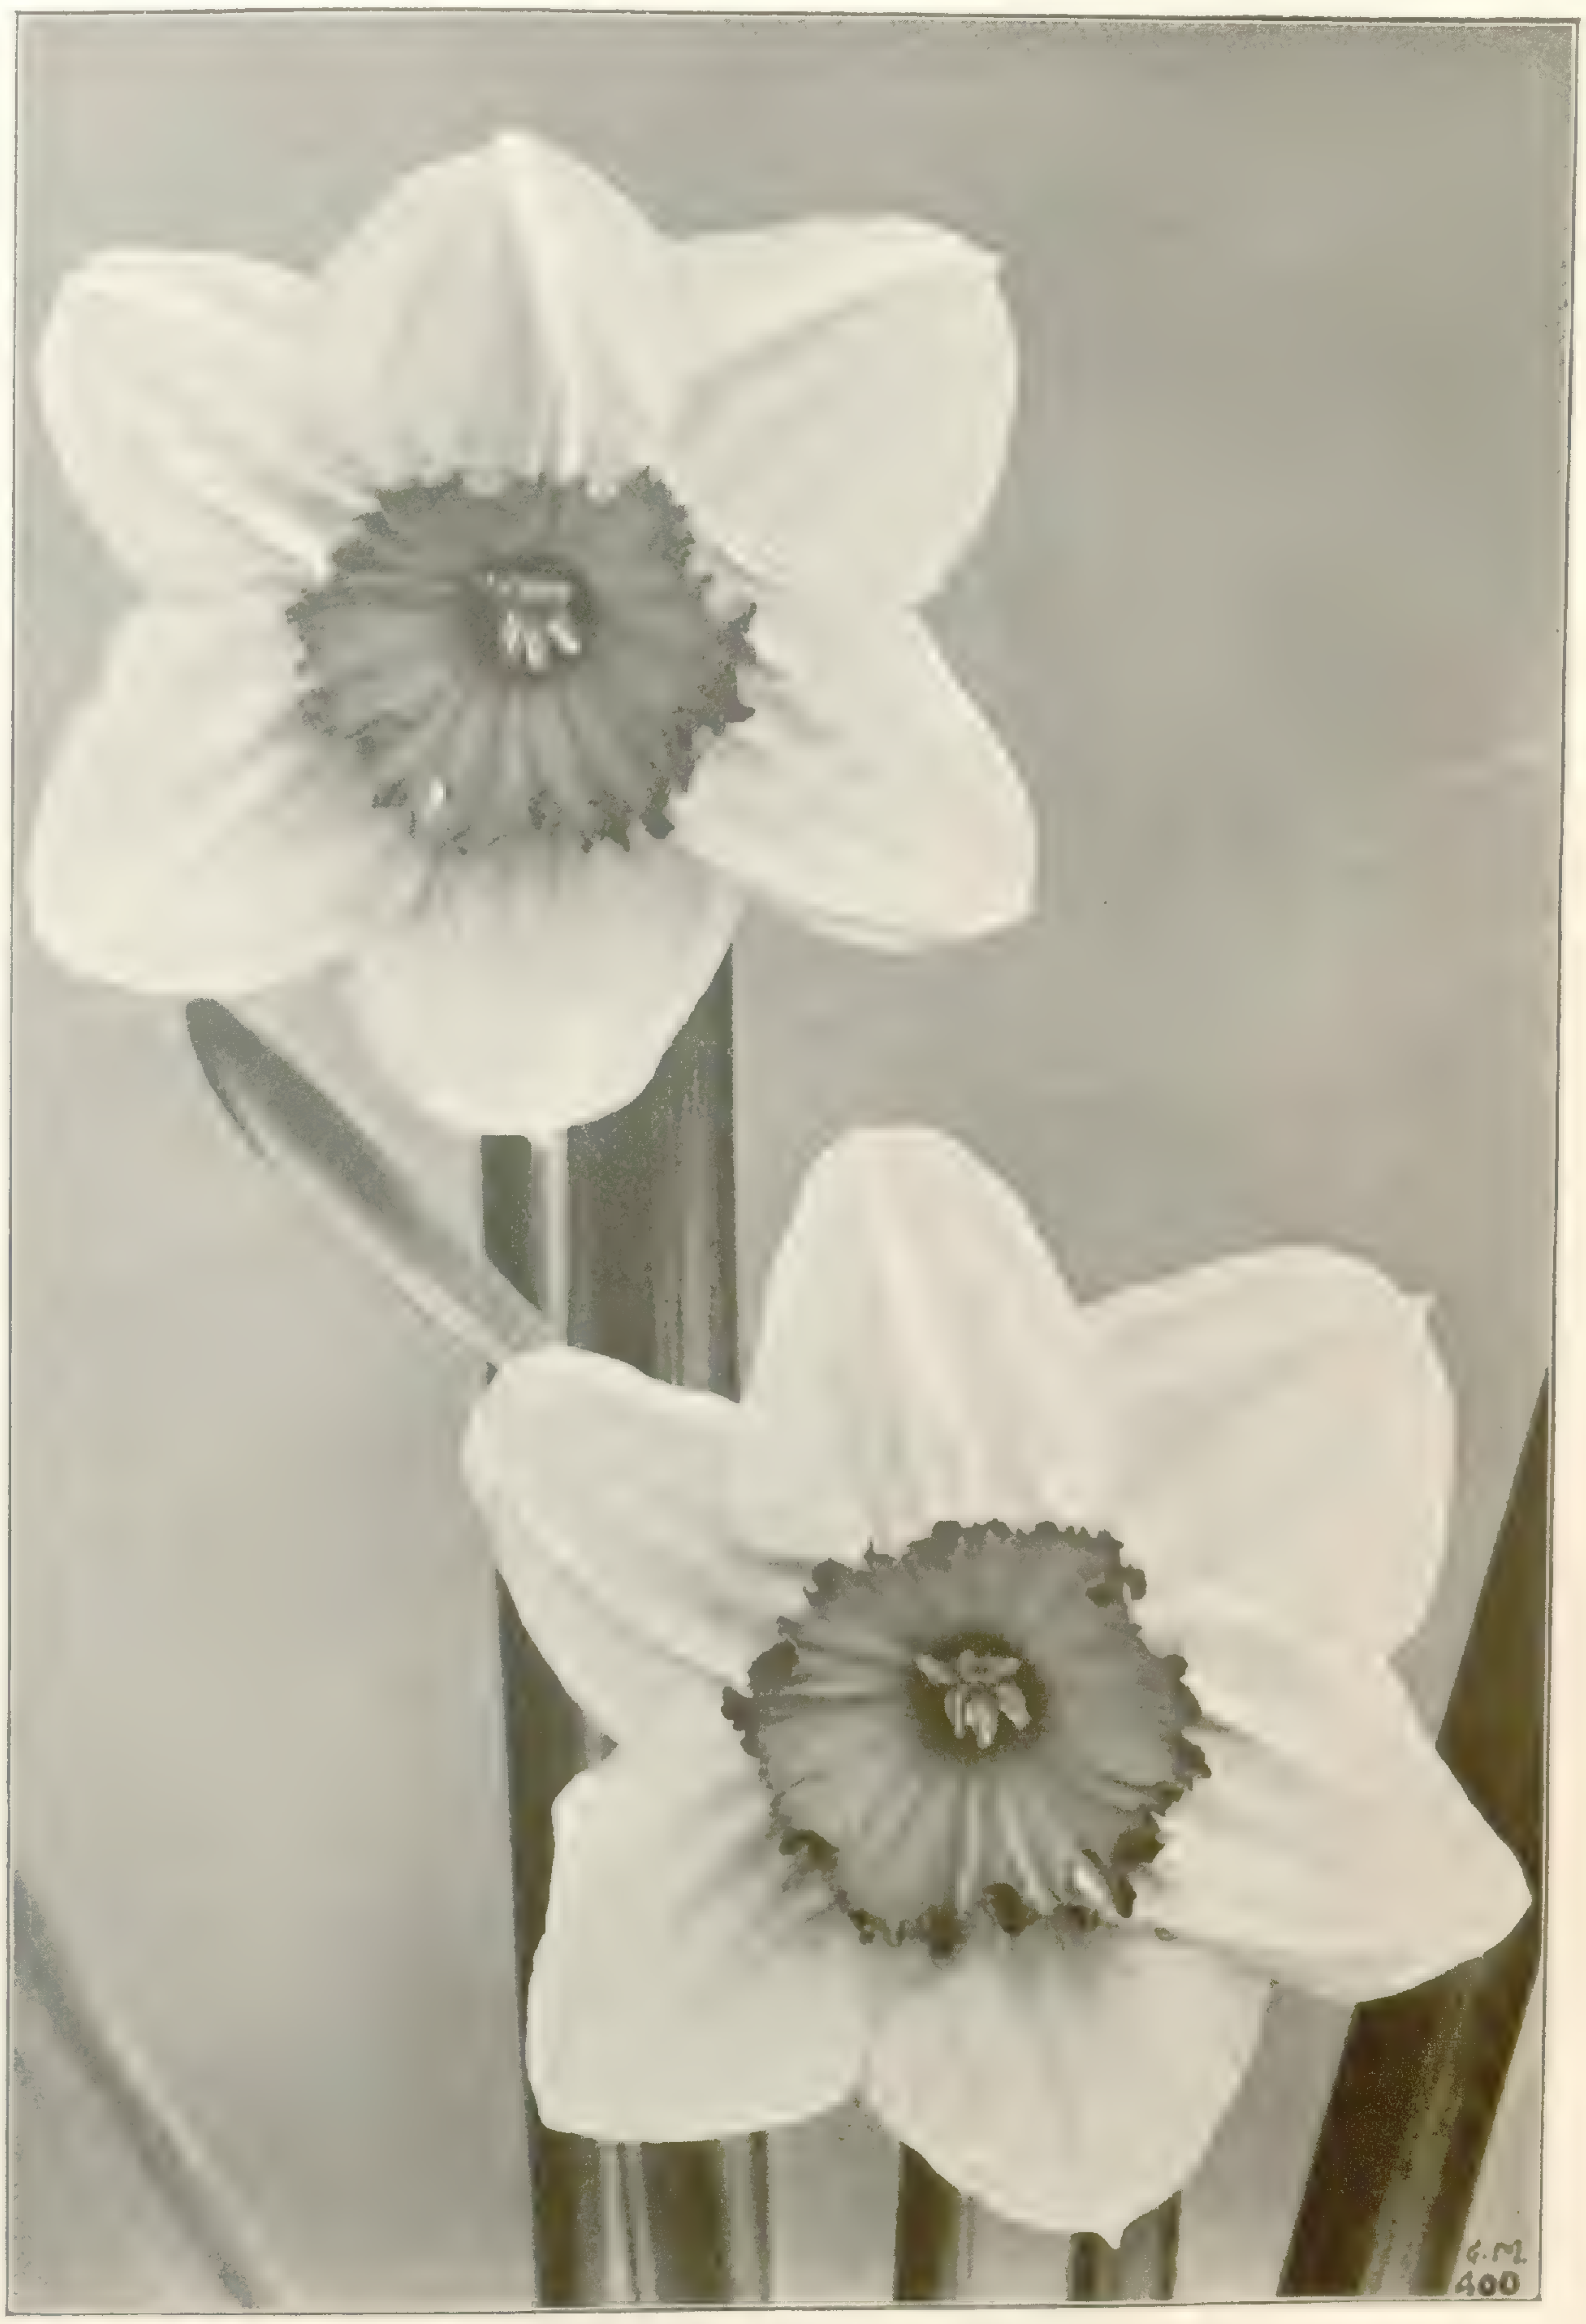
Some of my giant Leedsi seedlings have withstood the frost, snow, and rain very well. Lowdham Beauty, Hon. Mrs. Francklin, Priscilla, one with a long frilled cup (almost trumpet), tinted a delicate apricot, and having a delicious scent; and several unnamed ones have been really beautiful. Then some very good seedlings of various types have opened for the first time, and have helped to keep one from sinking into the state of despair into which the weather might otherwise have driven one.

The subject of colour in narcissi has always been a puzzling one, but this year has added to the difficulties. Though, perhaps, in one way it may have helped to substantiate one theory, viz., that in cold weather the colour is good, in hot weather it is more or less missing. This year the earlier red cups such as Lucifer, Firebrand, and the later Scarletta had wonderful colour. Then came a few hot days and all the later ones came almost entirely without colour. Albatross was yellow in the cup instead of having its red rim. Heroine, a much improved Albatross, was just the same. Beauty, Duchess of Westminster, Nelsoni major, and others were almost entirely free from any tint of red in their cups. The extraordinary part of the matter is, that some of the later blooms of the above varieties which opened in cooler weather came with much more red, and these changes all occurred in a few days. This clearly shows that while soil, moisture, and other factors undoubtedly have an effect upon colour in narcissi, yet the most potent factor is temperature.

The exhibitions of daffodils were extremely good considering the unfavourable season. Many people feared the Birmingham show would be a failure, yet in spite of frost, snow, wind, and hail a grand lot of flowers were staged, perhaps quite as good as at any previous meeting. If it had not been for our friends and rivals from the West of England and Ireland there would not have been much for visitors to see, but these growers turned up in such force and in such fine form that we poor Midlanders were hardly missed. The writer has had a very bad time of it from a show point of view, for he has not been able to take flowers to a single exhibition, for although he had at one time a grand lot of really fine things, they happened to open just in between the dates of the different meetings and could not be persuaded to last for the R.H.S. on May 12. Well, one bad flowering season will not make a real enthusiast give up in despair; he or she will lift, plant and wait—hoping—like a patient fisherman, for better luck next time.

J. DUNCAN PEARSON.

Lowdham, Notts.



DAFFODIL PRIMA DONNA.

PARSLEY.

The demand for parsley is so continuous that not less than two sowings have to be made during the year to provide for a constant supply. Even where every care has been bestowed upon it parsley will sometimes show a sickly growth, and cause a scarcity. With soils that are infested with wireworm considerable difficulty is experienced in keeping healthy plantations serviceable for cutting.

The most trying time for parsley is towards the end of winter and in early spring. Before the summer is too advanced, not later than July, a sowing should be made to form plantations for the above season, and where protection can be given them during sharp weather, such as a high, narrow south border running parallel with a wall, so that glass lights may be placed over the plants when required, success is practically ensured. I have often noticed that parsley has a partiality for the foot of a growing hedge, and will often go through the winter with less damage in this position than even under glass lights, especially if the ventilation has been at all faulty. My advice to those who are required to maintain a continual supply is to plant in several places and under various conditions, including a large pit full of plants, which may be relied upon for picking during the scarcest time.

Whatever the position selected careful choosing of the soil and its preparation is one of the important points in the culture of parsley. Give preference to a piece of ground that has carried a crop of early potatoes or other crop by which the soil has been thoroughly worked and sweetened, over one that has been hard worked by members of the Brassica family. If the site has been manured for the late crop no manure will be required when digging the bed for sowing, but supply a dressing of soot, with a little lime, and lightly work it in to allow the roots of the young plants to freely lay hold of it. This acts as a stimulant, and also as a deterrent against pests likely to affect the plants. It is not a rampant sappy growth that is required, but a firmly made growth that has been fully exposed.

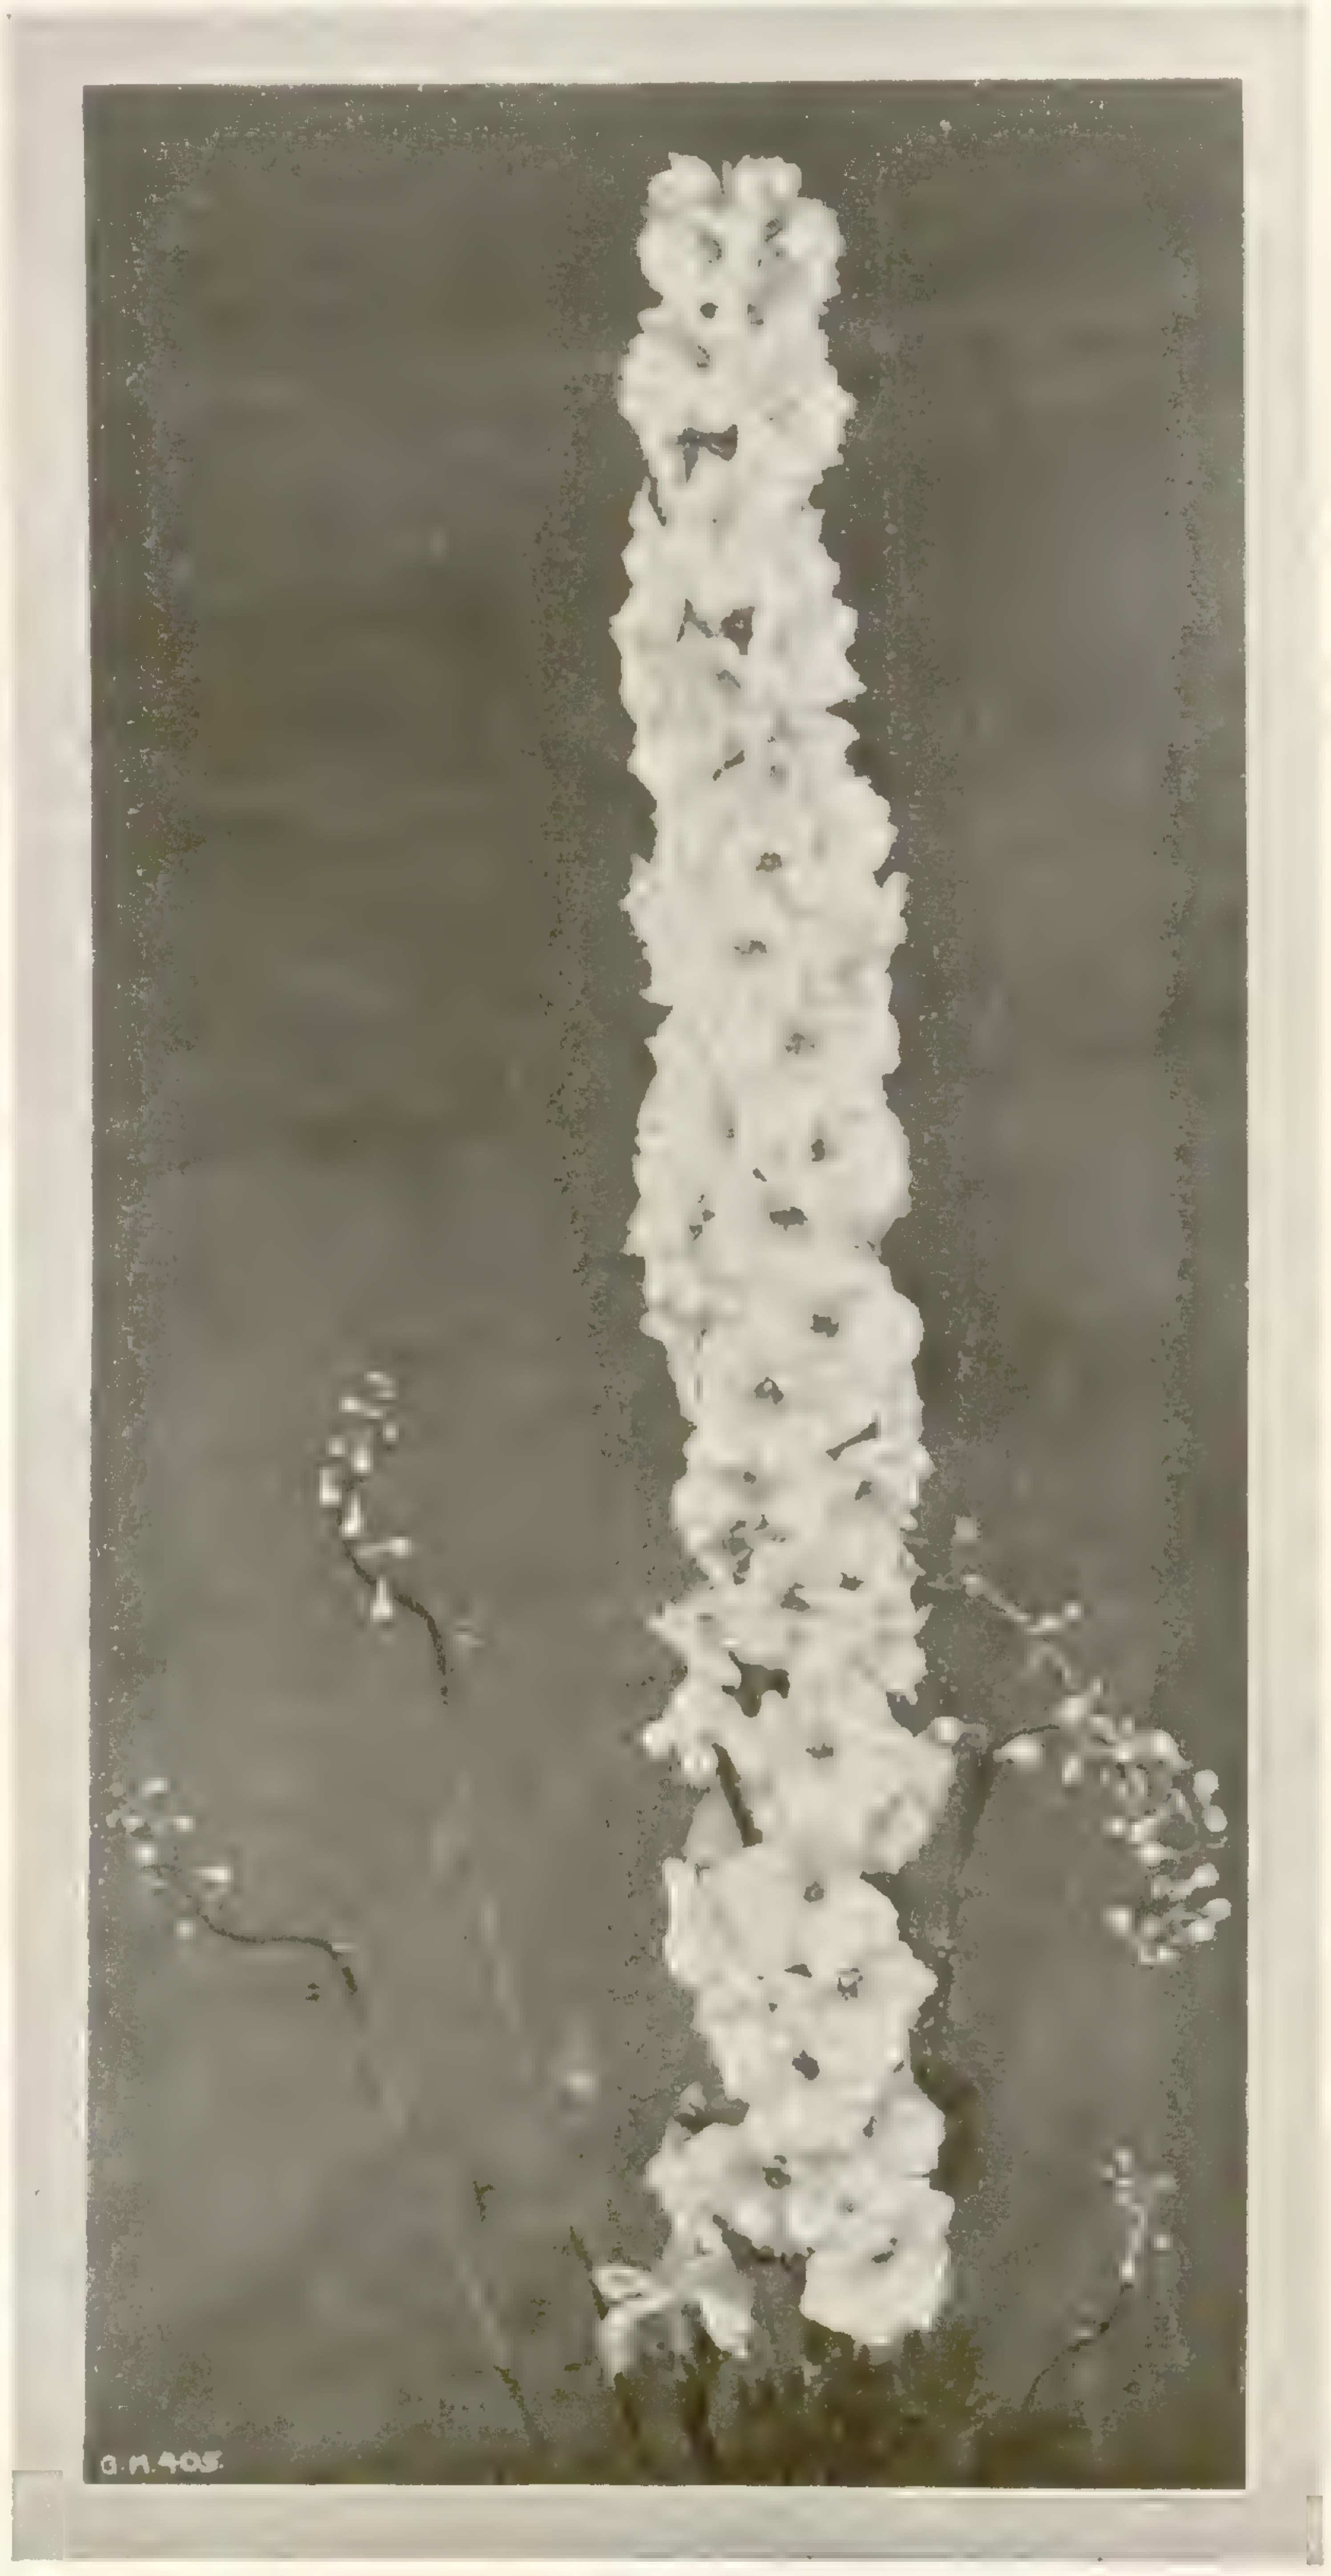
When the young plants have attained a height of two inches and have formed their rough leaves they will be large enough, and should be without delay planted in their permanent beds, which should be similarly prepared as advised for the seed sowing. I am aware that many growers sow their seed in beds and simply thin the plants to the required distance apart, but I find the extra time and trouble involved in transplanting from the seed bed is amply repaid, and the plants are more vigorous and satisfactory. It is not advisable to plant too thickly, but allow a distance from row to row of twelve inches, and not less than ten inches from plant to plant in the row; this permits proper development and encourages sturdy growth. When planting carefully retain every root possible by lifting the plants with a fork and expeditiously carrying out the work; immediately after planting give a watering to settle the soil. With good workmanship of this kind the young plants will quickly start into growth and be suitable by winter time to fill the demand.

Where there is a possibility of attacks from wireworm it is a good plan to sow dressings of soot between the rows from time to time, and water it in. Ply the hoe between the crop about once a week to disturb the crust of the soil, and remove all weeds.

The protection of the plants will largely depend upon the nature of the weather; it is not wise to resort to it too early, as parsley will stand a considerable amount of frost, and the longer protection can be avoided the hardier the plants will remain. When November is in it will be time to have protecting material in readiness that it may be promptly applied when necessary. In the case of plants in pits free ventilation is of the utmost importance, and the lights should not be closed down except when sharp frosts are experienced. On wet days they should be so arranged as to throw off the rain, and thus prevent damping. During fine weather every opportunity should be taken advantage of to remove the lights and give full exposure.

Should, through any cause, scarcity arise, there are two ways of meeting it; one is to lift a quantity of old plants, put them in boxes rather closely together, and place them in heat to force growth. The other, to make sowings in boxes under glass, in heat, and transfer the seedlings to other boxes when large enough, and grow them on in a genial temperature. This entails extra time and labour, but it is worth some trouble to keep the chef in good humour.

C. Flack.



NEW DELPHINIUM STATUAIRE RUDE.
A.M., R.H.S., July 7; Messrs. Blackmore and Langdon, Twerton-on-Avon. Colour soft pale heliotrope.

BAMBOO GROWTH.

By the courtesy of Professor F. O. Bower I recently had an opportunity of seeing a gigantic specimen of a bamboo rod in the Glasgow University Botanical Museum, and of obtaining the following particulars. This rod is no less than 105 feet long, being twelve inches in diameter at the base, and terminating in a slender point. It is cut into sections, and goes completely round the gallery balustrade. It is recorded that bamboos of this class make a daily growth of fifteen inches, and that the entire growth of such a rod is completed from the ground level in one growing season of five to seven months.

When one considers what such a growth means in cellular multiplication, and that it is not merely the terminal growth which is in question, but also the simultaneous expansion of the stem from bottom to top, the vegetable activity is seen to be immense, since millions of cells must be added daily to the structure to build it up on such lines in the time available. Rapid as outdoor growth is in this climate, especially in the case of many climbing plants, we can find no cases approaching that of tropical ones, when great heat and humid conditions stimulate activity to the utmost.

The banana may be cited as a fair rival even to the bamboo in question, since with that a small sucker, protruding from the ground in the spring, swells in the course of a few months into a crown of enormous leaves many feet long, borne on a solid trunk, possibly a foot in diameter, and seven or eight feet high to the leaf bases, while in addition an immense bunch of flowers, and, maybe, a hundredweight of the now familiar fruits may hang pendulous from the heart of it. Here again the mind utterly fails to grasp the extent of the vegetative work, the splitting up and multiplication of the innumerable tiny cells which contribute to build up such a fabric in a single season. It must be borne in mind, however, that in all such cases there is in the soil a vigorous, persistent root system, whence these rapid growths arise, and whence they draw the terrestrial supplies of nourishment from the outset. Even this adjunct, however, detracts but little from the marvel such remarkable development of plant growth involves.

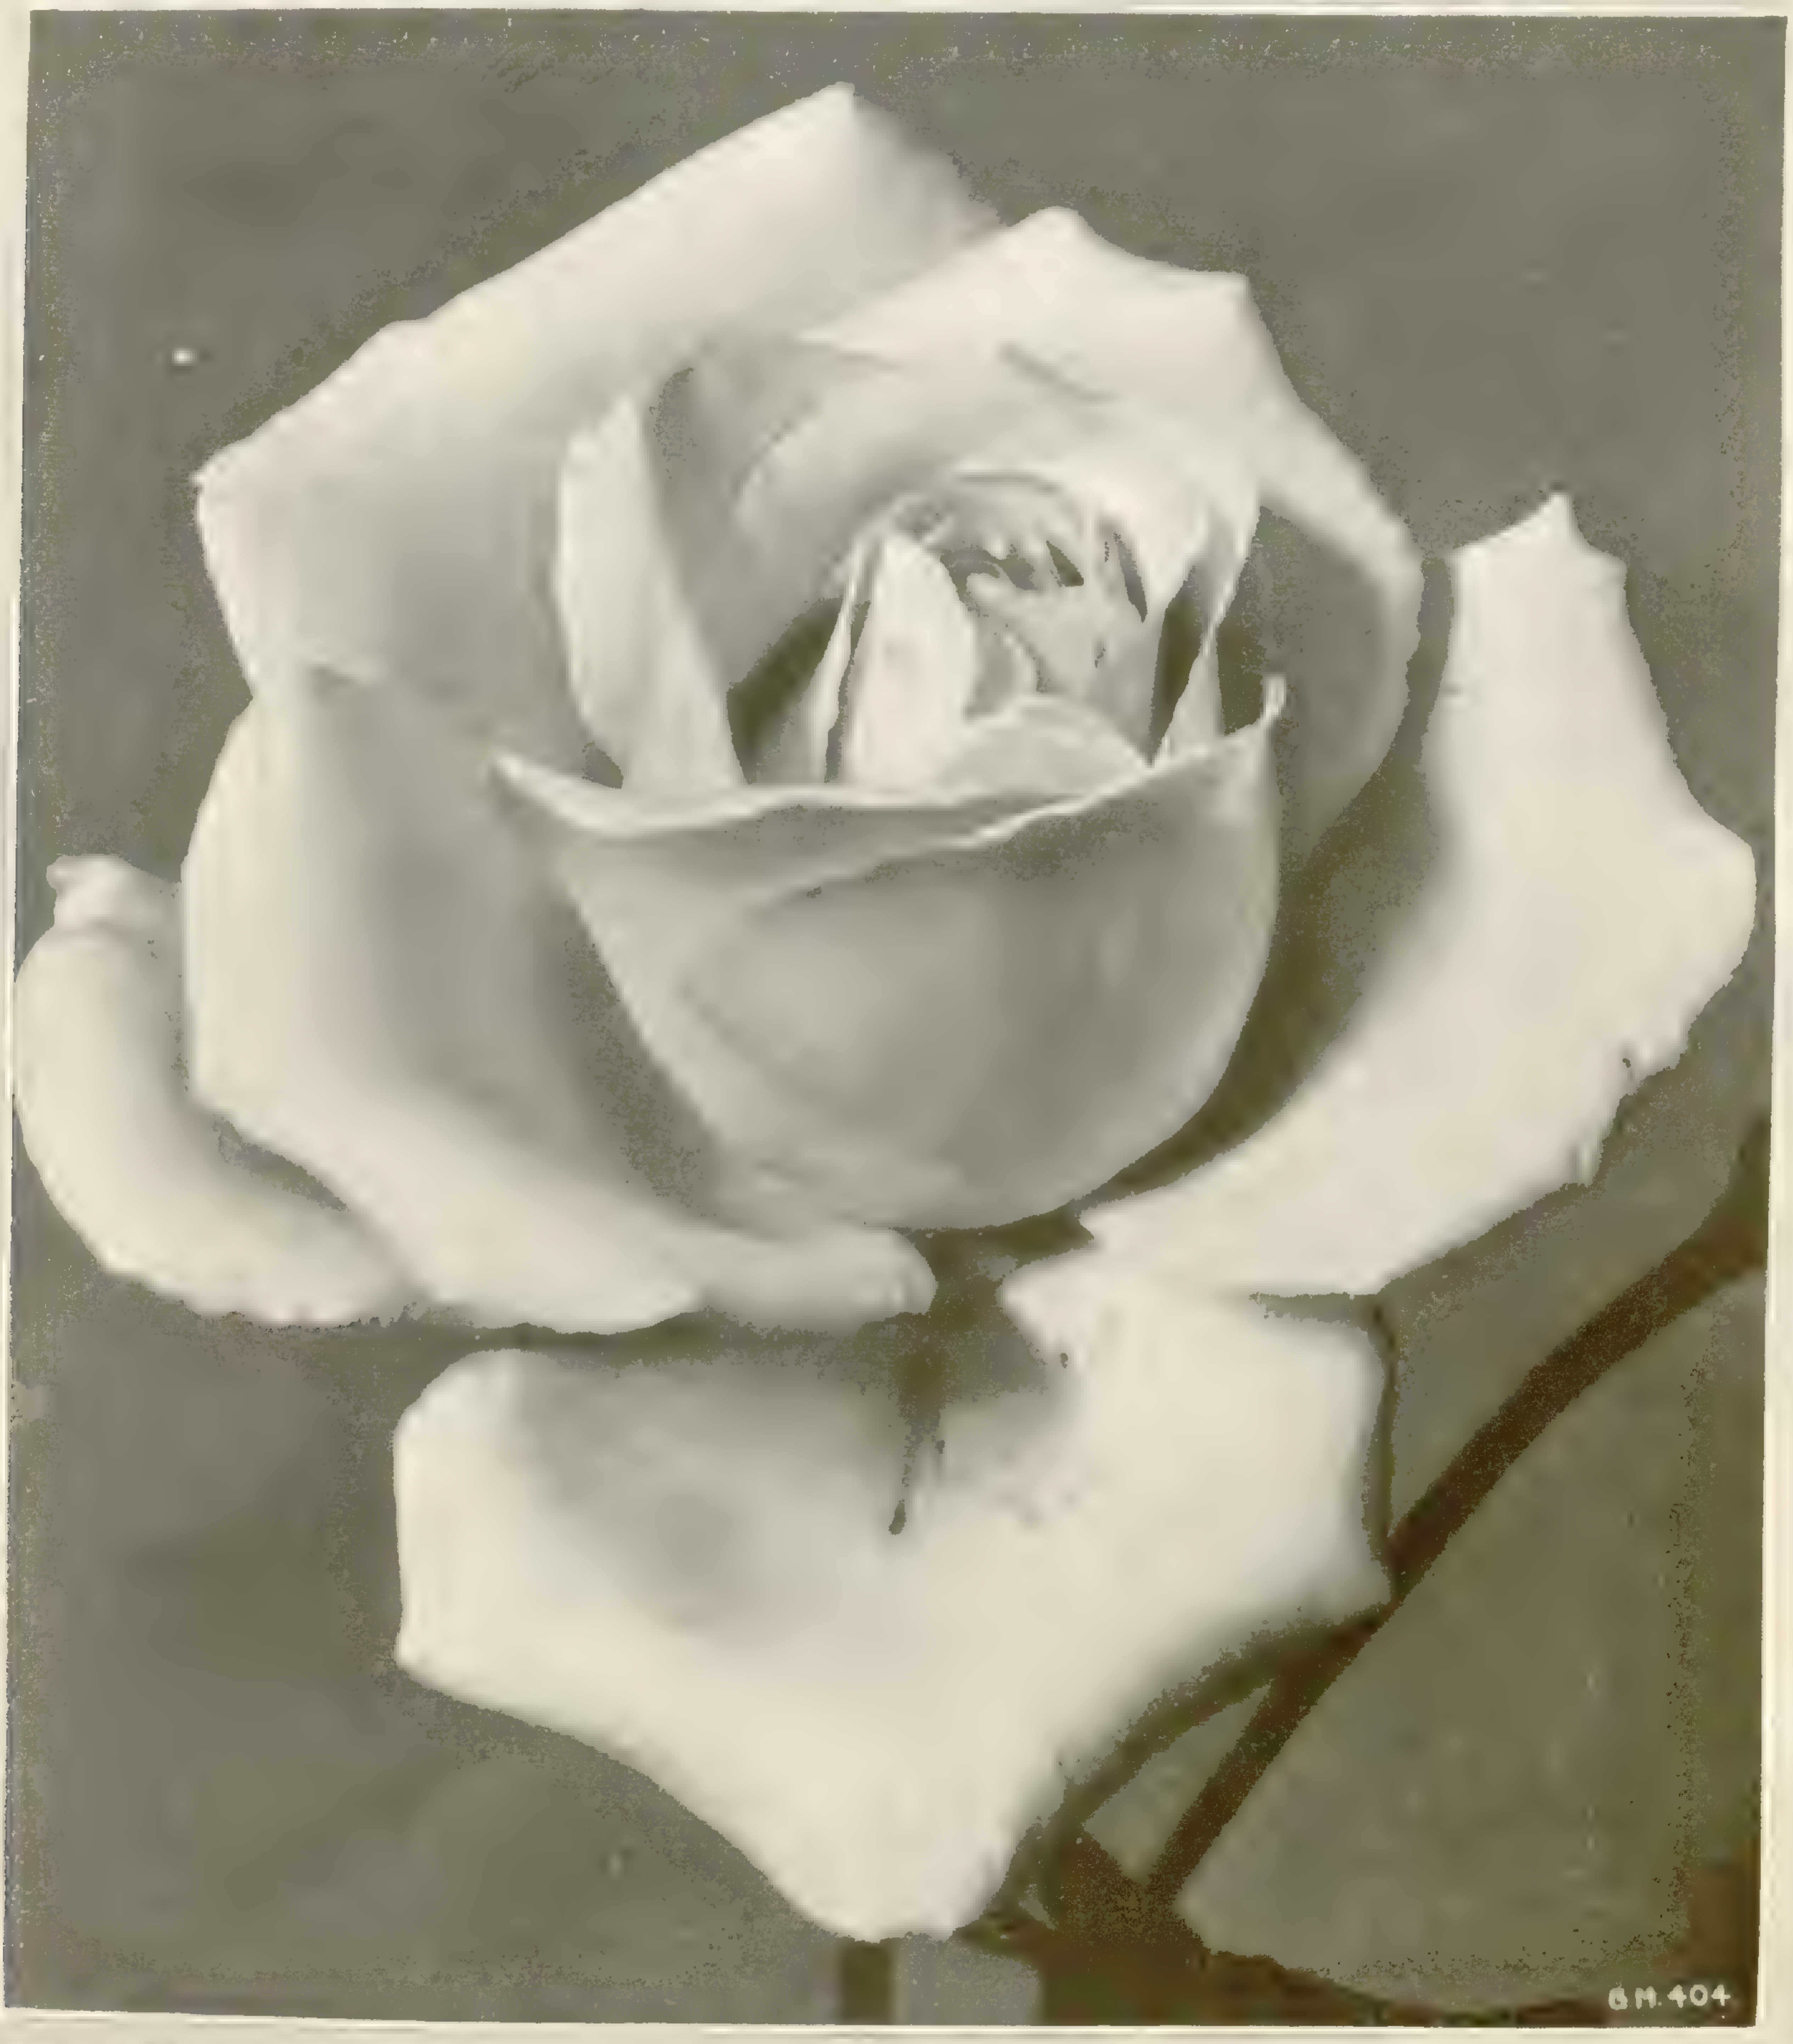
C. T. Druery, V.M.H., F.L.S.

NEW PLANTS, ETC.

◆

ODONTOGLOSSUM ILLUSTRE KING OF ENGLAND.

Although hybrid odontoglossums are now so numerous that ere long awards will have to be given for the best strain rather than to individuals, the variety named must rank as one of the best seen of late. Its probable parents are O. ardentissimum and O. Vuylstekeæ. The plant shown was figured in our issue of July 11, p. 542, so that there is now little need to describe the form of the flowers. The colouring is bright mauve purple, varying in shade, on a whitish ground. F.C.C., R.H.S., July 7. Mr. H. S. Goodson, Fairlawn, West Hill, Putney.



NEW H. T. ROSE MRS. DAVID JARDINE.

A.M., R.H.S., July 7; Messrs. A. Dickson and Sons, Newtownards. Colour rosy pink.

ODONTOGLOSSUM ELEANOR WESTONBIRT VAR.

A most elegant orchid, the result of crossing O. cirrhosum with O. Uro-Skinneri. The branching spike of comparatively small flowers is strikingly effective as well as most graceful. Both flowers and spike take most closely after O. cirrhosum, though the colour is different. The sepals and petals are soft creamy-green, thickly spotted all over with dark red-brown; the lip is white, freely speckled with dark red. A.M., R.H.S., July 7. Lieut.-Colonel Holford.

LÆLIO-CATTLEYA CLIVE MAGNIFICA.

A particularly handsome and finely-formed variety of the fine hybrid produced from Lælia præstans and Cattleya aurea. The blooms are of large size, with ample sepals and petals of a warm rose-purple hue, and a very large, bright crimson lip with old gold markings in the throat. F.C.C., R.H.S., July 7. Mr. H. Alexander, orchid grower to Lieut.-Colonel Holford, Westonbirt, Gloucester.

ROSES.

Mrs. David Jardine.—This promises to be one of the finest hybrid tea roses sent out from Newtownards. It is of perfect shape, broad-petalled, substantial and full, and it has good stems and foliage, and holds itself up finely. The colour is clear soft rose-pink. It is a beautiful and distinct rose, and should prove useful alike for the market, garden, or exhibition. A.M., R.H.S., July 7. Messrs. Alex. Dickson and Sons, Lim., Newtownards.

G. C. Waud.—A large-flowered and brilliant H.T. rose that adds a new colour to this useful class, and hence will be greatly welcomed. We find the colour difficult to describe; rosy-orange is the shade suggested. The raisers' description of "glowing orange-vermilion," is apt to be misunderstood. Anyhow, it is a fine bright, broad-petalled rose. A.M., R.H.S., July 7. Messrs. Alex. Dickson and Sons, Lim.

Molly Sharman Crawford.—A lovely tea rose with full high-centred flowers of beautiful form and sweetly scented. The colour is pale creamy white. A.M., R.H.S., July 7. Messrs. Alex. Dickson and Sons, Lim.

Florence Edith Coulthwaite.—Though not so high centred as the other varieties, this charming H.T. rose has a combination of colour that appeals to everyone. The ground colour is deep cream, and on this is laid the most exquisite shadings of rose, the tips of the petals having a rich rose flush. Very fragrant. A.M., R.H.S., July 7. Messrs. Alex. Dickson and Sons, Lim.

BEGONIAS.

Frilled Queen.—A fine development of the frilled single begonia. The flowers are a lovely shade of light pink, and have their edges charmingly frilled or ruffled. A.M., R.H.S., July 7. Messrs. Blackmore and Langdon, Twerton-on-Avon, Bath.

Duchess of Connaught. — This bold and handsome double begonia has large, well-defined flowers of a brilliant crimson-scarlet hue. A.M., R.H.S., July 7. Messrs. Blackmore and Langdon.

DELPHINIUMS.

Statuaire Rude. — A superb delphinium with large, very double flowers, well set on a long regular spike, that is neither too dense or too loose. The colouring is soft pale heliotrope, a most pleasing shade. A.M., R.H.S., July 7. Messrs. Blackmore and Langdon, Twerton-on-Avon, Bath.

Progression. — A distinct variety with a good spike of double white, cream-centred flowers. A.M., R.H.S., July 7. Messrs. R. Wallace and Co., Colchester.

TUNICA SAXIFRAGA FL.-PL.

A pretty little rockery plant that has recently caused quite a sensation on the Continent. It differs from the type in having its small lilac flowers finely doubled. A.M., R.H.S., July 7. Mr. G. Reuthe, Keston, Kent.

VIOLA ERNEST NEEDHAM.

A large-flowered fancy variety with a wide margin of soft violet round the white regular segments. A.M., R.H.S., July 7. Messrs. W. Artindale and Son, Nether Green, Sheffield.

HYBRID BERRY LOW JUNIOR.

This new fruit, resulting from a cross between the Loganberry and the Blackberry, is very richly and sweetly-flavoured. The berries are black, about the size of those of the Loganberry, but rather more pointed. A.M., R.H.S., July 7. Messrs. Hugh Low and Co., Bush Hill Park, Enfield.

THE ROUND-LEAVED REST-HARROW.

Those who are only familiar with the native ononises, or rest-harrows, would hardly recognise in the ornamental O. rotundifolia any kinship to these wildings of our own land which are so beautiful in their own way, but which are not so suitable as garden plants as this alpine species. It is, perhaps, less easily cultivated than they, but its distinctness and beauty are great, and call for the consideration of those who wish to possess good flowers of its class possessing some features of their own, and likely to give pleasure to their owner. Those qualities they will certainly secure in the possession of the round-leaved rest-harrow, which I grew for a number of years, and which always appeals to me as a distinct and pleasing plant for the border or rock-garden. It is of rather shrubby and erect-growing habit, reaching a height of from about a foot to almost two feet high, and forming a compact bush with rounded leaflets on the trifoliate leaves, and giving in summer many flowers, generally arranged in pairs, of a beautiful rose, the standards being veined with a deeper tint. Like almost all flowers with pea-shaped blooms, it is a graceful although sturdy plant.

The needs of the round-leaved rest-harrow are not exacting, but it appears to prefer, and, in some places, to require, a little shelter from cold draughts during winter and late spring. A sandy soil suits it best, and full exposure to the sun is alike appreciated. It can be increased by division, but is best raised from seeds sown in pots, pans, or boxes, in early spring under glass, and the seedlings pricked out when large enough to handle. Slugs are fond of seedlings of O. rotundifolia, and must be guarded against, or they will destroy the young plants. Seeds are obtainable from some seedsmen, and the plant is fairly plentiful in certain nurseries, but old specimens do not often transplant well.

S. Arnott.

BULBS FOR FORCING

In establishments where large quantities of cut flowers are required throughout the winter and early spring months, those produced from the various kinds of bulbs form a considerable proportion, as the flowers from many of them have long stalks, and, being of good substance, they last a considerable time when placed in water.

Daffodils.

Of all the bulbous plants none are more appreciated than the daffodils, and there is such a variety of these that a continuous supply of flowers may be had from them throughout the winter. Home-grown bulbs of all these, with the exception of the polyanthus varieties, are far preferable to those obtained from the Continent, and in gardens where a plot of ground can be set apart for their cultivation, they may be taken up as soon as the foliage has died off, and placed in a cool shed until they can be potted, or put in boxes ready for forcing. It is this early potting that produces the finest flowers with the least use of artificial heat. We grow about two acres of narcissi, a portion of which is lifted annually, and after picking out the largest for forcing, the others are again replanted. By doing this, there is an ample supply to draw from.

Many of the early kinds have now lost their foliage, therefore the sooner the bulbs are taken up the better, as they may be prepared for potting. It will be found that if the bulbs are potted early in August, and stood in the full sun, and liberally supplied with moisture, they will have started into growth before the cold weather sets in. Where a quantity of flowers are required for cutting the most economical way to proceed is to purchase from the nearest fruiterer all the French pear boxes you can, and these can usually be obtained at about eighteen shillings a gross. They are about fifteen inches long, ten inches wide, and five inches deep. If a couple of inches of rough leaf-soil or old mushroom bed manure be placed over the bottom, and covered with a rich compost, the bulbs can be pressed into this at equal distances apart. We usually plant twelve bulbs of the large varieties,such as Sir Watkin, and two dozen of the smaller ones, like ornatus, in a box. The boxes are then stood side by side in a sunny place and given a good watering to settle the soil, after which they are covered with about four inches of leaf-soil that has been passed through a half-inch sieve; this, being light and warm, allows the heat to penetrate, and if kept constantly moistened growth is robust. A thousand boxes do not cover a very big space, and as they are so portable they may readily be transferred from one place to another.

Narcissi treated thus are sure to give satisfaction; the flowers are large, of fine substance, having stout stems that hold them well up. Such varieties as Sir Watkin, Emperor, Golden Spur, Maximus, Horsfieldi, and all that class producing stems from a foot to fifteen inches in length are of much value for the production of flowers.

Spanish Iris.

These beautiful flowers are so easily grown, that good batches in separate colours should be planted in boxes as soon in the autumn as possible. To grow good bulbs for forcing a light rich soil and an open situation are essential. The bulbs should be planted in beds about four feet wide, allowing about four inches between the bulbs. When planted cover with about two inches of old mushroom bed material, or thoroughly decayed manure. The young growths will readily push through this in spring, and grow away rapidly, flowering freely in June. When the flowers have faded the stems should be cut off, and as the foliage dies down the bulbs should be lifted and stored away in a cool shed until they can be looked over and the finest picked out for forcing. Spanish iris will not stand a high temperature, therefore to have them in flower early they must be brought on gradually in a cool house, otherwise they will fail to bloom. They should be allowed all the light and air possible to insure sturdy blooms.

For early flowering use such varieties as Belle Chinoise, yellow; Avalanche, white; Blue Beauty, blue; and Cajanus, Cant[illegible] and Snowball. If boxed as recommended for narcissi, and covered with about two inches of light material, such as decayed leaf soil or short manure, this will both afford protection and keep the soil moist. The bulbs should not be covered more than a couple of inches, or the young growths will become spindly. When potting or boxing do not overcrowd the bulbs, or they will fail to bloom freely. Bulbs that have been forced degenerate very much, and are very little larger than the offsets from the larger ones, but if planted in the open in beds of light rich soil they will increase in size rapidly.

Freesias.

These are not hardy in this country, but small bulbs planted in a cold frame in the autumn and protected from frost will increase very much in size by the end of the summer, when they should be taken up, selecting the largest for potting, and replanting the smaller ones for another year. Bulbs grown thus usually give good results. A few thousands may be grown in a very limited space, but it is not well to overcrowd, or the bulbs will not swell out satisfactorily. Most people know freesias, but not all can grow them to perfection. When in full growth they require water frequently, and at no time must they be kept in a close temperature, or the flowers will be of but poor substance.

We have for some time grown our bulbs for forcing in cold frames during the summer, and when ripened they are lifted and replanted, so a good stock of fine bulbs is always at hand when required for potting, and if these are kept in cold frames they may be introduced into a gentle heat as required.

Gladioli.

There are among the early-flowering section many beautiful varieties with delicate flowers, but, like the freesias, they are not hardy with us. They may, however, be grown by the thousands in a very simple manner, and when thus cultivated they provide a wealth of flowers for cutting. The following is the mode we adopt for such forms as The Bride, Rosy Gem, Cardinalis, Fairy Queen, Blushing Bride, and [illegible]

Temporary frames are made, and the soil used is of a rich, light sandy nature, and in this the bulbs are planted in autumn from four to six inches apart according to the variety. When severe weather sets in the frames are covered with litter to protect them from frost, and when the mild weather returns they are uncovered so that air can be admitted. In this way they are not only protected from frost, but are brought forward so that by the time it is safe to leave them uncovered they have grown a good height, and succeed those grown in pots. Not only [illegible] but they keep up a supply of bulbs to select from for forcing. Some of these varieties when grown under glass are most beautiful when in bloom during the spring months. They will stand much forcing, but when brought on gradually they will give a wealth of flowers of a choice character that last well when put into vases in the rooms.

Ixias.

One is often puzzled to understand how it is that these are not more generally grown. The flowers, though small, are very attractive, being of such remarkably rich and varied colours, and as they are borne on long, wiry stems they form objects of rare beauty. To grow these to perfection, so as to have them in bloom early, a cold frame is necessary, as the flowers, when grown in the open, are often spoiled by the cold winds, and the foliage injured during severe weather.

The bulbs should be planted two or three inches apart in light, rich, sandy soil, about October. During the winter protect them from frost, but whenever the weather is mild remove the lights or ventilate freely so that the plants may grow as sturdily as possible. During May they will give a wealth of their brightly-coloured flowers.

MESSRS. FRANK CANT AND CO.'S EXHIBIT OF ROSES AT HOLLAND HOUSE.

This very fine exhibit of garden and exhibition roses was one of the features of the Royal Horticultural Society's Exhibition at Holland House, last week. It was deservedly awarded a Gold Medal.

For pot culture they are also useful. The bulbs ought to be potted up early in light, rich soil, using pots about five inches in diameter, and putting eight or ten bulbs in each. The pots should be stood in a cold frame and given a good watering to settle down the soil, but, like the freesias, they should not be covered, otherwise the growth will be spindly. Protect from frost during winter, and to induce them to flower early remove to a shelf in the greenhouse in February or March, according to the time they are required to bloom.

Tritelias.

Many people are acquainted with T. uniflora as a rock plant, which produces its charming flowers in early spring in the open. When well grown the stems are from six to nine inches long, carrying a single flower of a very peculiar shade of white and blue, and beautifully fragrant. When grown in pots under glass the flowers are very attractive, standing well up above the grass-like foliage. The bulbs should be grown in an open situation, in a light rich soil, and as the foliage dies away early the bulbs ought to be taken up as soon as they are ripe. If intended to flower early pot them up as soon as possible and stand the pots in a sunny position, giving them a liberal watering, but do not cover the pots as in the case of narcissi. When rooted introduced them to gentle heat, when they will bloom freely during the winter months. The bulbs are small, therefore a dozen or so may be planted in a five-inch pot, and when in bloom they make very pretty indoor decorative plants.

In addition to T. uniflora there is T. uniflora violacea, which, instead of being white shaded with blue, has the flowers blue, striped with violet. Those who have not grown these in pots would do well to give them a trial, as they are of such easy growth there is but little fear of their failing to give satisfaction.

H. C. Prinsep.

Buxted Park Gardens.

Mint.—This herb is in request almost daily; and in some gardens it grows like a weed, while in others it send up thin weakly shoots, and only just manages to exist. New beds should be made annually, and the best method is to put in cuttings about six inches long on well-worked ground this month, shading them from the sun with tiffany, and damping them over each evening, when they will soon begin to form roots and take care of themselves. For forcing, cuttings should be inserted in boxes, at the same time using any old potting soil, placing the boxes behind a north wall, and watering them as required.—T. W. Birkinshaw.

SWEET PEA JOTTINGS.

If anybody had a lingering doubt as to the enthusiasm of sweet pea-lovers that doubt would have been expelled had such person accompanied the expedition to Reading University College on Friday last to inspect the National Sweet Pea Society's Trials, so ably conducted there by Mr. Chas. Foster. About fifty members attended, and they discussed sweet peas, novelties, awards, mixed stocks, and the like, in the keenest and best-tempered manner possible. The social side of these inspections is never forgotten, and on this occasion Mr. Leonard Sutton, with his usual thoughtful hospitality, entertained the party at lunch in the College Hall, and in the afternoon Mr. Owen Ridley, chairman of the College Council, and Mr. C. Foster provided tea.

The official inspection of the trials by the Floral Committee was made on Thursday evening and Friday morning, July 9 and 10, and it speaks volumes for the enthusiasm of the experts, and their eagerness to do all that lies in their power to make the work of the National Sweet Pea Society effective and valuable, that the members of that committee came hundreds of miles to fulfil their duties without fee or reward. Mr. Malcolm came from Duns; Mr. M. Hitchins from St. Austell, Mr. T. Jones from Ruabon, Mr. G. Herbert from Winchester, Mr. T. Stevenson from Addlestone, Mr. J. M. Bridgeford from Cricklewood, Mr. S. B. Dicks from Norwood, Mr. J. Watson from Kingston, Mr. Herbert Smith from Birmingham, Mr. Andrew Ireland from Marks Tey, and the chairman, Mr. W. P. Wright, from Lyminge, in Kent. The only absentee was Mr. J. Jones, of Wem, who was prevented by indisposition from being present. So far as I am aware, no other floral society holds independent trials, and none other bases its awards to novelties upon the behaviour of the varieties at extensive and well-managed trials.

The work of the committee is not light. It includes granting certificates or awards of merit to promising novelties that are distinct, or an advance on older forms, and that are practically true in the trials. Any stock containing over 5 per cent. of rogues stands no chance of an award, however fine the correct variety may be. This work will safeguard sweet pea lovers and prevent much disappointment, and it will also deter raisers from sending out unfixed varieties. As the work of the society becomes better known and more widely understood the membership will increase, because all will recognise that only by the continuation of such work can the interests of the raiser, the seedsman, and the buyer be properly safeguarded.

In the matter of awards the Floral Committee exercised great discretion, and wisely so. The silver medal for the best novelty of the year, together with a first-class certificate, fell to Messrs. G. Stark and Son, Great Ryburgh, Norfolk, for a brilliant waved scarlet variety, named George Stark. The Messrs. Stark have for several years been hard at work on scarlet waved varieties, and their efforts have now been crowned with success. Mrs. Henry Bell, a beautiful pink variety, with creamy keel, annexed a F.C.C. for Mr. Robt. Bolton, of Carnforth, and Mrs. Andrew Ireland, a lovely waved bicolor with splendid rosy standard and pale wings, secured a F.C.C. for Messrs. Dobbie and Co., and thus fulfilled my own expectations of this variety. Constance Oliver, pink with creamy bases to the segments, is a charming variety from Mr. Lumley, and Paradise Ivory, a creamy variety with a faint pink tinge, from Miss Hemus, each secured an Award of Merit.

There were over three hundred rows of sweet peas at Reading, and, naturally, there were many beautiful novelties besides those that obtained honour. The King, a very large waved form of King Edward VII., is a glorious variety, scarcely fixed enough yet, but Messrs. Dobbie and Co. have the best stock and type of this sweet pea. Chrissie Unwin, a glorified Coccinea, is very beautiful, and is a charming rosy cerise sweet pea that needs another season's fixing. Etta Dyke stands ahead as the best white waved variety, in my estimation. Kathleen McGowan, best described as a waved Flora Norton, is a lovely blue, and it is almost true, so that a year or so hence it should prove a fine novelty for Mr. Breadmore. A. B. Bantock is a fine upstanding flower with a rosy lavender standard; it is from Messrs. Bakers. These are all worthy of special note.

A FINE VASE OF SWEET PEAS.
Exhibited by Mr. C. W. Breadmore, Winchester, and showing good style of arrangement for home or exhibition.

The weather was not altogether kind on Friday, July 10, and for some part of the afternoon the trial ground presented a curious spectacle, viewed from a short distance, as about fifty umbrellas seemed to have been suddenly gifted with locomotive power. But the weather on Saturday was splendid, and a long day was again spent among sweet peas, this time in Essex, at the seed farms of Messrs. Hurst and Son, and Messrs. Dobbie and Co., respectively at Kelvedon and Marks Tey. The party was even larger than on the previous day, notwithstanding that many had to reach Liverpool Street in time to catch the 8.45 a.m. train.

The first visit was to Messrs. Hurst and Son's grounds, where everyone was delighted to see Mr. N. N. Sherwood hale and hearty again after his long and trying illness. No fewer than five hundred rows of sweet peas were here to be seen, these representing the stocks of something like forty tons of sweet peas. It was a seed grower's trial conducted solely for the purpose of testing quality and genuineness, and in no sense conducted for the purpose of producing large blooms. The trial was a most interesting one, and as in some cases there were three, four, and five stocks of a variety, the fixity of some was as pleasant to see as the mixity (to coin a word) of others was painful. A big wholesale firm must keep a sharp eye upon its growers, and this is one of the methods by which it does so. Taking the variety Mrs. Collier as an example, there were several pure rows, another with one rogue in it, and yet another with almost all the colours in the range of sweet peas. The grower of the latter stock is sure to lose money, as his untrue stock is worthless, and would bring any seedsman into trouble.

Well, we inspected the sweet peas; again we admired Chrissie Unwin, and also the 300 yards run of Messrs. Hurst's St. George. We admired the newly-selected, large-flowered nemesias and the hundreds upon hundreds of rows of culinary peas, English, Scottish, and Continental. I was very greatly impressed by the admirable galvanised wire supports used so extensively by Messrs. Hurst and Son for their culinary peas. These are stiff and strong and of various sizes, and they stand firm by means of a wire foot at each end, and by means of slender iron rods thrust through the loops of the top and bottom wires and driven about a foot into the ground. Unless I am very much mistaken this means of support will come very largely into use among amateurs who find it difficult to obtain stakes. The first cost is about six times that of sticks, but the latter last one year and the wire supports are good for from ten to twenty years.

After the inspection, luncheon was served in the large old barn, and ample justice was done to the generous hospitality of Mr. Sherwood and Mr. W. Cuthbertson. After lunch Mr. Sherwood proposed the "Continued success of the National Sweet Pea Society," observing that he was proud of the fact that the society was born on his grounds, and pointing out that as a result of the society's work, the trade in sweet pea flowers and seeds had become a great industry. Mr. Cuthbertson, the president, said it was no use being president unless able to command, and he therefore called upon the hon. secretary to respond. The hon. secretary obeyed dutifully, and drew special attention to the work of the Floral Committee, the weeding out of worthless varieties, the trials, the steady increase of membership, and the many advantages attaching to membership. Mr. Arthur Sutton proposed "Our Hosts," and in an excellent speech, through which ran a rich vein of humour. He stated that Mr. Sherwood had been treasurer from the beginning of the society, and that Mr. Cuthbertson, with the late Mr. Richard Dean, first suggested the celebration that led to the founding of the society. Both Mr. Sherwood and Mr. Cuthbertson suitably replied. The former saying that if ever the society should fall on evil times he would be quite prepared to see it through.

At Mr. Sherwood's request, the party drove to Prested Hall, his house, but when brakes, traps, and motor cars were all ready to start the photographer was requisitioned, and then, on reaching Mr. Sherwood's home, the members were again photographed. The next item on the programme was a drive to Marks Tey, about three miles further east, and here, on Messrs. Dobbie and Co.'s grounds the finest sweet peas seen during the two days were found. Finely cultivated and smothered in bloom the large trials and [illegible] growing for seed astonished all who had not previously seen them. The stocks were wonderfully true, and it was evident that ing had been done. I thought [illegible] Mrs. Charles Foster could not [illegible] but here it was splendid and quite [illegible]. Mrs. H. Bell was greatly admired, as [illegible] Dyke, The King (very fine), Mrs. Andrew Ireland, Chrissie Unwin, Mid-blue, Miss H. C. Philbrick, the charming silvery-blue Mrs. Bieberstedt, and a splendid stock of John Ingman.

The large breadths of seedlings representing three generations of crosses proved a great attraction, especially to those raisers who believe that Mendel's law applies to sweet peas, and that by its careful observance the fixity of a variety can be secured in a reasonable time. But whether this is [illegible]. Messrs. Dobbie and Co. have a [illegible] of seedlings to select from for [illegible] trial, and the firm evidently believes the real sweet pea boom is still to come. I believe they are right, and, as Mr. Cuthbertson remarked at lunch, the Messrs. Sutton and Sons have entered the field as raisers and exhibitors of sweet peas, so evidently the Reading firm believes in a great future for this popular flower.

All good things come to an end, and so the sweet pea outings concluded at Marks Tey with a most refreshing strawberry tea, thoughtfully, amply, and graciously provided by Mrs. and Miss Cuthbertson, who were heartily thanked on the motion of Mr. [illegible]. Mr. C. W. Breadmore and Mr. [illegible] remembered the work of the hon. secretary, and he too received and acknowledged hearty thanks. After tea we departed our various ways—north, south, east, and west—to meet again, if the fates are kind, on July 24. This (Monday) morning's post has brought numerous entries for the show, and as good rains have fallen in the south lately we are sure to have a big show.

CHARLES H. CURTIS.

Melons.—Pot on the plants that are to give a late crop, keeping them close to the glass, and giving plenty of water.—A. B. W.

DENDROBIUM CLIO.

There are several distinct forms of this most desirable secondary hybrid, derived from the intercrossing of D. Ainsworthi splendidissimum grandiflorum and D. Wardianum. The typical hybrid was exhibited by Mr. White, from Sir T. Lawrence's collection, on March 10, 1896, at the Royal Horticultural Society, the plant receiving an Award of Merit. On April 7, 1896, D. C. Lyntisfield variety was shown from Mr. F. Hardy's collection, by Mr. Stafford, and was awarded a First Class Certificate. D. C. Vine House variety received an Award of Merit April 18, 1899, and on June 5, 1900, a F.C.C.

The subject of the accompanying illustration was shown from Sir T. Lawrence's collection, and received an Award of Merit; in my opinion it is the finest of the whole series, and one of the most beautiful hybrids of the deciduous section. The sepals and petals are deep rose, shading to white in the centre. The broad white lip is tipped with purple, and has a distinct band of yellow almost surrounding the maroon-purple disc. It is of free habit of growth, but, like most other hybrids derived from D. Wardianum, it is very liable to start prematurely into growth, and the prospects of flowering are then detrimentally affected. There is plenty of room yet for hybrid dendrobiums of this class, and hybridists would do well to turn their attention more to the use of D. Wardianum. There are few hybrids from it, and these are among the finest we have in cultivation.

Oakwood Gardens.

BEST PLANTS FOR GREENHOUSE.—Nearly 300 pages are devoted to the description, propagation, and culture of the best flowers and plants for the greenhouse in THE AMATEUR'S GREENHOUSE, by T. W. Sanders, price 5s. net, or by post 5s. 6d., from W. H. and L. Collingridge, 148, Aldersgate Street, London.

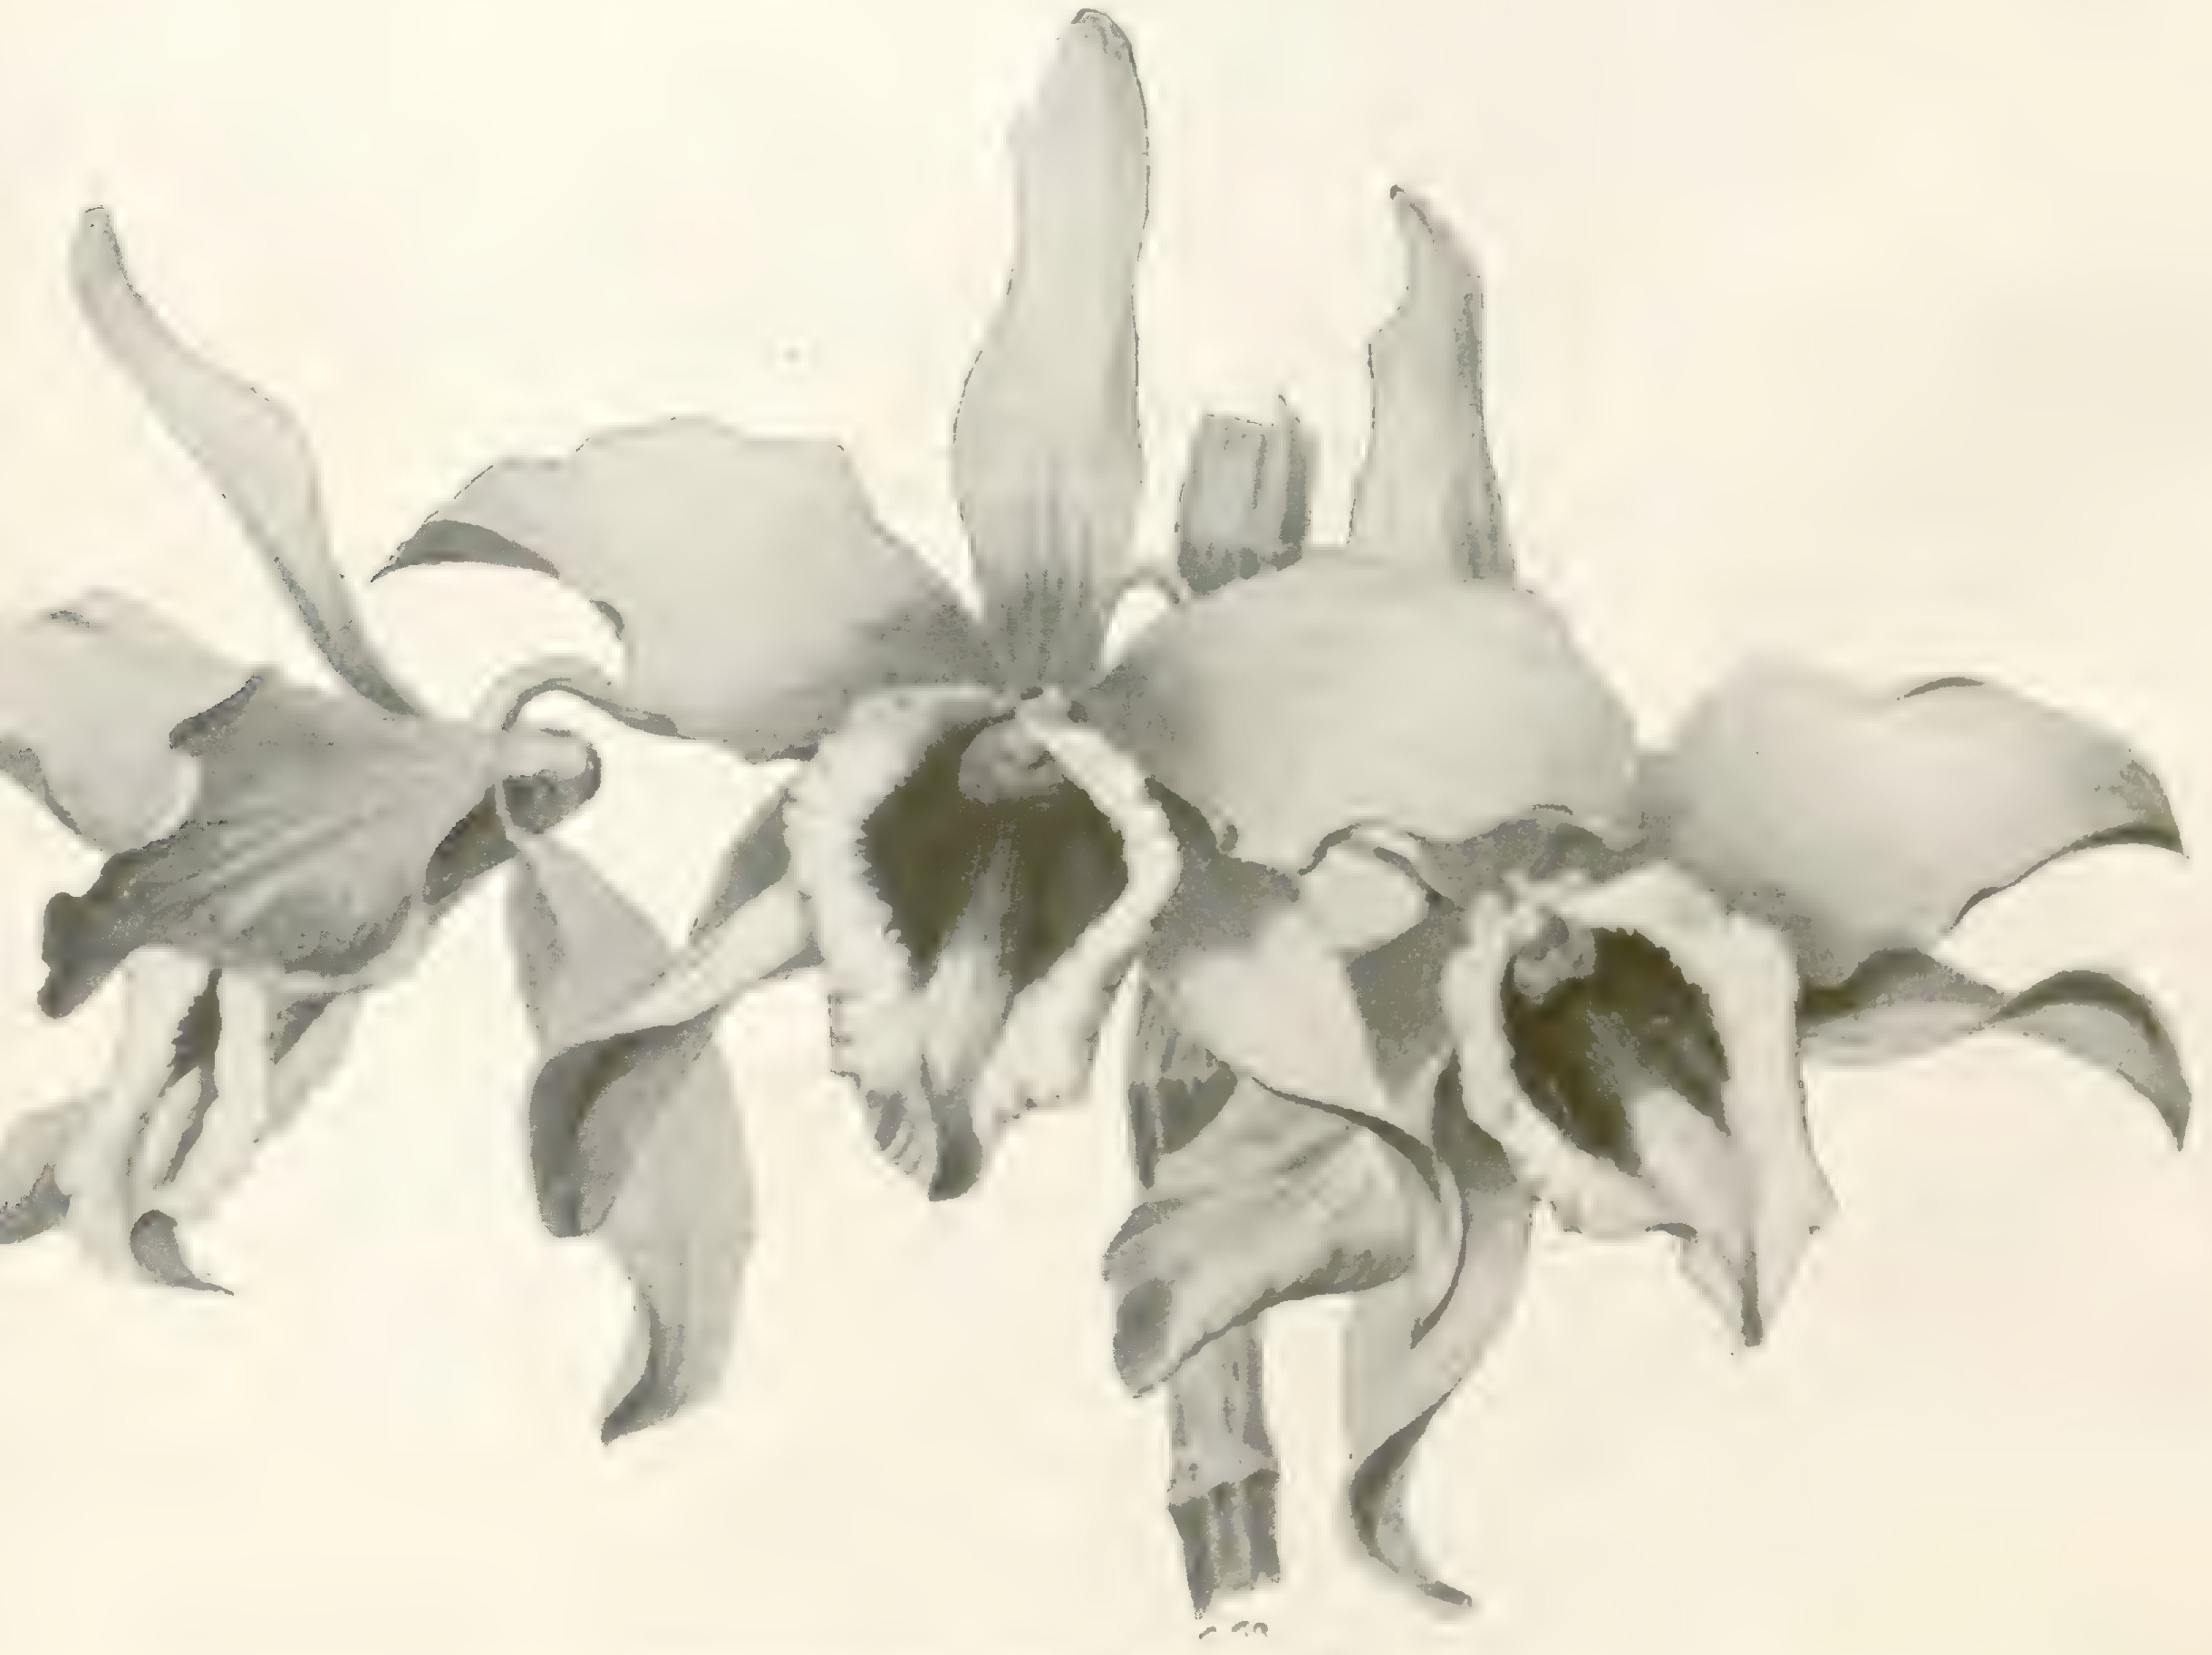
WORK FOR THE WEEK.

◆

THE ORCHID HOUSES.

VANDA TERES.—There are few orchids more desirable than this terete-foliaged plant. The delicate colours of the flowers and the long-stemmed racemes renders them exceedingly useful for cut-flower purposes. They are by no means difficult to cultivate, and when they receive conditions suitable to their requirements they give satisfactory returns. The plants will always do well in a hot, moist atmosphere during their active season of growth, but to produce satisfactory results it is necessary that they should have full advantage of the direct rays of the sun. Those which have recently passed out of flower should now be repotted as necessary. They may either be planted out in boxes or better still in a bed in a heated pit. In the former case the boxes should be well drained, and, after the plants have been placed in position, the remaining space may be filled in with chopped sphagnum moss, intermixed with plenty of course sand or finely-broken crocks. Where planted in a bed, they may be arranged in order of height according to the slope of the roof, but care should be taken that the growths are placed within reasonable distance of the roof glass. In the compost for this purpose I think it a good plan to have about equal portions of fibrous peat and sphagnum, with plenty of charcoal and sand added.

SPECIMENS. — Where the plants are grown in pots, if large specimens are desired, it is advisable to place several examples together. When a suitable pot has been selected one or more teak rods should be made secure in the centre of the pot, and the plants placed at suitable distances around them. Those that have become leggy from the loss of leaves may have the stems suitably shortened before planting. The potting compost, entirely of chopped sphagnum and sand, should be made firm at the base, and a little moss may also be worked in among the



DENDROBIUM CLIO SUPERBUM.

plants and stakes higher up the stems. They should then be placed in a hot humid position, where little or no shade whatever is given. Syringe the plants thoroughly, and give every encouragement to free growth.

INCREASE OF STOCK. — The parts of plants that have been shortened may be laid in a bed of sphagnum moss in a warm, moist place, where they will form new growths, which, when they commence to root, may be potted in the usual way.

VANDA HOOKERI is even more beautiful than V. teres. It is of much weaker constitution, and is seldom seen in perfection. It should be grown under the same conditions as V. teres. The hybrid V. Miss Joaquim is a robust grower, and in every way desirable. To be successful in flowering this it should be grown fully exposed to light at all seasons of the year. When in active growth, like V. teres, it requires ample moisture, with drier and cooler conditions when in the dormant state.—H. J. CHAPMAN, Oakwood Gardens.

STOVE PLANTS.

BOUVARDIAS.—Batches of bouvardias ought to be placed in their flowering pots before the end of July, to become well established before the winter months arrive. After the plants have been transferred, pinching out the points of the growth should be discontinued, and, if required for early flowering, they *may* soon be allowed to form their flower buds. As soon as the pots are filled with roots, weak liquid manure and soot-water should be applied at intervals of a few days. A further top-dressing of some approved artificial fertiliser will be of great assistance to the plants when developing their blooms. A neat green stake should be firmly fixed in the centre of each plant, and the young shoots carefully looped to it with green raffia tape.

POINSETTIAS. — Stock raised as previously advised will now be ready for shifting into four-inch and five-inch pots. I have noticed from observation that soils which contain a good percentage of iron greatly improve the colour of poinsettias, and where soil of this quality is not obtainable it is an excellent plan to mix with the compost a small quantity of iron filings. After repotting, careful attention must be given to shading and watering until root-action has commenced again. The plants, which may now be placed in cool pits or frames, should have sufficient space allowed to freely develop their foliage, for if, through any cause the foliage is allowed to suffer, their value for winter decoration is much depreciated.

CYPERUS ALTERNIFOLIUS. — Where large supplies of this plant are required for house decoration an autumn-raised batch is indispensable for early spring decoration. They are easily propagated, and quickly grown into useful plants; when they are growing freely they require abundance of water, and they will succeed well in either loam or peat.

CALADIUMS.—The earliest of caladiums are showing signs of ripening off; care must be taken at this stage to expose the tubers thoroughly to the sun, and that the drying off process is not completed too soon. As long as the foliage remains on the plants water may be given sparingly. When thoroughly ripened off, store away in a dry position, where the temperature does not fall below 50 deg. Caladiums for autumn decoration should be watered occasionally with weak liquid farmyard manure, which will greatly prolong their season of usefulness.—JOHN DONOGHUE, Bardon Hill Gardens.

FRUITS UNDER GLASS.

FIGS.—The early house should be kept well supplied with moisture. If the roots of the trees are restricted liquid manure may be given, but its application must be guided by the state of the trees. Keep the house open day and night, and well syringe twice a day to keep all clean. Regulate the shoots to allow plenty of light into the trees. Do not overcrop the second time, and if the trees are not strong the young fruits should be removed. Pot trees will now be out of doors, and will be best plunged in ashes to keep them from becoming too dry; give them plenty of water, liqud manure, and soot-water. These, like the above, will throw up a second crop, but if not in robust health the fruits should be removed. We are now gathering a good second crop of Violette Sepor, not large, but useful fruits.

MIDSEASON FIGS will be in fruit. The syringe must be dispensed with. In very hot weather a little whitening may be syringed on to the glass. Clear water should be given to the roots at this stage. Keep air on at night, and just warm the pipes. To keep up a succession of fruits a few trees are required in a cool case or house. Stop the shoots when they have made four or five leaves. Young plants struck last autumn should be given another small shift as they require it.

FRUIT TREES IN POTS.—If these are vigorous and carrying a good crop they will be best plunged in the ground to keep them from becoming too dry, and the hot sun from scorching up the tender roots. A layer of cow manure placed inside the rim of the pot and built up will enable more water or liquid manure to be given. Soot-water if used too strong makes the fruit bitter, especially peaches and nectarines. Trees that have failed to carry a crop should be stood outside, plunged in ashes, and kept well syringed. Cherries in pots soon show the effects of over-cropping and should be well thinned out. Pears are a good crop in pots; these require an abundance of water. Plums in pots are, as a rule, not satisfactory. One of the best methods of treatment to ensure a crop is to plunge the pots in the soil and train the stem up on the single cordon principle, keeping them shifted on until they are in 10-inch or 12-inch pots, then lift them every winter and plunge them back again. The roots will find their way through the holes at the bottom, and find sufficient nutriment to ripen the crop. The varieties we have tried here with good results, and these are 12-feet high, trained up the sides of the orchard house, are Early Transparent Gage, Old Green Gage, Kirke's, and Golden Drop, and no doubt most of the others would give good returns.

EARLY VINES.—The early crop being finished, give the vines a good syringing night and morning, and once a week (if there are any signs of pests) add a wine glassful of paraffin and a little soft soap to four gallons of water, and apply in the evening. Examine the border, and if nearly dry give a good soaking of liquid manure. Vines in pots or tubs that have carried a crop should be stood outside, and the rod be tied up securely to a rough fence and freely syringed and watered; place some long litter round the pots to keep them from becoming too dry, as the rods will require feeding to plump up their buds for another season.

BANANAS. — Those now swelling their fruit will require an abundance of water, both liquid and clear; top-dress them as they come into fruit with some good loam and manure. Keep plenty of heat and moisture in the house. Pot on a few plants when ready, as the young ones grow rapidly this time of the year.

TOMATOES.—Young plants required for a winter crop should be kept close to the glass and potted as necessary. Others carrying heavy crops should be liberally treated. Keep air on the house always at the top, and keep the pipes warm at night in dull wet weather.—A. B. WADDS, Paddockhurst Gardens.

THE KITCHEN GARDEN.

ASPARAGUS SEEDLINGS.—Where seeds were sown in permanent quarters the young plants should now be thinned out to 12 inches apart, so that they may grow strong and sturdy. Destroy all weeds as fast as they appear, and if the plants seem at all dry a thorough soaking of water will be beneficial. The old beds are now covered with growths that are top-heavy, and therefore require some support, such as stakes or string stretched along the rows. By this means next season's crowns will be all the better, and if liqud manure can be given now it will assist them very much.

ENDIVE.—Some of the early-sown plants are sure to bolt, so it is wise now to make another good sowing in good rich soil. If the seedlings are thinned out when ready and planted in a rough frame, this will leave the permanent plants more room to develop, and those that are pricked out into frames will be valuable later on. Let the early plants be well blanched before they are sent in for salads, or they will be very bitter. A very simple method is to lay boards or slates over them, and this also tends to make the leaves crisp.

BEANS.—Make a late sowing of dwarf beans on a warm, sheltered border, and where it will be possible to place old spare lights over them if necessary in case of early frosts. The soil should be good, so that they may grow right away without a check. If the ground is very dry give a good watering before inserting the seeds thinly in rows about 15 inches apart. Canadian Wonder is a suitable variety for this sowing.

RUNNER BEANS should be kept well supplied with water; syringe the foliage occasionally towards evening to assist them in setting their pods. Attend to the later batch by training the young growths up the stakes. Liquid manure should be given freely when the beans are in full bearing.

HERBS.—If a pinch of tarragon seed is now sown in a box of light soil, and placed in a cold frame, it will soon germinate, and be ready for planting out in lines about eight inches apart on the herb border. Then it will become established before winter sets in; at the same time if four plants are pricked out in each of several 6in. pots, and kept outside, they will come in for forcing later. This herb is always in demand for soups, etc. Stems of mint, when just coming into flower can be cut and dried for winter use. Summer savory, marjoram, and sage may be treated in the same way. Sorrel should have the old flower stems cut off at once, so that new leaves can push forth.

PARSLEY AND CHERVIL.—Preparations should now be made for the principal sowing of parsley for winter use. Select a warm border if possible, and where the soil has been deeply dug and manured. Sow the seed thinly in shallow drills one foot apart; if the soil is dry the drills should be watered before sowing. We find no difficulty in getting good plants on our strong clay soil. Make another sowing of chervil for autumn use, but where the old plants have been allowed to seed, seedlings very often come up freely.—T. W. BIRKINSHAW, Hatley Park Gardens.

Agaves at Kew.—The cultivated collection of agaves at Kew is an exceptionally large one, and there are nearly always some of them in flower. The tradition that A. americana, the "American Aloe," flowers only once in a hundred years sometimes gives rise to excitement in the daily press when it is seen that some of these "century plants," as they are popularly termed, are in bloom at Kew, with the result that many visitors are disappointed when they learn that the flowering of these plants is quite a common occurrence at the Royal Gardens. The age at which an agave will flower depends largely upon the conditions under which it has grown; happily situated it may flower when ten years old; on the other hand, if the conditions are unfavourable to healthy, quick growth, it may take 20, 50, or even a hundred years, or it may never flower at all. Mr. Watson records, in the "Kew Bulletin" that the species that have flowered at Kew this year are the following: A. Leopoldi, flower spike 14ft. high; A. micrantha picta, 2½ft.; A. horrida macrodonta, 7½ft.; A. polyacantha, 4½ft.; A. Bouchiei, 2½ft.; A. densiflora, 5ft.; A. Scolymus, 8ft.; A. Haseloffi, 3ft.

UNCOMMON ALPINE PLANTS.

To my mind too much space is often taken up in rockeries by common species which have been allowed to grow, in many instances, at their own sweet will and at the expense of rare and beautiful kinds. Both may have been planted at the outset, and almost imperceptibly the grosser-growing kinds have ousted the comparatively slow-growing species, and taken possession of six times their allotted space. This is a matter that calls for close attention on the part of the amateur, who should take care that each individual plant is happy, and provided with breathing space. Many instances of this kind came under my notice last summer, and I remarked a splendid specimen of Lithospermum prostratum being smothered by one of the brambles or rubus, while in another part of the garden a grand tuft of that rare beauty, Gentiana acaulis, was being rendered ineffective by the altogether too close proximity of a huge plant of Funkia subcordata grandiflora.

Since I have mentioned the gentian a word may be said on behalf of G. pyrenaica, which has delightful flowers, sky blue in colour, and tufts of glossy leaves; and G. angustifolia, of a deep blue shade, the throat being marked with green spots. These thrive under the same conditions as the well-known G. acaulis, namely, an open position, and chalk or lime rubble, peat, and loam to grow in. Erysimum thyrsoideum is a native of the Eastern mountains, and revels in any kind of soil in the crevices of rockwork, fully exposed to the sun. It has silvery foliage, and its inflorescence is very similar to that of the wallflower.

Ranunculus Sommeiri is a brilliant subject, and remains in beauty over ten weeks from early in May to July. To do it justice good loam and manure should be added to its site, and in times of drought water must be supplied. It has golden-yellow flowers and leathery leaves, and is easily increased by division early in spring. It is gratifying to know that the fine Corydalis Wilsoni is being widely distributed, and that it has proved itself capable of withstanding our winters, provided a somewhat dry spot is found for it. It hails from Central China, and forms a fine mass of gold in its season, being vastly superior to older kinds. Genista sagittalis is a hardy little plant from Southern Europe, and does not exceed half-a-dozen inches in height; yellow in colour, the inflorescence is borne in leafless and terminal spikes, the foliage being ovate and lanceolate. And yet another yellow-flowered species is Mimulus primuloides, which blooms continuously from June to the end of September. This New Zealand plant requires a raised position and a peaty soil.

Primula marginata, variety cærulea, is, as its name implies, blue-tinted, and altogether an exquisite subject. It does not grow very rapidly, and every effort should be made to increase the stock by offsets so as to form fine and bold groups. Campanula Allioni is a first-rate species for the rock garden, being of tufted growth, and bearing very large purplish-blue flowers. It is impatient of drought, and should be planted in a slight cavity, or upon the level, and in a loamy, well-manured soil. Tunica saxifraga looks very charming trailing over large stones, and is exceedingly graceful. It is wonderfully floriferous, blooming from early summer until smitten by frost. A group of half-a-dozen plants becomes very effective, and the plant is readily raised from seeds in a cold frame in spring. Geranium sessiliflorum affords a striking contrast to the many large forms seen among hardy geraniums. It does not exceed an inch in height, and from this tiny growth the purple and white flowers are produced.

The Plantain-leaved Slipperwort, Calceolaria plantaginea, is described in some catalogues as being hardy, which is misleading. In the case of continued severity it suffers to the point of extinction, while our notoriously damp climate acts injuriously upon it. It should be planted in a position where it lays rather dry in winter, and can be covered, or at least the basal part, with cocoanut-fibre refuse. Some folks place a bell-glass over the plants in severe weather. Slugs are very partial to the succulent leaves, under which they hide, but soot spread thinly over the whole surface occasionally will prevent their raids.

Walter H. Aggett.

DWARF LILIES.

Among the dwarfest of all the lily family must be included Lilium elegans, or L. Thunbergianum as it is often called, and its numerous varieties. Some of them, even in the case of vigorous examples, are, when fully developed, not more than a foot in height, while others are somewhat taller. Lilium elegans belongs to the sub-genus Isolirion, or cup-shaped lilies, whose flowers are borne erect in a compact head or cluster. The nomenclature of the different varieties is by no means uniform, indeed a good deal of confusion prevails on this point. A few years ago very fine bulbs of the best varieties used to be sent to this country from Japan in considerable numbers, but the supply seems to have lessened a good deal of late. Possibly this is owing to the demand for these smaller lilies being much less than for the large, showy kinds, such as L. auratum, L. longiflorum, and L. speciosum.

A few distinct varieties are still grown by the Dutch cultivators, but as far as my experience proves it is difficult to obtain as fine bulbs now as one could purchase from twelve to fifteen years ago. An exceedingly distinct variety from Japan, known as Horsmanni or Læmatochroum, with flowers of a rich, blackish-crimson colour has not come under my observation for the last three or four years, and another from the same country with clear lemon-yellow flowers known as Alice Wilson, is much scarcer than it was at one time.

Among the varieties of which bulbs can be readily obtained from dealers during the winter months may be especially mentioned the following: Alutaceum, not much more than six inches high, with buff-coloured flowers; astrosanguineum, deep red, a taller grower; bicolor or pictum, yellow, splashed more or less with red; Orange Queen, a beautiful orange-coloured variety; Prince of Orange, very dwarf, apricot yellow; sanguineum, light red, a rather tall grower; Van Houttei, a massive flower of a rich crimson colour; and venustum, clear apricot yellow, later in blooming than the rest. Most of the varieties of Lilium elegans flower during the month of June, but the variety venustum must be classed with the July lilies.

They are all good border lilies, and succeed in a well-drained sandy loam. When grouped among dwarf-growing shrubs or in the foreground of a border they are seen to very great advantage. Beside this they may readily be grown in pots for the embellishment of the greenhouse in early summer. The bulbs are small, hence three or four should be put in one pot. All the forms of Lilium elegans flower in a perfectly satisfactory manner the first season after planting.

W. T.

ATMOSPHERIC NITROGEN AS A FUTURE COMMERCIAL SOURCE OF PLANT FOOD.

(Concluded from page 482.)

◆

Use of Lime Nitrogen as Plant Food.

The suitability of calcium cyanamid, in the form of lime nitrogen, for plant food depends upon two factors: (1) its cost, and (2) its action upon plant growth.

The latest obtainable figures give the cost of this form of calcium cyanamid as $54 to $63 a ton, when produced under favourable conditions. This means that each pound of nitrogen costs thirteen and a-half to fifteen cents, which is about the average cost of nitrogen in nitrate of soda. If the material is found to be a thoroughly desirable form of nitrogenous plant food, it is highly probable that its cost will be considerably reduced. This end is, of course, being worked for constantly.

For three years past, considerable experimental work has been done, mostly in Germany, in testing the value of nitrogen in the form of calcium cyanamid for use in feeding plants. As might be expected, somewhat varying and contradictory results have been reported by different investigators; but, on the whole, and more particularly in the later experiments, the reports are quite favourable.

The following objections have been urged against the desirability of the use of calcium cyanamid as a plant food:

(1) It absorbs moisture readily, and, therefore, on standing some time, it forms a hard mass, difficult and disagreeable to handle as a fertiliser.

(2) It loses ammonia on standing, and is, therefore, not suitable for application in late fall or winter.

(3) It injures soil bacteria, and especially nitrogen-gatherers.

(4) It injures seeds and prevents germination when applied at or near the time of planting.

(5) It cannot be applied in mixtures with other fertilising materials on account of its tendency to absorb moisture, and cause caking. It must therefore be applied by itself.

(6) It is not suited for top dressing, as in case of grass lands, since direct contact with grass produces injury.

(7) Forcing crops, during their early stages of growth, are sensitive to the presence of calcium cyanamid, and may be unfavourably affected by it.

(8) It does not appear to work efficiently in soils rich in humus, or in acid soils, unless used along with considerable carbonate of lime.

On the other hand, the following favourable features have been extensively reported by different experimenters:

(1) The crop-producing efficiency of calcium cyanamid, under ordinary conditions, with field crops is from 75 to 90 per cent. of that of nitrate of soda, and not much below that of sulphate of ammonia. On garden crops, the efficiency was about the same as that of nitrate.

(2) On clay soils, lime nitrogen is nearly as efficient as nitrate of soda. On sandy soils, it needs to be used with caution on account of liability to cause burning of crops.

(3) Owing to recent improvements in methods of manufacture, it is claimed that the material does not absorb moisture, and does not lose ammonia on standing.

(4) Calcium cyanamid forms ammonia in the soil quite rapidly, the rate varying according to various conditions. The conversion of its nitrogen into ammonia is reported in one case as complete in twenty-

three days in a loam soil, at ordinary temperatures. In sandy soils the change is much slower.

(5) This material can be safely used in quantities varying from 135 to 270 pounds an acre, but it should be applied eight to fourteen days before putting in crop, and thoroughly mixed with the soil to a depth of three to five inches. The injurious effects on seeds can be overcome to a large extent also by mixing the lime nitrogen thoroughly with two or three times its weight of fine dry earth or other inert material before applying it to soil.

(6) It leaves as a residue in the soil carbonate of lime, which is desirable to neutralise acidity.

We may therefore conclude that in calcium cyanamid, in the commercial form of lime nitrogen, we have a source of nitrogenous plant food which, when used with proper precautions, may do efficient work in promoting plant growth. We can, at least, regard it as a very promising material, which will be found valuable as a source of agricultural nitrogen in case we are unable to find something equally or more efficient, and, at the same time, free from the inherent drawbacks which this substance seems to possess. In this connection it will be interesting to know that the material is to be exploited in this country by the American Cyanamid Company.

Calcium Nitrate.

The second substance we will consider in relation to nitrogenous compounds prepared by the use of atmospheric nitrogen, is known under several different names: Calcium nitrate, nitrate of lime, basic calcium or lime nitrate, basic nitrate, lime niter, etc. It is a compound closely related to nitrate of soda; in calcium nitrate, we simply have calcium instead of sodium combined with nitric acid. Strictly pure calcium nitrate contains 17 per cent. of nitrogen, a little more than is contained in pure sodium nitrate. The commercial product actually contains 12 to 14 per cent. of nitrogen, since it is not pure calcium nitrate, but a mixture of this compound with lime.

Method of Manufacturing Basic Nitrate of Lime.

Briefly stated, the process of manufacturing basic nitrate of lime consists of the following steps: (1) Ordinary air is passed through a powerful electric flame or arc, resulting in the combination of much of the oxygen and nitrogen in the form of nitric oxide. (2) This nitric oxide, on exposure to air, combines with more oxygen, forming other oxides of nitrogen. (3) These last formed oxides of nitrogen, on treatment with water, form nitric acid. (4) The nitric acid treated with lime forms lime nitrate.

The materials required by this process could hardly be simpler or more inexpensive, consisting of only common air, water, and lime. A high degree of heat, produced by electric power, is the form of energy used. The details of the various steps of the process are very interesting from a technical point of view, but we do not need to consider them here.

That portion of the process in which the nitrogen and oxygen are caused to combine appears to be less expensive than the subsequent portion of converting the oxide of nitrogen into nitric acid and nitrates. In its essential elements, the process is seen to be a simple one. The only expenses to be considered are: (1) electric power, (2) lime, and (3) current manufacturing expenses. The raw material which is consumed in largest quantities, the air, costs nothing.

Many patents have been taken out in connection with the electro-chemical production of nitrogen compounds from air. The patent of Bradley and Lovejoy was exploited by the Atmospheric Products Company, of Niagara Falls, and we heard much about it a few years ago. No one could obtain more than a vague knowledge of what was being done, but we were led to suppose that the process was successful, and that soon large supplies of nitrate nitrogen would be available at our door. This company stopped work in 1904, not having succeeded in producing nitrate nitrogen at a price which would enable it to compete with our usual sources of supply.

As nearly as can be ascertained, the best results have been obtained by the Birkeland-Eyde process, which is in operation on a commercial scale at Notodden, Norway. The necessary electrical energy is furnished by water power. The company which is at the back of this enterprise has gained control of most of the available water power of Norway, and propose to increase the number of manufacturing plants as rapidly as practicable.

Use of Calcium Nitrate for Agricultural Purposes.

The chemical substance known as calcium nitrate has a powerful attraction for moisture, but this is overcome by treatment with excess of lime. I believe they use an excess of about 2 per cent. This so-called basic lime nitrate powders readily, and does not absorb moisture seriously.

The cost of basic calcium nitrate at the works, not including packing and transportation, is about thirty dollars a ton, which would furnish nitrate nitrogen at about ten cents a pound. It is expected that its cost of production will be reduced to seven and one-half cents a pound. Even adding the cost of packing and transportation, the price compares most favourably with nitrate of soda. It is probable that it will be a strong competitor with the older sources of supply.

Basic nitrate of lime has been shown by numerous experiments to be fully equal to nitrate of soda as a nitrogenous plant food. As compared with nitrate of soda, basic nitrate of lime has certain advantages as a source of plant food: (1) When basic nitrate of lime is applied to soils, it leaves carbonate of lime as a residue, and this may be regarded, in general, as of more agricultural value than the sodium compounds left by nitrate of soda. (2) Basic nitrate of lime will probably be cheaper than nitrate of soda, if it is not already. The chief question for the future would appear to be an increase in the number of factories sufficient to meet the future demands, and this will naturally adjust itself.

It would, therefore, appear that we do not need to fear any famine in the future that might come from a lack of commercial supply of nitrogenous plant food for growing our crops.

Lime nitrate, as well as nitrate of soda, has the disadvantage of bulk. For each pound of nitrogen one must pay transportation on six or seven pounds of cheap material. A further problem in the production of cheaper nitrogenous plant food is the economical manufacture of a compound richer in available nitrogen. Such a compound is found in ammonium nitrate, which is probably the most concentrated form of nitrogen that would fulfil all the demands of the problem. In this compound we have both ammoniacal and nitrate nitrogen. The total amount of nitrogen is about 35 per cent., equally divided between the two forms of nitrogen. A good commercial product containing 30 to 33 per cent. of nitrogen would reduce one-half the cost of transportation which must be met in the case of nitrate of soda or of lime nitrate. The solution of this problem must be found in the economical production of ammonia and nitric acid in the same factory. It resolves itself, in reality, into the question of producing ammonia cheaply. It is possible that calcium cyanamid may be utilised in this way, if it can be produced much more cheaply.

There is some comfort in knowing that this little earth of ours has not yet run up against any great fundamental problem, seriously affecting the welfare of the whole human race, which has not been solved in time to prevent any overwhelming catastrophe. We are optimistic enough to believe that great things lie ahead of us in many lines, and especially in future developments relating to agriculture.

HORTICULTURAL SHOW ADVERTISEMENTS are inserted in this column at Ninepence per line, the minimum charge being Five Shillings. Offices, 148 and 149, Aldersgate Street, London, E.C.

EXHIBITIONS AND MEETINGS.

Bath Rose and Begonia Show.

JULY 7 and 8.

Owing to the Royal visit to Bristol on the 9th, the Bath Floral and Band Committee were under the necessity of fixing the date of their exhibition one day earlier than was intended; and as they had decided not to hold an autumn show, they were expecting a very large attendance. On the first day some 3,500 persons passed through the tents; but on the second day the attendance suffered owing to heavy rain and thunder-storms. The Sydney Gardens, Bath, presented a gay appearance on the first day, despite the heat, which, however, was fanned by a westerly breeze.

The open classes for roses well filled the centre of the "Queen of the West" tent, wherein were staged some 1,700 blooms, in competition, the amateurs' productions being located in the tent on the lawn above the railway; their contribution numbered about 800 specimen blooms.

NURSERYMEN'S ROSES.

There were four competitors in the class for seventy-two varieties, the silver cup going to Messrs. Alex. Dickson and Sons, Newtownards, for a noble collection, containing prominent flowers of Horace Vernet (selected as the N.R.S. medal H.P.), Florence Pemberton, Marie Rodocanachi, William Shean, Xavier Olibo, Caroline Testout, Mdme. Crapelet, Mdme. E. Verdier, Comte de Raimbaud, Ulster, Duchesse de Morny, Maman Cochet, Star of Waltham, Robt. Baesler, Earl of Dufferin, Her Majesty, Ulrich Brunner, Lohengrin, Gustave Piganeau, Bessie Brown, Marie Verdier, Princess Marie Mertshersky, Ben Cant, Mildred Grant, Tom Wood, Marquise J. de la Chataigneraye, Earl of Warwick, A. K. Williams, Mollie Sharman Crawford, Ellen Drew, Dean Hole, White Cochet, Alice Lindsell, The Bride, Souv. d'Elise Vardon, Duchess of Bedford, and Mdme. Melanie Soupert. The second award fell to the King's Acre Nursery Company, Hereford; Mr. John Mattock, Headington, Oxford, was third; and Messrs. G. Cooling and Sons, Bath, very highly commended. For thirty-six trebles Messrs. A. Dickson and Sons again headed the list, the best-balanced triplets being G. Piganeau, F. Pemberton, Duchess of Portland, White Cochet, B. Brown, M. Grant, Her Majesty, Mrs. Bateman, Horace Vernet, and Marquise J. de la Chataigneraye; Mr. J. Mattock, second, and the King's Acre Nursery Company third.

Eighteen trebles was another good class, Mr. Geo. Prince, Longworth, Berks, leading with Souv. de Pierre Notting, B. Brown, Mdme. C. Soupert, W. Shean, Comtesse de Nadaillac, Mrs. E. Mawley, Mdme. J. Gravereaux, F. Pemberton, Muriel Grahame, and K. Augusta Victoria; Messrs. Jefferies and Sons, Cirencester, were a good second; and Mr. H. Drew, Longworth, third. For three dozen single trusses, Messrs. Jefferies and Sons, led, having B. Brown, Ulrich Brunner, Her Majesty, J. B. Clark, F. K. Druschki, Queen of Spain, F. Pemberton, Duchess of Bedford, Mrs. E. Mawley, Helen Keller, Marechal Niel, Mdme. J. Gravereaux, White Cochet, Earl of Dufferin, and Golden Gate; Mr. H. Drew second, and Mr. G. Prince third. One of the best classes is that for eighteen teas or noisettes, and here Mr. Prince occupied the post of honour, with Bride, Comtesse de Nadaillac, Souv. de Pierre Notting, Mrs. E. Mawley, Muriel Grahame, Souv. d'Elise Vardon, Mdme. Jean Dupuy (the N.R.S. medal tea in the open class), Nellie Johnston, Marie Van Houtte, M. Niel, Maman Cochet, and Miss Ethel Brownlow, Mr. H. Drew second, and Mr. J. Mattock third. For a dozen of any variety of light rose, the King's Acre Nursery Company led with Bessie Brown; Messrs. A. Dickson and Sons second with Mrs. W. J. Grant; and Mr. Prince third for Dean Hole. For a dozen teas the awards went to Mr. J. Mattock, A. H. Gray, Esq., Bath, and Mr. Prince, each with White Maman Cochet. For five blooms each, in a dozen varieties, in vases, the awards fell to Messrs. A. Dickson and Sons, Jefferies and Sons, and Mr. Prince, but the exhibits did not appear very effective.

For six of any new rose of 1906-7, Messrs. A. Dickson and Sons and King's Acre Nurseries secured the awards with William Shean. Displays of roses on 40ft. were veritable bowers, Messrs. Cooling and Sons leading, this firm having the advantage of being at home.

AMATEURS' ROSES.

In the amateur's division were many excellent stands, very attractive being that for a dozen hybrid teas, the first prize (silver cup) going to Mr. R. Foley Hobbs, Worcester, thus winning the blue ribbon of the show, who set up eight buds of B. Brown, J. B. Clark, Mildred Grant, Florence Pemberton, Mrs. Bateman, Mrs. T. Roosevelt, Mrs. D. McKee, Dean Hole, White Lady, Mamie, Oberhofgartner Terks, and Robert Raizeler; A. Hill Gray, Esq., and Mr. Conway Jones, Hucclecote, took the lower awards, the champion prize for two dozen varieties also falling to Mr. Hobbs, with Rev. T. G. W. Henslow, Stanton St. Quinton, Chippenham, second; and Mr. Conway Jones third. For eighteen varieties A. Hill Gray, Esq., headed the list with a lovely set, very noticeable being Papa Lambert, Dean Hole, Oberhofgartner Terks, M. Cochet, Mrs. E. Mawley, Mrs. M. Kennedy, and Mdme. J. Gravereaux; the other prizes went to G. R. Bonnor, Esq., Gloucester, and Mrs. Rust. Mr. Hill Gray further added to his honours by securing the first prizes for six triplet teas, and eighteen singles (teas); in the latter class his White Maman Cochet was selected as the N.R.S. medal bloom; the other N.R.S. medal bloom was a Bessie Brown in the stand of four triplets staged by A. S. Chapman, Esq., The Cottage, Warminster, who also scored a premier for a dozen singles. W. Garrett-Thorpe, Esq., Gloucester, led for eight trebles and six singles. Miss Fisher, Devizes, for six teas, Mr. Conway Jones being placed first for a dozen teas.

MISCELLANEOUS CUT FLOWERS.

Classes were provided for collections of roses in vases, baskets, and shower bouquets, but the heat deprived many of the exhibits of their beauty. But one collection of cut stove or greenhouse blooms was staged, the greatest displays being made by the sweet peas and zonal geraniums. Hardy perennials filled a large amount of table space, and some charming collections of carnations in stands and on boards were most attractive.

Sweet peas were certainly a fine show, Mr. Humphries, Chippenham, leading for a dozen varieties.

Decorated dinner tables numbered eight, and were chiefly dressed with sweet peas, Mr. Viner, Bath; Sir W. Howell Davies, M.P., Bristol; and Mr. F. T. Cole, Bath, securing the prizes. The section reserved for ladies provided ten exhibits; Mrs. Viner first, Mrs Colston Hall, Warminster, second, and Miss E. M. Sheppard third. Single and triple bouquets of sweet peas were presented in numbers, and other cut blooms were sprays, vases, etc.

MISCELLANEOUS PLANTS.

Plants were set out as groups for effect on 200 square feet. Major H. Doherty, Mr. W. Walles, and Mr. C. W. Mackillop divided the honours in this class. Exotic ferns were limited to a second prize dozen varieties. Gloxinias in sixes were good, Captain Gillingham leading, while some lovely veined and marbled caladiums came from Major Doherty, who also scored a premier for a table of decorative plants. For one stove plant, Mr G. Hallett was placed first for a densely-flowered Bougainvillea Cypheri; Messrs. W. J. Stokes, Hilperton Marsh, Trowbridge, second for a balloon-trained Stephanotis floribunda. Begonias in sixes and single plants were sturdy examples, F. J. Tarr, Esq., Yatton, and Mr. A. A. Walters, Bath, being the winners of the first and second cards, the first-named making a grand show of large double forms in two dozen varieties.

STRAWBERRIES, VEGETABLES, ETC.

Strawberries were of most excellent quality. For six dishes Mr. W. D. Porter, Batheaston, led with Givon's Prolific, Trafalgar, Royal Sovereign, and Fillbasket; Mr. J. Ricketts, Batheaston, second, having Eleanor, Sir J. Paxton, and Royal Sovereign. For three Mr. Prince, Longworth, took the card for large, handsome berries of Royal Sovereign, Eleanor, and Sir J. Paxton; Mr. J. Ricketts second, adding President and Princess Alice; Mr. E. J. Ricketts third. The twelve heaviest berries were Givon's Prolific from Mr. W. D. Porter, who, likewise in the class for a dozen berries, staged the same variety.

Vegetables made a fine show, the prizes offered by Messrs. Sutton and Sons, and Webb and Sons being keenly contested.

Non-competitive exhibits comprised about 80 bunches of herbaceous perennials from Mr. N. Lovis, Leversdown, Bridgwater, Somerset; carnations, centaureas, zonal geraniums, statice, etc., from Taplin and Sons, Newton Abbot, Devon; alpine plants, sweet peas, and border flowers in variety, from F. Eames, Frome; about 50 well-posed gatherings of sweet peas, from Messrs. Toogood, Southampton; and a fine assortment of delphiniums from Mr. A. A. Walters, Bath.

Edgware Horticultural Society.

JULY 11.

The executive of this society may well be congratulated on the splendid results of their vigorous and well-devised policy. Instead of providing, as in the case of many local societies, a host of small classes, in which the competition is limited to residents in the respective districts, ample provision was made for local requirements, and several classes were provided of a special character in which the competition was open to the whole of the United Kingdom. There were, for example, six open classes for roses, including two with a silver challenge cup and a cash prize as the premier award, and five open classes for sweet peas, with two challenge cups, each of the value of ten guineas. As the result there was an excellent exhibition of miscellaneous subjects, and magnificent displays of roses and sweet peas.

Roses were staged in large numbers, and in a condition considerably in advance of those previously staged this season at English exhibitions, the rains of the previous week having greatly improved the quality of the blooms. The principal trade class was that for thirty-six blooms, in which a silver challenge cup, of the value of ten guineas, and a cash prize was offered as the premier award. There was a keen contest for the first place, and in the result Messrs. D. Prior and Son had the premier award made in their favour, their blooms being of great excellence. Messrs. R. Harkness and Co., Hitchin, followed closely for second place with a fine collection, the bloom of Horace Vernet being so meritorious that it was awarded the N.R.S. silver-gilt medal for the best bloom in the show, and the silver medal for the best bloom staged in the first and second classes. Messrs. Frank Cant and Co., Colchester, were a good third. The firm last named was first for twelve teas with superb blooms, and for a collection of garden roses, which made a rich display of colour. Messrs. B. R. Cant and Sons, Colchester, were second for twelve teas with finely developed blooms, and in the class for garden roses Messrs. W. and J. Brown, Stamford, were second with an excellent collection.

There was a keen competition for the premier award, which included a silver challenge cup, in the amateurs' class for twenty-four blooms, and the winner thereof was Mr. E. B. Lindsell, Bearton, Hitchin, who had superbly developed blooms of well-known varieties. Mr. W. Leggett, Colchester, was successful in obtaining second place, and the Rev. J. H. Pemberton was third. Mr. Lindsell was first also for twelve teas with an excellent box of blooms, that of Madame Jules Gravereaux being exceptionally good; Mr. W. Leggett, who was second, also staged blooms of high quality. Mr. J. Hart, Potters Bar, was first for six teas; Mr. W. Fowler and Mr. Judd, Edgware, were first and second for four bunches of garden roses with good arrangements; Mr. Fowler obtained premier honours for garden roses; and in a second class for garden roses Miss B. Langton and Mr. H. R. Darlington, Potters Bar, were first and second respectively. In the class for five blooms of any one variety, to be shown in vases, Mr. J. Hart and Miss B. Langton were the most successful exhibitors. For twelve blooms, distinct, Mr. A. Merck was first, with Miss B. Langton a close second.

Sweet peas were of high quality, and contributed in such large numbers that they nearly filled a marquee of huge dimensions. One of the most important of the classes for these fragrant flowers was that for twelve named varieties, nine sprays of each, open to amateurs residing within three miles of Edgware. There were thirteen collections, all good, and of these three were of quite exceptional excellence. Mr. H. K. Judd, Glenhervie, Edgware, the energetic hon. secretary, was successful in winning the first prize, consisting of a ten guinea silver challenge cup and £1 10s. in cash, with a collection remarkable alike for the splendid development of the sprays and the high quality and rich colouring of the blooms. The varieties included Audrey Crier, King Edward VII., Sybil Eckford, Nora Unwin, and Helen Lewis; Mr. C. S. Layton, Thornton, Harrow Weald, was second, with a collection of exceptional merit; and Mr. R. Blair, Oakleigh House, Harrow, who was third, also had flowers of great merit.

The entries were very numerous in the class for twelve varieties, twelve sprays of each, and at the head of the several competitors was Mrs. A. Tigwell, Harrow View, Greenford, who had finely developed sprays tastefully set up; Mr. Percy Cottam, Kings Langley, was second, with flowers of high quality; and Mr. E. Bennett, Cedar Park Road, Enfield, was a good third. In a second class for twelve varieties, in which there was no limit to the number of sprays, and any light foliage could be used, Mrs. A. Tigwell was again first, with a collection possessing much merit; Mr. Scaramanga was second with good flowers of high quality that lost much in staging; and Mrs. Arnold Steer, Oak Lodge, Hatch End, was third with flowers of comparatively small size, but very effectively staged. Very interesting was the class for four vases of sweet peas, to comprise one vase each of blue, white, yellow or buff, and crimson or scarlet. There was a strong competition, and at the head of the numerous exhibitors was Mr. H. K. Judd, with splendidly developed flowers of Mrs. Collier, Nora Unwin, Queen Alexandra, and Helen Pierce.

There was but one entry in the great trade class for twenty-four vases of sweet peas, distinct, and this was staged by Messrs. W. and J. Brown, and was of so high an order of merit as to fully merit the ten guinea silver challenge cup and cash prize that were awarded it.

Groups arranged for effect were finely shown by Mr. Blair, and Mrs. A. du Croz, one being remarkable for its caladiums and the other for crotons. Gloxinias were so well bloomed as to be as near perfection as we can hope to see them, and Mr. A. Merck and Mr. H. K. Judd, who were first and second, may be congratulated on the success they have achieved. Table decorations formed a strong and attractive feature, and Miss B. Langton and Mrs. Howard Williams were first and second with beautiful arrangements of roses.

There were an immense display of vegetables, and the Misses Crossman and Mr. J. Rayner were the most successful of the exhibitors in the two classes for collections.

The miscellaneous contributions included collections of roses from the Harrow Nursery Company, Harrow-on-the-Hill; Mr. J. Lion, Stanmore; Messrs. W. Cutbush and Son, Highgate; and Messrs. W. and J. Brown.

Southend Horticultural Society.

The annual summer exhibition of this flourishing society was held at the Palace Hotel, Southend, and proved even more successful than was the splendid gathering of last year. The products in competition for the large number of prizes were so numerous as to fill the ball-room, the winter garden, the white drawing-room, and various corridors, and they were as a whole of exceptional excellence.

Roses, which are grown with exceptional success in and around Southend and Westcliffe-on-Sea, were splendidly shown by residents in and near these two popular resorts, as well as by growers from a distance. The most important of the rose competitions was that for the challenge cup, offered as the premier award in the open class for forty-eight blooms. Here Messrs. F. Cant and Co., Braiswick Nurseries, Colchester, were first with blooms equally remarkable for their large size, high colour, and superb finish. Especially noteworthy were the blooms of Florence Pemberton, Dean Hole, Mdme. Constant Soupert, and Hugh Dickson. Messrs. B. R. Cant and Sons, Colchester, were a capital second, and Messrs. D. Prior and Son, Colchester, third. Messrs. Frank Cant and Co. were also first for a collection of garden roses, and very beautiful they were in their various shades of colouring. Messrs. B. R. Cant and Sons obtained premier honours for eighteen teas and noisettes with superbly developed blooms, and Messrs. Frank Cant and Co. followed closely for second place. Messrs. B. R. Cant and Sons were also successful in occupying the post of honour in the classes for twelve trebles, twelve blooms of any one hybrid perpetual, and twelve blooms of a hybrid tea. Amateur rosarians were in strong force, and staged blooms of remarkably high quality. In the division open to amateurs, irrespective of the number of plants grown, Mr. W. Leggett was first for eighteen distinct varieties, for six trebles, for twelve teas and noisettes, and for eight teas and noisettes, three blooms of each. Mr. H. Robins, Rev. F. R. Burnside, and Mrs. Barnes were also successful in this division. In the division open only to amateurs growing not more than 250 plants, the most successful exhibitors were Mr. S. Winn, Mr. G. W. H. Armstrong, Mr. A. J. Walker, Mr. A. T. Petty, and Mr. A. Talbot. The National Rose Society's medals were awarded as under. For the best H.T., to Mr. W. Leggett, for Dean Hole; for the best H.P., to the same exhibitor, for Horace Vernet, and for the best T., to the Rev. F. R. Burnside, for White Maman Cochet. Arrangements of roses were admirably shown by ladies and nurserymen, and in the class for the latter Mr. W. G. Hatch was awarded the gold medal, Mr. A. Davey the silver-gilt medal, and Mr. H. Robins the silver medal offered as the first, second, and third prizes.

Sweet peas were staged in considerably increased numbers, and in one of the two classes for twelve bunches, Mr. Hull was first, and in the other for the same number of bunches Mr. F. E. Belcher obtained premier honours. Messrs. Saltmarsh and Sons obtained first place in the class for nine vases of these fragrant flowers. Mr. A. J. Walker, and Mr. Brown exhibited well in the class for carnations and picotees, and Mr. W. A. Voss and Mr. E. Hill staged zonal pelargoniums in a cut state in excellent form.

The successful exhibitors of groups of plants were Mr. A. Davey, Rev. R. Stuart King, and Mr. Burles, and of baskets of plants Messrs. Saltmarsh and Sons, Rev. R. Stuart King, and Mr. A. Epps; Mr. A. W. Voss, Dr. G. F. Jones, Mr. A. Epps, and Mr. J. B. Steer were also successful in one or more of the plant classes.

Fruits and vegetables were plentiful and good. Mr. W. T. Meekings, Mr. J. Burles, Mr. A. Epps, Mr. G. Murrell, and Mr. E. J. Elford were the most successful of the exhibitors in the open classes for fruits; and the prize-takers in the open classes for collections were Mr. W. T. Meekings, Rev. R. Stuart King, Mr. E. Elsdon, Mr. G. Murrell, and Mr. T. D. Coe.

Both amateurs and cottagers also exhibited well in the classes set apart for them, and their contributions greatly enhanced the interest and attractions of the exhibition. The arrangements were admirably carried out by Mr. E. A. Watts, the hon. secretary.

R.H.S. Gardens Club.

The first annual general meeting of the club was held on the evening of the 8th inst., in the old Charles Dickens' room at Carr's Restaurant, in the Strand. In the unavoidable absence of Mr. Wright, who remained busy at Holland House, the chair was taken by Mr. F. J. Chittenden, the director of the laboratory at Wisley, and the following Chiswickites and Wisleyites were present: Messrs. E. M. Bear, A. du T. Bottomley, Thomas Bevan, A. P. Caldwell, G. S. Damsell, J. Fraser, T. Frazer, W. J. Jennings, J. T. Ledger, E. Miller, N. A. Phillips, G. Pyman, W. K. Reed, H. V. Richardson, H. F. Robson, H. L. Robson, H. E. Seaton, G. E. Sery, H. Spooner, R. J. Wallis, B. Wynne, and G. S. Yeoman. Students journeymen, foremen, etc., were thus represented from the time of Mr. Wynne, who entered the gardens as a student in 1866. After an excellent supper the rules of the club were drawn up and approved and the officers for the ensuing twelve months elected. It was decided to publish at an early date a list of past and present members of the R.H.S. staff, and in order to make this as complete as possible will all who have any remembrances of old Chiswickites please communicate with the hon. secretary, Mr. R. J. Wallis, R.H.S. Gardens, Wisley, Ripley.

United Horticultural Benefit and Provident Society.

The quarterly meeting of this society was held at the Horticultural Hall, Vincent Square, on Monday evening last, with Mr. Thomas Winter in the chair. Six new members were elected, making a total increase of 45 this year. The usual quarterly grants were made to old age members on the benevolent fund. The amount of sick pay for the month was £41 18s., which is rather heavy for this period of the year. The meeting closed with a vote of thanks to the chairman.

OBITUARY.

◆

MR. B. GREAVES.

We regret to record the death of Mr. Benjamin Greaves, which occurred at his residence in Arthur Street, Horsham, after a long illness. Mr. Greaves, who was in his 75th year at the time of his death, had been for forty years head gardener at Broom Hall, Dorking, and he retired from his charge about four years ago. Mr. Greaves was held in high respect by his late employers, and also by those who served under him.

Sweet Peas.—Do not allow seed pods to form if a continuous supply of bloom is required. As the latest sown plants advance see that sticks are placed to them. Rows or clumps must be well mulched with decayed or half-rotted manure, otherwise should the season prove a hot, dry one, they will be soon over. Note any of the new varieties and compare them with the older ones, as it does not always follow that the newest are the best.—E. F. H.

FORCING RHUBARB WITH ETHER.

Rhubarb is a plant that is being forced for winter use more and more every year. The method of forcing is very simple. Good strong, thoroughly established, three or four-year-old clumps are dug in the fall. These are stored in boxes or cold frames until required for use. They are then taken into the forcing house and placed close together in boxes or in beds underneath the benches. Soil is thoroughly packed between the clumps and a covering of from two to six inches of soil placed over them. The temperature of the house is kept between 50 deg. to 60 deg. and water applied when necessary. In about four or five weeks' time the rhubarb is ready to cut.

Methods of Etherisation.

In the experiments at Cornell on the forcing of rhubarb by the use of ether, the usual methods of culture were practised. The experiment was started on December 26, when three clumps of etherised and three clumps of unetherised rhubarb were placed in boxes in a dark mushroom house. Care was taken to have both lots as nearly the same weight as possible. The effect of the ether was very pronounced, the shoots of the etherised clumps being ready to cut fully five days before those of the unetherised clumps. Not only were the shoots of the etherised clumps earlier than those of the unetherised, but there were also a great many more of them. Four cuttings were taken from these two lots of rhubarb, and a comparison made between the weight of the edible stalks produced by the etherised and unetherised lots. The results were decidedly in favour of the etherised lots. The first cutting was made on January 20, when the etherised clumps yielded three pounds one ounce of edible stalks, and the unetherised clumps one pound six ounces. At the second cutting, which was made on January 26, the etherised lot yielded two pounds nine ounces, and the unetherised two pounds two and a-half ounces. The third cutting, made on February 3, showed no gain in favour of the etherised lot, as both lots yielded one pound thirteen ounces. In the fourth cutting, made on February 10, there was once more a slight increase in yield in favour of the etherised lot, it yielding one pound ten ounces, and the unetherised lote one pound seven and a-half ounces. There was, therefore, from the four cuttings a total gain of two pounds four ounces in favour of the etherised lot, which is equal to an increase of about 33 per cent. due to etherisation.

Cost of Etherisation.

The expense of etherisation is not as much as might be expected. The initial cost for a thoroughly air-tight box need not be great. Any well-made box may be used if the cracks are covered over with felt paper and the cover made to fit as closely as possible. Such a box can be made by any handy man at a very slight cost. Commercial sulphuric ether such as is required for etherisation, costs about 75 cents (about 3s. 1½d.) a pound, which quantity is sufficient to etherise 30 good-sized clumps of rhubarb. Thus the cost of the process is so little that it is more than covered by the five days' gain in time, which means a considerable saving of labour and often a better price for the rhubarb. The extra quantity of rhubarb produced by etherisation is clear gain. — "Canadian Florist."

TRADE NOTE.

Some handsome auricula-eyed sweet williams we have received from Messrs. C. S. Daniels and Son, of Wymondham, Norfolk, give ample evidence of the beauty and usefulness of these fine hardy flowers, and show that the Messrs. Daniels have taken great pains to select and perpetuate none but the best colours, finest flowers, and robust constitutioned varieties.

ANSWERS TO CORRESPONDENTS.

Editorial Communications should be addressed to the Editor of the GARDENERS' MAGAZINE, 148 and 149, Aldersgate Street, E.C.

Specimens of plants, flowers, and fruits for naming or opinion should be sent to the Editor of the GARDENERS' MAGAZINE, "Endsleigh," Priory Park, Kew, Surrey, and as early in the week as possible. All parcels must be sufficiently prepaid.

The Editor will be glad to receive photographs of gardens, plants, flowers, trees, fruits, etc., for reproduction in the GARDENERS' MAGAZINE. He will also be greatly obliged by correspondents sending early intimation of interesting local events relating to horticulture. In sending newspapers containing matter to which they wish to draw attention, correspondents are requested to distinctly mark the paragraph.

BITTEN BUDDLEIA LEAVES.—R. C. W., Bristol: There are no traces of insects on the leaves of Buddleia variabilis sent, and we can only conclude that the holes and bitten margins are due to the depredations of earwigs, weevils, or chafers. A night inspection would probably reveal the cause of the damage.

SWEET PEA EXHIBITIONS. — F. J., Derby: There are several exhibitions forthcoming, at which sweet peas are the chief feature. At two exhibitions they are the only feature, i.e., at the National Sweet Pea Society's show at Westminster, on July 24, and at Wolverhampton, on July 29. The N.S.P.S. holds a provincial show at Dublin in conjunction with the R.H.S. of Ireland on August 5, and sweet peas are a great feature of the Shrewsbury Fete on August 19.

THE MADEIRA VINE.—S. W. B., Kingston: The Madeira vine is a quick-growing tuberous-rooted climber that succeeds well—almost too well in a cool greenhouse, but is not a success out of doors, except in quite the South of England. Keep the tubers quite dry during winter, and repot them in spring when growth commences, and you will have abundance of elegant greenery for the roof of your cool-house all the summer and autumn. The botanical name is Boussingaultia baselloides.

DAMAGED GRAPES.—T. B., Essex: The vines are evidently in a very bad way, due, in some measure perhaps, to an inefficiently drained vine border, and also to incorrect treatment. Mealy bug is present, and this pest it is almost impossible to get rid of or keep under at this season of the year, but you must tackle it with a soft brush and methylated spirit. Much of the damage is due to scalding of the berries, brought about by failure to commence ventilation early and gradually. The blackened stems of some berries suggest "shanking," and indicate an unhappy state of affairs at the roots, or it may be induced by overcropping. Please consult p. 546 with reference to scalding, and write us further concerning the other matters.

JUDGING ALLOTMENTS.—J. F. K.: The points to consider in judging allotments are the cropping, the condition and character of the crops, neatness, and freedom from weeds. The crops that have been taken off the ground previous to the date of judging cannot be taken into account. In pointing the several crops you will, of course, give a greater number of points to the crops of first-rate importance, such as potatoes, peas, cabbages, and onions, than to the crops of kinds that are of less value to the persons by whom allotments are usually held. Mr. J. Wright, V.M.H., has arranged an admirable system of pointing for the allotments and cottage gardens of Surrey, and the maximum points allowed are as follows: Superior work, orderly crops, and clean plots, 20; peas, 10; potatoes, 10; onions, 10; winter greens, 10; hardy fruits, 10; flowers, 10; broad beans, 8; runner beans, 8; kidney beans, 8; beet, 8; cabbages, 8; carrots, 8; cauliflowers, 8; parsnips, 8; turnips, 8; vegetable marrows, 8; asparagus, 6; celery, 6; cucumbers, 6; leeks, 6; lettuce, 6; rhubarb, or seakale, 6; tomatoes, 6; artichokes, 4; red cabbage, 4; shallots, 4; spinach, 4; herbs, 4; radishes and cress, 4; unenumerated, 4.

MILDEW ON APPLES.—L. L., Salisbury: Spray the bushes with a weak solution of potassium sulphide, taking care to moisten every portion of leaf, fruit, and stem. Examine the roots of the trees, and if the soil is dry give a copious watering, followed shortly by a good soaking with liquid farmyard manure. A second spraying may be advisable, and it may be followed by a good hosing after five or six days.

SLUGS IN ORCHID HOUSE.—W. P. G., Everton: Place a ring of cototn wool round the base of each spike, as slugs will not crawl over this. Persistently hunt for the slugs after dark, using a bright lantern to aid in detecting the pests, and a tin of brine or paraffin to place them in when caught. Traps of bran, lettuce leaves, and cabbage leaves should be placed at various points on the stage, and under it, and these should be frequently examined. Sufficient care is not always exercised in the preparation of sphagnum moss for orchids: tiny slugs and eggs of snails are often allowed to pass, and thus cause future trouble.

WEAK VINE LEAVES.—E., South Wales: We have been expecting to hear from you again. We imagine the same cause will continue to operate unless you can get to the root of the matter. Position of the house, altitude, nearness of trees, and condition of the roof of the vinery should all be studied carefully, and their bearing upon the vines considered. It is not at all unlikely, we think, that a tree intercepts too much of the sunlight, and consequently the wood does not ripen well in dull seasons.

ROSES.—S. C. H., Chiswick: Apparently the Gloire de Dijon rose was not well rooted, or it may have been planted too late in the season, and consequently the plant has not gained sufficient vigour to produce new growth. Under the circumstances it would have been better to cut back the strong growths, and we suggest that you do this now, and if new growths are made they must be lightly protected with bracken during winter, as they will hardly have time to ripen up properly. In the case of Crimson Rambler rose, the side shoots needed for decoration should be cut close back to the main stem, and when flowering is over the whole of the flowering branch may be cut cut to make room for the new rods that are doubtless already many feet long. Regarding the pergola, of course so much depends upon the amount of shade the trees give, but no doubt roses would succeed in the sunnier parts, and other useful climbers could be planted where there is less sun. Bone-meal is a useful autumn dressing for roses. Hybrid tea roses are far and away more free flowering in the autumn than are the hybrid perpetual varieties. Glad to hear of your successes; we are always willing to help you, as far as possible.

DAVALLIAS FOR HANGING BASKETS.—S. J., Exeter: Almost all the davallias may be brought into service for cultivation in baskets. Most beautiful of all is D. tenuifolia Veitchi, not, unfortunately, one of the best to grow, though it is well worth a little extra trouble, and a position in the stove. D. bullata and D. canariensis may be grown quite cool, though they develop best in a moderately warm house. Others and larger-growing species, suitable for large ferneries, are D. polyantha and D. Mooreana (pallida). The finely divided D. dissecta and D. elegans are useful for smaller structures, and are very light and elegant.

ANTS.—G. W. R., St. Neots: There is no great difficulty in disposing of ants if the nest is get-at-able, and not in close contact with the roots of plants. Petroleum poured into their nests will quickly dislodge them, as will a decoction of quassia chips and a solution of alum; and ants may be banished from plant and fruit houses by means of pieces of coarse sponge and castor sugar. The pieces of sponge are laid down in suitable places, and have a little sugar sprinkled over them, and when the ants have crowded into them, as they soon will do, dip the sponges into water as near boiling point as possible.

NAMES OF PLANTS.

T. C., Barnes.—Sedum album.

M. P.—Sedum stoloniferum, often known in gardens as S. denticulatum.

S., Nottingham.—The Bird Cherry, Cerasus Padus. The other matter we are attending to.

R. M., Epsom.—1, Lathyrus latifolius; 2, Clematis montana; 3, Campanula carpatica; 4, Buddleia globosa.

A. W. G., Cardiff.—We cannot undertake to name florists' varieties of flowers. The rose appears to be Leuchtstern, but is very small.

N. T. N., Reading.—1, Picea nobilis; 2, Olearia Haasti; 3, Spartium junceum; 4, Weigela rosea; 5, Taxodium distichum; 6, Rosa multiflora.

C. M., Portmadoc.—1, Spiræa discolor; 2, probably S. canescens; 3, S. Bumalda; 4, Leycesteria formosa; 5, Deutzia crenata fl.-pl.; 6, Tropæolum polyphyllum.

NEW BOOKS.

◆

BULLETIN DE LA SOCIETE FRANCAISE D'HORTICULTURE DE LONDRES.

(66, Long Acre, W.C.)

This annual publication of an interesting and useful society has now reached its nineteenth number, and the contents are, as usual, full of readable and instructive matter. We notice for the first time an article in English that will be welcomed by those who are interested in French gardening, viz., "The Intensive Culture of Vegetables, French System," by M. P. Aquatias, who deals in a methodical way with the various details of the system. A double-paged plan of a French garden is given. Other readable matter worthy of a note is the article headed "La fête Schneider," which deals with the three meetings held in England and France to celebrate the promotion of Mr. George Schneider to the rank of Officier du Mérite Agricole. There is also a full account of the annual dinner in January last, at which Mr. Harry J. Veitch presided. Reports of the monthly meetings and the text of the papers read by the young members are supplied in accordance with the invariable rule. Other matter purely official, such as the annual report, financial statement, list of members, etc., find a place in the Bulletin. Several illustrations adorn its pages, and we notice the frontispiece is a portrait of Mr. Thomas Bevan, an old friend and supporter of the society. Taken all in all, the past year's work is a source of great satisfaction to the officers, and we compliment our old friend Mr. Geo. Schneider, the worthy president, on the success of the society, both here and abroad.

ONE PENNY WEEKLY, by post 1½d.

FARM AND GARDEN

THE DAIRY—POULTRY—PIGS—LIVE STOCK—ALLOTMENTS—MARKET GARDENING, etc.

This week's issue (July 18) contains the following:

TURNIP FLY.
LETTUCES IN SUMMER.
THINNING FRUIT.
HOW TO PACK FRUIT.
INFREQUENT CALVING.
LIGHT, AIR, AND MILK.
MILKING TRIALS AT THE ROYAL SHOW.
HORSES IN HOT WEATHER.
WARBLE FLY.
PIGS IN SUMMER.
LIVE STOCK NOTES.
FATTENING FOWLS.
GROWING TURKEYS.
CONSTRUCTION OF A TRAP-NEST.
HELPFUL HINTS.

SOLD BY ALL NEWSAGENTS.

OFFICES: 148 and 149, ALDERSGATE STREET, London.

FORTHCOMING ENGAGEMENTS.

The Editor is always glad to receive intimation of exhibitions, and copies of schedules.

TUESDAY, July 21.—Royal Horticultural Society; committees meet at 12 o'clock; lecture at 3 p.m.; Scientific Committee at 4 o'clock.

National Rose Society, at Manchester.

WEDNESDAY, July 22.—National Carnation Society, Westminster.

Cardiff Horticultural Society; two days.

THURSDAY, July 23.—Royal Ulster Society's Flower Show; two days.

Dunfermline Rose Show; two days.

FRIDAY, July 24.—National Sweet Pea Society, Royal Horticultural Hall, Westminster.

SATURDAY, July 25.—Winkfield Horticultural Society.

CATALOGUES RECEIVED.

BARR AND SONS, COVENT GARDEN, W.C.—An extremely useful and well-arranged catalogue of hardy perennials, alpines, and aquatics. Information as to the best positions for hardy plants adds to the value of the list.

AMOS PERRY, ENFIELD, MIDDLESEX.—Aquatics now form a prominent group of hardy plants, and no one has exhibited them better than Mr. Perry, whose catalogue of these subjects is an unusually complete one.

G. HAYWARD AND CO., LIM., BROCKLEY, S.E.—A catalogue that will appeal especially to the amateur in search of medium-sized greenhouses, frames, etc., wherewith to add to the pleasures of gardening.

WALTER VOSS AND CO., LIM., MILLWALL, LONDON, E.—This catalogue of fertilisers and insecticides is one that every cultivator should keep at hand. It is a valuable work of reference in respect of insect and fungus pests, as well as a catalogue of useful remedies and appliances.

RELIGIOUS TRACT SOCIETY, BOUVERIE STREET, E.C.—A list of interesting and freely illustrated books, dealing with natural history subjects, notably bird life, wild flowers, and nature study generally.

DANYSZ VIRUS, discovered at the Pasteur Institute, Paris, is not a Poison, but DESTROYS
RATS & MICE.
Harmless to other Animals and Birds.

VOL. LI.—No. 2,856. SATURDAY, JULY 25, 1908.

THE GARDENERS' MAGAZINE.

NOTES OF THE WEEK.

The Cult of the Sweet Pea.

Nine years cannot well be said to form a very considerable part of the history of a flower that has been in cultivation in this country upwards of two hundred years, yet within this period the sweet pea has undergone such marked improvement in the size, form, and colours of the flowers, and in the development of the flower spikes, as to have had its value in the garden increased at least a hundredfold. At the present time it is of considerable interest to recall to mind the high state of development to which sweet peas had attained in 1899, as the result chiefly of the splendid work accomplished by the late Mr. Henry Eckford during the twenty preceding years. We mention 1899 because in that year steps were taken for the first time to give greater prominence to these fragrant flowers by organising an exhibition wholly devoted to them. The improvements that had been effected had greatly increased their popularity, and they were rapidly making their way to the great exhibitions, but in the majority of cases they were not staged in such manner as to convey an adequate idea of their grace and beauty. Appreciating the importance of improved methods of staging, and of bringing into prominence the finest of the varieties in the several shades of colour, we suggested in the Gardeners' Magazine of March 25, 1899, the desirability of holding a special exhibition of sweet peas. This suggestion would appear to have at once attracted the attention of those who were interested in these flowers, for, in the following summer, as stated in these pages on several occasions, Mr. W. Cuthbertson and the late Mr. Richard Dean, when on a visit to Messrs. Hurst and Son's trial grounds, casually discussed the question of holding such exhibition. As the practical outcome of the discussion at Kelvedon a meeting was held at Edinburgh in September of the same year, with Mr. George Gordon in the chair, and it was then decided to hold an exhibition in 1900, the bicentenary of the introduction of the sweet pea into this country, and to take the steps necessary to bring it to a successful conclusion. It is now a matter of history that the bicentenary celebration was a splendid success, that the formation of the National Sweet Pea Society followed, and that the popularity of the sweet pea has increased with such rapidity as to surprise even the most sanguine, and to create a large industry in their seeds and flowers. A brief sketch of the work that has been accomplished by the National Sweet Pea Society could hardly fail to be of interest, but it must now suffice to state that the society is a splendid example of what can be accomplished by a special society in the cause of the flower to which it owes its existence when conducted on well-defined lines. From the first those responsible for its management have kept steadily in view the object for which the society was founded, and in carrying out that policy with due vigour have proved to demonstration the advantage of a combination of amateurs and members of the trade in the conduct of work of a national character. The society has held annual exhibitions, as in the case of other special societies, but within a very short period of its foundation it recognised the fact that there was other work of far-reaching importance to which it would be necessary to give attention as soon as the funds at its disposal would permit. The executive was not slow to see that the preparation of a list of too-much-alike varieties would have to be prepared for the guidance of cultivators, that an endeavour should be made to reduce the list of varieties in cultivation by the elimination of those superseded by more recent introductions, or unequal to varieties which had preceded them in matter of time. In both directions such excellent work has been accomplished as to place all who are interested in sweet peas under a debt of gratitude to the society. Not less important has been the manner in which the society has dealt with novelties. Anxious to encourage raisers of new varieties to the fullest possible extent, it was foreseen that unless the utmost care was exercised in the making of awards to new introductions that both the society and the raisers would suffer. Not only is it desirable that new varieties should be superior to those in cultivation, but it is essential they should be thoroughly fixed, and the fixing of a new sweet pea is so slow as to be rather trying to the patience of a raiser who is successful in obtaining a form that shows a considerable advance upon others in the same line of colour. Yet it is not less to the interest of the raiser than to the cultivator that mixed stocks should not be placed in commerce, for were that to be done to any appreciable extent there would at once be a decrease in the demand for new varieties. As we have

[Photo: Maull and Fox.

REV. F. PAGE ROBERTS.

fully informed our readers, the society has of late years had trials of sweet peas in the gardens of University College, Reading, and these, which have been conducted by Mr. C. Foster, the horticultural director, have been models of what such trials should be. These trials have proved of immense value in determining the relative merits of novelties, and this year only those varieties included in the trials are eligible for awards. In the examination of the new varieties at Reading the Floral Committee imposed a severe test by ruling out all that included more than 5 per cent. of variation from the type. This test, if rather severe, will impress upon raisers the importance of fixity of stock, and give that confidence to growers which is so necessary to a brisk demand for novelties, and thereby prove highly beneficial.

The Rev. F. Page Roberts has for so long a period occupied a prominent position among the leading amateur rosarians in this country, that it is quite unnecessary we should refer to his work among the roses otherwise than in the briefest manner. We might remind our readers that when resident at Diss he devoted for many years special attention to tea-scented roses, and obtained premier position for these varieties in many a keen contest. Mr. Page Roberts was indeed so successful with the teas that there can be no question as to his having done much to set the high standard which now obtains among these roses at the public exhibitions. Since becoming rector of Strathfieldsaye Mr. Page Roberts has given increased attention to roses of all classes, and it is difficult to imagine anything more delightful to the rosarian than to spend two or three hours with him in the charming rose garden he has formed. Here we find dwarfs and standards representative of the finest of the exhibition hybrid perpetuals, hybrid teas, and teas, and glorious masses of the most beautiful of the garden roses. Especially deserving of mention is the pergola over which the finest of the ramblers run riot and produce a beautiful display of colour. Much attention is also given to the cultivation of hardy perennials, and at Strathfieldsaye, as at Diss, the various eremuri are grown with a degree of success that might well be described as exceptional.

The Sherwood Cup Competition at Holland House. — Dr. Douglas L. Freeland, of Delamere, Snodland, Kent, writes:—I have read with interest the note, on page 528, in the last issue of the Gardeners' Magazine, and, as one of the two who competed for this cup, I think it is only fair that you should publish the following remarks: I entered for the competition at least eight days before the show, to comply with the schedule of the R.H.S. From that time until the 7th we experienced continuous and exceptionally bright sunshine every day, accompanied by north-east winds and cold nights. The consequence was that roses lasted no time, and when cut did not stand well. In my case the blooms had to be cut on the afternoon before the show, as I had to travel to London that night, so as to be at Holland House by 7 a.m. I was made to understand that there would be an ample supply of vases for exhibitors, but, upon my arrival at the show at 7 a.m., the only ones available were six inches high; the consequence was I was unable to use more than a quarter of the flowers I had with me, so that my exhibit, to my mind, was not nearly imposing enough. Judging was timed to take place at 10 o'clock, but it was nearly 12 before my flowers were looked at. This speaks for itself, for any rosarian knows how differently roses look at 12 o'clock in a hot tent that have been staged for the judges at 10. Although the flowers put up may not have been considered worthy of a ten guinea cup, in my humble opinion a great deal of credit was due to any amateur who was able to stage twenty-four bunches of roses on July 7, in a season admittedly extraordinarily early. Two points of interest to me were that the competitors for this cup were placed in different tents at considerable distance from one another, and the rapidity with which they were judged. In your note you express regret at the absence of the leading rosarians in the competition, but I think that this can be accounted for from the fact that we have had an unusually early rose season this year, so that most of our blooms were over before the 7th. As I had entered for the cup at a time when my prospects appeared bright, I did not consider that it would be good form to show the white feather at the last moment, so this explains my reason for staging flowers which were considered "unworthy" of the award, and it was done at considerable trouble and expense, not solely in the hope of winning a ten-guinea cup, but to show my devotion to the flower I love so dearly.

Plant Growth.—It is a matter of common knowledge that plant growth proceeds with great rapidity after thunderstorms following closely upon a period of great heat and drought, and accompanied by a heavy fall of rain. It is not, however, common for the "shoots of plants" to spring "upwards so quickly that the rate of growth could be marked by an observant watcher." This Mr. Owen Greening tells us in "The Standard" was his experience recently, and in his reference to the matter he asks, "Does not the electric energy effect some changes in the air as grateful to the senses of plants as in the known phenomenon of ozone formation to ourselves?" This question, in the light of the results of experiments that have been made with a view to determine the effect of electricity upon plant growth, might perhaps be answered in the affirmative. It might also be suggested that electricity has some influence upon those who are able to mark "the rate of growth" by the eye alone in rhododendrons growing in the open.

Plant Reproduction. — Mr. C. Sherry, of the Glasgow Botanic Gardens, is reported to have stated in the course of a paper read before the Andersonian Naturalists' Society on "Natural and Artificial Modes of Propagation," that "the importance of buds in the propagation of plants, although well-known to botanists, was comparatively little attended to by propagators in general." Also that "their value could hardly be overestimated, as they possessed an amount of independent vitality, and might be induced to give origin to new individuals." Surely Mr. Sherry could not have been properly understood by the reporter, for it is hardly possible he could have suggested that the general body of propagators do not appreciate the value of buds as a means of increase. In the case of roses alone, millions of plants are annually raised in the United Kingdom by means of buds; and in the propagation of fruit trees, of which many hundreds of thousands are annually raised in this country, buds are almost exclusively used. Many ornamental trees are also propagated by means of buds, as also are potatoes, and many other useful and ornamental plants. Supposing Mr. Sherry has been correctly reported, it would be interesting to ourselves, as to a large section of our readers, if he would tell us how "buds might be induced to give origin to new individuals." The question of bud sports has received much consideration from scientists and practical cultivators, and all who have studied have as yet had to confess their inability to assign a cause for their origin, and suggest a course of procedure by which they might be induced.

Nightingales in the Midlands.—We are informed by a correspondent that for some time past a nightingale has been heard singing at night at Haigh, near Wigan. The bird's song has so charmed the residents in the district, many of whom belong to the mining classes, that they are up before sunrise to enjoy the melody. Some weeks previously a nightingale was heard in the neighbourhood of Ashton-in-Makerfield, and during the time of its stay large crowds went to hear the bird's song. It is unusual for the nightingale to go so far north.

Gardeners' Visit to a Famous Rose Garden.—A few days' since the members of the Burgess Hill Gardeners' Association visited the gardens of Cambrian House, Burgess Hill, the residence of Mr. G. A. Hammond, who as so well known is one of the leading amateur rosarians in Sussex. The visitors having fully enjoyed the roses, which were in great beauty, were entertained by Mr. and Mrs. Hammond at tea on the lawn, and prior to leaving the gardens accorded a hearty vote of thanks to their host and hostess.

Exhibition of Preserved Fruits and Vegetables.—On November 26 and 27 next, the Royal Horticultural Society will hold their annual exhibition of home-bottled and preserved fruits and vegetables, and now that the fruit-preserving season has again arrived, it may give added zeal to the lovers of this useful domestic art to prepare fruits for award at this exhibition. Dried or bottled fruits of any kind may be shown, subject to the conditions of (a) there being no chemical preservative, or (b) artificial colouring matter used, (c) of their being tasted by the judges, and (d) provided they have been grown in the British Islands. The schedule contains classes for bottled fruits, home-dried or evaporated fruits, preserved vegetables, jams, fruit jellies, and cheeses, and miscellaneous appliances, preserving bottles, etc. One class is specially attractive, and it is believed quite original. It invites for exhibition three bottles of British-grown fruit (of which one must be raspberries) bottled and shown by amateurs. These will be examined by the judges and left in the care of the society until November, 1909, and a silver cup and other awards given.

London and Dublin Sweet Pea Exhibitions.—The Gardeners' Magazine of August 1 will contain a full and illustrated report of the London exhibition of the National Sweet Pea Society, to be held in the Royal Horticultural Hall, Westminster, on Friday, July 24, and the issue of August 8 will contain full and special reports of the Sweet Pea Show and the R.H.S. of Ireland Show, to be held in Dublin on August 5.

British Gardeners' Association.—The next outing of the London branch will be to Finsbury and Waterlow Parks, on Saturday, August 8. Members will assemble at the Station Gates, Finsbury Park, at 3.30 for 3.40 p.m. The floral display is exceptionally good this year. All professional gardeners are invited to this outing. Those unable to join the party at the appointed hour will, on inquiry, be informed of the direction the party has taken. The members expect to arrive at Waterlow Park at 6.30 p.m.

WATERING PLANTS IN POTS

On looking at this headline some may say, "Watering plants in pots! any fool can do that!" Let such read no further, for these notes are not intended for them. But let any amateur leave his pot flowers to the care of a friend when he is away from home for a week or two, and when he returns he will probably find that there is a wrong as well as a right way of watering. Perhaps the younger readers of this paper may learn something from the experience of one who was watering plants in pots before they were born, and has been at it ever since.

In the first place, as a general rule plants in pots should not be watered unless they are dry. The plants often stand in a row, and some may be dry and some damp, and it is a temptation to run the can over all of them. The result is that, after a little time, those pots which do not get dry so quickly as the others—either because they contain smaller or less vigorous plants, or because the drainage is not quite so free—soon begin to have a caked surface, and this becomes green, and most plants soon cease to be healthy in such circumstances. Besides this, it is a good thing for plants to get fairly dry occasionally, as the absorption of most of the moisture in the contained earth means that air takes its place —air which is so necessary to the germ life of the soil which is preparing food for the plants by breaking down organic substances, and air which is so necessary to prevent the soil becoming sour, a condition which is alike bad for the germs and for the roots of the plants. This principle of allowing the soil to become dry must not be carried to excess, especially with subjects like chrysanthemums, which, if once allowed to get into a very drooping condition lose their lower leaves and look bare for the rest of the season. Farmers say that iron is the best manure you can give the soil, meaning that it does the land a deal of good to get so dry that it wears away, and occasionally breaks, the ploughshares.

In the next place, when plants are really dry, do not think that if you just fill them with water up to the brims that that is all that is necessary till the next day, for that is a great mistake. The soil contracts when it gets very dry, and the result often is that the water runs through the pot by the easiest channel, and the mass of soil is scarcely touched except for a quarter of an inch at the surface. Anyone can prove this for himself by turning out such a pot half an hour after it has been watered. When plants in pots are very dry they should be watered a second time after an interval of an hour or so, and, assuming that this is done in the evening, they may with advantage be watered again in the early morning in very hot weather. Only in this way can pot plants stand very hot weather without injury. In ordinary weather a thorough soaking will be found to last two days with most things, which is better than half watering them every day.

Standing pots in saucers of water is bad, the plants drawing up the water with their roots at the bottom of the pot instead of through the medium of the soil, and the result is generally seen in weak, unhealthy growth. When plants in small pots get excessively dry, as is often the case with those indoors which are not regularly attended to, it is a good plan to immerse the whole pot for an hour or so.

Bear in mind that rain, unless it is very heavy or prolonged, does not sufficiently moisten the soil in pots that are very dry, especially if the plants have large leaves. I had a striking illustration of the popular idea on this subject some years ago. Having to leave home for a week or so, I arranged with someone to water some pelargoniums which were in pots in window balconies. On my return I found them as dry as dust and apparently dying. On inquiry I found they had not been watered during the last few days (which were very hot ones) because there had been some heavy rain, or what was regarded as such, two or three nights previously!

As regards giving plants in pots liquid manure, experience and discretion are alike necessary. To give liquid manure to them when they are very dry is not only wasteful—so much of it running through the soil to no purpose—but it may injure the plants, as in taking up the amount of water they need to make good the loss of the day they will have to absorb more of the fertilising elements than is good for them, the water containing them being their sole source of supply, and the result will be an unhealthy appearance, and possibly death. Thus the giving of liquid manure should only be done when the soil is damp, or, in very dry weather, after the soil has been thoroughly soaked in the way recommended above. It should be borne in mind that pot plants cannot stand liquid manure so strong as those in the open ground, as all the roots are brought into contact with the manure in the former case, while in the open ground only a part of the roots ordinarily come into contact with the liquid manure, besides which it becomes more diluted with the water in the soil, assuming it is not given when the soil is very dry. Plants are often killed by the last half-pint in the can when the liquid has not been kept well stirred.

ALGER PETTS.

A RARE HORSE CHESTNUT.

A search through various nurserymen's catalogues fails to find any mention of the Indian horse chestnut (Æsculus indica), whose great merit is that it flowers after all the others are past. It is apparently quite a tree in stature, the somewhat upright habited branches being clothed with leaves a good deal after the manner of those of the common horse chestnut, but with the leaflets more wide-spreading, while the stalks and midribs are red. The flowers, and the manner in which they are borne, also bear a good deal of resemblance to the common kind, the main point of difference being that the panicle is a good deal narrower, being in fact almost a spike. From its late-flowering qualities this horse chestnut is well worthy of cultivation, but, as above-mentioned, it is almost, if not quite, impossible to obtain it from the nurseries. A native of the Western Himalayas, Æsculus indica is said to have been first introduced in 1828, but afterwards lost till reintroduced in 1844. No mention of the horse chestnut family at this season is complete without a word in favour of the July flowering Æsculus parviflora, far better known in many gardens as Pavia macrostachya. This, which is but a shrub in growth, pushes up suckers so freely as to soon form a mass or clump. The leaves are unusually wrinkled, and of a particularly deep-green tint, while the long spikes of slender white flowers present quite a bottle brush-like appearance, owing to their long prominent stamens.

◆

VEGETABLES FOR HOME AND EXHIBITION.

By Edwin Beckett, V.M.H., F.R.H.S. (Simpkin, Marshall, Hamilton, Kent, and Co., London.) Price 5s.

One of the most important of the many changes that during the past quarter of a century have been made in connection with the gardening art, is unquestionably that by which an immense improvement has been effected in the cultivation of vegetables, and in the manner of presenting them to public notice. During the period coincident with the development of glass culture, the production of vegetables was regarded as a quite secondary matter in the education of the young gardener, and consequently skill displayed in the management of the kitchen garden failed to secure other than a small measure of appreciation; and when vegetables were contributed to the various exhibitions, they were usually presented in such manner as to contribute but little to the attractions of the gatherings. Happily, during the past twenty-five years there has been a steady and continuous change in the views held with regard to the position of vegetables in the economy of the garden. It is now fully recognised that a thorough acquaintance with the various kinds, and their cultural requirements, is essential to success in garden management, and that the production of abundant supplies of high quality is not less important than is the provision of plentiful supplies of fruits and flowers. As the result of this recognition, gardens have been made more productive, and tables better supplied with vegetables than was formerly the case. With a higher appreciation of vegetables as evidence of skilful garden practice, there came a desire to present them at the public exhibitions in a more attractive manner than had for so long a period been considered all sufficient, even by the leading exhibitors, and on all sides strenuous efforts have been made to so stage vegetables as to ensure their contributing their full share to the attractions of the display of which they form so important a part. These efforts have not only been strenuous, but they have been highly successful; and no longer do we see the collections relegated to the more obscure parts of the exhibitions, but find them where they can receive prominent attention, and be fully utilised as object lessons in the art of vegetable culture.

We have been induced to thus briefly refer to the great change that has been made in the views held by practical horticulturists with regard to the growth of vegetables for the purpose of enabling us to say that Mr. E. Beckett, whose new book on vegetables we have now before us, has, by example and precept, contributed in no small degree in bringing it about. For the greater part of the period of time to which reference has been made, Mr. Beckett has taken a leading part in the vegetable competitions at the chief exhibitions, and he has shown again and again that the finest quality is not only consistent with high cultivation, but that it is coincident therewith; and that it is possible to exercise taste in the disposition of the several kinds upon the exhibition table. He has thereby greatly assisted in dispelling the illusion so tenaciously held both in and out of the garden, that exhibition specimens were more or less unprofitable, and in the matter of quality decidedly unsatisfactory. We can remember the time, and that not so far distant, when the opinion was held by some who occupied prominent positions in the world of horticulture, that potatoes with shapely tubers were inferior in table quality to those having tubers characterised by a certain amount of roughness. These views are now changed, and Mr. Beckett has full justification for indulging in a feeling of satisfaction that he has been able to assist in bringing about the change.

By a large proportion of our readers it will be remembered that some nine years ago Mr. Beckett published a book on vegetables, which was at once acknowledged to be one of the best works on the cultivation of the occupants of the kitchen garden. The edition was large, but, owing to the popularity to which it very quickly attained, it rapidly passed through the publisher's hands, with the result that it has been out of print for some time. Instead of following the usual practice of making sundry additions and corrections for the purpose of bringing the book up to date, Mr. Beckett appears to have waited until he could write a more comprehensive and more freely illustrated volume than that which preceded it and brought so much credit to him. As the former work was a record of his own practice as carried out at Aldenham, the present volume rests, so to speak, upon the same foundation, and, for soundness of teaching, will not be less valuable. In other respects it is distinctly superior, all the subjects that have a place in its pages being dealt with in greater detail; and, in addition to the illustrations of the finest types of the several kinds, there are numerous illustrations of such operations as trenching, and making celery trenches, as carried out by Mr. Beckett in the gardens under his charge; and also of gold medal and other collections of vegetables contributed to the leading exhibitions, which are especially deserving the attention of those who are desirous of learning how to stage vegetable collections in the most tasteful manner.

In addition to the chapters on vegetables, there is one on herbs that forms an interesting and useful feature of the book; and there are freely illustrated chapters in which fungoid diseases and insect pests are so fully treated as to place the reader who has mastered the instructions given, in the best possible position to prevent attacks, and to effectually eradicate any of the pests that may have become established.

It is not necessary to speak of "Vegetables for Home and Exhibition" in further detail, but it is essential we should state, in no uncertain manner, that the work is so comprehensive in character, so admirable in the treatment of details, and so thoroughly sound in its teaching, that we heartily congratulate those in need of guidance in the practice of vegetable culture on having such a valuable mine of information placed at their disposal. We no less heartily congratulate Mr. Beckett on the success he has achieved in producing a work that will long occupy a foremost place as a text book on the cultivation of vegetables.

THE UNHEATED GREENHOUSE.

By K. L. Davidson ("Country Life," 20, Tavistock Street, Covent Garden, W.C.) Price, 8s. 6d.

While we are not able to agree with the author that it is an open question whether a tenth part of the pleasure can be obtained from a heated greenhouse all the year round that may be found in the successful management of one that is wholly unheated, we are in full agreement with him that unheated plant houses may be made a source of continual enjoyment. As the author speaks of the heated house being dangerous to health, it may be that he has not sufficiently differentiated between the structure devoted to the cultivation of tropical plants, and commonly known as the plant stove, and the greenhouse as generally understood in gardens. The latter structure is usually, if not invariably, devoted to plants from temperate regions, and requiring but little, if any artificial heat beyond that which is necessary for keeping them safe from frost, and drying up any redundant moisture in the atmosphere during the autumn and winter months. In such structure as this the temperature should not at any time be at a point at which it could be regarded as dangerous to plant-lovers having a weakly constitution, for it would be most hurtful to the plants that properly belong to the greenhouse.

"It is well from the starting point," writes the author, "to have a clear understanding of what is meant by a cold greenhouse. It is one in which it is neither convenient nor desirable to have a fixed heating apparatus, and in which it is only intended to prevent the temperature from falling below 35 degrees, or in other words, to keep out the frost." Proceeding, he states: "The term 'fixed' is used advisedly, for, though there may be cases of glass corridors, or of a large glass garden in which an ordinary fixed flow and return pipe might answer better than a removable apparatus, it must be borne in mind that the main principle of the unheated greenhouse—except during the two dead and dark weeks which precede and follow the shortest day, or on the occasion of a sudden fall of temperature, or of damping fog—is to keep it cool enough for the plants of temperate regions which alone are suitable to be grown in it. It goes without saying that the mere shelter of glass will not keep out severe frost. Therefore, some means of raising the temperature under certain conditions of weather to be considered later are not forbidden in the cold greenhouse."

In reading thus far we confess to a keen sense of disappointment because, in looking at the title of the book, we naturally supposed that the book had been written for the purpose of advising the amateur, and the professional gardener also, on the management of glass structures devoted to plants that can be successfully grown without the aid of artificial heat. Instead, we find the author dealing with the greenhouse as that structure is understood in every garden in the United Kingdom, and suggesting that a method of heating other than by the conventional boiler should be adopted. We are told that "such unheated glass-houses are not in favour," and we confess they are not, because those who understand anything of plant-growing know also that structures provided with temporary contrivances for heating give rise to considerable trouble, and not a little anxiety. If, however, the author intends to imply that greenhouses in which no more artificial heat is used than is necessary for keeping out frost are not in favour, we can only say that his experience differs from ours. The greenhouse of this character is just as popular as it was at any period in the history of gardening in this country, and if "the grand specimens of hard-wooded plants which were the pride and glory of a past generation" have disappeared, it is because gardeners carry out the wishes of their employers and grow such subjects as are more suitable for the decoration of indoor apartments and the supply of cut flowers than were the heaths, pimelias, eriostemons, and similar subjects on which past generations lavished their skill. It is quite true "the professional gardener, as a rule, pins his faith to boilers and pipes," and he does so because he is acquainted with the advantages resulting from their use. But he certainly does not "look askance at the plants which will thrive in a temperature lower than from 60 to 80 degrees." It is not quite clear to what plants reference is made, because a little farther on the author states that his "plea is not for unheated greenhouses, as against hot houses," because, he observes, "we cannot do without the lovely flowers of the tropics—the allamandas and dipladenias, the palms and the orchids—which are such a delight to all flower-lovers."

It is matter for considerable regret the author should have selected the title he has done for his work, and then endeavoured to show that a greenhouse in which the necessary artificial heat is supplied by a temporary apparatus is unheated. This we regard as unfortunate, because the furnishing and management of the greenhouse, as ordinarily understood, is discussed with a freshness that is none too common in garden literature, and the book contains an immense amount of information that is clearly and pleasantly stated. The author suggests a large number of extremely beautiful plants for the greenhouse that are not usually seen in that structure, and gives particulars of their cultural requirements that, if carefully acted upon, will enable the cultivator to achieve a high degree of success. As a guide to the "cool" greenhouse, the book is of great excellence, and can be strongly recommended to those who are in need of information relating to such structure.

BEGONIAS AT KEW.

During a walk round Kew one cannot fail to be struck with the important part that the begonia plays in the embellishment of our gardens, as the uses for which the different kinds may be advantageously employed are now multifarious.

Several of the original tuberous-rooted species are brought together in the T range, and it is very interesting to compare them with the garden forms of to-day, all of which have originated from about half a dozen distinct species, natives of the Andean region of South America.

Of these there are now flowering at Kew Begonia boliviensis, with narrow, light scarlet petals; Begonia Pearcei, for which we are indebted to the various shades of yellow and orange; and the vermilion-coloured Begonia Davisi, whose introduction in 1876 led to the formation of a smarter class of tuberous-rooted hybrids than had existed up to that time. Full of interest, too, is the white-flowered B. Dregei, whose thickened rootstock can, however, scarcely be called a tuber. This species is a native of South Africa, and in conjunction with the distinct B. socotrana, it yielded B. Gloire de Lorraine, unquestionably the most popular begonia of to-day.

Another South African kind, but with true tubers, is B. Sutherlandi, one of the most graceful of begonias, whose small coppery orange-coloured flowers are borne in great profusion. A quarter of a century ago a very popular species was B. Frœbeli, from Ecuador, but as far as I know it did not prove of any value to the hybridist, and is now seldom met with. At Kew, however, it furnishes a pleasing reminiscence of bygone days. The Mexican B. gracilis, known often as B. Martiana or B. Martiana gracilis, with upright branching stems, and bright rose-coloured blossoms is an exceedingly pretty tuberous-rooted begonia, but one that, as far as I know, will not intercross with the South American kinds. The last of these tuberous-rooted species to mention is B. Baumanni, from Bolivia, whose flowers are of a rosy-red colour.

From the three species B. boliviensis, B. Davisi, and B. Pearcei, to the numerous hybrids with both single and double flowers, in whose production they have played such an important part, is the next step. As bedding plants they are invaluable, and equally so for the embellishment of the greenhouse or conservatory at this season. The looser growing forms are seen, too, at their very best when grown in suspended baskets, as in most of them the flowers have a drooping tendency. When one compares the sturdy-growing, large-flowered forms of the present-day with the three species just mentioned, the great extent to which our gardens are indebted to the hybridist is then very evident.

There is also quite a long list of species whose roots are of a fibrous nature, and many of these, with their hybrids are very beautiful. Unsurpassed in many ways is B. semperflorens, of which there is now a long list of forms. The tall-growing B. semperflorens gigantea is of great value for flowering in early spring. Next come the varieties which are of a dwarf habit of growth, and whose leaves acquire a bright red tint under the influence of the summer's sun. These are now largely used for bedding purposes. Lastly, must be mentioned the varieties with double flowers, which, when first sent out by M. Lemoine, of Nancy, a dozen years or more ago, were thought to have a great future before them. These expectations have, however, scarcely been realised, though a group or two in No. 4 greenhouse at Kew shows them in a very favourable light.

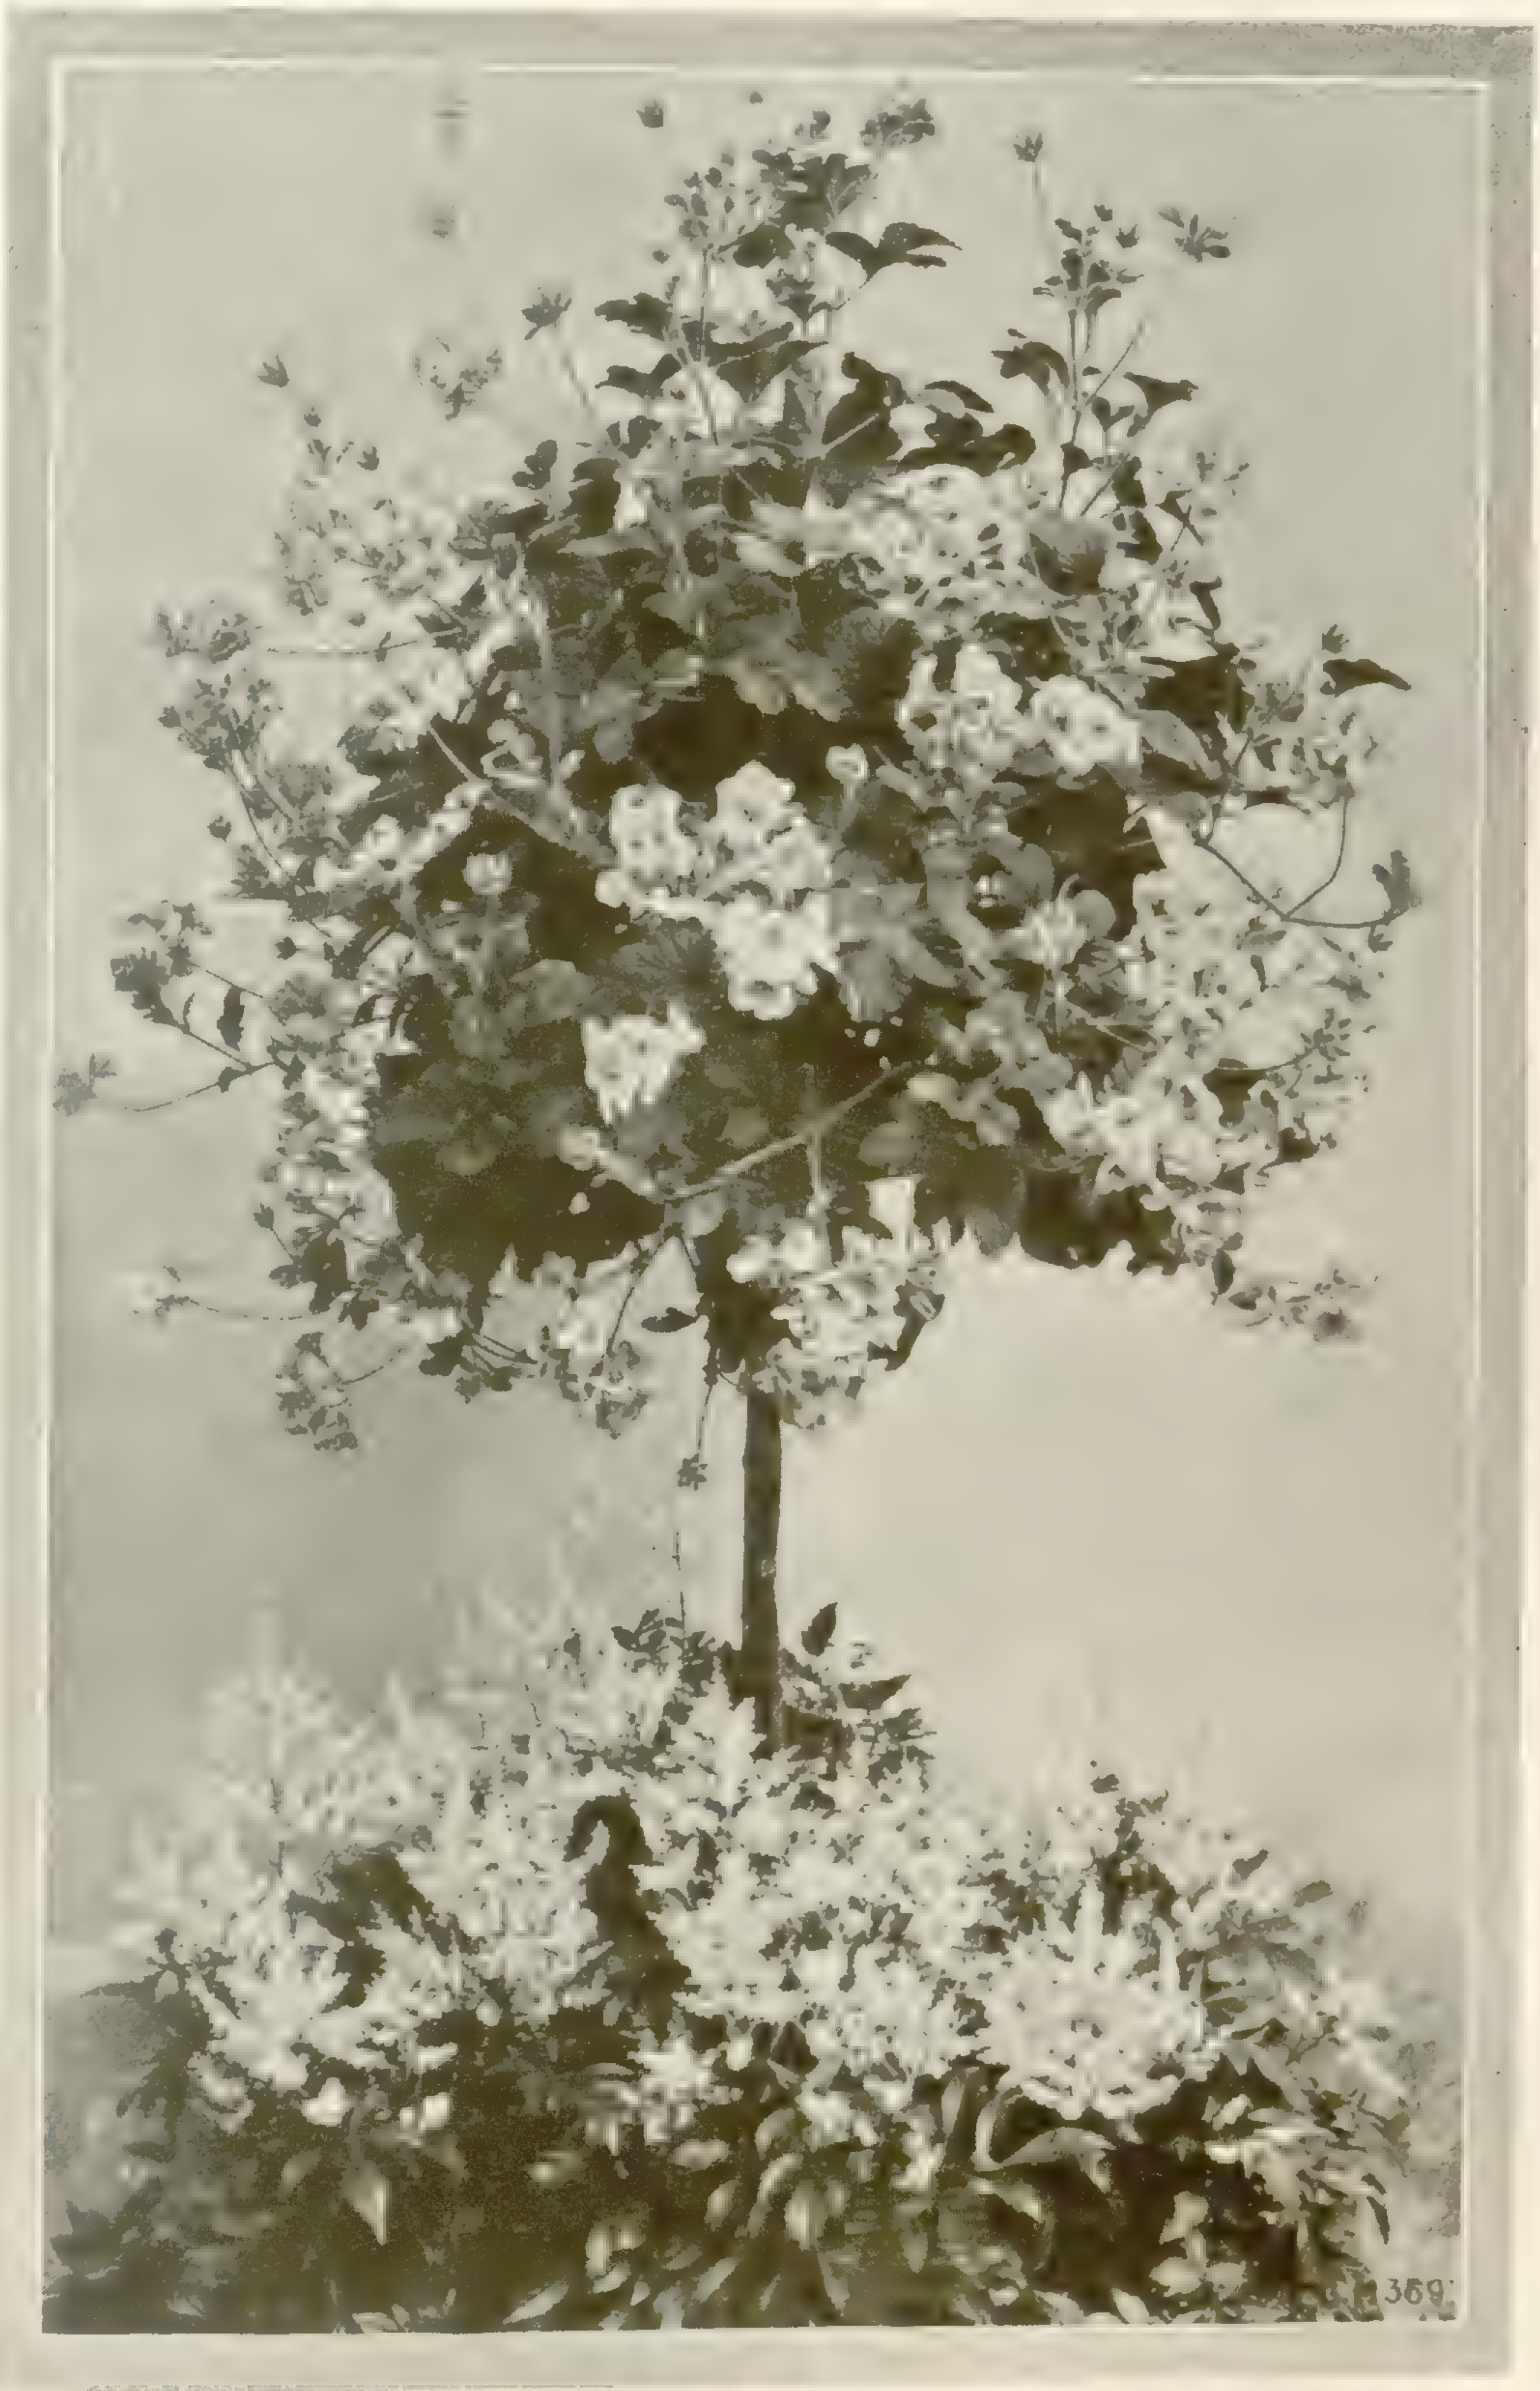
Another fibrous-rooted variety, B. Knowsleyana, with a profusion of small white blossoms, is in the greenhouse employed as a carpet for some upright-growing fuchsias, and the effect is certainly very pleasing. Begonia glaucophylla or undulata, whose flowers are of a reddish-salmon colour, is one of the best of all plants for large hanging baskets in a warm conservatory, while it is equally at home when clothing a wall. Begonia coccinea, too, whose shoots are pushed up after the manner of a bamboo, is seen to great advantage when planted in a prepared bed in the greenhouse, and trained to a pillar or to furnish a screen at the end of the structure.

This by no means exhausts the list of fibrous-rooted kinds in bloom, for there are several in a warmer structure than the conservatory. In conclusion, a few words must be spared to direct attention to the high position occupied by begonias as foliage plants alone. The most marked in this respect are the different varieties obtained by the intercrossing of B. decora, B. Rex, and B. Bowringiana, though some of the other kinds are scarcely less beautiful.

K.

STANDARD SPECIMENS OF PELARGONIUM CLORINDA.

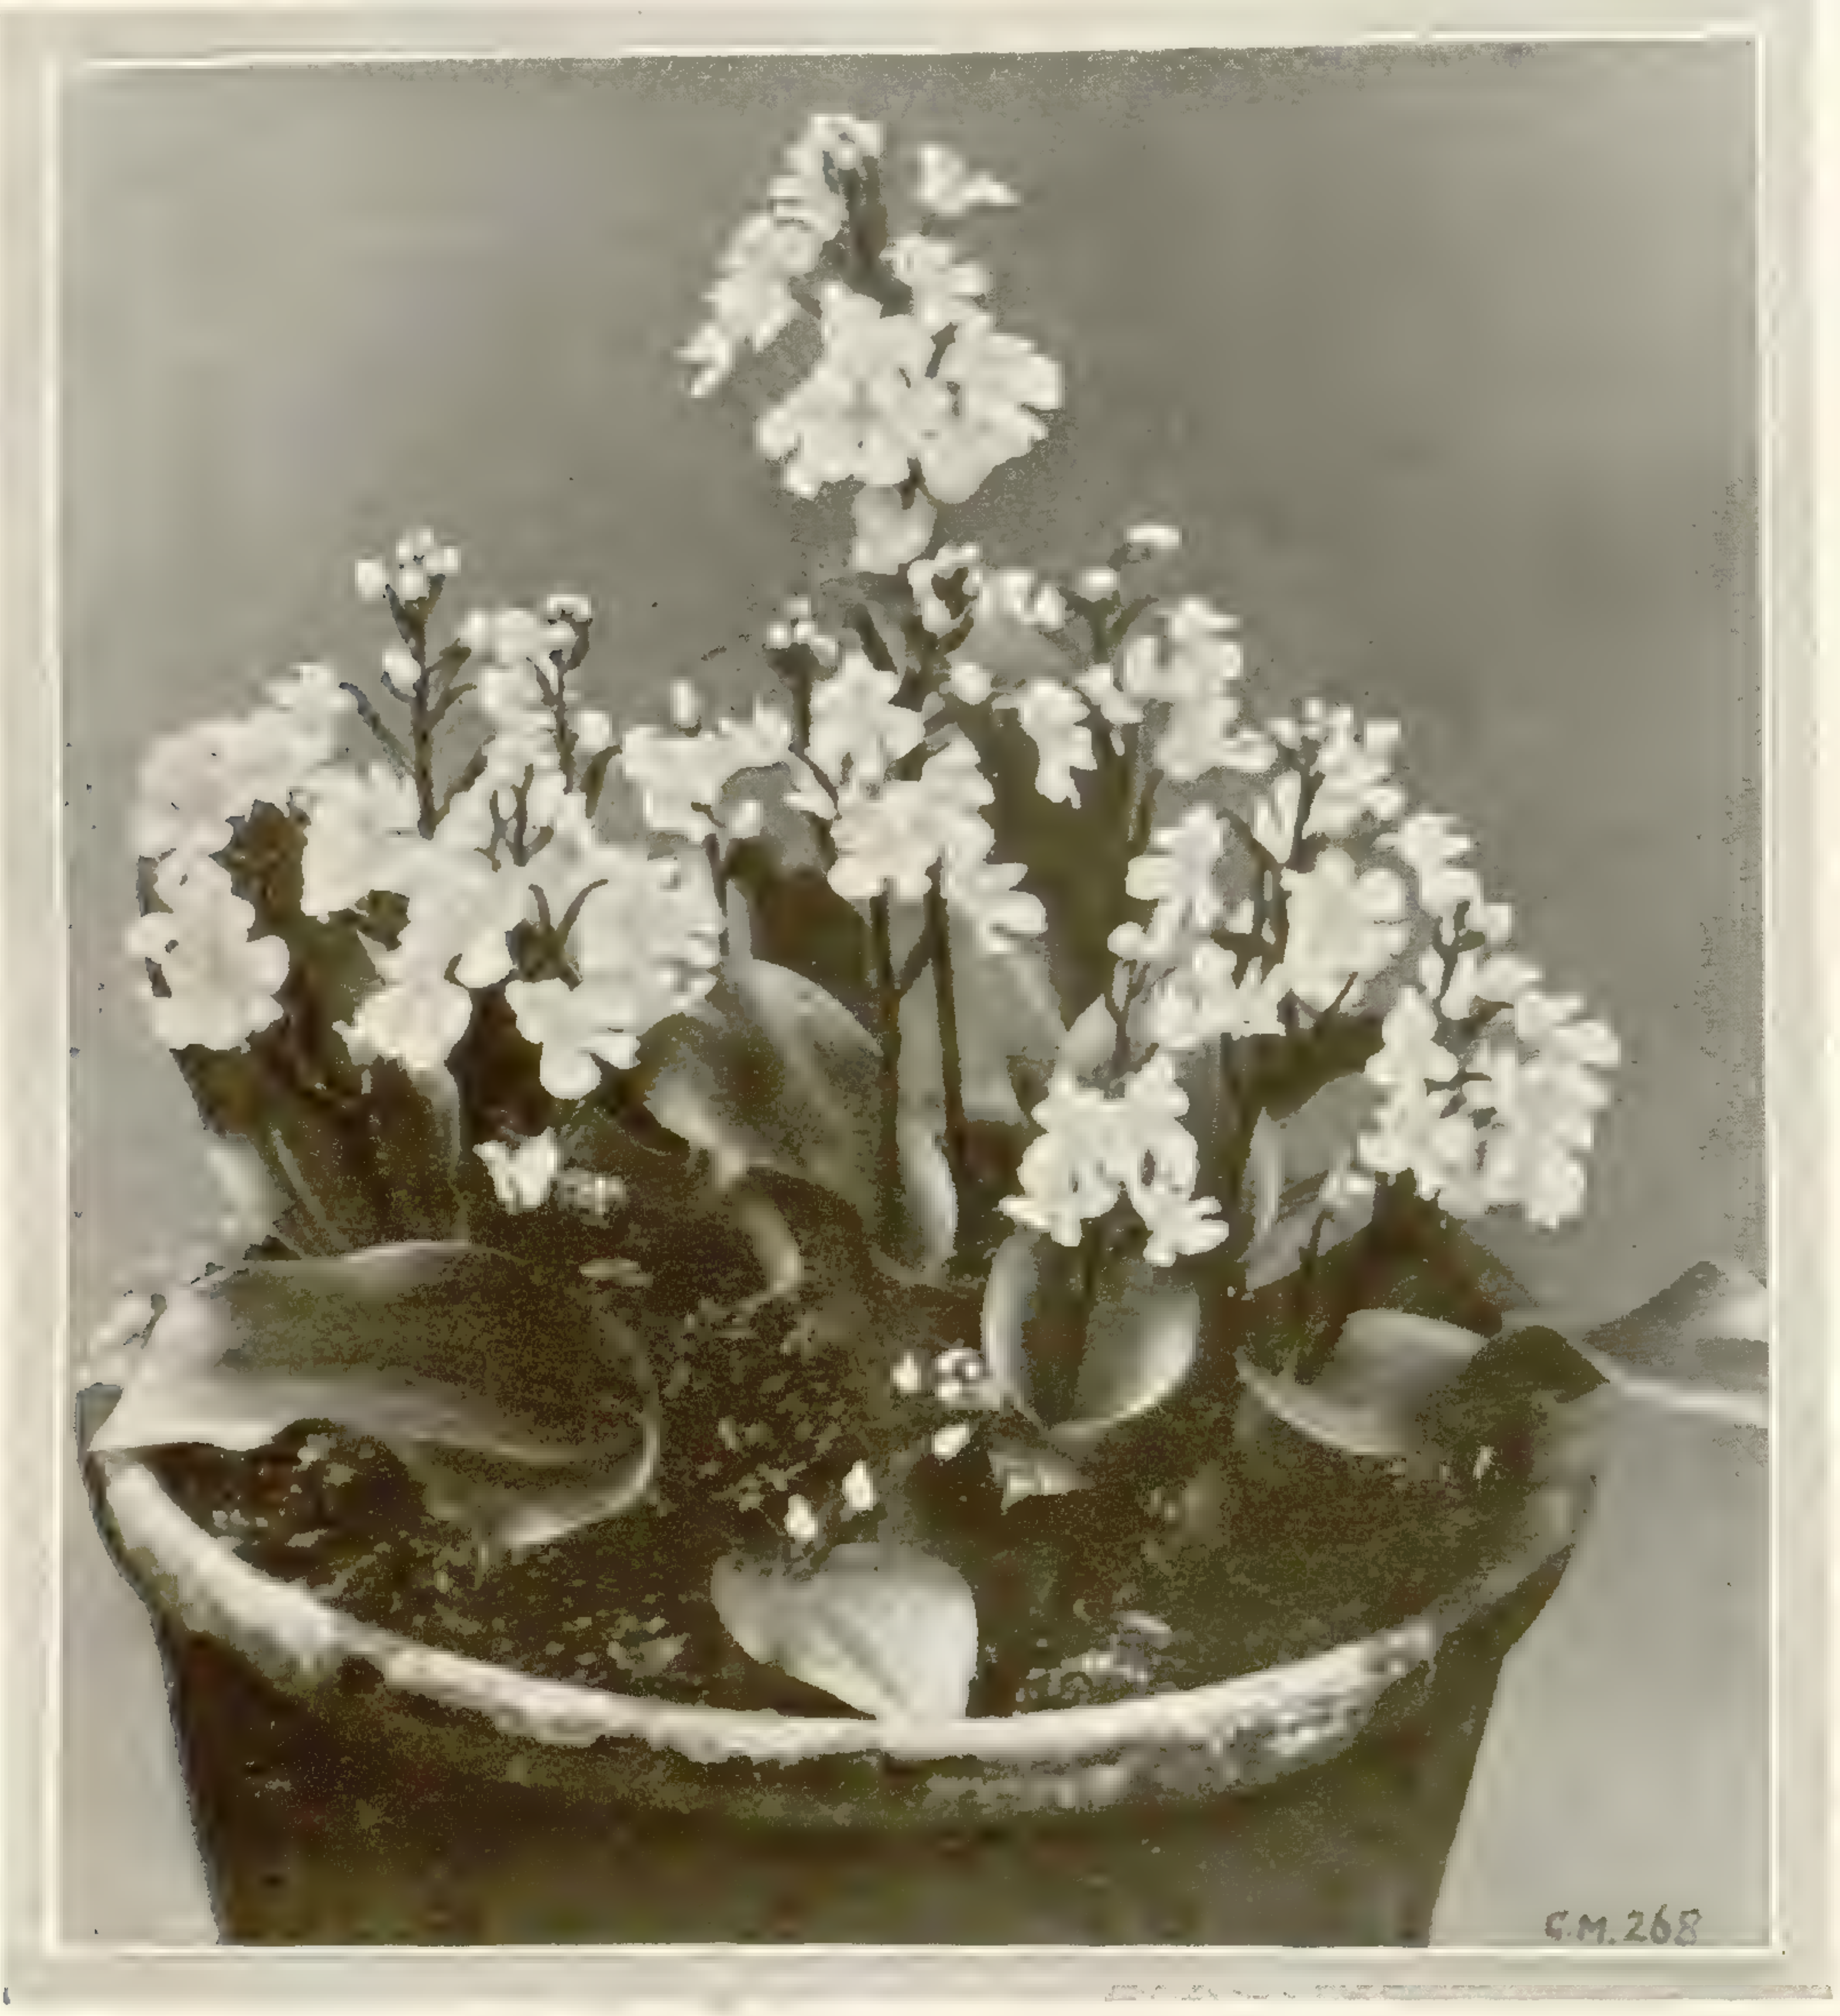
Among the very numerous varieties of pelargoniums introduced during recent years, I know of none superior to Clorinda for decorative purposes. This variety was brought before the public by Messrs. H. Cannell and Sons. I cannot speak from personal knowledge of its parentage, but the Swanley firm describe it as the result of a cross between a Cape pelargonium and Pelargonium quercifolium. It is a robust grower, extremely floriferous, blooming profusely throughout the whole of the winter and spring. The colour is a beautiful deep pink or rose, and the flowers last for a considerable time before fading; these latter and the foliage are alike pleasantly scented.



STANDARD SPECIMEN OF PELARGONIUM CLORINDA
As grown by Mr. E. Beckett, V.M.H. Flowers, bright rose.

When I first saw this pelargonium I was so impressed with it that I took the earliest opportunity of procuring a few plants, and, owing to its robust constitution I felt convinced that it would be most desirable for growing in standard form, and in due course I gave practical expression to my convictions. As the result, we exhibited a large group of standard specimens at the Temple Show in May last. The specimens shown have brought me many congratulatory letters from various parts of the United Kingdom and several from the Continent, and numerous inquiries as to our method of procedure.

The specimens exhibited, one of which is illustrated herewith, were raised from cuttings two years ago, and grown on in the ordinary way, running them up until the desired height was reached. The points of the leading growths were then pinched out and the heads formed. These were placed in the open during last summer, pinching the growths occasionally to procure as many shoots as possible, and arranged in cool houses during the winter months. Early in the new year they were shifted into 8in. pots, and placed in a late vinery, a small wire being fixed round the head to train the shoots into position. After the vines had started freely into growth, the plants were removed to a light span-roofed house, and liberally fed with diluted farm yard liquid, and, except tying in the shoots and regulating the growths occasionally they required but little further attention.



A LOVELY SOUTH AFRICAN ORCHID (CYNORCHIS COMPACTA).
Flowers white with crimson spot on the lip.

Fortunately this variety with us has resisted the attacks of the green aphis, and no other insect pests troubled them. During the flowering season the plants must be freely exposed to light and air, or the colour of the flowers will be very pale. During the autumn months the foliage takes on a beautiful rose-coloured tint much resembling some of the autumnal colours in the open. I am convinced that this pelargonium is well adapted for almost any purpose under glass. For training up the rafters or on the back walls of houses in pots or planted out, for growing as small decorative plants, trained into pyramids, and for hanging baskets, it should prove of great service. For bedding purposes, I have had no experience with it, but have heard accounts of its behaviour in the flower garden. One gentleman, who is no mean authority, assured me that it was one of the finest things he had in his flower garden last year, and that he has this season planted it more extensively, while I have been told by others that it has not proved a success. Cuttings root most freely from the hard wood under glass at any season of the year, and I strongly advise all who may not be acquainted with it, and have to provide flowers throughout the winter, either as pot plants or in a cut state, to lose no time in procuring this desirable variety.
E. Beckett, V.M.H.

Aldenham House Gardens.

FRUIT PROSPECTS IN SCOTLAND.

The general fruit prospects are this year better than they have been for a considerable time, and all concerned have reason to feel satisfied at the outlook. With the exception, perhaps, of the gooseberries, the fruit crop promises to be a heavy one. The gooseberries, however, suffered from the frosts in May just when the buds were appearing, and this has resulted in the quantity of fruit on the bushes being rather meagre. What berries there are, however, are of good quality, and fairly large and equal in size. A few have already been picked hereabouts, but these have only been for cooking purposes, and as it is most profitable to ripen the fruit picking will not be general until about the middle of this month. Black currants, too, have suffered from the effects of the frosts in spring, although not to the same extent as gooseberries, due to the fact that they are a little later. This crop, however, is quite an average one, both as regards quantity and quality, the berries giving promise of turning out both large and juicy.

The best and richest crop in these Northern regions this year is that of red currants, but what a pity it is that there is so little of these delicious fruits cultivated. The weather all along seems to have been particularly well suited to them, with the result that the bushes are looking extremely well, and are bearing a crop that is exceptionally heavy. A few samples of English black and red currants are now on sale here, but the Scottish demand for this kind of English-grown fruit is not great. The home-grown is regarded as much superior to the English, and, on account of the greater amount of acid in the berries, it is always keenly sought after. Besides, the English growers pick red currants in the bunches, whereas the Scottish nurserymen and gardeners pick them clean.

Raspberries are also looking well, and there is every appearance of an exceptionally good crop of them. Like the black currant and red currant, this fruit will not be thoroughly ripe until nearly the end of July. Rain, which was so greatly required, did fall a little in the early hours of last Saturday morning, but more is wanted, as the ground is much too dry for the good of the crop, but should we have a fairly good fall this week there is every indication of the yield being a rich one.

Cherries are exceedingly promising, as also are apples. There are also most favourable reports of peas and cucumbers, and the potato crop promises exceedingly well. Altogether, the outlook of the market gardener in the North of Scotland is a very bright one, and his prospects generally are better this season than for a number of years.

Aberdeen. W. Kelly.

CYNORCHIS COMPACTA.

This dainty little South African orchid has been in flower at Kew for the past two months, and will probably last another month at least. The flowers are borne on erect, many-flowered racemes four to eight inches high, and are pure white, with a few faint crimson spots on the lip, and from half an inch to three-quarters of an inch in diameter. The leaves, which make their appearance contemporaneously with the flowers, are elliptic or elliptic-ovate, erect when young, arching over and reaching a length of six to nine inches when adult; light green in colour, and glabrous.

The plant dies down annually about the beginning of May, and should be then kept only slightly moist until the end of autumn, when growth recommences. The underground tubers, formed annually, are from one to three inches long. These, as winter approaches, should be shaken out of their old compost and repotted in a mixture of turfy-loam, leaf-mould, and sand, in equal proportions. The pans in which they are grown should be well-drained, and a number of tubers be placed together.

This species has been successfully grown for the past nine years in a cool house at Kew, and has never failed to produce an abundance of flowers each spring.

The genus to which C. compacta belongs is an exclusively African one, and is closely allied to habenaria. About thirty species are known, and several of these are at present in cultivation, the chief being C. Lowiana, C. purpurascens, and C. villosa, all of which have purple flowers, and require tropical treatment.

C. P. Raffill.

"CHRYSANTHEMUMS AND HOW TO GROW THEM FOR EXHIBITION," by J. B. Wroe. Fifth Edition, revised to January, 1908, and including the new varieties.—Full details on timing and stopping for Northern, Southern, and Midland growers, selections of the best varieties, illustrated instructions on taking the buds, cuttings, staging, etc. Prices 1s. net, by post 1s. 2d.; cloth, 1s. 6d., by post 1s. 8d., from W. H. and L. Collingridge, 148 and 149, Aldersgate Street, London.

THE YELLOW AURICULA.

It is rather curious, but it is a fact, that as soon as the "florist" sets about improving any class of plants, his "improvements" generally run counter to that of Dame Nature herself, and the auricula is no exception. There are two species of primula regarded as being the parents of the garden auricula, namely, Primula auricula and P. Palinuri. The latter was published as long ago as 1835, and is the subject of plate 3,414 of the "Botanical Magazine." It has bright yellow flowers, and white, mealy calyces. P. auricula is also figured in "Botanical Magazine," tab. 6,837. It is more widely spread in its native haunts than any other species of primula, and the flowers are also clear yellow, the segments of the corolla are notched, and the flowers very much smaller than those of the garden auricula. The evidence is all in favour of this being the species from which have been derived our beautiful garden auriculas.

We may look backwards for two hundred years, and it will be found that all who have tried to improve the auricula during that period have ruthlessly stamped out the yellow selfs. One or two were in existence early in the nineteenth century; one of them, named Stadholder, I had in cultivation for several years, but it was of poor constitution, and the flowers were far behind the quality of the best dark-coloured violet and red selfs. Very few of the auricula fanciers have cared to cultivate the yellow selfs; there is no reason for this except custom, fashion, or one generation of fanciers blindly following each other.

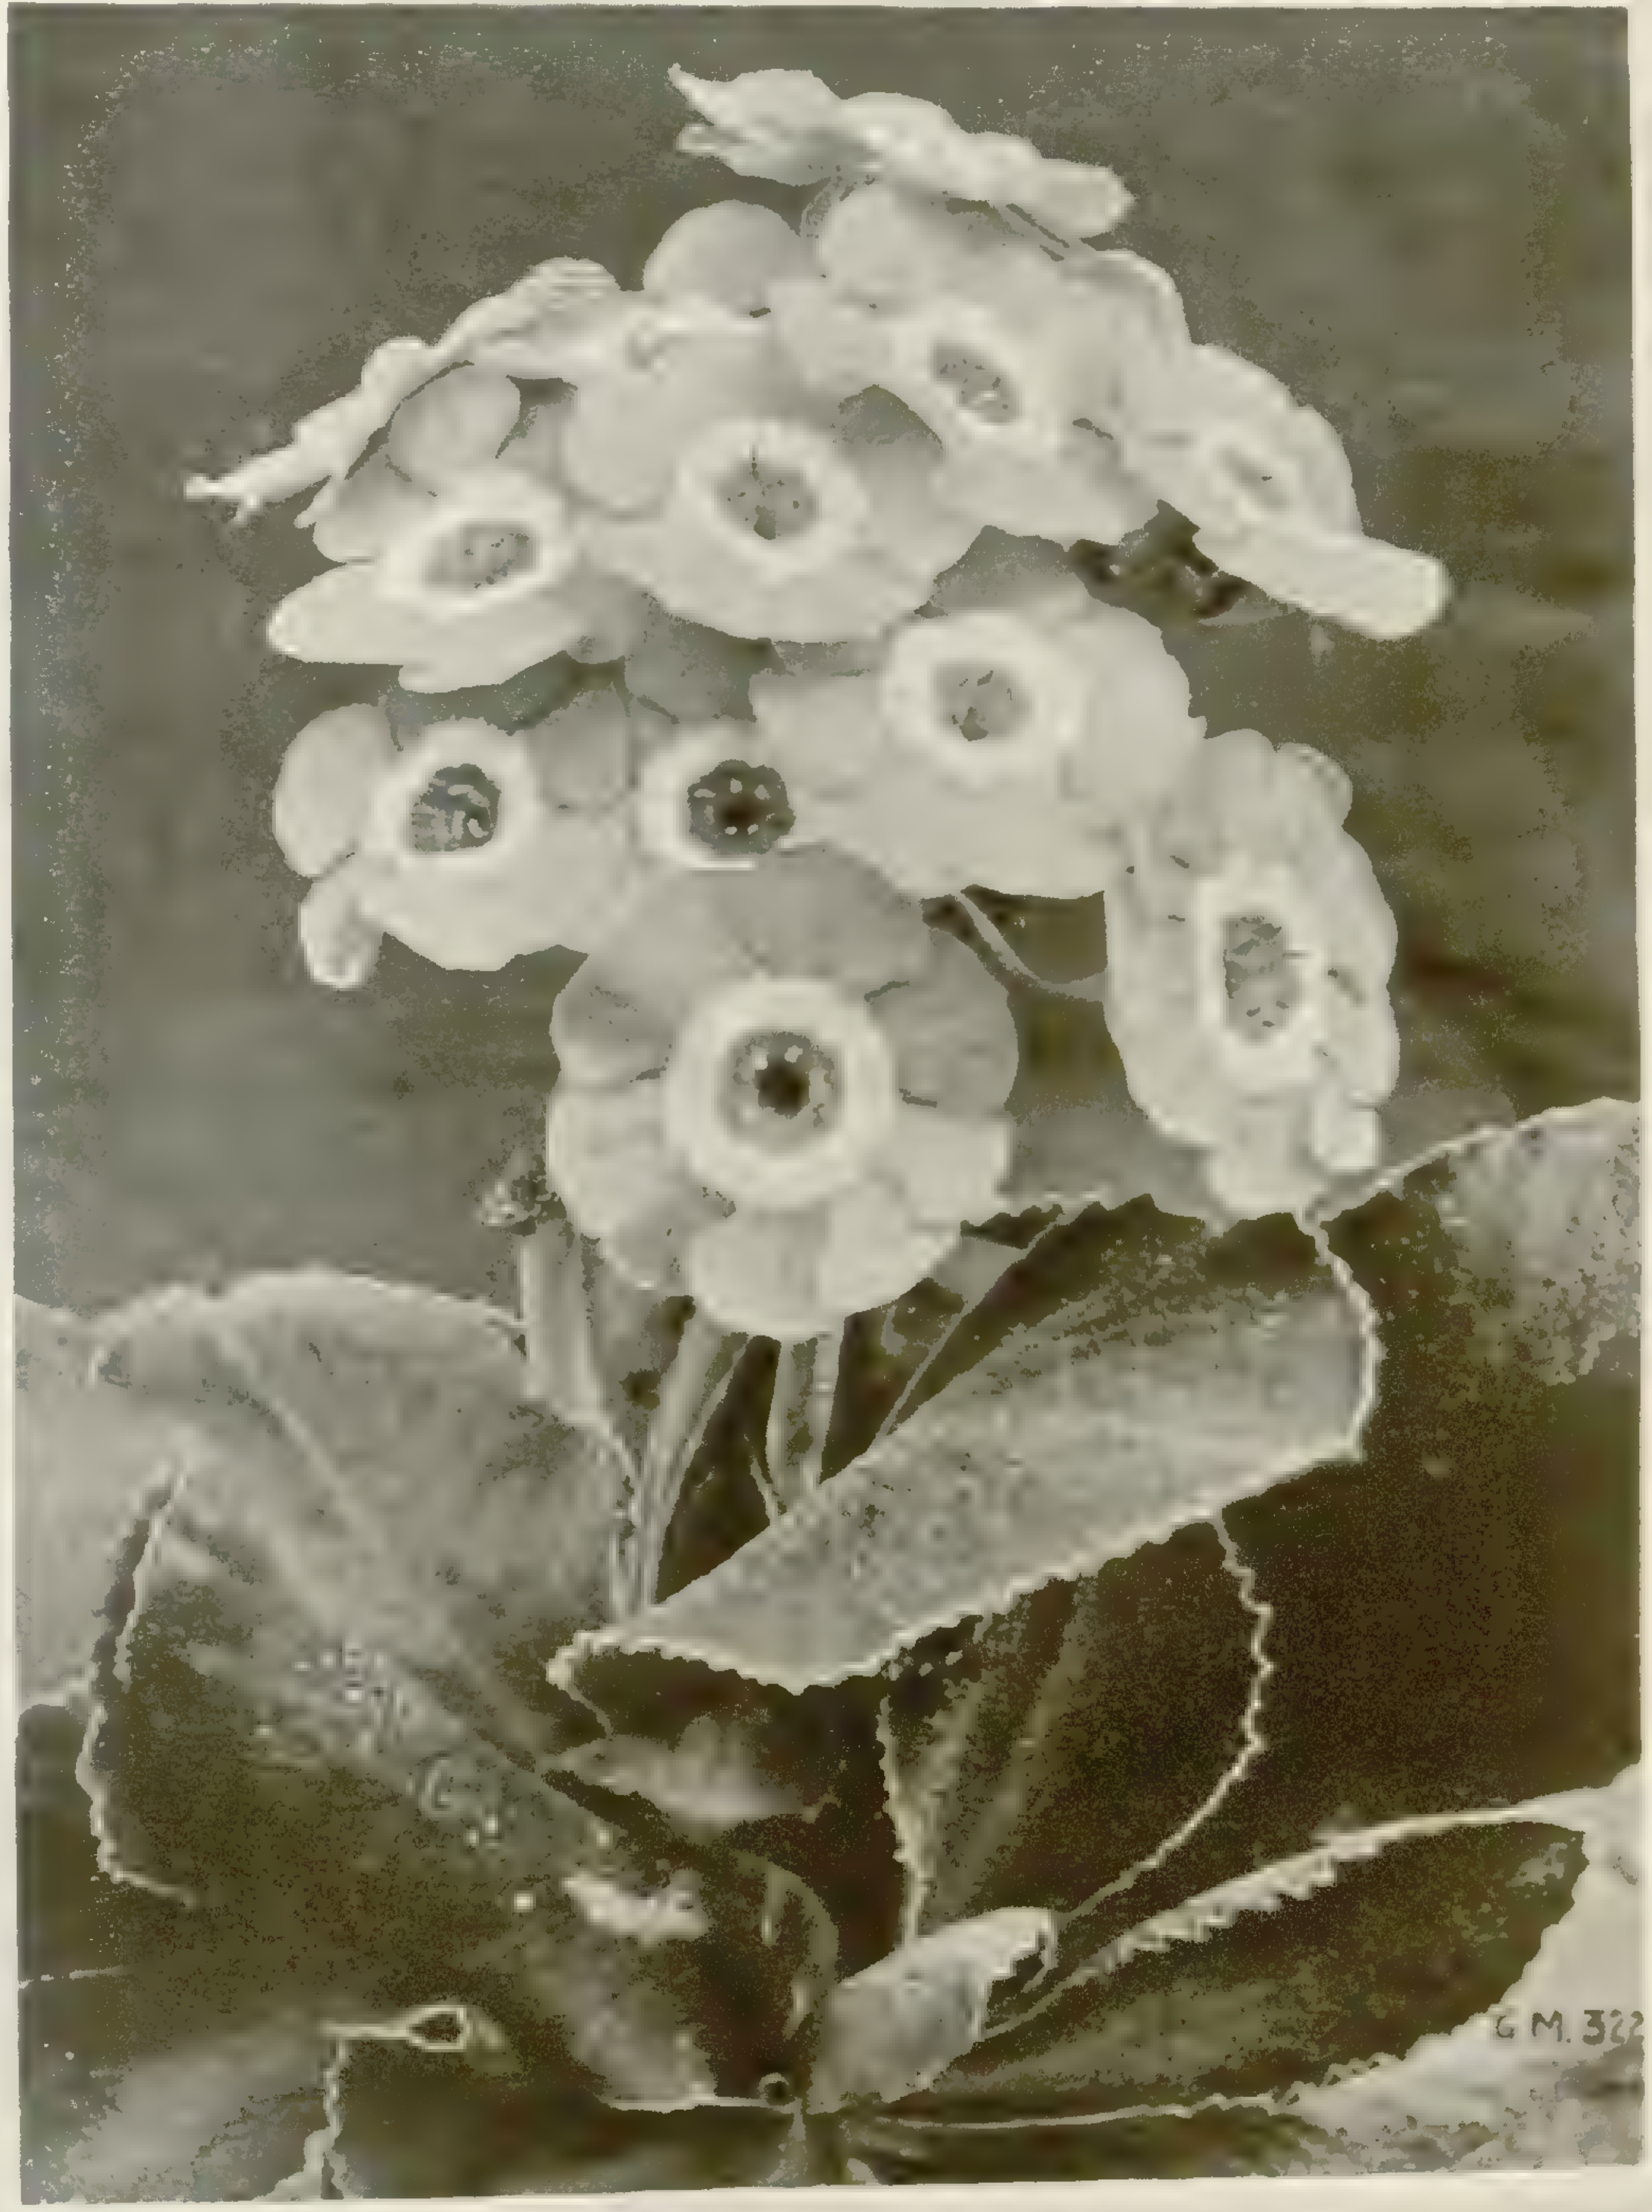
It will certainly add to the interest of our collections of these charming flowers if we can obtain yellow self-colours as large in size, and equal in form and substance to the best selfs. I have raised hundreds of yellow selfs, but for about twenty years failed to obtain any of sufficient merit to compete with the best coloured selfs. Recently we have crossed the best yellows with the best of the high colours, and in that way I obtained one named Daffodil, which was favoured with the A.M. of the R.H.S. The flowers are rich yellow and of handsome form. Later, I obtained one equal in form and quality to the very best in any class of auricula; it was in flower on May 1, and was named May Day. This obtained the A.M. of the R.H.S in May of the present year, and in the spring of last year received the A.M. of the Royal Botanic Society.

The editor of the GARDENERS' MAGAZINE has a quick eye to a good flower, and asked permission to have it photographed, and this it need hardly be said was readily given. We have now reached as high a standard of excellence in this colour as in any other, and probably greater improvements will be made in the future.

Auriculas are as easily cultivated as any other garden flower, and there is no reason why they should not be grown in every garden in the country. I heard a member of the Council of the Royal Horticultural Society remark that if he could grow one flower only it would be the auricula.

J. DOUGLAS.

Edenside, Great Bookham.



A BEAUTIFUL NEW YELLOW SELF AURICULA (MAY DAY).
Raised by Mr. J. Douglas, V.M.H.

Pelargoniums.—These will now have passed their flowering season, and should be exposed to sun and air, to ripen their wood previously to cutting down, but a little before and after this is done let the soil in the pots to dry. When the cuts are dried, and somewhat healed over, give the plants a little water, and keep them closer and warmer till they break.—T. B. FIELD.

BORDER CARNATIONS.

The cold, wet, and late spring was very trying for border carnations, and consequently the plants made little growth, and as this weather was followed by several weeks of brilliant sunshine and drought, the grass for layering purposes is not quite what one would wish for the purpose of increasing the stock by layers. A few recent showers have done much to revive the plants, but as the flowers are beginning to open there is not much promise of good blooms.

I am, of course, writing of the weather we have experienced in South Devon, where, while showers fell near us, yet we escaped the much-needed rain. In localities where the rainfall during the past month has been scanty, I fear the flowering period will be shortened, and therefore preparation should be made for layering the necessary stock for next season's requirements. It is essential that the layers be put down early to have them well rooted for early autumn planting, that they may be established in their new beds before winter sets in.

The old flower stems having been removed, some finely sifted soil, with a goodly proportion of sand added to it, should be prepared and placed in small mounds around the base of the plants, and pressed firmly. Those shoots intended to be layered should have some of the leaves removed to enable the longitudinal cut to be made, which forms the tongue for layering. The cut should start from just below a joint, and be extended about an inch and a-half lengthways, and should be fairly through the centre of the stem. Layering pins should be at hand, and when the tongue is made, the shoot should be securely pegged down, keeping the tongue well open while pegging down is being done.

The process of layering is quite simple, yet, like many other simple things, it requires to be properly done, as it is from the basal part of the tongue that the roots are formed, and the non-rooting of layers after being put down is largely due to not leaving sufficient substance to form roots. After layering the growths the mounds of soil should be kept well watered if dry weather prevails, but when watering care should be taken that the soil is not washed away from where the layers are pegged.

Carnations should be planted in a fresh site each season, only allowing the plants to remain one year in the same bed. The preparation of the beds or borders should be started in good time, so that the rooted layers may be planted by the end of September or early in October if soil is in good condition and weather favourable; never plant when the land is wet or sticky, avoid the use of strong manure if the ground is in good condition, and if the soil is heavy work in some lime previous to planting. Deep planting in heavy land should be avoided, or the losses during winter may be severe.

Border carnations are generally considered to be hardy enough to pass through our ordinary winters with safety. This, however, largely depends on the kind of soil in which the plants art grown. In a moderately light, well-drained soil the plants will pass through the winter satisfactorily, but in heavy, moisture-holding land, dependence can only be made on some of the hardiest varieties. Of course, if the layers are potted up and wintered in a frame most varieties may be grown. We can only grow about eight varieties to pass through the winter in the open, and these include Ruby, Mary Morris, Ketton Rose, Mrs. Eric Hambro, Robin Measures, and Mrs. Reynolds Hole. Yellows, fancies, and other newer kinds have to be wintered in a frame, and we have found from bitter experience the necessity of this protection.

It is for this reason we rely largely on the tree varieties, as these give far better returns, and a more extended season of flowering. Properly handled, there is a great future in store for the tree carnations for outside culture.

In making a selection of border varieties to be grown entirely in the open, the nature of the soil wherein the plants are to be grown must be considered The fact of good blooms being staged on the show boards is no criterion that the variety will produce as fine blooms in any kind of land. It is therefore wise when selecting any varieties to enquire under what conditions and in what soil the blooms were produced.

Poltimore Gardens. T. H. SLADE.

"CARNATIONS, PICOTEES, AND PINKS," will tell you plainly how to propagate and grow these favourite flowers to perfection. The work is freely illustrated with plates of leading varieties, and explanatory diagrams as to layering taking cuttings, fertilising blooms, etc. Price 2s. 6d. net, by post, in box, 2s. 10d., from W. H. and L. Collingridge, 148 and 149, Aldersgate Street, London.

A SUGGESTION FOR THE WILD GARDEN. [Photo: W. J. Mitchinson.

Water lilies, as grown at Mullaboden, Ballymore Eustace, Ireland.

THE WILD GARDEN—IV.

Water in any form greatly increases the attractions of the wild garden, whether it be a lake, a little pool, a stream, or merely a tiny runlet trickling from the higher to the lower levels of the grounds. Water demands, for floating on its surface, spreading over its moist margin and standing in its shallows, a type of vegetation entirely distinct from that which flourishes on dry ground.

Of this class of plants there is, fortunately, no lack, but there is need for the exercise of great discretion in the selection of the subjects, for there is no greater mistake than overburdening a sheet of water and its environment with a too varied assortment of species and varieties. This admonition has already been emphasised in regard to the wild garden as a whole, but it applies with especial force to ponds, particularly if they are of small extent. If we study Nature, as we should ever do in the wild garden, we shall find that in the ordering of her water schemes, especially if they are small, she is content to severely limit her materials. Little ponds and basins are often seen, which are so filled with water lilies that the surface of the sheet is entirely hidden. This is altogether wrong, for the chief beauty of water is that it should be a clear mirror in which the drifting clouds and neighbouring trees may be reflected.

Water lilies are among the loveliest of our hardy plants, but, like other good things, they may be easily overdone. In large lakes all the known varieties may fittingly find a place, but small ponds are better with but one or two of the finest. Crowding is equally objectionable in the surroundings of a sheet of water as on the surface itself. A lake with bare banks, on which not a single tree, shrub, or plant is growing, loses much of its possible charm, but one entirely shut in by tall vegetation is still more disappointing, since the water is hidden from sight. The spot from which the fullest extent of the lake can most easily be viewed should always remain unplanted, and open spaces should here and there be provided with well-grouped water-loving plants disposed naturally about them. For floating on the surface of the water no plants surpass the water lilies, of which there are now great numbers of beautiful varieties, the Marliacea hybrids being as lovely as any. Other plants with floating blossoms are the Cape pond weed (Aponogeton distachyon), which, in the south-west is in flower in almost every month in the year, and bears white blooms, and Villarsia nymphæoides, which produces a profusion of bright yellow blossoms.

There are numbers of plants that will beautify the water-margin with flower and foliage. Of flowering subjects some of the primulas are especially valuable, the stately Primula japonica, often over three feet in height, delights in moisture, and will flourish with its roots continually submerged. The type is deep-rose in hue, and there is a white variety. P. rosea also appreciates damp, and is seen at its best when growing in porous soil by the waterside, where a group in full flower provides a charming picture in the spring of the year. P. sikkimensis is another water lover, and is very pretty when seen in quantity, holding its pale yellow, drooping, fragrant flowers on tall stems by the side of a stream or lake. The herbaceous spiræas are among the best of flowering plants for grouping around the margin of a lake. Spiræa gigantea, or camtschatica, is the most superb of the race, often attaining a height of seven feet, and is very handsome when bearing its great heads of foamy plumes, often nearly two feet in length. S. palmata is a beautiful plant bearing large feathery panicles of bright rose-crimson flowers, whose rich tint has a striking effect by the waterside. S. venusta is another pretty spiræa with flesh-pink flowers, and S Aruncus with its variety Kneiffi may also be employed.

Of irises there is the Japanese I. lævigata, or Kæmpferi, with glorious flowers, sometimes nearly a foot across. I. sibirica grows well in shallow water. Of this there are several named varieties, the white Snow Queen being the best. I. Pseudacorus, the yellow waterflag of our damp meadows, has a very handsome variegated form that is especially attractive in the early summer, but in the autumn loses its variegation. I. orientalis, I. aurea, and I. Monnieri will also grow in fairly damp ground. Lobelia cardinalis is a native of North America, where it grows in moist woods. When grouped in large masses by the waterside, as it should be, it forms with its brilliant vermilion blossoms a splendid sight in the late summer. The yellow Loose-strife (Lysimachia) and the big purple Loose-strife (Lythrum) are good waterside plants, the variety superbum of the latter being a great improvement.

The common monkey flower, mimulus, delights in moisture, and, when planted on the bank of a stream, will generally invade its bed and spread over the water. It has become naturalised in many parts of England. The globe flowers, trollius, grow by the stream sides in their native lands. T. europæus is a native of our islands. Attractive species are T. altaicus, T. asiaticus, and T. caucasicus. The lately introduced Orange Globe is the finest of the family, having very large blossoms of a deep orange hue. The Willow herb, Epilobium, bears upright spikes of deep rose-coloured flowers and flourishes in any damp spot. A colony an acre or two in extent is a handsome sight when in full bloom. There is also a white variety. Calla æthiopica, the Arum lily, will grow well in a foot of water and flowers early in June. A Cornish lake (at Trellisick) is surrounded on two sides by these plants, and when they are in full bloom a thousand flowers might be cut without their being missed. Ranunculus Lingua, the great Spearwort, bears large yellow flowers, and will grow in a foot of water, and Menyanthes trifoliata, the Buckbean, and Pontederia cordata will also flourish in water.

Of foliage plants the Gunneras come first. G. manicata is the finest, its giant leaves being often ten feet across. It flourishes best when planted in rich soil on the margin of a lake, where a great clump standing on the brink, with its noble foliage reflected in the still water, is a glorious sight. Rodgersia podophylla is a very handsome plant, revelling in moist ground, where its deep bronze leaves parted into five deeply-divided lobes are most effective. In the summer it throws up a branching flower spike with heads of feathery, ivory-white blossoms. Saxifraga peltata, though a native of California, is quite hardy, as it is underground all the winter. In the spring it produces from its leafless crown tall flower heads, sometimes three feet in height, bearing loose clusters, six inches in diameter, of pale pink flowers. Later on the large, handsome, deeply-cut leaves are perfected, a foot across and carried on stalks eighteen inches in length.

A SUCCESSFUL EXAMPLE OF THE USE OF WATER AND MOISTURE-LOVING PLANTS
In the gardens of Lockinge Park, Wantage.

THE BEST DWARF ROSES FOR THE GARDEN.

The following are the varieties that obtained the first, second, and third places in the ballot for the Nickerson Cups, offered for the best crimson, pink, white, and yellow roses of dwarf growth:

Hugh Dickson, H.P.—Raised by Mr. Hugh Dickson, and distributed in 1904, this brilliant crimson rose obtained premier position in its class with 33 votes. The flowers are of high quality, and the growth vigorous; a fine variety for standards.

Ulrich Brunner, H.P.—A rose well known for its vigorous habit and the large size and effectiveness of its light crimson flowers, which are delightfully fragrant. It was second in the class for crimson roses with sixteen votes. One of the best roses for bush and standard culture, and specially adapted for suburban districts. Raised by M. Levet, and introduced in 1881.

Richmond, H.T.—A brilliantly-coloured, free-blooming rose, raised by Messrs. E. G. Hill and Co., and introduced in 1905. Especially useful for bedding and for the supply of flowers for decorative purposes. It was third for crimson roses with eight votes.

Caroline Testout, H.T.—One of the finest of garden roses, and placed first for pink roses with 34 votes. MM. Pernet fils-Ducher were the raisers, and introduced the variety in 1890. The bright pink flowers are of high quality, and produced freely and continuously throughout the season. Valuable for beds and standards.

Madame Abel Chatenay, H.T.—As was generally anticipated, this fine rose followed Caroline Testout closely for second place in the class for pink roses. The number of votes was 21. The raisers were MM. Pernet-Ducher, and the year of introduction was 1895.

La France, H.T.—One of the best known of the roses of dwarf growth, and bearing pink flowers, and until Caroline Testout and Madame Abel Chatenay were introduced it was the most popular of the hybrid teas in its line of colour. It was raised by M. J. B. Guillot fils, and distributed in 1867, and obtained the third place in the class for dwarf pink roses, with 14 votes. La France is so generally known that there is no occasion to refer to it otherwise than briefly, and we shall not do more than suggest that, while the other two varieties mentioned above are in some respects superior to it, La France is sufficiently distinct from them, and so highly meritorious as to still deserve a prominent place in the garden.

Frau Karl Druschki, H.P.—Raised by Mr. Lambert, and introduced in 1900, this fine rose quickly attained to a high degree of popularity, and is unquestionably the best of all the white roses for general culture. It was placed first in the class for white roses with 54 votes. It is valuable for standards and beds.

White Maman Cochet, T.—A beautiful white tea-scented variety, placed second in the class for dwarf white roses with 10 votes. It originated with Mr. Cook, an American grower, and was introduced in 1897, and is of much value.

Viscountess of Folkestone, H.T.—An excellent bedding rose, with flesh-coloured flowers raised by the late Mr. H. Bennett, and introduced in 1886.

Madame Ravary, H.T.—A charming rose, raised by MM. Pernet-Ducher, and introduced in 1899. It obtained premier position in the ballot for yellow roses with 29 votes. It is a fine garden rose, and especially suitable for standards. The flowers are orange-yellow and highly effective.

Marie van Houtte, T.—One of the finest of the teas for the garden, this variety was placed second for yellow roses with 15 votes. It was raised by M. Ducher, and introduced in 1871.

Souv. de Pierre Notting, T.—Although failing to fully realise expectations, this is a useful variety. The colour is a rich shade of yellow, and the flowers are of good form. The habit is good, and the flowers freely produced. It was raised by MM. Soupert and Notting, and introduced in 1902; and obtained third place for yellow roses with 10 votes. V.

VIEW OF THE NATIONAL SWEET PEA SOCIETY'S TRIALS,
Conducted by Mr. C. Foster at the University College Gardens, Reading.

NOTES ON STRAWBERRIES.

This has been one of the best strawberry seasons on record, notwithstanding that some injury was done in places to such early varieties as Royal Sovereign and Vicomtesse Hericart de Thury from their "crown" buds being killed by frost on April 23, when 9 deg. were registered here, with the thermometer protected by a screen.

Strawberries, like other garden produce, cannot be obtained in the best of condition unless special pains are taken in their culture; and, moreover, even then the soil must be of a suitable description. Rather heavy garden soil, placed in an open position, deeply broken up (two spits deep), and well dressed with short farmyard manure, is the kind of tillage required. The ground may be prepared as described during autumn or winter, and, after an early crop, say, of peas, has been taken from it, be dug and rather finely broken over one spit in depth before the plants are bedded out. It is not advisable to plant upon newly trenched land, as in this case the plants would not root so readily, and are liable to suffer from drought. Neither can they be so satisfactorily supplied with water, as when planted on ground that has become more consolidated.

Plants should be raised by layering runners, as soon as they can be obtained, in 3in. pots, and in purchasing runners those prepared in this way are much to be preferred to those lifted from the ground. This reference to purchasing rooted runners reminds me of some remarks made with respect to the deterioration of Royal Sovereign. In our case this variety has of late years become more or less badly affected with spots on its leaves, caused by a fungus. The growth becomes weaker year by year, and fewer runners were produced, which, owing to our requirements, especially for forcing purposes, was to us a serious matter. We, however, last season on several occasions sprayed both the old and young plants with a solution of sulphide of copper, and this year, so far, the beds are almost free from the disease, but whether this is the result of the spraying or owing to the dry state of the weather, I am not prepared to say.

Until now our stock of Royal Sovereign has, year after year, been raised from our original stock, purchased when the variety was first distributed. Last summer we secured a fresh stock of plants from a distant nursery, and planted them under similar conditions as were those raised here. They have this year grown stronger, cropped better, and produced many more runners than have our own plants. I recollect some years ago being asked for some runners of Vicomtesse H. de Thury by a gardener friend in Sussex, who said his stock of that variety had "run out." He wrote the following year to say the plants we sent him had succeeded as well as possible, and he was discarding his old stock. These facts suggest that in the case of strawberries, as is known in some other subjects, a change of stock is at times desirable.

The finest fruits of strawberries from all points of view are invariably obtained the first year after the beds are formed, though the second year's crop is the heaviest, and the fruits under good management are also of splendid quality, especially if the trouble is taken to thin it. In the private garden it pays to thin dessert strawberries as well as to support them with stakes, though these operations take up much time. In wet seasons particularly, staking greatly saves damage from slugs. Watering occasionally with diluted liquid manures during dry weather, from the time they commence to grow until their fruit begins to colour contributes considerably to success. But to ensure the best results it must be thoroughly done. In wet seasons suitable soluble compound manures answer a similar purpose, and in any case mulching with straw or something of its kind, avoiding short grass, is necessary.

Varieties of strawberries, like those of apples, peas, potatoes, and tomatoes, have become perplexingly numerous, at any rate, to the inexperienced grower of a few; but perhaps if for no other reason than in order to maintain the vigour in the plants it is desirable to continue to raise seedlings; besides, occasionally a real acquisition turns up, as in the case of Royal Sovereign. T. Coomber.

The Hendre Gardens.

INDIGOFERA GERARDIANA.

Of the numerous species of Indigofera this is the best for outdoor culture as it is of a showy character when in bloom, and of decidedly elegant appearance throughout the growing period by reason of its dainty foliage. It is a native of the Himalaya, and under natural conditions assumes the proportions of a large shrub. In many parts of the country, however, it is affected by cold in the open ground, and dies to the ground line each winter. The root-stock, however, lives through the most severe weather we experience in the British Isles, and sends up large numbers of annual shoots, which during summer grow between 2 and 3ft. in length and bear an inflorescence from nearly every leaf axil.

In the warmer parts of the country it grows into a bush in the open border and blossoms freely, whilst it may also be grown against a wall. The leaves are pinnate, and 3 to 4in. long, the leaflets being small and oval. The flowering period commences early in July, and lasts for about six weeks. The rosy-purple flowers are small and pea-shaped, and borne in dense racemes 3 to 4in. long. It thrives in loamy soil, and is increased by means of cuttings during summer, the cuttings being inserted in sandy soil in a warm propagating case. It is advisable to place it in permanent quarters as early in life as possible, as it does not transplant well when large. W. D.

Kew.

SWEET PEA JOTTINGS.

Splendid rains have occurred over the whole of the southern counties, and also in many, if not most, other parts of the country, and if only bright weather prevails from the beginning of the present week there will be many fine flowers forthcoming on July 24. Entries for the great show have come in freely, but these is not the rush there was in 1907, when everyone had good flowers as a result of the cool, moist conditions that prevailed.

INSPECTING THE SWEET PEA TRIALS AT MESSRS. HURST AND SONS' GROUNDS AT KELVEDON.

The medal of the National Sweet Pea Society continues to give the greatest satisfaction. The silver copies were recently sent to the several societies now in affiliation with the parent society, and from practically every one of the newly-joined societies a few words of kindly comment upon the beauty and uniqueness of the medal have come with the acknowledgment of receipt. It may be interesting to note that the medal I carry on my watchchain, and which I, like all other members of the jury, received in connection with the Ghent Quinquennial Show of 1903, was the basis of the design of the N.S.P.S.'s medal. The drawing from which the model was made was executed by Miss Wilkinson, of Regent's Park, through the kind offices of Mr. E. F. Hawes.

In the present issue three illustrations serve to show the style and extent of the trials of sweet peas at Reading, Kelvedon, and Mark's Tey. At Reading the photographer caught Mr. Breadmore and myself in the act of tendering our congratulations to Mr. Stark on the success of his new variety George Stark. At Messrs. Hurst and Son's trials a whole crowd of sweet pea notabilities came within the scope of the lens at the upper portion of the trial grounds, while at Messrs. Dobbie and Co.'s grounds at Mark's Tey the extent of the trials is very evident, though from a pictorial point of view it was unfortunate that the foreground of the photograph consisted of dark varieties of sweet peas. A large number of photographs were taken for the N.S.P.S. and a selection of these will be reserved for reproduction in the Sweet Pea Annual for 1909.

At many of the leading flower shows it is now quite the thing to set apart a tent for sweet peas, and this is invariably well filled with the charming and fragrant blossoms. At Woodbridge the other day sweet peas were admirably shown. Dr. Gosling, Captain Cautley, and Messrs. G. Stark and Son carrying off the leading awards. Dr. Gosling is, to me, a new competitor, and he knows how to grow and also how to stage sweet peas. An interesting class was for the best bunch of a 1908 novelty, and the award fell to a bunch of St. George. In the same class there was a bunch of the newer George Stark, but a recent hailstorm at Great Ryburgh had spoiled the flowers. I wonder now, whether, had the flowers been of equal merit with those of St. George, the judge would have placed the medal variety of 1908 before the medal variety of 1907? Hardly, I think, considering George Stark is not yet in commerce.

I have received no good reports from users of nitro-bacterine. In some cases the seeds were soaked in a bacterial solution, and in others the ground was watered with a solution. On the other hand, I have received no evil reports of its use, but if readers of these notes who have tested nitro-bacterine for sweet peas would kindly send me a few notes of the behaviour of treated rows as against untreated rows I shall be very grateful. So far as I can gather at present the results are negative, and it would appear that on highly cultivated ground nitro-bacterine serves no purpose, good or ill, in connection with sweet pea culture. Chas. H. Curtis.

INSPECTING THE SWEET PEA TRIALS AT MESSRS. DOBBIE AND CO.'S NURSERIES, MARK'S TEY.

Annuals.—As the earliest of these pass out of bloom they should be cleared off, and if there is a reserve substitute others for them, special care being taken not to disturb the roots more than is necessary. Keep all weeds down, and keep the Dutch hoe freely at work among all things as much as possible.—E. F. Hazelton.

WORK FOR THE WEEK.

◆

THE ORCHID HOUSES.

CATTLEYA HOUSE.—The bright sunlight of the past few weeks has been most beneficial to cattleyas and allied genera. Every encouragement must be given to assist the plants to mature their growths during the next few weeks. I find it a good plan to give a little ventilation from the roof at night, when the outside conditions are favourable. This will assist the drying of the atmosphere, and will also help to harden and mature the growth as it develops. Any roof ventilation should be taken off before damping is commenced in the morning. Where roof ventilation is given the leeward ventilators only should be used, thus avoiding the possibility of direct draughts. All plants (excepting those that will be coming into flower shortly) that are emitting new roots and require repotting should be attended to before the roots become too far advanced. There is less danger of the roots being broken when repotted in their early stage of rooting than is the case afterwards. Such plants as will produce their flowers immediately the growth has developed should have their repotting deferred until after they have passed out of flower.

INSECT PESTS.—At the present season insect pests are perhaps more troublesome than at any season of the year. Thrips are the most troublesome pests we have to contend with. Owing to the heat and drought experienced a short time ago trees outside have become infested with thrips, and as they are easily dislodged from the leaves by the wind they are carried, either through the open ventilators into the houses, or lodged on the outside roof, where a shower of rain carries them into the soft water tanks. I was surprised after a recent shower to observe the large number of black thrips that were floating on the surface of the water in the tanks. This fact shows the necessity for constant and close observation to enable us to take the necessary steps to prevent injury to the plants. Fumigation appears to have but little effect, but with regular spraying, or spraying when the insects are observed, this pest will be effectively kept in check. Scale insects, especially the small white kind, attack the young growths of many of the autumn-flowering kinds, especially Cattleya labiata. In this species they appear in a very small state immediately the leaf becomes expanded, and if they are not removed they cause an indention in the leaf that leaves a permanent disfigurement. It is a delicate operation to dislodge these insects, a piece of soft stick carefully pointed is the best means of removal. Where they attack the pseudo-bulbs and rhizomes between the bulbs carefully sponging is the best means, we find, for their removal, using a weak solution of soft soap mixed in rain water.—H. J. Chapman, Oakwood Gardens, Wylam-on-Tyne.

CONSERVATORY AND GREENHOUSE.

ZONAL PELARGONIUMS FOR WINTER.—Whatever the value of these plants in the flower garden, there can be no question as to their utility for winter blooming, their bright and telling colours lighting up the greenhouse when it is most needful. Now is the time for potting up a stock for next winter. The plants should be potted in good loam of a fibrous character, to which has been added a little dried cow manure and plenty of leaf-mould and sand. After potting, they should be stood outside in the full sun, and kept well on the dry side until root action is free, when a fairly liberal allowance is necessary. So treated they make a stronger growth than in frames, owing partly to the fact that more room can be allowed. They are almost sure to push flower buds at once, but these should be pinched out. The plants may stand in the open until the middle or end of August, according to the weather, when protection must be given. At all times under glass a good circulation of warm, dry air must be kept up about the plants, these being stood as close to the roof as possible, and no shading allowed at any time. If more convenient, they may be brought on in batches to ensure a succession of blooms for several months. The double flowered varieties require rather more warmth to induce them to open freely than do single ones, but in a house in which a temperature of 60 deg. at night is maintained, and kept fairly dry, both will be satisfactory.

CLIMBERS. — These will form a special feature just now, and there should be a good many things in bloom. Bougainvillea glabra will do well if planted out in the borders of a warm conservatory where it can grow near the glass in a light position. In a cool light house Solanum jasminoides is very effective. The tacsonias and passion-flowers require much room, and the growths to be thinned and regulated during growth. In a cool corner Clianthus puniceus and lapagerias (red and white) are at home, the latter to be planted in a well-drained bed of loam and peat. Camellias and oranges are beautiful wall plants. The former should have a cool, shady position. When plants are grown in a circumscribed space the quality of the soil or compost is very important. Some have an idea that heat and moisture will do anything, but those who are of this opinion will soon find out that something is lacking in their work when compared with the work of others who study soils and composts. Good loam, peat, and leaf-mould is an absolute necessity, and if it cannot be obtained locally it should be had from some other source.

CRASSULA COCCINEA.—This useful greenhouse succulent has, from some cause or other, ceased to be popular. A few years ago it was one of the most brilliant specimens in collections of stove and greenhouse plants at the exhibitions. When grown in a greenhouse its season of flowering is from Midsummer to the end of July, and we are all well aware that at that period there is not so much variety in plants that flower naturally as there is in May and early June. If six or eight strong shoots are placed around the edge of a 4in. pot they will soon root, and if shifted into 6in. pots in the spring they will produce many heads of blooms. The plants do not need very large pots, and good specimens may be grown in pots of from 8 to 10in. in diameter. The old plants may be kept of useful size for many years by cutting out the old straggling growths after flowering.

MIGNONETTE.—The first batch of seed should now be sown either in the flowering pots or in small-sized 60's. Thin out the seedlings early, and stand the pots in a cool frame, and give a sharp look-out for slugs; they are always troublesome at this season of the year.—T. B. Field, Ashwellthorpe, Norwich.

THE FLOWER GARDEN.

WALKS should be kept in good condition. In many cases after a prolonged spell of drought the surface gravel becomes loose, and if there is much traffic some of the larger stones will work to the top. When this occurs not only is the appearance unsatisfactory, but the walks are uncomfortable to walk upon. Where this is the case give a good rolling immediately after rain has fallen, and thus again secure a smooth, firm surface.

BOX EDGINGS should now be clipped, and in doing this be careful to cut as level a surface as possible, and the best guide is a garden line tightly stretched at the proper height. By cutting now second growth will at once be produced, and have a pleasant appearance throughout the season. Should a few growths become unduly long they can be easily removed. The same remarks apply to yew, holly, privet, and other hedges, unless in very late districts where growth is still active, in which case clipping may be postponed. Where topiary work is practised cut the figures and designs into as perfect a shape as possible.

CLIMBING ROSES.—As those on arches, pergolas, pillars, and walls pass out of bloom the wood that has flowered should be cut quite out down to the strongest growth nearest the ground, to insure vigorous growths for flower production next season. By cutting this wood out immediately after flowering succeeding growth has a better opportunity of maturing and ripening. Where roses are rambling through and over trees or other objects, the same practice should be adopted, but when growing over a dense shrub growth should only be shortened. When planted near the front of a clump of shrubs growth may be brought out and tied to some support, afterwards being carefully worked back into or over the shrubs.

CLIMBING PLANTS.—Many climbers may be treated as advised for roses. Young plants should be carefully attended to, and supported and trained as may be necessary. Even with the free-growing rambling types of clematis due care should be taken to prevent their becoming tangled masses, which would otherwise soon occur; watch carefully that nothing suffers from drought, this being more likely to occur with climbers planted near walls than with plants in the open. The walls not only prevent the whole of the fall of rain reaching the roots, but also, to some extent, acting as an absorbent.

IVY.—Where ivies have quite covered their allotted space, and young growths are either projecting or hanging loose, they should be cut quite off.

CARNATIONS.—As these pass out of bloom no time should be lost in proceeding with the work of layering. Remove the old flower stems; carefully clean the beds before commening to layer; cut out small weakly growths not required or strong enough for layering.

LILIUMS.—See that these are well supported before the buds become heavy, and guard against drought. A mulching of well-rotted manure will be helpful, or a watering with liquid manure should the weather be hot and dry.—E. F. Hazelton, Knowsley Gardens.

HARDY FRUITS.

MORELLO CHERRIES.—These trees, trained fan-shape on north walls, should have attention, and the shoots required for filling up space and the formation of neatly trained trees must be made secure. Train them straight from the base, and leave ample room in the ties or shreds to allow for the swelling of the bark. Some of the shoots not wanted may be shortened back to within a few buds of last year's growth. Do not train the shoots too thickly; what is wanted for the production of heavy crops of large fruit is firm medium wood. A good tree ought to be well furnished from the bottom to the top with clean, healthy, fruitful wood. Netting the trees to protect the fruit from birds must be done early. A good plan is to run wire-netting along the bottom at three feet from the walls, and then hang on the fish netting so that the bottom rests on the wire. It is marvellous how effectually the wire-netting prevents the birds getting beneath the nets. The roots must not be overlooked. If the borders have been properly made a good soaking of liquid manure in dry weather will greatly assist the fruit in gaining size, and the development of the wood for next year's fruiting.

STRAWBERRY BEDS.—When the fruits have all been gathered, remove the nets, and if runners are not required for layering, clean the beds. All weeds should be removed, runners cut away, with a portion of the lower leaves. After clearing the beds lightly prick up the soil to the depth of a couple of inches, this being essential on land that has been much trampled upon and is likely to crack open in dry weather. Should the land be light and porous, give a good dressing of manure, placing it well about the roots. Mulching at this season will greatly help the new growths. Do not forget when planting to make a good bed of Givon's Late Prolific. This variety I grow rather largely, and last year planted a nice batch on the same border (early) as Royal Sovereign. The latter with me were fine, and the Givon's equally so, thus giving a capital succession, the fruits being large, firm, and of excellent colour and flavour. I shall plant more of this variety this year. Leader is remarkably productive, and for size amongst the largest, though the flesh and flavour are not of the best quality. — H. Markham, Wrotham Park.

REQUIEN'S PENNYROYAL OR CORSICAN THYME.

Mentha Requieni (syn. Thymus corsicus) is one of the most delightful of small aromatic herbs in any garden, and is sometimes known by Linnæus's name of Thymus corsicus. Why the great botanist gave it the name of Thymus is difficult to conceive, as the little plant is not thyme-scented, but strongly aromatic of peppermint, and thus properly called Mentha by Bentham. It is so minute that it would be overlooked but for its strong scent of peppermint, which is at times perceptible without touching it, but which is at once made evident if the herb is touched with the hand or even with one's garments in passing along. It clings as closely to the soil as any moss, and makes a covering of small green leaves, which can hardly be said to rise above the surface of the earth. On this carpet are produced many tiny violet or purple flowers, so small as almost to require the microscope.

Its value lies mainly in its odour, but it is all the same a delightful little plant which likes shade and a fair amount of moisture, although these are not absolutely necessary. It is not entirely hardy in the coldest gardens in severe winters, but is generally enduring enough when established in all but the stiffest and coldest soils. In some gardens Mentha Requieni has become thoroughly established, and I know one place in the south-west of Scotland where it has become naturalised amid the grass of the flower garden, and there must be thousands of plants, these apparently holding their own amid the short grass with the greatest ease. This little mint can be increased by division or by means of seeds if these are procurable.

S. Arnott.

HORTICULTURAL SHOW ADVERTISEMENTS are inserted in this column at Ninepence per line, the minimum charge being Five shillings. Offices, 148 and 149, Aldersgate Street, London, E.C.

EXHIBITIONS AND MEETINGS.

◆

Royal Horticultural Society.

JULY 21.

The display at Vincent Square on the same date was a comparatively small one, carnations and hardy flowers predominating.

FLORAL COMMITTEE.

Hardy flowers were largely shown by Messrs. Barr and Sons, Covent Garden, whose water lilies and phloxes were the chief features. Mr. Amos Perry, Enfield, contributed a lovely lot of water lilies, the beautiful Lychnis cognata, L. Haageana hybrids, and some choice new seedlings of Chrysanthemum maximum. Phloxes, choice gladioli, the bright-fruited Coriaria japonica (A.M.), and the yellow-fruited C. terminalis, with other good things were set up by Mr. Maurice Prichard, Christchurch. Mr. G. Reuthe's contribution was a large one, and consisted of hardy flowers in great variety, including spiræas, campanulas, and liliums. Messrs. T. S. Ware, Feltham, made a very bold display of hardy flowers, their Chrysanthemum maximum King Edward VII., and the scabiouses being very good. Messrs. Hugh Low and Co., Bush Hill Park, Enfield, showed the elegant Buddleia variabilis Veitchi, Solanum Wendlandi, and a very fine lot of Malmaison and perpetual carnations in great variety.

Messrs. Jas. Veitch and Sons, Chelsea, submitted a showy lot of annuals that served to illustrate Mr. Watkin's lecture during the afternoon. The coreopsis, candytufts, poppies, and godetias attracted a good deal of attention. This firm also had the lovely blue Delphinium macranthum in another group, together with carnations, the fine Solanum Wendlandi, greenhouse rhododendrons, and cannas. In other parts of the hall they had a brave show of phloxes, Isatis glauca, campanulas, etc., and a group of pyramid and dwarf fuchsias.

Against a green background, and arranged chiefly on the ground level, Messrs. W. Cutbush and Son, Highgate, N., had a novel and very attractive exhibit of carnations, perpetual, border, and Malmaison varieties, arranged in vases of varying heights. Mr. R. Bradford, gardener to E. H. Brown, Esq., Highwood, Roehampton, put up a very artistic group, exhibition style, in which crotons, carnations, gloxinias, palms, liliums, etc., were gracefully and tastefully associated. Messrs. Eggett and Son, Thames Ditton, showed a few varieties of hardy ferns, and Messrs. William Bull and Sons, King's Road, Chelsea, showed a group of stove foliage plants. Messrs. Phillips and Taylor, Bracknell, Herts, staged border carnations in variety, and Messrs. Kelway and Son, Langport, attracted a good deal of attention with their exhibit of gladioli, though it was a too early date to find the spikes at their best.

Pink spiræas and Humea elegans were shown together by Messrs. R. and G. Cuthbert, Southgate, N. Drooping fuchsias, mostly triphylla hybrids, and all of great beauty, were well shown by Messrs. H. Cannell and Sons, Swanley; these ought to make fine rafter plants, and be equally useful for baskets. Hydrangea grandiflora alba was also well shown by the Swanley firm. Messrs. G. Bunyard and Co., Maidstone, had a big bank of hardy flowers, phloxes, liliums, and pentstemons forming the chief items. Fuchsias were also well shown by Messrs. H. B. May and Sons, Edmonton, who also had the tender nephrolepis and a bank of ixoras.

Carnations, border varieties, were beautifully shown by Mr. Dutton, Iver, Bucks, whose long-stemmed blooms of Goldfinder, Grenadier, Rony Buchanan, Queen of Scots, Mrs. Robt. Morton, Isinglass, Lord Napier, Germania, Daffodil, and Bookham Clove, etc., vied with the perpetual varieties in size and elegance. Mr. A. F. Dutton had to divide his exhibit into two parts, and it was the part devoted to perpetual varieties that was the chief attraction to many people. Mr. James Douglas, Great Bookham, Surrey, had a lovely lot of border and other carnations: Robt. Berkeley, Ann Hathaway, Lord Steyne, Hercules (Malmaison, A.M.), Eleanor, Splendour (A.M.), Cardinal (A.M.), and Celestial were particularly good. Sinningia hybrida Dr. M. Masters, a pink, semi-pendulous, gloxinia-like gesneraceous plant, from Mr. Ernst Benary, Erfurt, Germany, gained an A.M.

The fringed single begonias shown by Messrs. Sutton and Sons, Reading, attracted no small amount of attention, by reason of their beauty of colouring and elegance of form. Sweet peas were exquisitely shown by Messrs. J. Carter and Co., High Holborn, London, who had a light temple of brass-work with suspended vases and baskets of flowers; beneath the temple were vases of sweet peas; smilax and asparagus supplied the necessary greenery, and the whole made up the most elegant display in the show.

New pink astilbes, raised by Mr. Arends, Ronsdorf, Germany, were a leading feature. Several of these are crosses having Astilbe Davidi as one parent. Astilbe Arendsi Ceres (A.M.), with lovely plumes of graceful rose-pink, is a real beauty; and A. A. Pink Pearl, pearl-pink, is equally beautiful, and quite distinct. This race cannot fail to become popular.

Very lovely—indeed, beautiful beyond description—was the big flower of Nelumbium speciosum Osiris (F.C.C.) shown by Mr. Jas. Hudson, V.M.H., gardener to Leopold de Rothschild, Esq., Gunnersbury House, Acton. It was a huge pink flower, glowing to cerise on the outside of the petals, and in the heart of the flower a glow of cream-pink surrounded the golden stigma and stamens. Mr. Hudson also sent up Nymphæa gigantea Hudsoni, the fine blue lily that gained a F.C.C. five years ago.

ORCHID COMMITTEE.

There were not many orchids on view on this occasion; indeed, this is almost a "close time" for orchids. Messrs. Hugh Low and Co., Enfield, showed the graceful Platyclinis filiformis, Cynoches chlorochilum, the comparatively rare Oncidium Lanceanum, and a few other things. Mr. G. Thwaites, Chessington, Streatham, showed Odontioda Thwaitesi (A.M.), that gave evidence of Cochlioda vulcanicum parentage.

Mr. Burkinshaw, Hessle, sent a fine form of Cattleya Warscewiczi named Rochford's var. From Sir Trevor Lawrence's collection Mr. White brought up Angræcum augustum (A.M.), with long-spurred white flowers, and Epidendrum costatum. Cypripedium Vipani roseum, with three flowers, came from Mr. J. Brooks, gardener to W. M. Appleton, Esq., Weston-super-Mare. A form of Stanhopea Wardi was submitted by Lord Rothschild, Tring Park, Tring (gardener, Mr. Dye), who showed a spike of nine big flowers. Several bolleas were shown by Mr. J. Birchinall, Alderley Edge, Cheshire, but these have outlived their former popularity.

Messrs. Charlesworth and Co., Bradford, had a few good things, and their superb form of Stanhopea tigrina (F.C.C.), brilliant crimson and cream, was the great attraction. Odontoglossum Ossulstonei, O. Rolfæ, Pachystoma Thompsoni Gentilii, Oncidium Lanceanum, Odontoglossum Uro-Skinneri alba, O. Eleanor, and Cattleya F. W. Wigan, were also included.

Mr. Alexander, orchid grower to Lieut.-Colonel Holford, Westonbirt, Gloucester, had a few good orchids on view, notably Cattleya Warscewiczi Frau Melanie Beyrodt, Cattleya Lord Rothschild, Miltonia vexillaria superba, the rare Dendrobium Regium, and Cattleya Hardyana.

FRUIT AND VEGETABLE COMMITTEE.

The chief exhibit before this committee consisted of a splendid display of culinary peas, admirably set up by Messrs. Dobbie and Co., Rothesay. The pods were regularly arranged in oval wicker baskets, and there were about four dozen varieties, one basket of each, with a small bowl of shelled peas beside most of the baskets. The leading varieties were Fillbasket, Rentpayer, The Laxton, Gradus, The Sherwood, Exhibition Marrowfat, Prince of Peas, Duke of Albany, Bystander, Telephone, and Dr. McLean.

The twelve varieties of cabbage lettuces shown by Messrs. J. Veitch and Sons, Chelsea, made an educational exhibit of great value. Acquisition, Summer Gem, Imperial, and Crystal Palace were notably good varieties. Peas were largely staged by Messrs. J. K. King and Co., Coggeshall, but as they were shown flat on the table the exhibit, though interesting, was not attractive. Messrs. Spooner and Sons, Hounslow, sent a box of the bright Early Red Margaret apples.

CERTIFICATES AND AWARDS.

First-class Certificates.—To Nelumbium speciosum Osiris, from Mr. J. Hudson, V.M.H., gardener to Leopold de Rothschild, Esq., Gunnersbury House, Acton; to Stanhopea tigrina superba, from Messrs. Charlesworth and Co., Heaton, Bradford.

Award of Merit.—To Astilbe Arendsi Ceres and A. Arendsi Pink Pearl, from Mr. George Arends, Ronsdorf, Germany; Sinningia hybrida Dr. M. Masters, from Herr. Ernst Benary, Erfurt, Germany; Begonia Kewensis, from Messrs. Jas. Veitch and Sons, Chelsea; Coriaria japonica, from Mr. Maurice Prichard, Christchurch, Hants; border carnations Splendour and Cardinal, and Malmaison carnation Hercules, from Mr. Jas. Douglas, Great Bookham, Surrey; Odontioda Thwaitesi, from G. Thwaites, Esq., Chessington, Streatham; Angræcum augustum, from Mr. White, orchid grower to Sir Trevor Lawrence, Bart., Burford Lodge, Dorking.

MEDALS.

Silver-gilt Flora.—Messrs. Jas. Veitch and Sons, Chelsea.

Silver-gilt Banksian.—Messrs. Jas. Carter and Co., High Holborn; Mr. James Douglas, Great Bookham, Surrey.

Silver Knightian.—Messrs. Dobbie and Co., Rothesay and Marks Tey.

Silver Flora.—Mr. Alexander, gardener to Lieut.-Colonel Holford, Westonbirt, Gloucester; Mr. Bradford, gardener to E. H. Brown, Esq., Highwood, Roehampton; Messrs. Wm. Cutbush and Son, Highgate; Messrs. H. Low and Co., Enfield; Messrs. H. B. May and Sons, Edmonton; Mr. Amos Perry, Enfield; Mr. M. Prichard, Christchurch; Mr. G. Reuthe, Keston; Messrs. G. Bunyard and Co., Maidstone; Mr. James Douglas, Great Bookham; Messrs. T. S. Ware, Lim., Feltham.

Silver Banksian.—Messrs. H. Low and Co., Enfield (orchids); Messrs. Charlesworth and Co., Heaton, Bradford.

Birmingham.

The second of the two summer exhibitions promoted by the Birmingham Botanical and Horticultural Society was held in the Exhibition Hall of the Botanical Gardens, Edgbaston, on the 11th inst., and proved to be a success. The show was indexed as one for a competition in roses, sweet peas, and hardy herbaceous flowers; but the visitors were rather disappointed to find not a single exhibit of roses, and only one of herbaceous flowers, this being accounted for by the recent wet and rough weather, which marred the roses especially. Sweet peas, however, served in a considerable measure to fill the show, and in a like manner the non-competitive contributions helped.

There was a keen though not a strong competition in the class for sweet peas, nine varieties, not more than thirty stems in each vase. Mr. T. Parry, gardener to A. Hughes, Esq., Puckwood Grange, Knowle, led with a capital lot, and most tastefully arranged; second honours fell to Mr. W. Marple, Penkridge, Staffs, for good blooms, but the arrangement was hardly up to the artistic style usually evolved by that grower; third position was assigned to Mr. W. King, gardener to A. E. Butler, Esq., Elmdon, Selby Hill; and a fourth prize was awarded Mr. J. Sceany, Harborne.

A vote of thanks was accorded Mr. W. H. Morter, Cannon Hill Public Park, for three fine specimens of Nephrolepis todæaoides.

The non-competitive exhibits atoned for the sparse display in the competitive section. Mr. J. Deacon, gardener to the Right Hon. Joseph Chamberlain, M.P., Highbury, brought a grand bank of Malmaison and tree carnations in pots, the flowers of the former being especially fine, and we noticed such sterling varieties as Princess of Wales, H. J. Jones, Old Blush, Maggie Hodgson, and Sir Charles Freemantle as the best; the whole was backed with a wide bordering of tree carnations; a special gold medal was awarded; and a like award went to Messrs. Bakers, Codsall Nurseries, Wolverhampton, for one of their noted displays, consisting principally of climbing and other roses effectively set up, and flanked by sweet peas, early-flowering gladioli, Iris Kæmpferi, etc.

Mr. C. H. Herbert, The Nurseries, Acocks Green, deservedly annexed a silver-gilt medal for a collection of herbaceous flowers most tastefully and lightly arranged; an award of merit was accorded to Galega officinalis Her Majesty, a great improvement in colour, robust, and of tall habit; a similar award went to a hardy border pink, named Progress; it is sweetly scented, colour a blush pink, stout and smooth-edged petals. Mr. Robert Sydenham sent a fine collection of sweet peas, most effectively set up; also early-flowering gladioli and English irises; a silver medal was granted. Messrs. Richard Smith and Co., Worcester, were awarded a silver medal for a collection of roses, Kæmpferi irises, water lilies, and herbaceous flowers. Messrs. W. H. Simpson and Sons, Chad Valley Nurseries, Edgbaston, made an imposing display of sweet peas, and in which St. George was conspicuous; silver medal. Messrs. Heath and Sons, Cheltenham, set up a rock garden planted with interesting alpines; bronze medal. A similar award was accorded Mr. J. Webb, gardener to W. Byng Kenrick, Esq., Metchley Lodge, Edgbaston, for a creditable display of greenhouse plants, including finely developed gloxinias, francoas, tuberous begonias, Lobelia tenuior, and caladiums. It may be remarked this was the young grower's first essay on a comparatively large scale in the exhibition arena.

Gloucester Rose Show.

JULY 14.

On the above date the Gloucestershire Society held its annual exhibition in a large marquee erected in the Spa Field, Gloucester. The morning opened with showers, but the after-part of the day was enjoyable, and a large attendance resulted. Entries for roses reached 150, while 115 were sent in for sweet peas. A very excellent quality was manifest, the blooms in the open classes being regarded as a fair average, taking into account the variable weather of the previous three weeks. In the open amateur section were any number of grand flowers, and the popularity of Maman Cochet was demonstrated in the class for six of one variety of tea rose, where five competitors staged White Maman Cochet. The National Rose Society's medals went to Mr. R. Foley Hobbs, Thornloe, Worcester, for Mrs. Theodore Roosevelt; to Mrs. B. Bonnor, Barnwood, for a White Maman Cochet; and to Mr. G. R. Orpin, Gloucester, for a big Bessie Brown.

In summarising the awards in the seven divisions for roses, it may be stated the Messrs. A. Dickson and Sons, Newtownards, Ireland, secured in the open-to-all sections the premier awards (challenge cup value £30, won outright), for forty-eight single trusses, twenty-four trebles, twelve dark and twelve light roses of any one variety. Messrs. John Jefferies and Son, Cirencester, led for thirty-six single trusses, six vases of five blooms each, and a dozen bunches of garden roses. Mr. Henry Drew, Longworth, Berks, was awarded premiers for eighteen teas or noisette, and twelve trebles; and in the open amateur classes Mr. F. Dennison, Rosecroft, Kenilworth, was placed first for two dozen single trusses and twelve trebles; Mr. Foley Hobbs second in both classes. Mr. Conway Jones was strong in the classes for a dozen single trusses, six trusses of any variety of tea with White Maman Cochet, and nine bouquets of garden roses; Mr. Dennison second in the two last-named classes. Among the county amateurs, Mr. G. R. Bonnor, Barnwood, headed the list for eighteen varieties (cash and piece of plate), six of one variety, nine teas or noisettes, and twelve bunches of sweet peas. Three tables were decorated with roses and foliage by Miss M. B. Smith and Miss L. A. Nicholas, Gloucester, and Miss M. D. Watson, Cheltenham; and for a basket of roses, the award fell to Mrs. W. H. Pickford, Mr. A. V. Wright, and Miss M. D. Watson.

There were thirty-two awards in the classes for sweet peas. In the county division, Mr. W. J. Thorpe, Hucclecote, led for eighteen varieties; while for city residents, Mr. W. H. Pickford secured the award for nine varieties; Mr. J. Orpin led for six; Mr. W. J. Gordon-Canning was first in another class for nine, and also first for one bunch of a scarlet variety; Major Timms led for one bunch each of pink and blue; and Mr. E. Remes scored for six varieties (cottagers), and one bunch each of orange and lavender. Miss A. L. Mercer, Sandhurst, secured the special prize for a display.

Woodbridge.

The quaint old Suffolk town of Woodbridge is always en fête for its summer flower show, and the numbers of flags that adorn the winding and hilly streets, and the amount of bunting and flags that adorn the houses, show how keenly everyone is interested in this function. Mr. J. Andrews, the erstwhile secretary, is still the moving spirit of the Woodbridge show, and in the capacity of show director he has a welcome for all and sundry, and once a person has competed at Woodbridge, Mr. Andrews makes it difficult for him to ever stay away.

The exhibition on July 15 was a very fine one, both in extent and quality. There were numerous tents variously devoted to sweet peas, roses, fruit and vegetables, plants and groups, flowers and decorations, and cottagers' produce, and these were arranged around a spacious meadow at Woodbridge Abbey, kindly lent by Colonel R. J. Carthew, J.P. The weather was threatening, and there were one or two showers, but on the whole it was fairly good, and the attendance seemed excellent.

SWEET PEAS.

One whole tent was devoted entirely to sweet peas. The premier award in the leading class for six bunches was won by Dr. G. V. Gostling, Needham Market, with lovely bunches of George Herbert, Mrs. Hardcastle Sykes (N.S.P.S. silver medal), Evelyn Hemus, Frank Dolby, Helen Lewis, and Etta Dyke; there were a dozen entries, and Captain Cautley, Bury St. Edmunds, and Mrs. Wainwright, Claydon, Ipswich, came second and third respectively.

Dr. Gostling scored in another class for six bunches, and was here followed in order by Miss Snell, West Hill House, Ipswich, and the Rev. E. T. King, Glemham Rectory. Dr. Gostling also won the award for three bunches of striped and fancy varieties with Prince Olaf, Jessie Cuthbertson, and Sybil Eckford. Mr. C. W. Platten had the best bunch of a new variety in Evelyn Hemus. For a display of sweet peas, Captain Cautley was easily ahead with fine bunches and lovely blooms of Constance Oliver, Princess Victoria, St. George, Olive Ruffell, etc.; Lady Farren, Great Bealings, coming second, and the Rev. E. T. King third.

The silver cup for fifteen bunches of sweet peas, distinct, was won by Messrs. G. Stark and Son, Great Ryburgh, with a set remarkable for brilliant colouring coupled with good size; George Stark, H. Lewis, Mrs. Duncan, Olive Ruffell, Mrs. Pitt, Mrs. Collier, and Frank Dolby were very fine; Mr. T. Cross, Bury St. Edmunds, was a very close second, only missing the cup by about two points; Messrs. Saltmarsh and Son, Chelmsford, third; and Mr. Taylor, gardener to A. E. Long, Esq., Hurts Hall, Saxmundham, fourth.

In the Eckford classes, Mr. Robertson, gardener to Sir Ronald Lane, Colton Hall, led for a blue variety with D. R. Williamson; Dr. Gostling led for a lavender variety with Lady G. Hamilton; Mr. Showell for an orange variety with Henry Eckford in grand colour; Mr. Showell for a pink variety with Gladys Unwin; Dr. Gostling for a scarlet variety with Queen Alexandra; and Mr. Showell for a white with Nora Unwin.

ROSES.

In the premier class for roses (open), Messrs. Frank Cant and Co., Colchester, led the way for thirty-six blooms, with fresh, clean flowers of Captain Hayward, Bessie Brown, Frau Karl Druschki, Horace Vernet, Ulrich Brunner, etc.; Messrs. B. R. Cant and Sons, Colchester, second; and Messrs. D. Prior and Sons, Colchester, third. These competitors came in precisely the same order in the class for two dozen blooms, the first set containing Fisher Holmes and Lady Moyra Beauclerc in good form. Messrs. F. Cant and Co., Messrs. B. R. Cant and Sons, and Mr. R. C. Notcutt, Ipswich, were placed as named for two dozen bunches of garden roses, and this class made an excellent showing.

In the amateurs' section, Mr. W. Leggett, of Colchester, and Mr. R. Steward, Saxingham Old Hall, were first and second respectively for two dozen flowers, and each showed well. For a dozen varieties, Mr. Leggett showed exceptionally well, and led, followed by Dr. F. H. Cooke, and Mr. R. Steward. Mr. Leggett was also first for twelve teas, and Mr. Steward scored for six teas. Captain H. H. Travers, Long Stretton, led for twelve varieties, six varieties, and six teas, in the smaller section; while in the local classes Mr. Robertson, Woodbridge, scored for six bunches of garden roses, followed in order by Mr. R. Don, Hasketon, and Mr. W. Pipe, Rushmere.

DECORATIONS.

Table decorations are a great feature at Woodbridge, and in some cases there were a dozen entries in a class. In one class first prize was awarded to Miss S. M. Kemp, Woodbridge, for hypericums and maidenhair fern; Miss M. Snell second with pink sweet peas; and Mrs. Butcher, Ipswich, third with deep pink carnations. The two latter tables we liked better than the first one. The first prize basket was one of clarkia and gypsophila from Miss Hayward, Thorofare. In the class for a wild flower table decoration, Miss Farren, Bealings House, Woodbridge, won with a design in honeysuckle, dog roses, and grasses. First prize for a circular table was won by Miss Harwood, Colchester, with a beautiful arrangement of roses of the Mdme. Ravary type; Mrs. O. G. Orpen, Colchester, second with Lady Gay roses well set out; and Miss S. M. Kemp, Woodbridge, third, with cattleyas and lælio-cattleyas.

The best table decoration of roses was adjudged to be the one of pale yellow blooms from Miss M. Snell; Miss Hetherington, Ipswich, second, with pink roses; and Mrs. Butcher, Ipswich, third, with large pink roses. Mrs. Waller, of Dove Place, Woodbridge, had the best epergne, a pretty exhibit of yellow sweet sultans, and the same lady had the best bowl of sweet peas. First prize for a vase of flowers fell to Mrs. J. H. Saville, Woodbridge, for an elegant arrangement of Chrysanthemum maximum.

Baskets of roses were very fine, Mrs. Martin, Eye, leading, and Mrs. J. H. Saville coming second, both showing pink roses. Mrs. Saville scored for a basket of sweet peas with white and scarlet flowers, but in this class we noticed several competitors had not placed the flower stems in water or wet sand, hence in a few hours they were drooping badly.

FLOWERS.

Mr. R. C. Notcutt, Ipswich, had a very fine group of hardy flowers, gaining first prize therewith; his Romneya Coulteri was particularly fine; Mr. C. Jacoby, Ipswich, second. For two dozen bunches of hardy [illegible] Mr. Andrews gained first place with [illegible] and a splendid bunch of Chrysanthemum maximum The Speaker. For [illegible] bunches, Mrs. Warnes, Bramsford, [illegible] secured the premier award, with Mr. [illegible] second. In the class for nine bunches [illegible] Mr. J. S. Clarke, gardener to W. Pipe, Esq., The Lodge, Rushmere, led, followed by Mr. [illegible], gardener to Dr. Cooke, Birch, [illegible].

Dahlias were fairly good for so early a [illegible], and Mr. O. G. Orpen led for six cactus [illegible] with popular kinds, and Mr. R. [illegible], Hasketon, was second. First prize for [illegible] was won by Mr. A. Andrews, who had grand bunches of zinnias, French pink [illegible], shirley poppies, larkspur, and gladiolus.

GROUPS AND PLANTS.

Mr. T. King scored for a group of tuberous begonias, and he had a fine bank of well-grown plants; Mr. C. F. Marnes, Hasketon, second. For six double begonias, Sir R. [illegible], Bealings, led, and Mr. Robertson had the best six single varieties. Achimenes were best shown by Mr. T. King, who was second to Mr. Robertson for a group of [illegible], the latter showing splendidly. Mr. H. Grant, The Grange, had the best group of miscellaneous plants, and was followed in order by Mr. A. Andrews and Mr. T. King. Mr. H. Gall, Thorofare, had the finest exotic ferns, and Colonel Carthew the best hardy ferns.

Several non-competitive groups were forthcoming, and these materially assisted in making a gay display. Mr. R. C. Notcutt, Ipswich and Woodbridge, was a large exhibitor; Messrs. R. Wallace and Co., Colchester; Messrs. J. K. King and Co., Coggeshall; Messrs. Hobbies, Lim., Dereham; and Mr. J. Williams, Ealing, all contributed of their best.

FRUIT AND VEGETABLES.

Fruits were very good. Mr. W. Messenger, gardener to C. H. Berners, Esq., Wolverstone Park, Ipswich, led for a collection of dessert fruit, with good Foster's Seedling grapes, Dymond peaches, Brown Turkey figs, Laxton's Leader strawberries, and a melon; Mr. H. Rogers, gardener to Lord Rendlesham, Rendlesham Park, second; and Mr. A. Andrews, gardener to the Hon. W. Lowther, Campsea Ash, third. Mr. T. King, gardener to J. A. Berness, Esq., Melton Lodge, led for two bunches each of black and white grapes, and Mr. T. Turpin, gardener to Lady M. North, Glenham Hall, was second.

For strawberries, in a keen competition, Mr. Taylor, gardener to W. E. Long, Esq., Hurt's Hall, Saxmundham, scored, with Dr. Hogg and Ganton Park; and Mr. Robertson, [illegible] Hall, second, with Dr. Hogg and [illegible]. Mr. Rogers led for peaches, and Mr. Messenger for a single dish of strawberries.

In the vegetable classes Mr. A. Andrews, Mr. Simpkin, gardener to Mrs. Ogilvie's Trustees, Mr. T. King, Mr. Gaviett, Saxmundham, and Mr. G. Todd, Halesworth, were the leading prizewinners.

National Rose Society.

JULY 21.

This northern exhibition was held during glorious weather in the exhibition house of the Royal Botanical Gardens, now known as the White City, Old Trafford, Manchester; this is the sixth visit from the National Society in 28 years. The competition throughout was good, although many of the blooms showed the strain of unfavourable weather experienced of late; the blooms were of fair size, and the dark varieties were conspicuous for their fine colouring.

For thirty-six blooms, distinct, nurserymen, Mr. Hugh Dickson, Belfast, secured the premier award with a bright stand of fair-sized blooms; especially good were Mrs. S. [illegible], Earl Dufferin, Gustave Piganeau, Comte de Raimbaud, Comtesse de Ludre, Madame Melanie Soupert, Caroline Testout, Horace Vernet, Hugh Dickson, Mildred Grant, Frau Karl Druschki, Mamie, Mrs. Theodore Roosevelt, and Chas. J. Graham; Messrs. A. Dickson and Sons, Newtownards, second with fine Ben Cant, Chas. J. Grahame, etc.; third, Messrs. R. Harkness and Co., Hitchin.

For seventy-two blooms, distinct varieties, Mr. Hugh Dickson was again to the fore with an even collection, and amongst the best blooms were Mamie, Alfred Colomb, Comtesse de Ludre, Duke of Wellington, Ulrich Brunner, Killarney, Liberty, Auguste Rigotard, Horace Vernet, Victor Hugo, Beauty of Waltham, Marquise Litta, J. B. Clark, Earl of Warwick, Exquisite, and others; Messrs. A. Dickson and Sons followed with many fine blooms, and Messrs. Frank Cant and Co. took the remaining award.

For twenty-four distinct varieties, three blooms of each, Messrs. A. Dickson and Sons secured the chief award with a very telling stand, Messrs. Frank Cant and Co., and Mr. Hugh Dickson following. For thirty-six blooms, distinct varieties, the prizemen were Messrs. W. H. Frettingham, Nottingham; King's Acre Nursery Company, and G. and W. H. Burch, Peterborough.

For sixteen varieties three blooms of each, Mr. W. H. Frettingham led, having good blooms of Duchess of Bedford, Horace Vernet, Prince Arthur, Lord Macauley, etc.; second, Messrs. G. and W. H. Burch; third, King's Acre Nursery Company. For eighteen teas, distinct, Mr. G. Prince, Longworth, led with smart flowers, the chief being Mrs. Edward Mawley, Bridesmaid, Comtesse de Nadaillac, Medea, Golden Gate, Souv. de P. Notting, etc.; Messrs. Frank Cant and Co., Colchester, and Mr. H. Drew, Longworth, took the remaining awards. For twelve teas, distinct, Mr. J. Mattock, Oxford, proved the winner, staging good blooms of Mrs. E. Mawley and Bridesmaid.

OPEN CLASSES.

The class for twelve new roses brought out a strong competition, Messrs. Frank Cant and Co. proving the winners with J. B. Clark, H. Armytage, Wm. Shean, Chas. J. Grahame, Countess Annesley, etc.; second, Messrs. A. Dickson and Sons; and third, Messrs. B. R. Cant and Sons. For twelve blooms of any white or yellow rose, Messrs. Frank Cant and Co. won with a good box of White Maman Cochet; second, Messrs. A. Dickson and Sons; third, King's Acre Nursery Co., each staging Frau Karl Druschki. For twelve of any light pink rose, Mr. Hugh Dickson scored with Mrs. Theodore Roosevelt; second, King's Acre Nursery Co. with Mrs. J. Laing; third, Messrs. F. Cant and Co. with Dean Hole. For twelve crimson roses the prizetakers were Mr. Hugh Dickson with a beautiful stand of Hugh Dickson; King's Acre Nursery Co., with Alf. Colomb; and Messrs. G. and W. H. Burch with Horace Vernet.

In the class for twelve vases, five blooms in each, Messrs. A. Dickson and Sons led with a well-arranged lot, Duke of Wellington being exceptionally fine; Messrs. D. Prior and Sons, and Messrs. G. and W. H. Burch were placed as named. For twelve distinct varieties of teas or noisettes, three blooms of each, the awards went to Messrs. F. Cant and Co., G. Prince, and H. Drew.

Eighteen distinct varieties of decorative roses were good, and here Messrs. Frank Cant and Co. won with a fine bank in which Hiawatha, Encariate, Perle d'Or, Minnehaha, and L'Ideal were charming. For twelve distinct varieties under the same conditions, the awards went to Mr. J. Mattock, Messrs. Frank Cant and Co., and Mr. G. Prince.

AMATEURS.

For two dozen blooms, distinct varieties, for the Jubilee Challenge Trophy, Mr. E. B. Lindsell secured the coveted award, having good blooms of Mrs. Mawley, Alfred Colomb, Horace Vernet, Duchess of Bedford, Mrs. J. Laing, A. K. Williams, etc.; Mr. W. Boyes, Derby, and Mr. N. Dennison, Kenilworth, were placed second and third. For thirty-six blooms, distinct, Messrs. R. and L. Park, Bedale, took leading honours, having good blooms of Victor Hugo, Horace Vernet, Mildred Grant, Liberty, etc.; second, Rev. J. H. Pemberton, and Mr. H. V. Machin third.

For nine blooms of any one rose, except a tea or noisette, Mr. H. Dennison led with richly-coloured Horace Vernet. Mr. C. S. Speight and Mr. H. V. Machin also secured awards.

For six distinct varieties, three blooms each, Mr. C. S. Speight had the winning stand, and for six blooms of any rose, except a tea or noisette, Mr. G. Speight led with Her Majesty, Mr. C. Burgess being second with Alfred Colomb.

Mr. M. Whittle secured the leading prize for twelve varieties, distinct, and for nine blooms, distinct, Mr. E. Russell led.

For nine blooms in the smaller growers' section, Mr. M. Upton had the best, and Mr. A. M. Buxton won in the class for six varieties. For twelve blooms of teas or noisettes, distinct varieties, Mr. R. S. Park, Bedale, led, having good blooms of White Maman Cochet, Constance Soupert, etc., and Mr. W. Leggett and Mr. W. Boyes took the remaining awards. For nine blooms Mr. W. S. Paul took the lead.

For nine blooms, confined tô limited growers, the Rev. J. H. Pemberton took leading honours, and for six blooms Mr. W. M. Upton had the leading stand. For six blooms of one variety, Mr. M. Whittle led with Nota Bene.

For six distinct varieties, not more than seven trusses of each variety, the Rev. J. H. Pemberton and Mr. H. V. Machin were placed first and second. Mr. C. Burgess scored in the local classes.

MEDALS.

Gold.—To Mr. Hugh Dickson, for Simplicity, a new large, pure white single variety, that stood well through the bright sun and heat. To Messrs. A. Dickson and Sons, for G. E. Waud, a bright crimson hybrid tea; and to Messrs. B. R. Cant and Sons for White Dorothy Perkins.

Silver.—Mr. W. Boyes, for the best H.T. with Mildred Grant; Mr. E. B. Lindsell, for the best tea or noisette, with Mrs. Mawley; and Mr. H. V. Machin, for a rose other than a H.T., T., or noisette. Mr. Hugh Dickson, for a grand bloom of Hugh Dickson and also for a hybrid tea, with the Lyon Rose

National Carnation Society.

The National Carnation Society is in its thirty-second year, and so cannot be called juvenile. So far as its exhibitions are concerned, it seems to have lost the freshness and vigour of youth, because in recent years its displays have not come up to the old standard of extent and excellence. Of course, it must be said that the present season has been by no means favourable to the full development of fine, clean flowers of the border varieties, and, as a consequence, the show suffered considerably in the matter of quality. In the leading classes for blooms on boards, the competition was very limited, no new exhibitors coming forward to cross swords with the older men. Mr. Blick again did well, and a fine feature of the show was the way that old veteran florist, Mr. James Douglas, V.M.H., stood out ahead in so many classes; he had nine firsts in one division, and secured a silver cup thereby with the maximum of points.

As a spectacle the show was materially helped, one had almost written redeemed, by the non-competitive displays. We believe there is still a great future for border carnations, and we should like nothing better than to see the society and its exhibitions flourishing.

PREMIER DIVISION.

There were only three entries of eighteen show blooms, and first place was secured by Mr. Arthur R. Brown, King's Norton, with fair-sized examples of Master Fred, Thalia, Admiral Curzon, Mrs. T. Lord, J. S. Hedderley, Sportsman, George Melville, Lord Salisbury, Guardsman, Meteor, Arthur, Chas. Henwood, Reliance, Sarah Payne, and Robt. Houlgrave. The ground colour was not very clear in any case; Mr. C. Blick, gardener to Martin R. Smith, Esq., Hayes, Beckenham, second; and Mr. Hayward Mathias, Medstead, third. Mr. Hayward Mathias, Medstead, secured first place for eighteen self carnations, with moderate blooms of Ensign, Carabas, Mrs. Charrington, W. H. Parton, Mrs. Flight, Her Grace, Miss Willmott, Daffodil, Sir Bevys, Mrs. Eric Hambro, W. H. Parton, Cantor, Medoc, and Nymph; Mr. C. Blick second, and Mr. A. R. Brown third; three entries.

Premier place for eighteen fancy carnations was won by Mr. C. Blick, who had gorgeous blooms of Father O'Flynn, King Coffee, Rhea, Hengist, Outlaw, Mohawk, Linkman, Highland Lass, Mrs. Leo. Hunter, Erl King, Mandarin, Pasquin, Hercules, Lord Steyne, and Deerslayer; Mr. A. R. Brown second, and Mr. H. Mathias third; three competitors. Mr. Blick led for eighteen white-ground picotees with small but clean, bright specimens, all unnamed; Mr. A. R. Brown was a good second; and Mr. H. Mathias came third. For yellow-ground picotees, eighteen blooms, Mr. C. Blick was a good first, and his set consisted of Lady Flightly, Mrs. Oldfield, Sophia Western, Montezuma, John Ruskin, Leonora, Coquelin, Agnes, Clara Clemens, Lady Gascoigne, Exquisite, Her Majesty, and Regal; Mr. H. Mathias second, and Mr. A. R. Brown third.

For eighteen undressed self blooms in vases, Mr. James Douglas, Great Bookham, led the way, and among many good things had Ann Hathaway, Etna, Nevada, Amy Robsart, Carnival, and Miss Willmott; Mr. A. R. Brown second, and Mr. Chas. Turner, Slough, third. For a similar number of undressed fancy carnations, Mr. James Douglas again led the way with handsome and bright flowers, followed in due order by Mr. C. Blick and Mr. H. Mathias.

Mr. C. Blick gained first place for eighteen undressed yellow-ground picotees, his best being Valhalla, John Ruskin, Mark Twain, and Peter Pan; Mr. H. Mathias second. In the class for a dozen selfs, fancies or picotees, three blooms of each, in vases, Mr. C. Blick was first, making a good display with Mandarin, Pasquin, Agnes Sorrel, Douce Davie, Father O'Flyn, etc.; Mr. J. Douglas second, showing Celestial, a bright yellow-ground fancy; Mr. H. Mathias third. Mr. A. R. Brown was first, Mr. B. Nash, gardener to H. R. Taylor, Esq., Cheam, second, and Mr. J. Fairlie, Acton, third, for six of any bizarre or flake, Mrs. T. Lord being the premier variety. For six blooms of a white-ground picotee, Mr. A. R. Brown led with Mrs. Chaundy, very fine; Mr. B. Nash second, and Mr. R. G. Rudd, King's Norton, third.

The class for five undressed blooms, selfs, brought out a good competition, and Mr. R. Morton, Woodside Park, scored with Mrs. Eric Hambro; Messrs. Phillips and Taylor, Bracknell, second; and Mr. B. Nash third. For five fancies, similarly staged, Mr. A. R. Brown led with Margaret Thurston, finely shown; Mr. C. Blick second with Mandarin; and Messrs. Phillips and Taylor third. For five fancies, other than yellow grounds, Mr. C. Blick led with The Nizam; Mr. B. Nash second, and Mr. R. Morton third, with the same variety. For five yellow-ground picotee blooms, Mr. C. Blick led with clean, bright examples of John Ruskin; Mr. Morton second, and Mr. B. Nash third.

LOWER DIVISIONS.

In the second division, the chief awards for bizarres and flakes were won by Mr. B. Nash, Mr. C. H. Herbert, Acocks Green, Birmingham, and Messrs. Phillips and Taylor. Mr. R. G. Rudd scored for twelve selfs, and showed a fine Miss Willmott in his stand; Mr. B. Nash second, and Messrs. Phillips and Taylor third. Mr. Rudd annexed the premier award for twelve yellow-ground fancies, and he showed well; Mr. C. H. Herbert second; and Messrs. Phillips and Taylor third. Mr. C. H. Herbert Mr. Rudd, and Mr. Nash shared the awards in the order of their names in the class for white-ground picotees, and though the flowers were small, they were clean. The order of merit for a dozen yellow-ground picotees was Messrs. Phillips and Taylor, Mr. Nash, and Mr. C. H. Herbert.

Mr. R. Morton led for a dozen undressed selfs, in vases, and was followed in order by Mr. Nash and Mr. Rudd, but there were no first-rate flowers in the class. Mr. Morton was also successful for twelve fancies, in vases, and was followed here by Mr. Rudd and Messrs. Phillips and Taylor. For yellow-ground picotees, similarly displayed, Mr. Morton was once more successful, with Messrs. Phillips and Taylor and Mr. Rudd second and third respectively. Much better blooms were seen in the class for nine selfs, fancies, and yellow-grounds, three blooms of each, Mr. H. Lakeman, Thornton Heath, winning with a heavy set of Rony Buchanan, Mr. Guy Sebright, Pagon, Sport, Erl King, Bridegroom, Mrs. W. Heriot, Paganite, and Douce Davie; Mr. R. Morton second, and Messrs. Phillips and Taylor third.

In the third division the principal prizewinners were Mr. G. D. Ford, Acocks Green, Mr. A. H. Beadles, Sydenham; Mr. J. J. Sheldon, South Woodford; Mr. C. Alcock, Liverpool; Mr. C. A. Philbrick, Reading; Mr. J. J. Keen, Southampton; Mr. C. A. Linzee, Alresford; Mr. E. Charrington, Limpsfield; Mr. A. Best, Andover; Mr. H. S. Bartleet, Shooter's Hill; Mr. A. G. Russell, Woodeaton; and Mr. L. G. Gryspreedt, Croydon, Mr. Ford being specially successful.

In the fourth division, open to amateurs who do not employ a gardener regularly, the leading prizewinners were Mr. J. H. Linington, Newport; Mr. L. G. Gryspreedt; Mr. C. A. L. Brown, Hatfield Peveril; and Mr. E. Answorth, Acton, who practically secured all the awards.

OPEN CLASSES.

Several open classes were provided for nine blooms of one variety in a vase. For a pink or rose variety, Mr. J. Douglas led with Miranda; for a white variety Mr. Douglas was first with Amy Robsart, and Mr. C. Turner second with Lady White; for a dark-red Mr. J. Douglas led with grand flowers of Agnes Sorrell, and Miss Shiffner was second with the same variety; Mr. Douglas led for a yellow variety with Daffodil in grand condition, Miss Shiffner second with the same variety; for a scarlet variety Mr. Douglas led with the new Premier, and Miss Shiffner was second with H. Cutbush. For a yellow-ground picotee Mr. Douglas scored with Peregrine, and he led for a buff self with Marmion, for a fancy with Pasquin, and for any other fancy than a yellow-ground with King Edward VII., white and crimson, a bold flower.

Mr. Hayward Mathias had the best vase of carnations and picotees, and Mr. J. Fairlie, Acton, was second; for a vase of seedlings Mr. B. Nash was an easy first, and for button-holes Mrs. H. L. Sell, Luton, and Mr. A. G. Russell, Woodeaton, were the chief prizewinners.

Mr. C. Blick had a very handsome group of carnations and foliage plants, the gorgeous fancy carnations harmonising well with the bright crotons; he won first prize, and Mr. Chas. Turner, Slough, came second. Mrs. C. Blick was placed first for table decorations with a design in pale-yellow picotees; Mrs. C. H. L. Brown, Hatfield Peveril, second with deep rose-pink flowers, and Mrs. H. L. Sell, Luton, third with blush and white flowers.

NON-COMPETITIVE.

Mr. Bradford, gardener to E. H. Brown, Esq., Roehampton; Messrs. H. B. May and Sons, Edmonton; Messrs. Eggett and Son, Thames Ditton; Messrs. W. Cutbush and Son, Highgate, N.; Mr. Maurice Prichard, Christchurch; Messrs. Thos. S. Ware, Lim., Feltham; Messrs. James Carter and Co., High Holborn; Messrs. Phillips and Taylor, Bracknell; Mr. A. F. Dutton, Iver, Bucks; Mr. James Douglas, Great Bookham; and Messrs. Hugh Low and Co., Bush Hill Park, Enfield, all kept over their exhibits from the R.H.S. meeting of the previous day.

Mr. H. Miller, Harrietsham, Kent, showed several vases of self carnations, and Mr. J. Williams, Oxford Road, Ealing, showed carnations in his rustic flower stands. Mr. Wm. Sydenham, Melbourne, Derbyshire, contributed a bright display of carnations, showing popular border varieties and numerous gay seedlings.

Brentwood Horticultural Society.

JULY 16.

The exhibition of this society was, as usual, held in the grounds of Middleton Hall, which occupies a position in one of the most pleasant parts of Brentwood, and, horticulturally, it was a decided success; financially, it must have been otherwise, for it rained more or less heavily throughout the afternoon.

Roses had ample provision for them, and as they were well represented both in numbers and quality, they constituted an important and delightful feature. In the strong competition in the trade class for thirty-six blooms, Messrs. F. Cant and Co., Braiswick Nursery, Colchester, was first with a collection of finely developed blooms, and thereby became the winners of the valuable silver challenge cup; especially noteworthy were the blooms of Comte de Raimbaud, Charles Lefebvre, Bob Davidson, Horace Vernet, Dean Hole, Captain Hayward, Frau Karl Druschki, Earl of Warwick, and Maman Cochet; Messrs. R. Harkness and Co., Hitchin, second; and Messrs. B. R. Cant and Sons, Colchester, third, both firms staging excellent blooms. In competition for the prizes for twelve varieties, three blooms of each, the firm last named was a capital first, and Messrs. F. Cant and Co. followed for second place. Messrs. B. R. Cant and Sons were first also for twelve teas, staging superbly developed blooms of well-known varieties; and Messrs. F. Cant and Co. exhibited well for second place. The last-named were first for six bunches of garden roses with an attractive collection. In the amateurs' division, Mr. W. Leggett, Malton Road, was exceptionally successful, his chief successes being the winning of the silver challenge cup in the class for twelve roses, the first prize for twenty-four roses, distinct, the first for twelve roses of one colour, the variety being Dean Hole, and first for twelve teas. The Rev. J. H. Pemberton obtained premier place for garden roses, and exhibited successfully in several other classes; Mr. H. Pope and Mr. F. Davy were also successful exhibitors of roses.

Of sweet peas there was a large and beautiful display, and chief among the successful exhibitors in the principal classes were Mr. F. W. Medcalf, Mill House, Brentwood; Mr. Paul, High Street, Brentwood; Mr. J. G. Ward, Brentwood; Mr. H. Robarts, Ponders, Margarethen; and Mr. A. Geary, Brentwood. Mr. Burrell, gardener to W. Duffield, Esq., Broomfield, was first for twelve varieties of zonal pelargoniums, three trusses of each, and in the class for twelve carnations Mrs. Pilkington, Hutton Hall, Hutton, occupied the first place with superb blooms. Mr. J. Britton, Brentwood, was awarded premier honours in the class for twelve bunches of hardy flowers, and Mr. J. Burrell was second, both collections possessing much merit.

Groups arranged for effect were of great excellence, and that for which Mr. H. Holloway was awarded the first prize evinced taste of a high order; Mr. J. Bradley second. There was a strong competition in the class for decorated fireplaces, and Mr. Holloway and Mr. Turner were first and second with tasteful arrangements.

Fruit was less plentiful than might have been expected, but that staged was of excellent quality. Mr. J. Burrell was first for collections and for a dish of black grapes; Mr. Britton was first for white grapes; and Mrs. Pilkington first for melons. Strawberries were splendidly shown by Mr. F. Davey, Warley Mount, Brentwood, who was first in each of the two classes; and Mr. Rossiter was first for cherries. Table decorations were numerous, and of a high order of merit; and chief among the exhibitors were Miss King, Coggeshall, who was first in two of the classes for decorated dinner-tables, and in the class for tables decorated with wild flowers, Mrs. Hume, Ingatestone, was first with an exquisitely beautiful arrangement.

Vegetables constituted a great feature, for in addition to the many fine collections exhibited by gardeners and amateurs, there were numerous collections, and hundreds of single dishes from cottagers, all more or less meritorious. Mr. E. Barker, gardener to Lady Neave, Dagnam Park, was successful in winning the first prize in the class for eight kinds, and Mr. Holloway, gardener to Mrs. Baxter, Hutton Park, was a close second. In competition for Messrs. Sutton and Sons' prizes for six kinds, Mr. Barker, Mr. H. Turner, Brentwood, and Mr. H. Wilson, Brentwood, were first, second, and third respectively. Mr. Barker and Mr. Bradley exhibited potatoes in exceptionally good condition. Mr. Holloway had the best tomatoes, Mr. Barker the best cucumbers, and Mr. Bradley the best salads.

Cardiff Gardeners' Association.

A large number of members of the above society availed themselves of the kind invitation of Messrs. William Tressider to visit their City Nurseries, Llandaff, recently, where they were cordially received and entertained by Messrs. F. and R. Tressider on behalf of the firm. A long time was spent in viewing the forest trees, which, it was gratifying to note, were, with a few exceptions, raised from seed at their own nurseries, amongst which the Japanese larches were extremely fine. Notwithstanding the recent drought, the ornamental and fruit trees, the roses and herbaceous borders were seen to the best advantage. At the close Mr. Malpass proposed, and Mr. Mountney seconded, a hearty vote of thanks to Messrs. Tressider for the kind reception extended to the members.

FORTHCOMING ENGAGEMENTS.

SATURDAY, August 1.—Auldearn Horticultural Society.
MONDAY, August 3.—Carshalton Horticultural Society.
Weybridge Horticultural Society.
Andover Horticultural Society.
Atherstone Horticultural Society.
TUESDAY, August 4.—Royal Horticultural Society; Meeting of Floral, Fruit, and Orchid Committees at noon; General Meeting, 3 p.m.; Scientific Committee, 4 p.m.
Leicester Flower Show in Abbey Park, two days.

TO ROSARIANS.—The Rose Walk at Purley is now nearly completed, and may be seen by those interested at any time. It is within a mile of Purley Station, towards the upper end of Foxley Lane, at considerable elevation, though itself almost level ground.

About six thousand rose trees were planted last season with the greatest care.

The trees, comprising some 400 varieties, were chosen after a personal inspection from the nurseries of Messrs. Benj. R. Cant and Sons, of Colchester, winners of the N.R.S. Championship for many years, and of the Purley Challenge Cup this season in a very strong class.

The beds, 2ft. 6in. deep, were formed of clay, fibrous top spit, and manure, and the chalk subsoil adds the necessary qualification of perfect drainage, while Purley is noted for its pure air which every rose grower knows is a sine qua non of success in his favourite hobby. The general scheme is for decorative effect, free blooming garden varieties of bush roses being flanked by ramblers and other climbers, but that a fair sprinkling of exhibition sorts are included may be gathered from successes already scored at the local shows.

The 27 plots which front Rose Walk, and which comprise an area of about two-thirds of an acre each, are enclosed at the sides and rear by hedges, belts of trees, climbing roses and herbaceous plants.

In order to afford protection a picturesque lodge has been built at each end of the "Walk," and iron entrance gates are being hand wrought at the estate smithy.

With regard to the road itself, an attempt has been made to construct the finest carriage way in the whole district, and no expense has been spared to realise that aim. The sewer, gas, and water mains, electric light cable and telephone wires have been laid and branches in each case taken across the road to the respective plots in order to prevent that constant "picking up" which spoils so many good roads. Surface water drains are laid, gas lamps erected and fire hydrants fixed, while granite kerb and channel line the carriage way, which is covered with such heavy coatings of flints that it should keep its hard, smooth surface for many years. The above particulars, coupled with a glance at the road, will at once convince the visitor that no expense or trouble has been spared to produce one of the most delightful spots for a gentleman's detached residence that can be imagined.

The price of the plots in this portion of the Upper Woodcote Estate, with plan and any further information, may be obtained by applying to Mr. W. L. Winborn, Keeper's Cottage, Furze Lane, Purley.—[ADVT.]

ANSWERS TO CORRESPONDENTS.

Editorial Communications should be addressed to the Editor of the GARDENERS' MAGAZINE, 148 and 149, Aldersgate Street, E.C.

Secretaries of horticultural societies are invited to send early notification of forthcoming exhibitions and meetings, and are requested to advise us concerning changes of dates.

Specimens of plants, flowers, and fruits for naming or opinion should be sent to the Editor of the GARDENERS' MAGAZINE, "Endsleigh," Priory Park, Kew, Surrey, and as early in the week as possible. All parcels must be sufficiently prepaid.

MILDEW ON ROSES.—C. S. S., Winchester: Your roses are suffering from a very bad attack of mildew, and unless means are taken at once to clean the trees they will suffer considerably. Spray the roses with a mixture of two ounces of liver of sulphur in three gallons of water, adding one tablespoonful of liquid glue to each gallon to make the mixture adhesive. In the course of a week or ten days it may be necessary to spray again, using half an ounce of liver of sulphur to one gallon of water.

PEA AND BEAN ROOTS.—S. J., Wrexham: The statement is perfectly correct. Peas and beans should never be pulled up when the crop has been gathered, but be cut down to the ground line, leaving the roots in the soil. The bacteria that inhabit the nodules on the roots of these and other leguminous crops store up nitrogen, consequently the ground will be all the richer if the roots are left in it. Of course, digging can proceed, if necessary, at once, or the surface may be roughly forked and levelled for late green crops.

SCAB ON APPLES.—R. H. N., Chelmsford: It is quite useless to spray now for the cure of apple scab. Gather up and burn all infested leaves and fruits as they fall, and in winter the trees must be given two good dressings of the caustic soda and potash solution, to be followed, in early spring, as soon as the leaves have expanded, with a spraying of a weak—about half strength—Bordeaux mixture.

DESSERT APPLES FOR NORTH WALES.—G. F. H., Bangor: Varieties of dessert apples that are known to be useful for cultivation in the North Wales district are: Adam's Pearmain, Allington Pippin, American Mother, Baumann's Winter Reinette, Beauty of Bath, Blenheim Pippin, Chas. Ross, Cockle's Pippin, Cornish Aromatic, Court Pendu Plat, Cox's Orange Pippin, Devonshire Quarrenden, Dutch Mignonne, Fearn's Pippin, Gascoyne's Scarlet, Hubbard's Pearmain, Irish Peach, James Grieve, Kerry Pippin, King of Tomkin's County, King of the Pippins, Lady Sudeley, Lord Burghley, Melon Apple, Mr. Gladstone, Red Astrachan, Ribston Pippin, Sturmer Pippin, The Rival, Washington, Wealthy, and Worcester Pearmain.

NEW ROSE FOR COMPETITIVE PURPOSES.—B. S. B., Lancaster: If the class is for new roses of 1908, then a variety not yet in commerce could not be admitted, although it had gained an award this season. The same thing holds good with sweet peas; novelties of 1908 are taken to mean varieties catalogued in the 1908 seed catalogues, some of which are, of course, sent round before the new year.

BOXES FOR ROSES.—S. D., Epping: We cannot do better than quote the National Rose Society's regulation with reference to boxes for roses, and at the same time urge you to join the society now you propose to take up rose culture seriously: All blooms exhibited (except where specially directed in the schedule to be shown in vases or otherwise) must be staged in boxes of the regulation size, viz., 4in. high in front and 18in. wide, and of the following lengths, all outside measurements: For 24 blooms 3ft. 6in. long, for 18 blooms 2ft. 9in. long, for 12 blooms 2ft. long, for 9 blooms 1ft. 6in. long, and for 6 blooms 1ft. long. In the above boxes for single blooms the tubes must be 5in. apart each way from centre to centre of the tubes. For 8 trebles 3ft. 6in. long, for 6 trebles 2ft. 9in. long, and for 4 trebles 2ft. long.

EQUAL PRIZES.—P. S. W., Wolverhampton: It is the general rule at exhibitions that when two competitors have exhibits of equal merit, and both merit a prize, that the higher prize shall be added to the prize next in order, and the sum be equally divided between them. Thus, if two competitors are granted equal first prizes, then the first and second prize should be lumped and equally divided between these two competitors; no second prize should be awarded, but the next exhibit in order of merit should win the third prize.

COOKING APPLES FOR NORTH WALES.—G. F. H., Bangor: The following varieties of cooking apples are recommended for the North Wales district: Alfriston, Annie Elizabeth, Baron Wolseley, Beauty of Kent, Beauty of Stoke, Belle de Pontoise, Bismarck, Bramley's Seedlings, Cellini, Cox's Pomona, Duchess of Oldenburg, Dumelow's Seedling, Ecklinville, Emperor Alexander, Gloria Mundi, Golden Noble, Golden Spire, Grantonian, Hoary Morning, Hollandbury, Keswick Codlin, King Edward VII., Lady Henniker, Lane's Prince Albert, Lord Derby, Lord Grosvenor, Lord Suffield, Malster, Mank's Codlin, Mère de Ménage, Newton Wonder, Peasgood's Nonsuch, Potts' Seedling, Royal Jubilee, Sandringham, Stirling Castle, Stone's, Striped Beefing, The Queen, Tower of Glamis, Wareham Russet, and Warner's King.

CHRYSANTHEMUM YEAR BOOK.—M. R. F., Eye: The National Chrysanthemum Society has not undertaken the publication of a chrysanthemum year book this season for purely financial reasons. A year book was issued early in 1907, and it contains many very useful and instructive articles on chrysanthemum culture. We believe some copies of this year book are still to be had 1s. 3d., post free, from Mr. R. A. Witty, St. James Villa, Swain's Lane, Highgate, N.

NEW STRAWBERRY.—W. R. P., Canterbury: The variety appears to be an excellent one, but we very much doubt whether it is sufficiently distinct from a good stock of Royal Sovereign to merit a new name. Earlier fruits sent when the crop was at its best would have better enabled us to form an opinion of the variety, but, unfortunately, so many of our correspondents send us the last flowers or last fruits, or, in the case of apples and pears, very inferior samples, and expect us to form a proper opinion of the crop thereby or to give the correct names, as the case may be. This may be a compliment to us, but such procedure does not tend to correctness of judgment. The strawberries were firm, of good flavour, and beautifully packed. If the plants crop well, and are free from mildew, then the variety is well worth perpetuating, but we should need to see the crop growing before we decided whether the variety was worthy of distribution under a new name.

ONE PENNY WEEKLY, by post 1½d.

FARM AND GARDEN

THE DAIRY—POULTRY—PIGS—LIVE STOCK—ALLOTMENTS—MARKET GARDENING, etc.

This week's issue (July 25) contains the following:
COW-HOUSES IN SUMMER.
CABBAGE PLANTS FOR SALE.
CELERY FOR THE EARLY MARKET.
TOMATO DISEASES.
FORCED STRAWBERRIES.
ASPARAGUS FOR MARKET.
HEDGE-TRIMMING.
SEED-GROWING IN ESSEX.
STIMULATING THE ROOT CROPS.
SEASONABLE NOTES ON POULTRY.
INDIAN RUNNER DUCKS.
MILKING IN THE FIELD.
DUTCH CATTLE IN ENGLAND.
COWS FOR BEEF.
THE HOUSEHOLD.
HELPFUL HINTS.

SOLD BY ALL NEWSAGENTS.

OFFICES: 148 and 149, ALDERSGATE STREET, London.

NITRATE OF SODA FOR EARLY CHRYSANTHEMUMS.—G. C. H., Purley: On light and poor soils nitrate of soda is an excellent manure for early-flowering chrysanthemums if judiciously applied. It is an excellent plan to give a dressing during showery weather, or to thoroughly water it in and follow the next day with a surface hoeing. The best method of applying nitrate of soda is to mix one part of the nitrate with four parts of dry, finely-sifted soil, such as old potting soil, turning the whole four or five times to ensure thorough mixing; use one pound of the mixture to every eight square yards, spreading it as evenly as possible. Three or four dressings may be given during the season, but a fortnight should elapse between any two applications.

WITHERED APPLE SHOOTS.—T. E., Selby: We cannot be at all certain as to the cause of the mischief, unless we have an opportunity of inspecting some of the shoots that have withered. Judging from the meagre evidence contained in your letter we suspect the disease from which your apple trees are suffering is that known as the Brown Rot (Sclerotinia fructigena). One familiar result of an attack is seen in the shrivelling or mummification of the fruits, these hardening and hanging on the trees through the winter. Infected shoots, spurs, and fruits should be cut off or picked and burned, and weak Bordeaux mixture should be sprayed on the trees just as the leaves expand in spring time. A thorough winter dressing should also be given when the trees are quite dormant. Send us some of the infected shoots.

NAMES OF PLANTS.

R. H., Slough.—Curculigo recurvata.

R. J. H., Royston.—Begonia Martiana.

F. F., Bournemouth: Calandrinia Menziesi.

D. E., Long Eaton.—1, Lupinus arboreus; 2, Cupressus Lawsoniana albo-spica.

C. N. G., Ewell.—1, Zygadenus elegans; 2, Platycodon Mariesi; 3, Cimicifuga racemosa.

L. F. W., Ipswich.—1, Camassia Cusicki; 2, Trichosanthes anguinea; 3, Lagenaria vulgaris.

M. L. B., Northampton.—1, Rosa multiflora; 2, Ricinus Gibsoni; 3, Melianthes major.

C. H. M., Manchester.—1, Hieracium lanatum; 2, Empetrum nigrum; 3, Begonia heracleifolia.

R. B. T., Scarborough. — 1, Hypericum Moserianum; 2, Phlomis fruticosa; 3, Hoya carnosa.

N. F., Penarth.—1, Acacia lophantha; 2, Grevillea robusta; 3, Asparagus deflexus; 4, Panicum plicatum.

OBITUARY.

Mr. George Walker.

With regret we record the death of Mr. George Walker, head gardener at Waltham Hall, Grimsby, the residence of Sir George Doughty, M.P., which occurred under peculiarly painful circumstances. The deceased, who was in his 26th year, was appointed gardener at Waltham Hall about four months ago, appears to have been much worried because he was unable to accomplish so rapidly as he could wish the work he desired to carry through, and so in a fit of despondency he committed suicide.

CLACTON-ON-SEA. — FOR SALE, the valuable FREEHOLD PROPERTY, The Nurseries; good business; same hands 15 years; substantially-built dwelling-house, 12 rooms; 450 ft. run of Glasshouses, etc.; price low; part can remain. SPENCER, The Nurseries, Clacton-on-Sea.

SITUATION WANTED.

MANAGER or FOREMAN; 20 years' experience; age 33; single; well up in Roses, Vines, Tomatoes, Cucumbers, Chrysanthemums, Stove Plants, and Forcing; good references. F. BARROWCLIFFE, 8, Nichol Street, Brenwell, Newcastle-on-Tyne.

METEOROLOGICAL OBSERVATIONS.

TAKEN IN THE R.H.S. GARDENS AT WISLEY, SURREY.
Height above Sea-level, 150 feet.

This, the Queen of Autumn Crocus, thrives in ordinary Garden Soil.

Known as Colchicum speciosum album, each Bulb throws up from four to six snow-white flowers, as large as Pottebakker Tulips from beginning of September to end of October. It is more free and vigorous in growth and flower than any other Colchicum. For size, substance, and purity of colour, the gem of the autumn flower garden. Awarded first-class certificate by Royal Horticultural Society.

BULBS MUST BE PLANTED NOW TO FLOWER THIS AUTUMN. ORDER AT ONCE.

THE GARDENERS' MAGAZINE.

NOTES OF THE WEEK.

From Seaweeds to Roses.

To the ordinary mind it would seem to be an absolute impossibility that there can be any connection between the sometimes beautiful and sometimes weird growths which fringe our coasts and inhabit the shallower parts of the ocean and the brilliant roses which are flooding our gardens with resplendent tints. Nevertheless the evolutionist will tell us, and tell us truthfully, that the rose and all other flowering plants are the outcome of slow modifications and adaptations to changing conditions as the surface of the earth has changed its character. It is now generally accepted that life first appeared in the warm ocean waters at a time so inconceivably remote as to utterly defy definite computation. Simple at first as are the very lowest types of the present day, such as the amœba, a mere microscopic jelly-like mass, yet capable of slow movement and of absorbing any nutriment in its course through any part of its body, these organisms gradually assumed different types, becoming more and more complex in structure and presently the two great tribes, the vegetable and the animal, separated, and pursued distinct lines of development. All these, however, we must presume were aquatic; the earth at that period must have been constantly tossed and riven by earthquake throes and volcanic outbursts: flooded now by torrents of lava, and now by overwhelming invasions by the ocean due to similar catastrophic upheavals of the ocean bed. Under such conditions it is obvious that life in any form on the land had little chance of survival, and still less of any evolution on the slow progressive lines which shapes creation. In the ocean, on the other hand, the chance of survival was great, and that of destruction merely local. Presently, however, this tempestuous phase of terrestrial conditions gave place to more stable ones, and the coastal forms of life began to adapt themselves here, there, and yonder, to, first, amphibious conditions, and eventually to purely land ones. In this way there seems to be no doubt that some of the ocean vegetation became modified to suit terrestrial conditions, at first in damp, humid, marshy environments which constituted a preliminary stage to drier ones, and in our ferns and their allies the mosses, horse-tails, liverworts, and lichens we nowadays still see as it were the several grades or stages through which the transformation had been effected prior to the evolution of the seed-bearing plants by modifications of the spore-bearing ones, and the consequent ushering in of the age of flowers. Professor F. O. Bower, Regius Professor of Botany to the University of Glasgow, in his recently published work, "The Origin of a Land Flora," has brought together a vast mass of data showing, as far as possible, how this transformation has been effected by gradual modifications and adaptations of structure to meet new needs, until primordially simple forms have assumed greater and greater complexity in order to fit them the better for reproduction and dissemination, the two great factors essential in the competitive struggle for existence. In this book he points out that the ferns and their allies aforesaid inherit to this day the necessity for a watery environment at the reproductive stage of their existence, and as this formed a barrier to progress, some of the members of these associated tribes contrived to so far modify the fertilising operation bit by bit until the pollen tribe was perfected, one sort of a spore becoming the pollen grain and another the embryo seed, between which two connection was effected under conditions afforded by a dry and even arid environment. Some of the plants so modified required outside aid to carry the pollen, and hereupon began that wonderful interaction between insect and plant, the former exercising choice and the latter increasing its charm to secure a visit, until there arose that wealth of bloom with which we are happily familiar in wild plants. Man then steps in as a selective factor, and thus puts the final touch to the long evolutionary process which links in one unbroken chain the lowliest seaweed with the loveliest Queen of Flowers. When considering such a transformation, what must we think of that wonderful Creative Power which guided it throughout, and has brought it to such marvellous perfection?

MR. W. BOYES.

Mr. W. Boyes, whose portrait we have the pleasure of presenting to our readers in this issue, has long occupied a prominent position among amateur rosarians, and during the period he has devoted his leisure to the cultivation and exhibition of roses he has enjoyed the respect of all who, like himself, have a strong affection for these flowers. It is not necessary to recapitulate Mr. Boyes' many successes, for, as an exhibitor, he is widely known, but it may be said that in staging he has invariably aimed at high quality, and endeavoured to present his roses in such manner as to fully display their many attributes of beauty; and that, while a good winner, he has invariably accepted his defeats with the best possible grace. For many years Mr. Boyes resided at Derby, and he did much, by his counsel and example, to promote the cultivation of roses in the Midlands. He has also taken an active part in the work of the committee of the National Rose Society, of which, reckoned by years of service, he is one of the oldest members. Since his removal to Middleton-on-the-Wolds Mr. Boyes has been elected the hon. local secretary of the National Rose Society for Duffield, and in this position he has done such excellent service as to show that the National Rose Society is well represented in the north-east of Yorkshire.

Asparagus Fern.—A correspondent is very indignant because his collection of ferns was disqualified at a recent local flower show, owing to the inclusion of an "asparagus fern." He suggests that in disqualifying the collection the judges showed a remarkable want of knowledge of plants, and he writes, "If the 'asparagus fern' is not a fern, I should like to know what it is." It must be very unpleasant to have one's collection of plants disqualified, and we can, to some extent, understand our correspondent's feelings in the matter; but we cannot understand anyone including the "asparagus fern" in a competitive collection of ferns. The plant is not a fern, but an asparagus, probably Asparagus Sprengeri, and therefore the collection was properly disqualified. We have during the current season seen two collections of ferns in which this elegant asparagus was included, and in one case the collection was disqualified, and in the other the asparagus was overlooked. It is so easy a matter to distinguish ferns from flowering plants that there is really no excuse for confounding asparagus and ferns, and it would be difficult to find one for the absurd popular name that has been given the ornamental asparagus.

Meeting of British Association.—The meeting of the British Association will this year be held at Dublin, under the presidency of Mr. Francis Darwin, F.R.S., Reader in Botany at the Cambridge University, and has the promise of being one of the most successful gatherings the association has yet held. An excellent programme of scientific papers and discussions has been prepared, and numerous social functions have been arranged. Mr. Darwin will discuss in his presidential address the problem of the inheritance of acquired characters, previously passing under review the movements of plants that are to be used as illustrative of stimulus and reaction, establishing the modern view that morphological changes are regulated in similar manner, and restating Hering's important thesis that memory is a universal function of organised matter. Dr. F. F. Blackman is the president of the botanical section, and in his address will discuss the manifestations of the laws of physical chemistry in the living organism, and he will insist upon the importance of critical quantitative work upon vital processes, and will discuss the data relating to growth, assimilation, and respiration, and the acceleration of reaction velocity by temperature. The meetings of the botanical section is likely to prove of more general interest than usual. Professor Dixon, of Dublin, is expected to contribute a paper on the mechanism of the ascent of water in tall trees. Professor Bose, of Calcutta, will give an account, with demonstrations, of some of his investigations on the mechanical and electrical responses of plants; the Cambridge Botany School will contribute papers on the utilisation of the carbon dioxide of the atmosphere by green plants, and there will be a discussion on the origin of dicotyledons. The section devoted to educational science should also prove of interest to those concerned with horticulture. There will be a discussion on the several aspects of education in rural districts; Professor Miall and Professor J. A. Thomson, will deal with Nature study; Miss L. J. Clarke and Professor Houston will discuss the advantages of school gardens, and the methods by which they may be utilised in creating an interest in rural occupations.

Destruction of Dodder.—It is a matter of considerable interest to know that the dodder, which does much damage annually to the clover crop, can be destroyed by spraying with a solution of sulphate of iron. According to Dr. Hiltner, director of the Munich Botanical Institute, a plot was, in 1906, sown with red clover seeds containing 2,000 seeds of dodder. The latter germinated freely, and the plants grew so vigorously that they soon spread over the clover. In August it was sprayed with an 18 per cent. solution of sulphate of iron, with the result that the clover had so black an appearance that one might have thought it was ruined. After a short while, however, it made new growth, and grew at least as well as the portion which was left unsprayed. The latter was ultimately still more checked in its growth by the spreading dodder. The dodder entirely disappeared from the sprayed plot, though it afterwards made its appearance, to a small extent, in consequence of fresh infection from the adjacent plot. It is necessary the solution should be applied by means of a sprayer to ensure it falling with some force on the ground and reaching the growths of the dodder that are attached to the clover under the surface. An application with a watering can was unsuccessful.

Early Potatoes in Ireland.—The cultivation of early potatoes has been greatly extended in Ireland within the past few years, and the results have fully justified the views of those who have urged upon growers the importance of early potatoes as a paying crop. Early potatoes for market are chiefly grown in County Dublin and in the more favoured districts in the south-western counties, and are found more profitable than the various other crops grown. The majority of the crops have been sold at prices ranging from £40 to £50 per acre.

Visit to Messrs. J. K. King and Sons' Seed Farms.—A few days since a party of French landowners and farmers visited Messrs. J. K. King and Sons' seed farms and experimental grounds at Coggeshall, and, favoured by fine weather, the various crops were seen under the best conditions. The visitors were under the guidance of Messrs. G. Jourdain and E. Cassez, two of the leading professors of agriculture in France, and were received at Purley's Farm by Mr. H. T. King, the head of the firm. They then proceeded to make a tour of the several farms, and were evidently much interested in the many objects of interest that came under their notice. As growers of garden and farm seeds of all descriptions Messrs. King occupy eight farms in the Coggeshall and Chappel districts for the production of such seeds as can be the most successfully grown in the district, and for experimental purposes. The methods of procedure in the cultivation of the several crops were explained by Mr. Millard as the visitors proceeded from field to field, and the splendid condition of the cereals, the healthy growth of the various roots, and the heavy crops of cabbage, radish, and turnip seed were much admired. Of special interest to the visitors were the great breadths of nasturtiums, godetias, clarkias, etc., now producing glorious displays of colour, and the large collection of finely grown sweet peas, which also is highly attractive. In the course of their visit they were afforded an excellent opportunity for obtaining an insight into the course of procedure by which new varieties are raised and fixed, and the purity of stocks maintained. The party was entertained at luncheon by Messrs. King, and at the close thereof Professor Jourdain spoke in appreciative terms of the courtesy shown by the firm, and of the instructive and pleasant character of the visit.

R.H.S. Exhibition of Forced Bulbs.—The council of the Royal Horticultural Society have decided to make the meeting for March, 1909, a general one for the exhibition of collections of forced spring-flowering bulbs, with a view to specially demonstrating which varieties (daffodils, for instance) are the best suited for forcing. Exhibits of small collections are invited from amateurs and the trade, and medals will be awarded according to merit. The council have also accepted a series of prizes from the Dutch Bulb Growers' Society, at Haarlem, for hyacinths, and these will be competed for at this meeting. There will be four classes for hyacinths, in three of which the competition will be limited to amateurs and gentlemen's gardeners, and in the fourth nurserymen can alone compete. The amateurs' classes are for eighteen and twelve hyacinths, distinct, and for four pans containing hyacinths, ten bulbs of one variety in each; the four varieties are to be of "distinctly different colours." There are six prizes in the first class, ranging from £6 to £1; five, ranging from £5 to £1, in the second; and in the class for pans there are four prizes, ranging from £4 to £1. The trade class is for a collection of hyacinths in pots, pans, or glasses, and the prize offered therein is the gold medal of the Dutch Bulb Growers' Society.

Dublin Flower Shows.—As previously announced, the Royal Horticultural Society of Ireland will hold its summer exhibition in Dublin on Wednesday next. The provincial show of the National Sweet Pea Society will be held in association with this important gathering, and as this will be on a comparatively large scale, it is regarded with much interest in Ireland. A report of the two exhibitions will be given in our next issue.

Cricket on Grape Vines.—We learn from their "Journal" that the Board of Agriculture received an insect taken on a grape vine, and this, on examination, was found to be the common Cricket (Gryllus domesticus). This insect affects warm places, hiding during the day, and coming out to feed at night. The common food is bread and bread crumbs, and moist vegetable matter. As no previous case was known of harm done by the cricket to vines, the correspondent was asked whether, after further observation, he was absolutely satisfied that the damage complained of was due to crickets, and not to vine weevils. In reply, the Board were informed that a cricket was observed on a leaf by lamplight, the position of the leaf was noted, and the cricket left undisturbed: in the morning the leaf was found to be eaten in several places. Crickets were also observed on buds, and it was found that the buds were eaten just when they opened. After the leaves became older and tougher they did not appear to be touched.

THE GARDEN AS A HOME.

As the years pass men and women learn more of the value of outdoor living, with no screen of roof between them and heaven, no barrier of glass window shutting out pure breezes, and the modern "cure" that is most popular is, undoubtedly, that of the open-air. Children grow brown, rosy, and strong by playing all day in the garden, so though their elders cannot often enjoy twelve consecutive hours of pastime their very work may sometimes be capable of accomplishment out of doors. Now is the season to adopt the beneficial habit of making a home of the garden.

"The sun is high in heaven, the skies are
bright,
And full of blessedness.
. . . .
And every day that goes
Is a full-scented, full-blown garden rose."

But there must not be lacking outside the house certain of those comforts that are to be found within; we must have shade from scorching heat, enough warmth to maintain a sufficient temperature of the body when it is still, screens from draughts, easy seats, a table at which to work, and a stool for the feet. The scene spread out around should be not only beautiful but sweetly perfumed.

Breakfast is a meal that ought to be taken out of doors in all suitable weather. If there is a chilly wind a summerhouse or tent facing south will prove a cosy shelter; if the breeze comes from the south chairs and table can be set beneath some tree, or, if sunheat is not excessive, on the unshadowed lawn or gravel. Should there be a south-west gale blowing it will be well to take advantage of the north-east side of a fence or wall.

An umbrella-shaped canopy of tiffany, mounted on a frame of bamboo sticks and without any handle can be easily made in any size from six to twelve feet across, and is most useful to suspend from the branches of some giant oak, cedar, lime, or other tree, to serve as a protection to the breakfast table; it will prevent sun-rays from glinting through sparse foliage, and caterpillars from descending by swinging webs. To begin the day happily is a great boon, and to begin it in the fair garden is the sweet way of providing ourselves with cheering influences. As Thoreau, that great lover of Nature, wrote: "There will be so much the more air and sunshine in our thoughts."

An elaborate midday meal, or late dinner, cannot often be laid out of doors without entailing a great deal of extra labour, yet when it is possible—that is to say when space can be spared and cost does not matter—one of the new movable summer-houses, those little pavilions that can be turned upon a pivot so as to face in any direction, should be put up near the house. If it can be located on the lawn just outside the real dining-room the distance to carry dishes will not be much greater.

Surely the tea-table is never seen at so much advantage as when set in a rose-arbour? Now that Ramblers are so largely cultivated a large square or round shelter can be built of these, supported only on a few rows of hop poles with others laid across to form the roofing foundation. Either autumn-blooming roses should be added, to ensure late blossom, or cobæas, or other summer climbers must be associated with the Ramblers. A farmhouse garden known to me possesses each year a commodious arbour of scarlet runners and canary creeper, combining two kinds of service with beauty—the yield of shade and crop.

If there is a pergola of any kind that is the garden's best feature a portion of it can be used as an arbour; curtains of green linen should be made to fit the space between two of the pillars at one side, then to shut off a further stretch of the walk at one end, and also to provide a roofing, thus affording sufficient shelter. The curtains can be furnished with small rings to slip over nails fixed in the pergola wood, then they are quickly put up and taken down again.

Supper, the lightest repast of the day, is never so refreshing as when partaken of in the garden. No longer is there need for any roof, since the brightest light of the moon will be an unmixed boon; shield from cold winds we must have, and the shelter, whether of building, wall, fence, evergreen mass, or hedge, should leave a wide dry space of flooring, for turf will be moist and far too cool. Close by the seats, or the favourite nook for chairs, let us possess beds of nicotianas, verbenas, evening primroses, stocks, and mignonette. The tiny annuals Matthiola bicornis and Schizopetalon Walkeri may form the edgings, and not far away sweet briars, honeysuckles, jasmines, and lilies should flourish.

M. H.

LIGULARIA MACROPHYLLA.

The subject of this note is a hardy herbaceous perennial belonging to the natural order Compositæ, and it is generally cultivated in gardens under the above name, though it is now placed under Senecio in the Kew Hand List, where it is named Senecio Ledebouri. It is an old plant in gardens, and when established it sends up quantities of spikes densely furnished on the upper part with yellow flowers, presenting a very stately appearance in the garden during July and August. The height of established specimens is about 3ft.; but the flower stems stand clear above the foliage and invariably reach five or six feet high.

The leaves are a distinct feature; they are in the form of large paddles and of a bright glaucous green colour, being borne upon long footstalks which arise from the crown, and in specimens these cover a diameter of six feet or more.

Although the several parts attain their greatest dimensions when growing in moist positions, it is, however, one of the best subjects for ordinary borders, provided the ground is deeply worked and liberally enriched at planting; and when come to flowering strength it seems remarkable that each season's effort should eclipse the last, even when no addition has been made to the soil or assistance given in the form of artificial manures.

This old species, in spite of the host of splendid additions to this family in recent years, is yet able to maintain a position in gardens as one of the most distinct of hardy plants, and one which amateurs can always regard as an acquisition to their collection. It is propagated by division and seeds, and while the former has generally to be relied upon to obtain a stock, the latter method forms a ready means of increasing the same. The seeds should be sown thinly in shallow drills in the open ground early in summer, and if thinned to a distance of 12 or 15 inches apart, the seedlings may remain two years in the seed bed before transplanting, a process they resent at all times, and it will generally be found that by division, two, and sometimes three years elapse before the plants have sufficient strength to make an effective display.

Thomas Smith.

Walmsgate Gardens, Louth.

HORTICULTURE AT THE FRANCO-BRITISH EXHIBITION.

The part that horticulture plays in a great exhibition like that at Shepherd's Bush is no mean one, for the proper display of many and beautiful buildings depends very largely upon their surroundings. Moreover, after an inspection of thousands of paintings and photographs, after the excitement and noise of wonderful machinery, and even after the quiet and deeply interesting contributions from Canada and New Zealand, and the wonderful displays of English and French Applied Art, all in huge palaces, it is an immense relief to come out into the sunshine and let one's eyes wander over green lawns and beautiful flowers.

The avenue trees at Shepherd's Bush are not an unqualified success. Some of the poplars have done as well as could be expected, but in some of the rows the limes and poplars are by no means happy, though if they are allowed to remain for another exhibition a year hence they should give a better account of themselves.

In the following notes a few of the displays set out in the great exhibition grounds are briefly reviewed, but those not now referred to will be discussed on future occasions.

The first of the horticultural exhibits that greets a visitor who enters from the Shepherd's Bush end is one of cacti and succulents, arranged on two large tables in the corridor by Messrs. H. Cannell and Sons, Swanley. Along the centre the various cereuses are set up. and in front of these are rows of echinocacti bristling with spines, the downy but spiny Opuntia microdasys, a good Echinocactus ornatus, a pair of E. Grussoni, and numbers of specimens of the old man cactus (Pilocereus senilis), a species that on each occasion we have been present has attracted a great deal of attention.

One of the chief garden features is to be found in the large open space between the four great buildings devoted respectively to Music, French Applied Art, Women's Work, and British Applied Art. Right across the centre Messrs. Jas. Carter and Co., High Holborn, have a series of beds on grass, the several lawns being intersected by broad walks. Palms, tall cordylines, phormiums, standard bays, and acers stud the lawns and relieve the display from flatness. The lawns are all, of course, the result of Carter's lawn grass seeds. The beds are variously planted, and zonal pelargoniums have been extensively employed. Petunias, Kochia scoparia, pyrethrums, lobelias, pansies, and violas, tuberous begonias, double annual chrysanthemums, and numerous other useful summer flowers that may be easily raised from seeds are here to be found, the whole making an interesting and effective display in which the International Prize pansies and the fine self-coloured and veined petunias were specially good.

In the two large open spaces across this same square, but in the opposite direction, Messrs. Sutton and Sons, Reading, have an imposing exhibit. In the panels, worked in blue lobelia and pyrethrum, is the emblem "Sutton's Seeds," with dwarf antirrhinums on either side. Lawns made from Sutton's grass seeds surround big beds of tuberous begonias. Large beds are filled with marguerites and liliums, and others contain splendid displays of Superb petunias, the fancy striped varieties being especially attractive. Sutton's Perfection pansy is largely used for bordering, and the Reading firm's strain of garden dianthuses and godetias add their quota to the general effect. Round one of the broader pieces of water is a border of scarlet double pelargoniums, white marguerites, blue violas, and variegated cocksfoot grass.

Beyond the displays already noted, in another large square, M. R. Goyer, Limoges, France, has beds of cannas and Musa ensete, the former not yet at their best. M. Goyer contributes a collection of clematises and numerous large beds of roses, the latter including the yellow Soleil d'Or, edged with Madame Norbet Levavasseur, Prince de Bulgarie, Mrs. H. Cutbush, the very free-flowering Kaiserin Augusta Victoria, at present rather spoiled by the free use of sulphur as a mildew cure.

Messrs. Millet and Son, Bourg la Reine, Paris, contributes a large and artistically disposed collection of irises, montbretias, and gladioli, but this must be visited later. Messrs.Charles Molin, Place Bellecour, Lyons, shows roses extensively, and, like others, shows Prince de Bulgarie largely, but here, too, for the moment, the evidence of sulphur is unpleasant. Gladioli between the roses will contribute an autumn display, as will the collection of dahlias. Messrs. J. B. Guillot and Sons, Monplaiser, Lyons, are large exhibitors of roses, both standards and dwarfs, but they are not yet in good bloom.

Around the Ville de Paris building numerous well-known French nurserymen and seedsmen have made displays. Rhododendrons and other evergreens from Messrs. Moser and Sons, Versailles, make a good setting for other things, and more groups of this character would be useful in other parts of the grounds.

Messrs. Vilmorin, Andrieux, and Co., Quai de la Megisserie, Paris, have a sunken garden, edged along the central path sides with boxes of various annuals, chrysanthemums and tropæolums figuring largely. The beds on the flat are filled chiefly with varieties of begonias of the semperflorens type, and these are now very pretty. On the sloping banks similar plants have been used in a very elegant festoon design. Herbaceous plants set out in grass by Messrs. Cayeaux and Le Clerc, Quai de la Megisserie, Paris, will be at their best at a later date, as they are chiefly autumnal bloomers. Roses are quite largely shown in this part of the grounds, but they are planted very closely together, and in many cases the various labels are much too prominent. M. Ad. Rothberg, Gennevilliers, France, has beds of roses, standards and dwarfs, consisting of popular varieties. M. Bruant, Poiteres, has filled several beds with gay zonal pelargoniums and heliotrope, etc.; behind the "Ville de Paris," and close by their exhibit we notice a pagoscope, the thermometrical instrument for notifying a fall of temperature likely to be harmful, and thus giving a grower an opportunity of providing shelter; this is from Mr. T. G. Phillips, 2, Charterhouse Street, E.C.

M. Abel Chatenay, Vitry, contributes a collection of lilacs, and Messrs. Croux and Sons, of Chatenay, have some handsome blue Atlantic cedars, golden acers, and silver euonymuses, M. Aug. Nonin, Chatillon-sous-Bagneux, has a summer bedding arrangement of fuchsias, zonal pelargoniums, calceolarias, marguerites, etc., close to the building devoted to "Iron and Steel."

The most interesting of the several exhibits made by French nurserymen are those composed entirely of trained fruit trees. These are arranged all round the City of Paris Gardens in double rows. One can but admire the vast amount of time, patience, and skill expended in the production of these perfectly-trained examples. Messrs. Croux and Sons, Chatenay, have wonderful goblet-trained pears and cherries, oblique palmette plums, demi-palmette pears, and horizontally-trained pears with six rows of branches as regular and true as if cast in a mould. The double and single Y cordons, the palmette verrier specimens and those in which the branches have been crossed diamond or lozenge fashion, all show the effect of great skill and patience. M. Lecointe, Louveciennes, Seine et Oise, is another extensive exhibitor of trained trees, and notable in his set are pears trained in pyramidal outline, but with the branches tied out on a series of flat tables; and a pyramidal pear tree trained so that the branches are in five perfectly true vertical series, so that one could stand within any two rows right up to the main stem. M. H. J. Leconte, Snr, Aux Beagis, Seine, has finely trained specimens, but a number of the examples have died.

Two other very fine exhibits of these beautifully trained fruit trees—a sight well worth seeing by British gardeners, and especially by amateurs who make a hobby of fruit culture—are made by Messrs. Pinguet-Guindon, of Tours, and Messrs. Nomblet-Bruneau, of Bourg-la-Reine, Seine. The latter has a set in specially fine condition, and one that includes, beside the other firms referred to, tall standard goblet-trained plums and cherries.

NEW PLANTS, ETC.

◆

ASTILBES.

Arendsi Ceres.—This is a very beautiful astilbe, obtained by crossing A. astilboides floribunda with A. Davidiana. The colour is deep pink, very like that of the variety Queen Alexandra. The plants shown were about 2½ft. high, very graceful and effective. A.M., R.H.S., July 21. Mr. E. Arends, Rousdorf, Germany.

Arendsi Pink Pearl.—This differs from the above in having paler colouring, the shade being bright pearly pink. The spikes seem to last longer, or, in other words, the flowers open more slowly than in the case of some varieties. This is of similar parentage to Ceres.

CARNATIONS.

Cardinal.—A large sized and finely formed border carnation, of brilliant clear scarlet colour. A.M., R.H.S., July 21. Mr. James Douglas, Great Bookham.

Splendour.—Another border variety, of the finest form, and with very smooth petals; colour, rich purple crimson. A.M., R.H.S., July 21. Mr. J. Douglas.

Hercules.—An interesting carnation, obtained by crossing the Malmaison variety Maggie Hodgson with a tree or perpetual variety. It has large flowers, is very fragrant, has a non-splitting calyx, and is rich deep red. A.M., R.H.S., July 21. Mr. James Douglas.

CORIARIA JAPONICA.

A beautiful shrub, that is hardy in favoured southern localities. C. japonica differs materially from C. terminalis, as it produces an abundance of racemes of small fruits that are of a reddish hue at first, but presently they turn to a dark purple hue as they ripen. Branches carrying numerous fruiting displays are very attractive. A.M., R.H.S., July 21. Mr. Maurice Prichard, Christchurch, Hants.

ROSE, LADY GODIVA.

This lovely Wichuraiana rose bears soft salmon-pink flowers in clusters of large size. The flowers are fairly double. A.M., R.H.S., July 21. Messrs. Paul and Son, Cheshunt.

BEGONIA KEWENSIS.

This should prove a useful begonia for basket culture, owing to its semi-pendant habit, and its method of producing its white flowers in dense drooping clusters. A.M., R.H.S., July 21. Messrs. Jas. Veitch and Sons, Chelsea.

SINNINGIA DR. M. T. MASTERS.

This is probably a bigeneric hybrid between a gloxinia and a gesnera, and is, as we have already pointed out, very like a gloxinia, with flowers that droop from the apex of the footstalk. The flowers are of medium gloxinia size, bright carmine in colour, heavily shaded with crimson in the throat. Now that gloxinias are so fine, this plant, though interesting, is hardly needed. A.M., R.H.S., July 21. Mr. Ernst Benary, Erfurt, Germany.

NELUMBIUM SPECIOSUM OSIRIS.

One of the loveliest flowers we have ever seen. It is of large size, measuring fully ten inches across. The broad segments are of a delightful pink shade, deepening to rich cerise towards the apex, and merging into a yellow-pink glow around the circle of golden stamens and central yellow stigma. An exquisite aquatic for a tropical house, or where the water can be heated. F.C.C., R.H.S., July 21. Mr. Jas. Hudson, V.M.H., gardener to Leopold de Rothschild, Esq., Gunnersbury House, Acton.

STANHOPEA TIGRINA SUPERBA.

A magnificent form of a well-known old orchid, that has, unfortunately, gone out of fashion during later years. The very large fleshy flowers are creamy-yellow, heavily stained and blotched with vivid crimson, both colouring and size being an advance upon the type. F.C.C., R.H.S., July 21. Messrs. Charlesworth and Co., Heaton, Bradford.

ANGRÆCUM AUGUSTUM.

An interesting species with white flowers borne in two ranks on an arching spike. The flowers are of moderate size, and each has a long slender green spur. A.M., R.H.S., July 21. Mr. White, orchid grower to Sir Trevor Lawrence, Bart., Burford Lodge, Dorking.

ODONTIODA THWAITESI.

This differs from recently raised odontiodas in having a rosy-lilac lip, and rosy-purple sepals and petals, the colouring at once suggesting the parentage, i.e., Cochlioda vulcanica and Odontoglossum Harryanum. A.M., R.H.S., July 21. Mr. R. G. Thwaites, Chessington, Streatham.

SWEET PEAS.

George Stark.—A very handsome and brilliant scarlet sweet pea, that is a splendid waved counterpart of the popular smooth variety named Queen Alexandra. F.C.C., and silver medal as the best novelty, N.S.P.S., July 10, at the Reading Trials. Messrs. George Stark and Son, Great Ryburgh.

Mrs. Andrew Ireland.—A beautiful bicolor sweet pea, with very bold, wavy, bright rose-pink standard, and broad blush white wings. F.C.C., N.S.P.S., July 10, at the Reading trials. Messrs. Dobbie and Co., Rothesay.

Mrs. Henry Bell.—A delightful pink variety of salmon shade, wavy, but with a standard inclined to hood a little. Very graceful and pretty. F.C.C., N.S.P.S., July 10, at the Reading trials. Mr. Robt. Bolton, Warton, Carnforth.

BULBOPHYLLUM BINNENDIJKII.

An attractive species of striking character, bearing large flowers, from seven to ten on a spike; the sepals and petals bright green spotted with brown, the lip pale green suffused and marbled with red-purple. This bulbophyllum was discovered on the mountains near Buitenzorg, and made its appearance in London in the spring of 1807 under the name of B. Ericssoni, Kraenzl, when it obtained considerable attention. "Bot. Mag.," t., 8,187.

KÆMPFERIA KIRKII VAR. ELATIOR.

A beautiful variety of Kirk's Ginger that would probably obtain considerable attention were tropical plants more popular than is at present the case. It is a native of British and German East Africa, attains a height ranging from fifteen to eighteen inches, has handsome oblanceolate leaves, and bears its flowers on erect spikes, four or five on each; the flowers are about three inches in diameter, and have a white tube, bright rose-pink lobes, and yellow staminodes marked with red. "Bot. Mag.," t., 8,188.

SAXIFRAGA BRUNONIANA.

A distinct and interesting species, having a wide range in the Himalaya mountains at an elevation ranging from 9,000 to 13,000ft. The growth is rather thin, and the flowers are bright yellow and borne on erect spikes with red stems. From the lower leaves of the flower stems thread-like runners bearing leaf-buds at their tips are produced, and as these are red, as in the case of the stems, they contribute to the attractions of the plants when in bloom. The species has proved hardy on the rockery at Kew, but, according to Mr. W. Watson, it appears to best advantage when grown in a pan and given the protection of an unheated structure. "Bot. Mag.," t. 8,189.

PUYA VIOLACEA.

A handsome bromeliad from Chile, having long narrow leaves, arranged in dense clusters, from which rise the rather tall much-branched flower spikes. The flowers are comparatively large and of a rich violet hue. Puya violacea "was first raised from seeds in the Jardin des Plantes in 1833, and flowered for the first time at Neuilly in 1847." "Bot. Mag.," t. 8,194.

STRAWBERRIES IN 1908.

Strawberry plants came through the winter fairly well, but a few varieties lost their foliage owing to the snow and frost—but they all started into growth freely and have given good average crops—specially heavy and fine in North Kent, where the berries have been larger than with me. A friend in the Southampton district says the crop there all came in at once, owing to the very hot weather, and values fell so low that although the crop was double that of 1907, its value was less. But in fruit like strawberries the weather, both for picking and consumption, is a most uncertain factor.

No particular variety has stood out in the front this year; Royal Sovereign and Sir Joseph Paxton still remain our leading and reliable sorts. The earliest we gathered was Leo XIII., which came four or five days before any other, and as the flavour is excellent, with rich pine suggestion, and fair sized berries, I think it will prove valuable for first pickings; it also remains a long time in fruit. In Laxton's recent introductions Reward maintains its position as a handsome dark fruit, of large size and fine flavour. I fear my land is too light for The Bedford, or Bedford Champion to show themselves to advantage, as they have only given a moderate crop, but with some fine large berries. Progress, which was poor last year (a wet time), has this season been very good in size and crop; its remarkable vigour of foliage should enable hybridisers to obtain greater strength in such splendid flavoured kinds as Frogmore Late Pine, Countess, etc.

Laxton's Latest has borne out the good opinion I formed of it in 1907, and has produced very fine four-sided fruits, solid all through; it, however, is not productive, and must remain a connoisseur's garden sort. [illegible] and Cropper have not been established with me long enough to warrant an opinion, and the strawberry is so fickle that one hesitates to write of novelties till they have been tried in various soils, and probably these high-bred fruits want first-rate culture, which in our open fields we cannot give them.

Fillbasket has produced an enormous crop but came in the dry and hot weather and lost flavour, while next to them the old Filbert Pine had an equally fine crop of the richest quality. These two sorts would pay for thinning out. The orange-red colour of Filbert Pine is against it, but few in its season can compare with it in flavour.

Givon's Late Prolific has been extra fine and is one every garden should contain, its large rich fruits, just complete the season of big berries. It should be planted one and a half feet apart in the rows, when its ample foliage would protect the fruits more than when a wider row is made. The dis[illegible] Kentish Favourite I am unable to [illegible] from Leader. The fruits are alike [illegible], but the former may be more vigorous in foliage. Louis Gauthier, with its cockscomb, whitish-pink fruit is becoming a great favourite, both forced and in the open. It is one of the heaviest bearers and has a distinct and pleasant flavour when not left too long on the plant. Some fruits have measured five inches round. President Loubet, of the Waterloo type, is good, but not a heavy bearer. Laxton's New Perpetual, of good flavour in July, I have not yet proved, but Antoine de Padoue is so far the best autumnal fruiter. The older St. Joseph is smaller, but full flavoured. The foreign kinds, President Carnot, La Productive, and General Chanzy, are of no value here. The finest strawberries I have seen this year were those in the collection from Mr. Coomber, the Hendre Gardens, at the Holland House show. Each variety was at its best, and a credit to the grower. Mr. Jas. Hudson grew Reward very finely indeed, showing handsome fruits, wedge shaped, of rich colour, and attractive flavour.

We began to pick on June 16, six to eight days earlier than in 1906-7, and finished July 16—a short season, owing to the forcing weather. The beds were very healthy and we have had no mildew. The season has again emphasised the importance of deep and rich cultivation, for where this has not been given the fruit has failed in quantity and quality.

Mr. C. E. Shea tells me he has entirely adopted the one-year system, and finds the crop is earlier and the berries much larger than from two-year-old beds. I recommend this idea, but late sorts, such as Waterloo and Givon's Late Prolific, should be retained for two years, as in the one-year-old plants the foliage is so thin that the plants do not properly lengthen out the season.

George Bunyard.

Maidstone.

NEW SWEET PEA MRS. H. BELL.

Awarded F.C.C., in the N.S.P.S. trials at Reading. Flowers of large size and exquisitely coloured cream and pink.

Nita Weldon is the correct name of the beautiful new rose figured in our issue of July 11, under the name of Meta Weldon. It would be an immense advantage were the National Rose Society to place the names of the new varieties on the boxes immediately they have been judged, instead of waiting until the award cards have been filled up later in the day.

CUT FLOWERS IN SUMMER.

The fashion of decorating, not only the dinner table, but various parts of the house, with cut flowers has now become so widely, one might say universally, adopted, and the demands for material for the purpose have become so exacting, that no man can expect a garden to have the appreciation of the ladies of his household unless there is an ample supply of flowers with which they can indulge their fancies. The mere man, though possibly getting as much enjoyment out of the contemplation of the table decorations at meal times as anyone, yet refrains from expressing much appreciation for fear of giving excuse for more extended raids upon the garden. The only suggestion I can make for protecting, at least to some extent, the most prized parts of one's garden, is to grow plenty of material elsewhere, solely for the purpose of supplying the house.

FIRST PRIZE VASE OF SWEET PEAS.
Exhibited by Miss Jessie Cuthbertson, at the N.S.P.S. Show.

Roses.

Some are born with a truly artistic sense, knowing how to arrange flowers to the best advantage from their early years, while others learn from observation of the methods of their friends and acquaintances. It is the season, however, when more pleasure may be derived from the exercise of restraint than from the gratification of the desire to display the profusion of the season within the house. Let us take the rose as an instance. Some like to have large open bowls crammed full with, perhaps, twenty or thirty exhibition blooms, all with short stems, and massed together. Tastes in this matter differ very widely, and it is unwise to lay down any hard and fast rules, but this much may be said, namely, that, if one of the objects to be kept in view in arranging flowers is to preserve as much as possible of the natural grace of the flowers, this way of using roses quite defeats that object. It has been said that hybrid perpetuals do not lend themselves to cutting with long stems and plenty of foliage, as the latter is not attractive, and if this is so it would be better to confine their use to that of specimen blooms in small glasses on the table. On the other hand, with teas and hybrid teas, where the foliage of the summer shoots is only less beautiful than the flowers themselves, no arrangement can improve upon two or three sprays of the same variety, with foliage and young shoots of the same, arranged in a silver or china bowl, or wide Munstead glass, with plenty of room to display the beauty of both flower and foliage fully. The polyantha section, sweet briars, Chinese and rugosa roses (the foliage and buds of these two being especially beautiful), and the numerous decorative varieties we now have in gardens, may all be treated in the same way very effectively, and with economy of material at the same time.

Sweet Peas.

Next to the rose, the sweet pea has, perhaps, of recent years, become the most commonly used flower for indoor decoration, at least at this season. A mistake is generally made in growing sweet peas so thickly that they do not grow strongly enough to furnish that abundance of strong laterals for cutting which is desirable. We generally see them cut with their flower stems only, and arranged in small vases or bowls, with the ubiquitous gypsophila, or, what is worse, scores of blooms of various shades of red, pink, and purple, tucked together into a trumpet vase. I venture to assert that an infinitely preferable way is to cut sprays a foot to eighteen inches long, with tendrils and unopened buds, and to arrange these rather loosely in an open bowl, with the help of some floral aid contrivance. The reds and purples do not mix well together, and, in general, not more than one or two varieties should be put in the same receptacle. Though one variety only in an arrangement can hardly be improved upon, yet a mixture of two or three of the various delicate shades of this flower may well call forth all the taste and skill of the colourist.

Lilies.

Lilies are a very large family, and though not many species succeed sufficiently well in ordinary gardens to furnish much material for cutting, most of us can get an abundance of Madonna—perhaps the most beautiful—as well as tiger, Turk's cap, orange, and nankeen lilies. Lilies, in general, should be cut with two or three feet of stem, and arranged in vessels suitable to such majestic flowers. The stems should be slit up a few inches, and immersed in a good depth of water, their duration being increased if, previous to arranging, the stems are put in warm water. White lilies, when they have to be carried some distance by hand, should have the anthers wrapped in a little tissue paper. They are, unfortunately, too strongly scented for a small room, or for any room that is not well ventilated.

Carnations.

The carnation needs to be well grown to provide good material for cutting, as it is not effective on short stems—except as single blooms in small specimen glasses—and long stems, if weak, are not suitable. Cutting carnations means a sacrifice of many buds, though these add greatly to the beauty of the arrangement, the buds of few flowers being of more beautiful form than those of this favourite flower. Tall vases are best for them, either trumpet or funnel-shaped, the side or lip lending some support to the stems. Where these flowers are plentiful, especially those of any one variety, there is nothing more beautiful than an arrangement in a fancy basket, in a vessel of water, of course, the sides of the basket, if sloping outwards at the right angle, lending support to those stems which need it. **Alger Petts.**

(To be continued.)

Antherozoids is the name given to the fertilising organisms of ferns and their allies, and although extremely minute, are of extreme interest to students of life forms, since although generated within vegetative cells, and undoubtedly truly vegetable in character, they behave precisely as microscopic members of the animal kingdom do, so far as independent locomotion, by means of active cilia or swimming hairs are concerned, and even give evidence of volition by steering in certain definite directions towards a desired goal, i.e., the seed to be fertilised. It is certainly one of the most striking scenes in microscopical investigation to catch one of the antheridia or capsules containing these bodies in the act of bursting, and sending out its score or so of slender-looking tadpole-like swimmers into the dewdrop provided for their accommodation on the underside of the "prothallus" or flowering scale. The field of view is immediately filled with moving organisms, which, had their origin not been ascertained, would never be taken for vegetative ones. We have already spoken of volition, though it seems impossible that such minute organisms can have a will of their own and act upon it; yet skilled observers have noted that if a tiny touch of malic acid be placed on the prothallus, these little bodies steer for it. This acid, it may be said, has been used as a lure because its presence has been traced in the archegonia at the base of which lies the embryo seed which it is their function to fertilise.—C. T. D

ASSOCIATIONS FOR THE FORMATION OF SMALL HOLDINGS.

The Small Holdings and Allotments Act of [illegible] session authorises local authorities, with [illegible] consent of the Board of Agriculture, to [illegible] small holdings and allotments to any association formed for the purpose of creating or promoting the creation of small holdings or allotments, and so constituted that [illegible] division of profits amongst the members [illegible] association is prohibited or restricted [illegible] sections 9 and 21 (3) of the Act.)

With the view of facilitating the formation of such associations, and of enabling existing societies to alter their rules in order to bring them within the requirements of the Act, the Board of Agriculture have, in consultation with the Registrar of Friendly Societies, drawn up the following rules (which we reprint from the Board's "Journal") which must be adopted by any association or society desiring to hire land from a local authority under the Act:—

Small Holdings and Allotments.

(1) The objects of the society shall include the business of creating, or promoting the creation of, small holdings or allotments, and encouraging their proper cultivation, with power to acquire land from local authorities acting under the provisions of any Act for the time being in force relating to small holdings or allotments, or from any other person or body, to adapt any land so acquired for small holdings or allotments by the erection of dwelling-houses or other buildings or the execution of any other improvement, and to let the land to members of the society to be cultivated by them as small holdings or allotments.

Small Holdings and Allotments Accounts.

(2) Separate accounts shall be kept by the society of all receipts and expenditure of the society under the Rule headed "Small Holdings and Allotments." The receipts shall be applicable for the following purposes and no other purpose, whether during the existence of the society or on dissolution:—

(i) For payment of the expenses of managing land acquired under the said rule, including payment of rent, rates, taxes, and other like outgoings;

(ii) For payment of expenses of repairs or improvements from time to time made by the society on such land;

(iii) For payment to the general account of the society of interest at the rate of £5 per cent. per annum on all capital expenditure by the society on the acquisition or adaptation of such land.

(iv) For recouping capital expenditure by the society on improvement or adaptation of the land within such period as is reasonable, having regard to the probable duration of the improvement or work of adaptation;

(v) For forming a reserve fund not exceeding [one] year's annual value of the land, and so that such reserve fund shall be available for any purpose authorised by this Rule but for no other purpose;

(vi) For prizes for the encouragement of the proper cultivation of the land; and

(vii) For creating or promoting the creation of small holdings or allotments generally.

Nothing in this Rule shall prejudice or affect any right or remedy of any creditor of the society.

The advantages of letting land to an association need very little emphasising. The local authority will receive its rent in a [illegible] from the association, and will be relieved of a good deal of the responsibility in connection with the management of the land. The association will select its own tenants, supervise the cultivation of the land and collect the rents from its individual members. It will be to the interest of every member to see that the tenants are carefully chosen, and that the land is well farmed.

By adopting the foregoing rules existing societies can become land renting societies under local authorities, and so widen considerably their sphere of usefulness. Accordingly the Board have been in correspondence with the Agricultural Organisation Society and the Co-operative Union in the belief that the far-reaching organisation of these bodies forms the best channel by which practical effect may be given to the special provisions of the Act to which reference has been made.

The Agricultural Organisation Society of Dacre House, Dacre Street, Westminster, S.W., has hitherto done useful work in promoting the formation of local agricultural trading societies on co-operative lines, and under its auspices such societies have been established in various parts of the country for the purpose of enabling farmers to purchase their requirements and to sell their produce by organised co-operative methods. By arrangement with the society the two special rules drawn up by the Board have been incorporated in the Model Rules which the society issues for the guidance of those desiring to form a local society of the nature indicated. A society formed on the basis of these rules will therefore not only qualify as the tenant of land under a local authority, but will at the same time be in a position to offer its members the advantages to be obtained from co-operative methods of business.

In the case of the Co-operative Union and industrial co-operative societies generally, still greater benefits may be expected to result from the use of the powers given by the Act. These societies already possess the machinery to enable them to handle large quantities of agricultural and market garden produce, and, flourishing as they do chiefly in the large centres of industrial population, they can provide a ready market for such produce.

The fact that some of the industrial societies have acquired by their own efforts, and already manage successfully, considerable areas of land, is a good augury for the successful development of the agricultural side of the co-operative movement. It is therefore a matter of satisfaction that the negotiations between the Board and the Co-operative Union have resulted in an active movement on the part of the latter body to encourage industrial co-operative societies to avail themselves of the opportunities given by the Act.

NEW SWEET PEA GEORGE STARK.

Awarded F.C.C., and silver medal in the N.S.P.S. trials at Reading. Flowers large, the standards waved, and the colour rich scarlet.

PRUNING FRUIT TREES IN SUMMER.

There is much to be said for and against the practice of summer pruning. Among the advocates for such work are necessarily practical fruit growers, who, from past experience, have found the advantages derivable from such detail in the improved condition of their trees and crops. There are many trees, we know, that would well repay summer pruning—large bush and pyramid trees of the garden, for instance, which have to forego the attention because in so many instances the staff is insufficient.

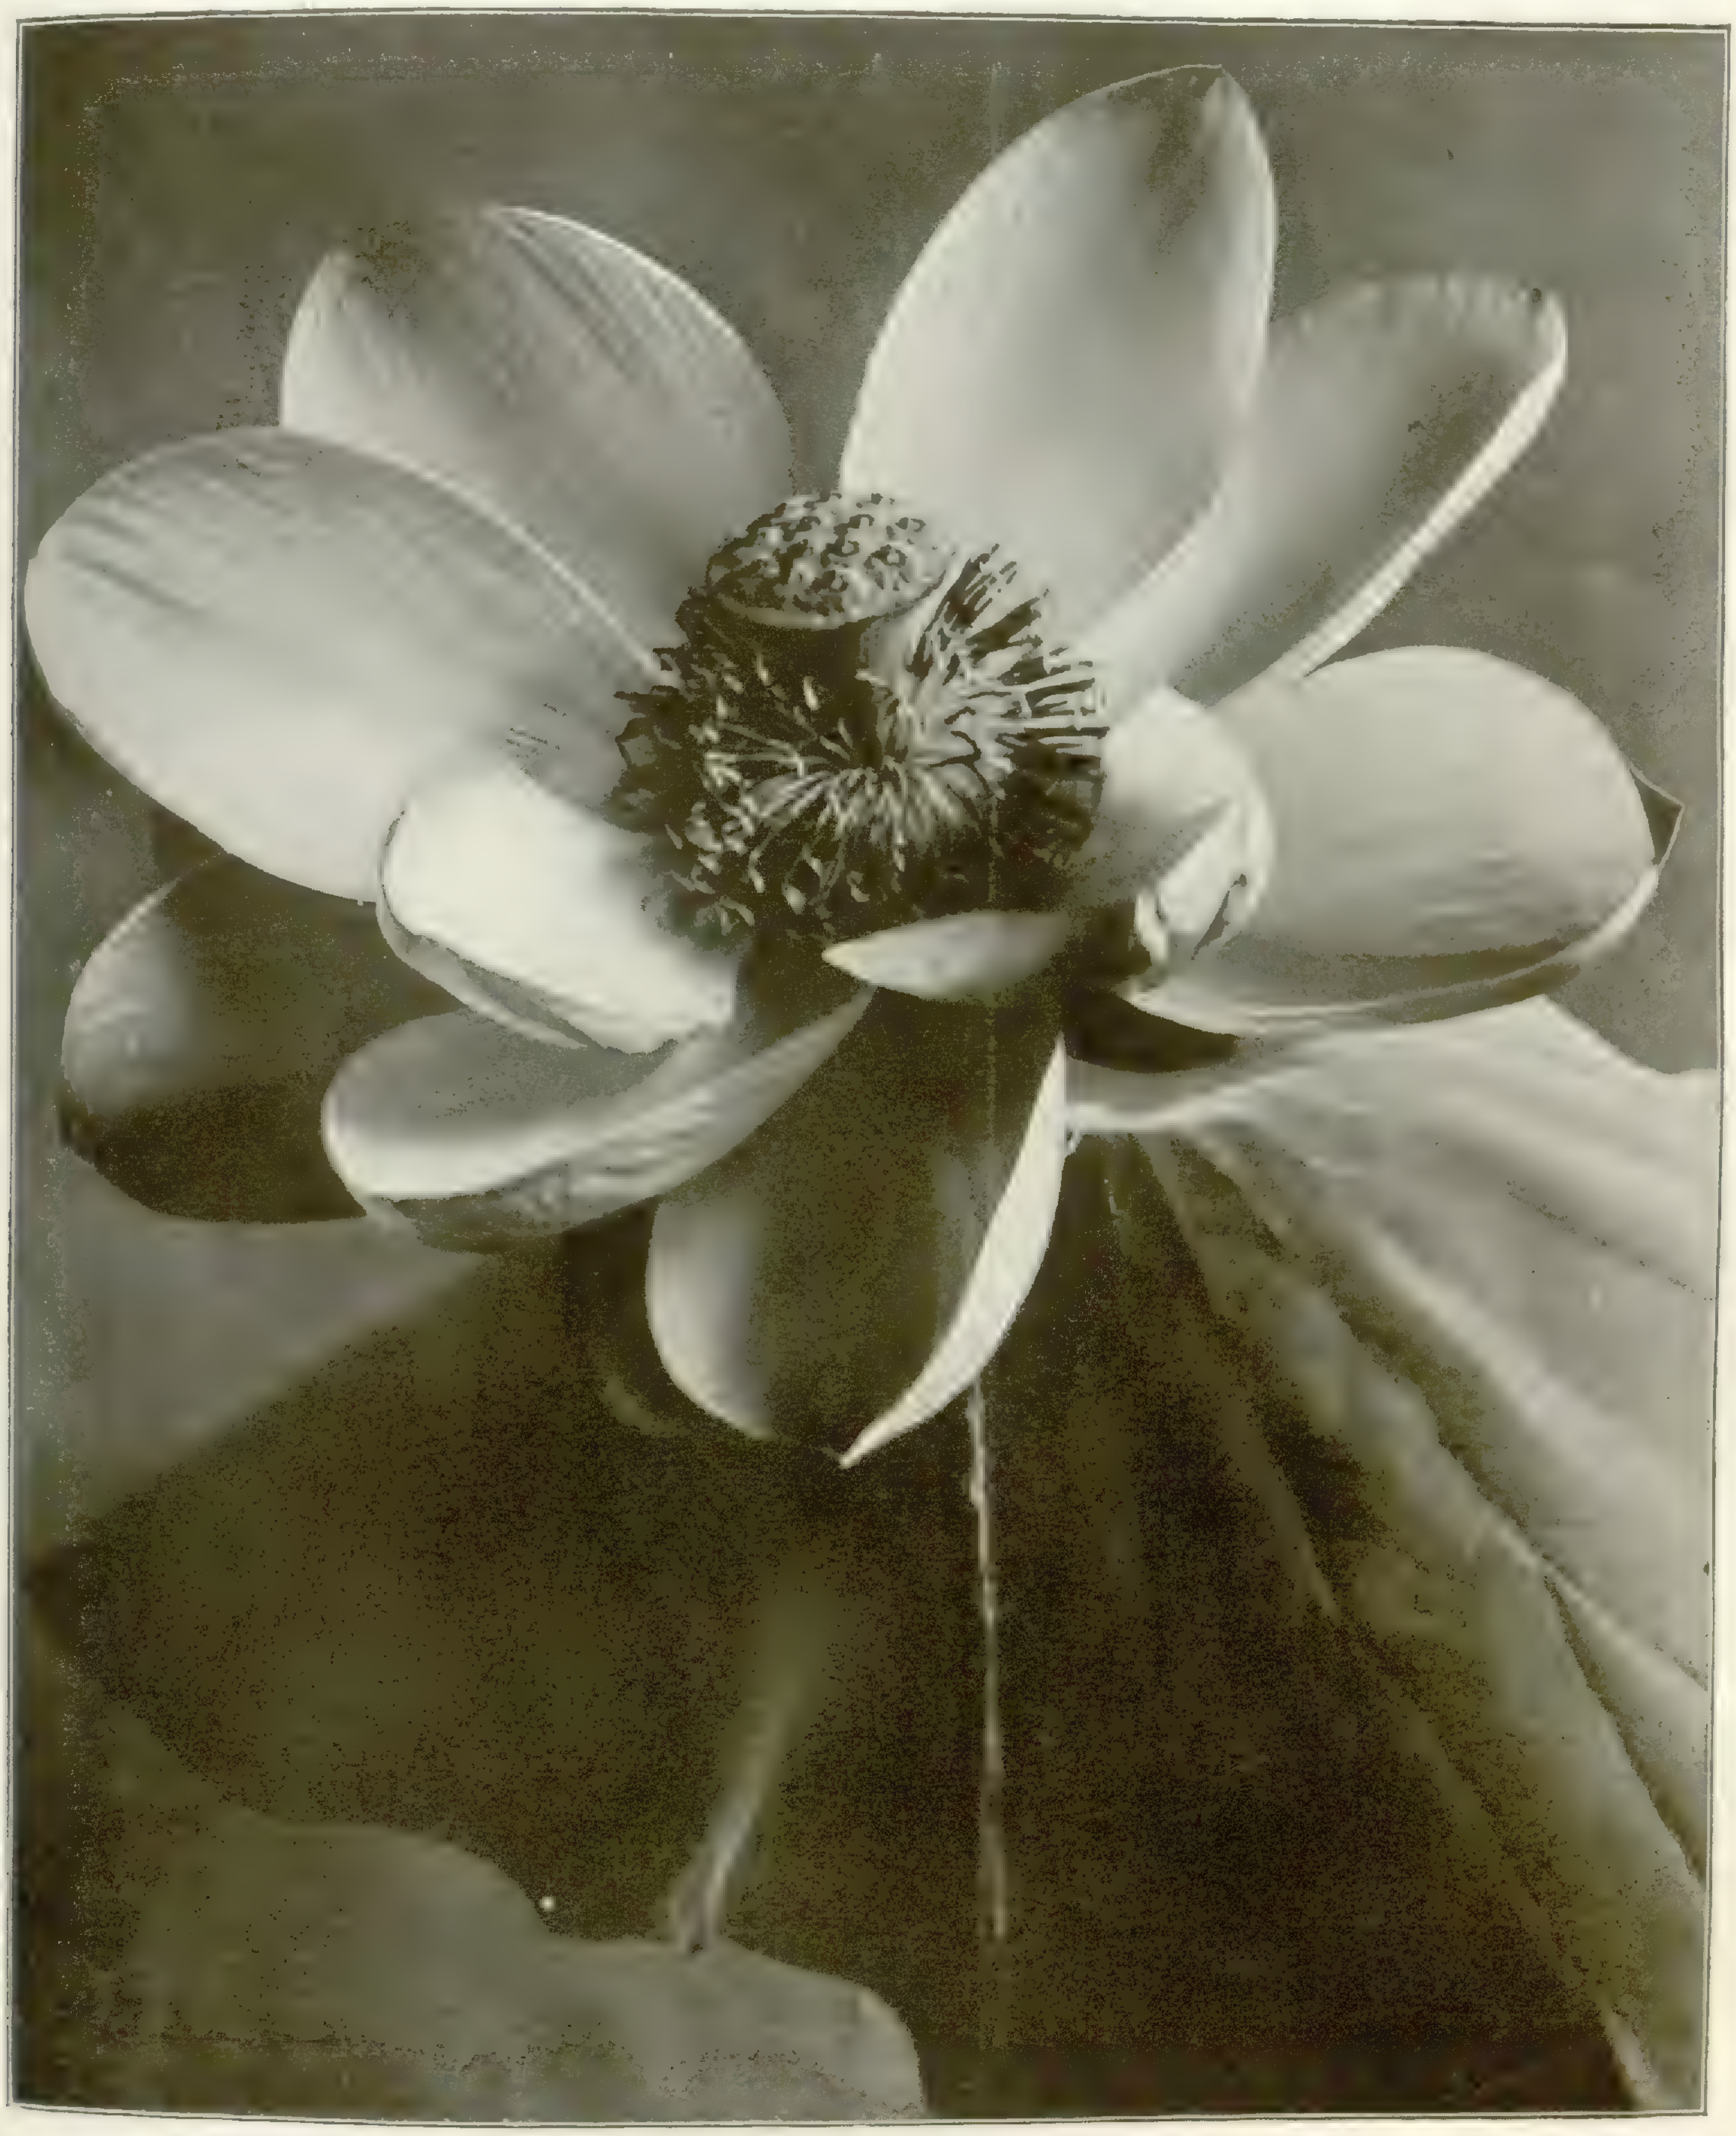
NEW SWEET PEA MRS. ANDREW IRELAND.
Awarded F.C.C. in the N.S.P.S. trials at Reading. Flowers large, with waved standards, and attractively coloured carmine-pink and blush.

Summer pruning is practised principally on wall-trained, cordon, and espalier trees, and sometimes even these make heavy demands on the staff. Those who abuse summer pruning are persons, who, without adequate knowledge, practise it without discrimination, and in this way often do more harm than good. By too early a curbing of the summer shoot, vital forces are directed to the basal buds, causing them to start into growth at a time when Nature otherwise decrees they should remain dormant. In the case of a full-grown tree, it would be better to avoid pruning altogether than to carry it out at an early period of the summer. Judgment, too, must be brought to bear upon the variety of tree to be dealt with.

Except in the case of trained trees not much attention is devoted to apples, as a rule, in the matter of summer pruning, yet much advantage would accrue from the removal of surplus sprays, which both obstruct the passing sun-ray, as well as hinder the full maturity of the advancing fruit-spur. Beside, a much more ready estimate of the space can be made when the leaves are present on the branch than is possible in winter, when they are pruned in a nude state. It is usually regarded as essential to cut the spare shoots from wall surfaces, no matter what the kind of tree, and it is equally necessary in the case of bush and pyramidal trees.

We find it a good practice in the case of wall trees to prune the lower half early in July, deferring the completion some ten days or a fortnight. In this way there is very little sign of secondary growth from the pruned spurs, because the upper part of the tree converts the passing sap into wood tissue without much enforced effort. Much depends on the weather in regard to the action of sap movement, the passing summer has been one that has tended to lessen exuberance of leaf shoot, except where trees are deeply rooted, and the soil heavy and moist. It was quite safe to prune plums, pears, and cherries by the second week of July, but apples need more time to allow them to finish their summer course. It is a quite reasonable condition that apple growth should be later, when one remembers these are, perhaps, the latest of our garden trees to start in spring. It is therefore a good policy to defer the pruning of these trees until all others are finished. The points of the shoots themselves are the best guide in deciding on this summer work, not only in the case of apples, but of other fruits also. When it is seen that the last leaf is forming at the point of the shoot, pruning may be proceeded with without any apprehension with regard to the possible ill effects from the bursting of basal buds. There is no possible gain in shortening back these green shoots to the first bud, even should the condition of the tree make it possible to do so. At least four leaves should be left when pruning, shortening these again in winter. It is, of course, not these current shoots now pruned that become fruit spurs for next season's fruit productions. Thus, while the summer's growth, acting under the force of a tropical sun may apparently be complete, a heavy soaking of rain and change of temperature may stimulate the growth, and in such case the closely pruned tree would run riot, much disturbing earlier prospects.

Nailing of reserved shoots follow closely on the pruning; then there is less danger of breaking stubborn leaders, the wall is neat, and, moreover, the growth is then in the best position for maturing its wood tissue. Such work commences with peaches and nectarines, which are the first trees to demand this attention. It is particularly desirable to nail or tie in the shoots of sweet cherries, because, often, these grow very awkwardly, and unless they are brought into position while they are flexible, ugly-formed branches become inevitable. Morellos are often left unpruned, so that nets, when placed over them, are kept well away from the ripe fruit, which have such attractions for thrushes and blackbirds. Certainly, the thinning of these lateral shoots can be made prior to the placing on of nets, even when nailing is deferred. There is always a large surplus of green summer shoots in Morello cherries to be dealt with at some time, and the advantage is all in favour of the tree, if these are removed in July. Apricots need to be especially remembered early,for they are so liable to gumming that the less they are pruned in winter the better. Very strong shoots are better cut back early in the season, so that the wounds heal over quickly. Many advocate the pinching of apricot shoots in order to maintain a freedom from branch troubles, but in some gardens, whatever course is taken, the mysterious collapse of branches continues. Where [illegible] out of doors a thinning of summer shoots admits additional air and sun, which is most beneficial. Figs need, broadly speaking, a treatment suited to local conditions. There are some soils which do not encourage coarse growth, consequently a difference in practice is permissible. Usually they fruit freely near the coast, and are not so much influenced by winter's frost; indeed, they succeed as bushes in the open garden.



NELUMBIUM SPECIOSUM OSIRIS.

Exhibited at the R.H.S. Meeting, July 22, when it was awarded a F.C.C. Flowers large, and the colour rich rose.

[illegible], and wire-trained gooseberries need the same attention as is paid to other [illegible]. The removal of all surplus [illegible], followed by the training of the [illegible] shoots, seems to accelerate the growth of the fruit, and it also expedites [illegible] the work of gathering, rendering it a really simple matter compared to [illegible] from bush-grown trees. Both trained and bush currants, red and white, may advantageously be given similar treatment. [illegible] by an early thinning of superfluous shoots that the crop ripens quicker, which is a marked advantage, because often it is found that much of the raspberry crop is gone before the currants are ready for gathering. The need for protection may be felt more keenly in this case, because the exposure of the fruit to sunshine and air makes bird molestation more easy. Wire enclosures dispel this fear of fruit loss attendant on the pruning away of the protective growth. In the case of currants, the main, or leading, growths are not shortened, but only the side laterals. Black currants are better thinned after the crop is cleared, then the older fruiting branches can be cut clean out to give room to their successors.

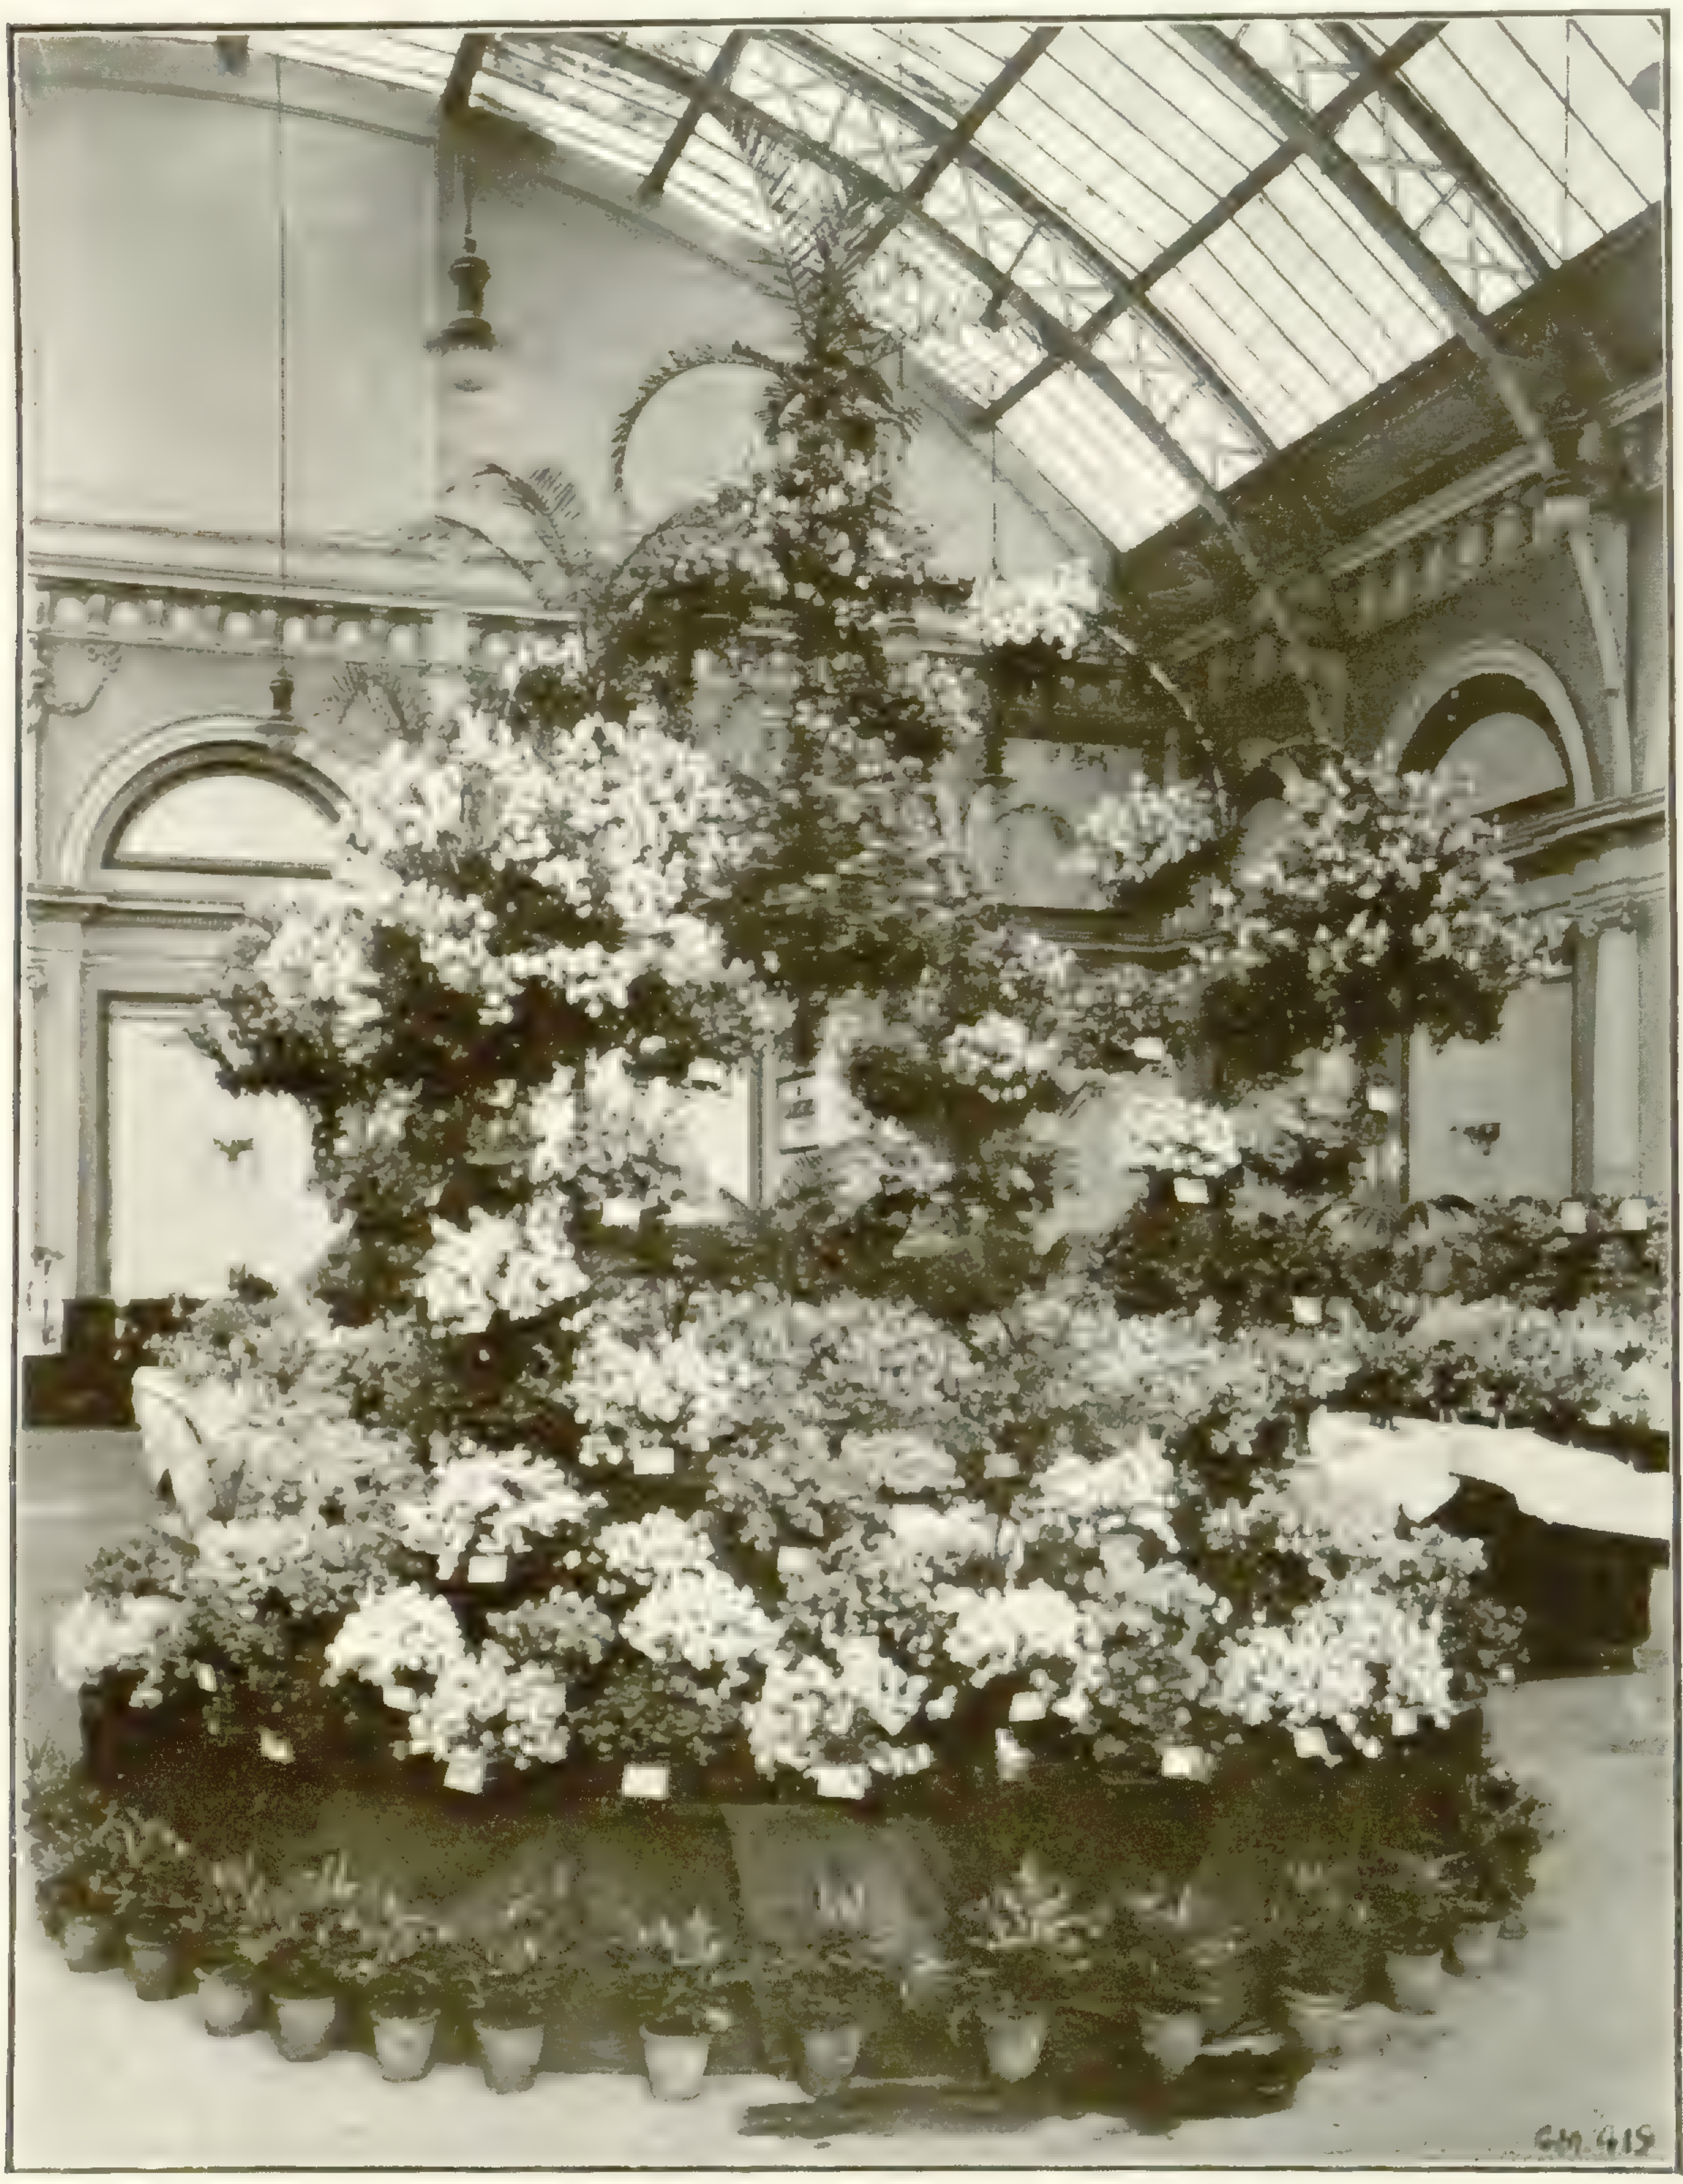
PROFITABLE FRUIT GROWING for Cottagers and Small Holders of Land.—By John Wright, V.M.H. A Gold Medal Essay, written for the Worshipful Company of Fruiterers. Fully illustrated. Price 1s., by post 1s. 3d., from W. H. and L. Collingridge, 148 and 149. Aldersgate Street, London.

DWARF CAMPANULAS.

The marked interest associated with this most diverse section of the campanula family, and the utility of the several members for filling various positions in the flower garden, is sufficient recommendation for a closer study of the group by all gardeners who are desirous of using the various hardy subjects to the best advantage. For the creation of a summer display of blossom in the rock gardens the campanulas are unsurpassed, and the soft blues, lilacs, purples, and whites which are found amongst their charming colours produce a delightfully cool and pleasing effect when they are at their best. With the majority of the campanulas culture is comparatively easy, and, though a few species give a little additional trouble, the majority are at home in a fairly cool and well-drained position. Though the dwarf bell-flowers generally like a cool root run, yet they may be classed as sun-lovers, and are not adapted for culture where much shade obtains. An especially good position for these campanulas is that portion of the rock garden known as "the sunken valley," where they can obtain a cool root run and a good amount of diffused sunlight. Moreover, if the valley runs east to west, one can also obtain positions in which the various species and their varieties can obtain the amount of sunshine which they may seem to especially desire.

The quiet beauty of a good collection in full blossom will astonish those who are not acquainted with the majority of the dwarf forms.



A BEAUTIFUL ARRANGEMENT OF SWEET PEAS
Exhibited by Messrs. J. Carter and Co., at the N.S.P.S. Show.

The labour spent during recent years among the dwarf campanulas has resulted in a twofold benefit, in that new species have been introduced to cultivation, and many charming hybrid and varietal forms have been raised. For instance, the varieties of the Carpathian Bell-Flower, C. carpathica, at one time practically limited to the well-known alba, are now supplemented by such forms as Riverslea, a deep-hued gem, White Star and Little Gem, two pretty white forms of distinct appearance, and when you add to these such daintily coloured varieties as China Cup, cælestina, and grandiflora, one is able to better understand the possibilities of any one species. With reference to the unbounded potentialities of the raising of hybrid forms, one has only to note the charming hybrids in present day culture. Stansfieldi, for instance, is a hybrid between carpathica and Waldsteiniana and G. F. Wilson; Hendersoni, Fergusoni, and other useful gems are of hybrid origin. When one remembers that many species remain as yet practically untouched by the hand of the hybridist, it at once becomes apparent that much remains to be done in this direction.

The very distinct species, such as the dainty C. Zoysi, the effective C. Raineri, the recently introduced C. nana, C. cenisia, a brilliant little gem from Mont Cenis, the rare Caucasian C. collina, C. excisa, and a host of others, with their varied forms and characteristics would undoubtedly respond to the work of the hybridist in the creation of interesting and pretty novelties.

Perhaps I may not be deemed as being too critical if I speak of the need for closer study, and a more widely extended culture of the dwarf campanulas. It is impossible, I know, for the average cultivator to delve deeply into every group in Flora's kingdom; the vast range of subjects would not permit of the detailed systematic study necessary to obtain a full acquaintance with each group, but with the spread of the love of hardy subjects the gardener must perforce obtain as much knowledge as possible of the plants which he will have to deal with. In the study of the principal groups of hardy perennials the campanulas will certainly call for due attention.

The pleasure and knowledge derived from the culture, and from noting the special requirements of the rarer forms, will awaken one to the fact of the vast interest which pervades the whole group. To be acquainted with the soft blue bells of Zoysi peeping out of the rock clefts, the rare lanata, with its downy, saffron, pink-tinged blossoms, the varied types of Raineri, the blue and violet of Waldsteiniana, the rare yellow petræa, the pretty alpina, with its blue flowers of the barbata type, and the many other equally charming forms, is but to realise something of the importance and surpassing beauty of the dwarf campanulas.

In closing, may I briefly refer to the value of the free-growing forms for adorning rock edgings to the pathways? To see a walk, edged with rock-stones, over which are clambering and trailing the campanulas, with their myriads of soft-hued blossoms, is but to realise the value of these plants for such a purpose. Added to this, the fact that the blossoms last fairly well, and that the plants seldom become weedy in appearance, one can quickly appreciate a few of the merits of the dwarfer bell-flowers.

P. S. Hayward.

NOTES ON PEAS.

During the summer months, when plants are in full growth, it is well from time to time to note any peculiarities they may have, as it is impossible to remember every little variation. This is especially advisable with vegetables, as they vary so much, and there is such a number of them, that unless one takes special notes of each it is difficult to know which to grow. As all gardeners like to cultivate the best, this appears to be the only way for them to inform themselves as to their merits and distinctive qualities. Many things are sent out with laudatory descriptions, and one sees them at shows in splendid form.

If notes are taken of every particular during the growing season for comparison much useful information will be obtained. Peas this year, especially in the early part of the season, were anything but promising, for the slugs and cold winds kept them very much in check. Indeed, until the warmer weather set in there was much difficulty in recording their progress. Here we do not usually grow round-seeded varieties, as they do not find favour in the house, but this season, by way of comparison with some of the older forms, a few of the newer round-seeded kinds were tried. Side by side with the old Blue Express we sowed, on March 17, Giant Blue Express, a new type sent out by Messrs. J. Carter and Co. this year. A careful examination of the growth was made from time to time, and the results noted, so that we knew exactly how things were progressing. From the same quantity of seed the produce of the new form was more than double that of the old variety. Blue Express, as all know who have grown it, is very productive, but the pods are so small that it takes a large number and a long time to fill a bushel with them, whereas with the new form the pods are more than double the size of the old type, and the plants are quite as prolific. Sown on March 17 the pods were ready to gather on June 20. This is certainly a poor man's pea, and it would do well for allotments, and field cultivation for market supplies.

Side by side with the foregoing were two other round-seeded peas. The old Lightning, and a new form known by the name of Giant Lightning. The new form is as much superior to the older one as the Giant Express is over the other. We have also several others, notably one raised by crossing Duke of Albany with Early Morn. This grows to the height of about six feet, pods large and well filled, much resembling the first-named parent, but it is a fortnight earlier, coming in at the same time as Edwin Beckett. A variety raised from Duke of Albany crossed with Prior is very similar, but about a week later. Both varieties are excellent. Reading Record is a good dwarf early variety, which grows about two feet high; but, in my opinion, the best pea that Messrs. Sutton and Sons have sent out for a number of years is King Edward. The haulm and pods are of a dark green hue, the former being about four feet high, and very robust, while the later are produced in pairs, which makes it an enormous cropper. This is a good second early, the flavour being all that one could desire. It is very interesting to watch the growth of these different varieties, especially when one has grown them from the time they were introduced.

ATTRACTIVELY ARRANGED COLLECTION OF SWEET PEAS
Exhibited by Messrs. E. Webb and Sons at the N.S.P.S. Show.

Peas being so easily cross fertilised, like potatoes, soon deteriorate, therefore it is necessary to raise fresh stocks, otherwise they would in time go back to the wild forms; growers have, therefore, great cause to be thankful to those who have taken so much pains to improve the stocks. Many of our leading seed firms go to great trouble and expense in obtaining these improved varieties, but as all gardeners are not able to test them until they become popular, it would be well if those who have the opportunity of doing so would give a faithful report of their merits, regardless of the party who introduced them.

A pea that we hear or see but little of is Gladstone. This is a fine variety for mid-season or late use. It has a good constitution, resists the mildew in dry seasons, is very prolific, producing peas of fine colour and flavour; those who have not grown this variety would do well to give it a trial. Dreadnought, is also a most excellent variety, of medium habit, sown the same day as Quite Content, side by side, does not grow more than half its height, and is quite a fortnight later. The haulm is very dark, and pods and seed are deep green. It is very prolific, resisting the mildew in hot weather.

The rainfall with us has been light, while the temperature has been as high in the daytime as in most places; eleven times this year it exceeded 80 degrees in the shade, once 92 degrees, and once 86 degrees, which are trying temperatures for peas, especially on poor ground, and where water is a consideration. There are several fine varieties sent out from Wordsley, but these I must leave for a future time, as some of them are not at their best at present. There are also several beans I hope to draw attention to later on.

H. C. P.

A Beautiful Golden - leaved Tree.—One of the best-known of our variegated trees is that form of Acer negundo, whose leaves are freely variegated with white, it being an especial favourite for planting in villa gardens. Beside this, it is often grown under glass, and employed for various decorative purposes. In addition to the white variegated form, there is a variety aureum variegatum, in which the variegated portion, instead of being white, is of a golden hue. A third variety is A. negundo californicum aureum. In this the leaves are entirely of a rich golden tint, that is, when so situated that they are fully exposed to the summer's sun. A feature of great merit is that the foliage does not scorch, even in very hot weather, as many golden-leaved trees do. Instead of this, the more brilliant the sun the deeper does the yellow of the leaves become. It is certainly one of the very best small trees with golden foliage that we have, and for villa gardens or in similar positions, where a large tree would soon outgrow its allotted space, it is just the thing. Although it can now scarcely be regarded as a novelty, it is by no means so generally met with as its merits entitle it to be. Where trees with bright-coloured foliage are desired, this and the white variegated form, and the dark purple-leaved Prunus Pissardi, form a very effective group.—W. T.

WORK FOR THE WEEK.

THE ORCHID HOUSES.

ONCIDIUMS.—The cool growing oncidiums are all more or less attractive subjects, but it is with the O. superbiens section I wish more particularly to deal. In this section is included the popular O. macranthum, O. serratum, O. loxense, etc. These form useful subjects for decorative and exhibition purposes, and in O. macranthum we have an easily cultivated and free-flowering plant that should have a place in every cool orchid house. There is no great variation among the plants of this species, and they may be procured in an imported state, or as established plants, for a modest outlay. The whole of the species included in this group will practically thrive under the same conditions as that usually provided for the successful cultivation of Odontoglossum crispum.

POTTING.—Plants that have recently passed out of flower will have their young growths advanced to the stage when new roots are being emitted from the base. I consider this to be the most suitable stage at which to attend to any repotting necessary. I would advise caution before repotting is attempted, for practically the whole of this class of orchids resent being disturbed for the purpose of repotting, therefore unless the potting compost is in an advanced stage of decay, or the plants require more root room, it is advisable not to disturb them more than is absolutely necessary. The decaying compost may be carefully picked out from among the roots without disturbing those roots that have become attached to the sides of the pots, and fresh drainage and compost worked in its place. If carefully done the plants may be kept for several years in the same pot. Where repotting is necessary, turn the plants carefully out of their pots. If the compost is well wetted previously to turning the plants out, it will be found that the roots adhering to the sides of the pots are more readily detached. All the old compost having been removed, cut away all dead bulbs and decaying matter about the base of the plants. The pots selected should be ample large, and two-thirds should be filled with drainage, which may be either broken crocks or prepared bracken roots.

THE POTTING COMPOST we find suitable consists of two parts fibrous brown peat, broken into fairly large lumps, the remaining compost consisting of about equal portions of oak or beech leaves, broken up and passed through a half-inch sieve, and chopped sphagnum moss, with sufficient sand added to render the whole porous. The compost should be pressed moderately firm, and the surface may be covered with a layer of chopped sphagnum moss. The plants should be well watered with rain water as soon as repotting is completed, taking care to wet the compost through. The plants should then be staged where they may be shaded from glaring light until the roots push into the fresh material. I find it a good plan to spray the freshly potted plants once or twice a day, as this not only assists in retaining the bulbs plump, but also acts as a restraint to insect pests.—H. J. CHAPMAN, Oakwood Gardens.

STOVE PLANTS.

BEGONIA GLOIRE DE LORRAINE.—Examples of this useful begonia ought to be transferred to their final pots without further delay; pots of 6in. or 7in. diameter will be quite large enough. The plants must be handled with care so as not to damage the roots; the soil should be lumpy and porous, and a small quantity of well decayed manure thoroughly incorporated with it will be found of great assistance in promoting luxurious growth. I have noticed that this begonia makes rapid progress during August and September if a thoroughly moist atmosphere and even temperature are maintained. The paths and stages may be occasionally damped down with liquid manure, and shade must be given during the hot weather. Plants trained in pyramidal form, carefully looping the side shoots to the centre stake, are excellent. As soon as the pots are well filled with roots give regular applications of weak liquid manure, with an occasional change of some approved chemical fertiliser and clear soot water. The latter imparts a healthy, glossy dark green colour to the foliage, which is much appreciated. The flower buds should be removed as soon as they make their appearance until about a month or six weeks before the plants are expected to be at their best. This begonia is easily grown from very small plants, and is most useful for table decoration during the winter months. If good strong cuttings taken from the base of the old plants are now placed singly in small pots, and allowed to remain in them during the winter, they will prove most valuable.

FITTONIAS.—An autumn batch of this useful dwarf edging plant ought to be raised for winter stock, and if three or four cuttings are rooted near the edges of thumb pots, and afterwards transferred into 60-sized pots, they will soon develop into useful plants for winter decoration. I have also found fittonias most serviceable for filling the groundwork of hanging baskets; it is well, however, to observe that they succeed best when their roots are kept moist.

PANICUM VARIEGATUM. — Another supply of this serviceable trailing and edging plant should be raised for autumn use.

PANCRATIUMS.—As these pass out of bloom they ought not to be ripened off too quickly; the foliage must not be allowed to droop or flag for want of water. I prefer to ripen off the plants by a gradual reduction of temperature and water, and as soon as the foliage has ripened off the pots should be turned on their sides and examined at intervals with a view to watering them if necessary, remembering that the bulbs must not be allowed to shrivel.

GENERAL REMARKS.—Now that the season is becoming somewhat advanced, attention must be given to late summer potting, which operation ought to be completed at the first opportunity. Batches of winter-flowering subjects will also require regular and careful attention in respect to feeding with artificial manures or liquid manure. Carefully examine all the plants for insect pests, which must be eradicated immediately.—JOHN DONOGHUE, Bardon Hill Gardens.

FRUITS UNDER GLASS.

STRAWBERRIES.—Runners that were placed in small pots a few weeks ago will be ready for putting into their fruiting pots (or, at least, the majority of them). The weather has been suitable for quick rooting, and ere this the runners should have been separated from the parent plant and stood together in the open on a bed of ashes. The soil should consist of good fibrous loam, old spent mushroom bed manure, a little bone-meal and soot, and old mortar rubble or plaster, to keep it open. The pots should be well drained, and have some rough turf placed over the crocks. Have the soil in a suitable condition, neither too wet nor too dry, and any plants that are not fit to pot, place on one side for a week or two, as nothing is gained by potting too soon; neither should they become pot-bound while in the small pots, as they do not then readily take to the new soil. When potted, stand them in beds on coal ashes, where they can be damped over if necessary.

MADRESFIELD COURT GRAPE.—This is, perhaps, one of the most difficult grapes to cultivate, and especially to colour; the bunches usually come out too large, and are most difficult to finish. If wet weather prevails, and the roots are partly outside, these should be covered up with old lights to keep off excessive rains; after they have started to colour, all plants should be removed from the house, and plenty of air be admitted whenever possible; and in dull, wet weather, such as we recently had, the pipes should be always warm, so that ventilation can with safety be left on at night, as a free circulation of air will be the best means of colouring this grape. The laterals should be allowed to run at will if the vines are strong. Mrs. Pince and Mrs. Pearson are planted in the same house as Madresfield Court here, and as they require more water, it is difficult to get these to mature properly.

LATE MUSCATS.—In cold soils the roots of these grapes are best inside; they must not be over-cropped, and watering should be done carefully and on fine days. Keep a good warmth in the pipes at night, with a little ventilation at the top when favourable. If the weather is dull the vines will require additional care to get them to finish up before short days set in. Robins are very destructive in the vinery, and soon spoil the bunches; therefore wasp netting should be put over the ventilators, but this keeps the air out to some extent.

MONSTERA DELICIOSA.—This is now giving some good fruits; we have it planted out and running up the back wall of the banana house, where the temperature is suitable for it. Six good fruits are ripening, about 12in. long, and these are of pineapple flavour; more young fruits are showing on two side shoots. The roots from the stem cling to the wall, and therefore no tying up is needed. The monstera revels in plenty of heat and moisture, and the foliage is large, handsome, and of good colour.

MELONS.—The late batch will now be growing strongly, and if given the assistance of bottom heat by means of leaves and long litter, they will be greatly benefited. Watering should be done very carefully in dull weather, especially when melons are in bloom. Keep up a good heat in the pipes, and admit a little air by the top ventilators. For a late crop good free setters should be grown, and should not be over-cropped.

PEACHES AND NECTARINES IN POTS.—As soon as the young wood has done growing the plants should be placed outside, plunged in ashes, and syringed on bright, warm days. They should not be allowed to become dry at the roots. Liquid manure may be given liberally. If any are sickly the fault will be generally found at the roots or drainage; give the trees an open position with some shelter from strong winds.—A. B. WADDS, Paddockhurst Gardens.

THE KITCHEN GARDEN.

ONIONS.—Autumn-sown onions that were transplanted to permanent quarters in the spring will soon be finishing, and these will derive much benefit if the necks are twisted or bent down to check the upward flow of sap, and help to plump up the bulbs. Any of the earlier varieties that are already matured should be pulled up to dry, so that the skins may become hard before storing. If the weather is at all showery the bulbs should be placed in a cold frame facing the sun, and be given all the air possible. Onions that were sown and planted out from boxes are growing vigorously since the welcome rains came, and they should be given weak liquid manure about once a week, and have a little soot dusted over them occasionally to give colour to the foliage and keep insects at bay. The Queen onion is almost ready for harvesting, and is a very useful sort for early use, and the ground where it has occupied can be utilised for other things.

WINTER GREENS.—These may still be put out wherever there is a vacant piece of ground. Savoys that are planted at this date make very useful heads for a late supply. The planting of broccolis and kales should now be completed, and firm ground will give the best results.

RIDGE CUCUMBERS.—These should be encouraged by weak applications of liquid manure at least once a week. Do not allow the shoots to become over-crowded, nor let the fruits become too old before cutting, as fresh young fruits are the most serviceable.

CELERY.—The maggot of the celery fly has been very prevalent in this district this season. The only remedy which I have found to answer is picking out the affected parts of the leaf and burning them, and frequently dusting the plants with old soot when the dew is upon them. By this process I have managed to check it. Plants intended for August and September supply will now be well advanced, and should have all suckers removed. Some of the best roots should be selected and wrapped round with brown paper to hasten blanching, and at the same time they can be more liberally fed with liquid manure and artificials. It will also be found by this time that the surface of the trenches are a mass of roots that will be greatly benefited by a top-dressing of soil cut down from the sides of the trenches. This top-dressing will be highly beneficial, and also tend to keep the plants from bolting.

CARROTS that have germinated well, and are for pulling young in the autumn, may be thinned out to three inches apart. Then, after showers of rain, apply a dusting of soot and destroy all weeds as soon as they appear. If a cold frame is available another sowing of an early forcing variety should be made which will be most serviceable later on.

MUSHROOMS.—When there is a plentiful supply of material a bed should be made up at once, choosing a north aspect, making the bed ridge-shaped, and adding to the manure a fair quantity of good rich loam from an old pasture. During wet days the mushroom house should be thoroughly cleaned out, limewashing the walls, and putting the stages in good repair if necessary. Throw open doors and windows so that everything may [illegible] sweet and clean, and in readiness for making the beds. Collect manure daily and keep it well turned over.

WINTER ONIONS.—About August 10 is a very suitable date to sow for this [illegible] If sown very much earlier there is [illegible] a possibility of a good many plants [illegible] to seed; and if sown much later, the seedlings do not become strong enough to survive the severe weather in winter. [illegible] seeds on good trenched soil which has [illegible] well manured, and make the ground [illegible] treading when sowing the seeds. [illegible] A1 and Giant Lemon Rocca are two [illegible] varieties for winter.—T. W. BIRKIN[illegible] Hatley Park Gardens.

SHREWSBURY GREAT FLORAL FETE.
Aug 19th and 20th, 1908.
[illegible] are offered amounting to above £1,200,
with Cups, Medals, etc.
[illegible] may be had, post free, on application to
the Hon. Secs.
Messrs. ADNITT and NAUNTON, Shrewsbury.

HORTICULTURAL SHOW ADVERTISEMENTS are inserted in this column at Ninepence per line, the minimum charge being Five [illegible]. Offices, 148 and 149, Aldersgate Street, [illegible] E.C.

EXHIBITIONS AND MEETINGS.

◆

National Sweet Pea Society.

The eighth London exhibition of this flourishing society was held on Friday, July 24, in the Royal Horticultural Hall, Westminster. The display was an extremely pretty one. All round the sides of the hall were ranged the non-competitive exhibits, twenty in all, from the leading sweet pea specialists. In the centre of the hall Messrs. Carter and Co., High Holborn, made a delightful exhibit, and just inside the main entrance there was a large arch decorated with sweet peas of all colours.

Down the centre of the hall the decorated dinner-tables and the tables of flowers entered in the Burpee Cup competition were arranged alternately, and along one half of the hall they were flanked by the epergnes, [illegible], and large vase exhibits. The rest of the hall space, and the annexes, were filled with the exhibits in the general classes, the class for small growers more than filling one annexe. The quality of the flowers was high throughout, and came as a surprise to many, who expected that the late date and the very hot weather of late June and early July would produce a small show and poor quality. The attendance was large, and must have pleased the executive body.

TRADE EXCLUDED.

The special audit class is for fifteen bunches of sweet peas, distinct, selected from the twenty specified varieties that headed the select classes in the audit of 1907. The premier award—the Sutton Challenge Cup, a gold medal, and cash—was won by Mr. A. E. Usher, gardener to Sir Randolf Baker, Bart., Ranston House, Blandford, with very bright, clean, and substantial blooms of Mrs. Hardcastle Sykes, Helen Lewis, Frank Dolby, John Ingman, Sybil Eckford, Jeannie Gordon, Mrs. Walter Wright, Helen Pierce, [illegible], America, Black Knight, Dorothy Eckford, Mrs. Collier, Countess Spencer, and King Edward VII.; second prize fell to Mr. Thos. Jones, Bryn-Penylan, Ruabon, who had splendid long-stemmed spikes; third to Mr. T. Stevenson, gardener to E. Mocatta, Esq., Woburn Park, Addlestone; fourth to Mr. J. Vickers, gardener to W. B. Rawnsley, Esq., Well Vale, Alford, Lincs.; and fifth to Mrs. A. Tigwell, Greenford, Middlesex. The [illegible] scored for twenty-four bunches, [illegible] winning Messrs. C. C. Morse and [illegible] award with a strong set that consisted of King Edward VII., Lord Nelson, John Ingman, Frank Dolby, Helen [illegible], Evelyn Hemus, A. J. Cooke, Betty, Mrs. Alfred Watkins, Evelyn Byatt, Sybil Eckford, Horace Wright, America, Etta Dyke, Janet Scott, Jas. Grieve, Emperor, Cream Spencer, Queen Alexandra, Mrs. W. Wright, Mrs. W. Rawnsley, Henry Eckford, Duke of Westminster, and Sutton's Marbled Blue. Mr. J. T. Tubb, Oakbank, Seale, Sevenoaks, secured the second prize; and Mrs. A. J. Norris, Sonshaw, Chipstead, Surrey, came third, and all showed well.

The Eckford Cup class is always a most popular one and this year there were fifteen competitors. It was expected that Mr. T. Jones and Mr. T. Stevenson would put up a great fight for this handsome trophy, and this they did; but their calculations were upset by an entirely new grower and exhibitor, Mr. Hopkins, gardener to Francis Wellesley, Esq., Westfield, Woking, who won the cup and gold medal with a dozen of the finest bunches one could wish to see, and, although the spikes had ample stems, these were not gross; the varieties were King Edward VII., Lord Nelson, John Ingman, Helen Pierce, Mrs. Hardcastle Sykes, Mrs. Collier, Nora Unwin, Audrey Crier, Prince of Asturias, St. George, Frank Dolby, and Helen Lewis; Mr. T. Jones came second with fine flowers on very long stems; Mr. A. E. Usher came third; and Mr. T. Stevenson, last year's champion, had to be content with fourth place. For a dozen bunches of new Eckfordian varieties, Mr. Usher was awarded the second prize. For nine bunches, Mrs. A. Tigwell led with Audrey Crier, Dora Breadmore, Dudley Lees, Elsie Herbert, Etta Dyke, George Herbert, Helen Lewis, J. T. Crier, Mrs. C. W. Breadmore, Prince of Asturias, Tweedy Smith, and Vera Jeffery; Mr. E. Keith, Wallington Gardens, Cambo, Morpeth, was a good second.

In the Horace Wright Bowl competition, limited to nine bunches of garden varieties, selected from a given list, Mr. Basile, gardener to the Rev. T. McMurdie, Woburn Park, Weybridge, led with splendid examples of Dorothy Eckford, Helen Pierce, Dora Breadmore, Countess Spencer, King Edward VII., Jeannie Gordon, Mrs. W. Wright, Janet Scott, and John Ingman; Mrs. A. Tigwell was a good second. Mr. Prophet, gardener to E. Broad, Esq., Rosehill, St. Blazey, Cornwall, gained first place for six bunches, his admirable set consisting of Mrs. Collier, Prince Olaf, Mene Christie, Mrs. Hardcastle Sykes, The Marquis, and St. George, all very bright and clean; Mr. A. E. Usher came second; Mr. Thos. Jones third; and Mr. R. Wright, Halsell Lane, Formby, fourth.

For six bunches, distinct, any varieties, Mr. Broad led the way with Etta Dyke, Lord Nelson, Evelyn Hemus, Henry Eckford, Mrs. Chas. Foster, and George Herbert; Mrs. Tigwell was a close second, and was followed in order by Mrs. E. H. Pellier, Manor House, Abbots Kerswell, Devon; and Mr. R. Wright. The best three bunches of Miss Millie Maslin came from Mr. E. Keith, with Mr. M. Y. Green, The Lodge, Eynsford, second; Mr. W. L. L. Loat, Cumnor Place, Oxford, third; and Mr. W. Lintott, Marden Park, Woldingham, fourth. Mr. Keith, Mr. Loat, Mr. M. Y. Green, Mr. A. E. Usher, and Mr. Lintott secured prizes, as mentioned, for three bunches of Herbert Smith. For a bunch of Devonshire Cream, Mr. Usher, the Rev. J. B. Shackle, Dropmore Vicarage, Maidenhead, and Mr. G. Aitkens, gardener to H. Yorke, Esq., Erdigg Park, Wrexham, secured the awards.

OPEN CLASSES.

In the Classification Class, the prizes are given by Messrs. Hurst and Son, for eighteen bunches. Mr. A. E. Usher secured the chief award with excellent flowers of Mrs. W. Wright, Jeannie Gordon, Evelyn Hemus, Romolo Piazanni, Mrs. Hardcastle Sykes, Sybil Eckford, America, Queen Alexandra, Horace Wright, Helen Lewis, Dorothy Eckford, Countess Spencer, Black Knight, Dora Breadmore, Helen Pierce, Marbled Blue, John Ingman, and Frank Dolby; Mr. C. W. Breadmore secured the second place; Messrs. Saltmarsh and Son, Chelmsford, third; and Messrs. G. and A. Clarke, Dover, fourth. Mr. Usher also annexed the first prize for two bunches each of Mrs. Alfred Watkins, E. J. Castle, Nora Unwin, Evelyn Byatt, Gladys Unwin, A. J. Cook, and Frank Dolby; Mrs. A. Tigwell was again a good second; and Messrs. Jones and Son, Shrewsbury, came third. Messrs. Watkins and Simpson gave the prizes in this class.

Messrs. Cooper, Taber, and Co.'s prizes for two dozen varieties, distinct, were won in order by Mr. C. W. Breadmore, Messrs. Saltmarsh and Son, Messrs. G. Stark and Son, Great Ryburgh, and Messrs. G. and A. Clark. Mr. Breadmore's varieties were waved Mrs. Kenyon, Navy Blue Spencer, Mrs. C. W. Breadmore, Helen Pierce, Henry Eckford, Mrs. Hardcastle Sykes, Helen Lewis, York Jubilee, George Herbert, Marjorie Linzee, Kathleen MacGowan, Tweedy Smith, King Alfonso, Constance Oliver, Elsie Herbert, A. N. Dickson, Mrs. Collier, Countess Spencer, Marjorie Willis, Seedling Bicolor, Etta Dyke, Duchess of Sutherland, Silas Cole, and Lavender George Herbert.

For a dozen bunches, Mr. Silas Cole, gardener to Earl Spencer, Althorp Park, Northampton, scored with beautiful blooms of Gladys Cole, Mrs. Hardcastle Sykes, John Ingman, Silas Cole, Earl Spencer, Lady Sarah Spencer, Lady Althorp, Miss Delia Spencer, Lord Althorp, and two seedlings; Mr. Hopkins showed well for second place; Mr. G. M. Edwards, The Cedars, Addlestone, came third; and Mr. G. Humphries, Kington Langley, was fourth.

WAVED VARIETIES ONLY.

In the class provided by Mr. Felton and Miss Hemus for twelve bunches, distinct, to include at least six of Miss Hemus' varieties, Mr. A. E. Usher won the first prize (a rose bowl) with Paradise Regained, King Edward VII., Marjorie Willis, St. George, Lucy Hemus, Dudley Lees, Hester, Evelyn Hemus, Sutton's Queen, Helen Lewis, Paradise Carmine, and White Paradise; Mr. Thos. Jones was second. For one bunch each of Clara Curtis, Mrs. Henry Bell, Purity, Helen Lewis, Mrs. Hardcastle Sykes, and John Ingman, Mr. Bolton's prizes were won in order by Mr. E. Keith and Mr. Andrew Hoggan, Strathyre, Busby, Glasgow, both northern growers. The best six bunches, distinct, were splendid specimens of Elsie Herbert, The Marquis, Primrose Spencer, Helen Lewis, Bobby K, and Prince of Asturias, shown by Mrs. W. E. H. Pellier; Mrs. A. Tigwell second; Mr. W. L. S. Loat third; and Mr. E. Watford, Netherfield House Gardens, Weybridge, fourth; this was a good class, and in it, as well as for three bunches, Messrs. Hobbies provided the prizes. For three bunches, Mr. M. V. Green led with Audrey Crier, Nora Unwin, and Rosy Morn; Mr. Prophet second; Mr. T. Stevenson third. The best three bunches of Paradise came from Mr. E. Keith, who was followed in order by Mr. W. Marple, Penkridge, Staffs, Mrs. A. Tigwell, and Mr. W. L. S. Loat, and all showed well.

THE BURPEE CLASSES.

Unusual interest centred around the three classes provided by Mr. W. Atlee Burpee, Philadelphia, U.S.A., who offered a splendid silver cup as first prize for a table of the Countess Spencer varieties, arranged on a space 4ft. by 3ft., not more than one bunch or basket of a variety admitted. Mr. Robt. Bolton, Carnforth, won this magnificent trophy for the first time, with beautiful flowers of Helen Lewis, Countess Spencer, Tom, Primrose Spencer, two new seedlings, Mrs. Hardcastle Sykes, Audrey Crier, Constance Oliver, Mrs. Henry Bell, The Marquis, Evelyn Hemus, Nancy Perkin, Mrs. Chas. Foster, John Ingman, and Purity, all admirably set up; a very close second was Mr. Silas Cole, who had beautiful bunches of Earl Spencer, Mrs. Hardcastle Sykes, Silas Cole, John Ingman, Lord Althorp, Lady Sarah Spencer, E. C. Waud, Gladys Cole, Althorp White, Miss Delia Spencer, Helen Lewis, Lady Althorp, Althorp Countess, Miss Lavinia Spencer, and a seedling; Mr. A. E. Usher third.

For six bunches of the Countess Spencer type, Mr. S. Cole scored with White Spencer, Primrose Spencer, Countess Spencer, Silas Cole, Lord Althorp, and John Ingman. Mr. T. Stevenson came second, and Mr. Thos. Jones third.

Eighteen competitors staged one bunch each of Burpee's Primrose Spencer and Burpee's White Spencer, and here Mr. Basile won the premier award with two grand bunches, his Primrose form being one of the finest bunches in the whole show. Mr. Thos. Jones second, and Mr. Hopkins third.

SMALL GROWERS.

The prizes in the small growers' classes were keenly contested, and in almost every case the popular varieties were submitted. There were nineteen entries of twelve bunches, distinct, Mr. E. M. Allen, Sandhills Cottage, Formby, winning first prize with a very fine set of Countess Spencer, Lord Althorp, George Herbert, Frank Dolby, St. George, Mrs. Henry Bell, Chrissie Unwin, Silas Cole, Etta Dyke, Mrs. Hardcastle Sykes, Helen Lewis, and Evelyn Hemus—a set that would not have disgraced a

Hopkins, a Jones, or a Stevenson; Mr. G. Stevenson, Chadworth Cottage, Esher, second; Mr. S. Hibbins, Ashford, Middlesex, third; and Dr. E. V. Gostling, Needham Market, fourth. For six bunches, Mr. F. J. Harrison, Ulverston; Mr. J. F. Beale, Brierly House, Sidcup; Mr. E. T. Baker, Brigstock Road, Thornton Heath; and Dr. G. S. Leggatt, Selhurst Road, South Norwood, secured the awards in the order of mention. For six bunches with waved standards, Mr. F. J. Harrison was again first, followed by Mr. G. Davidson, Quadrant Road, Thornton Heath, and Mr. E. T. Baker. For a bunch each of a white, crimson, and blue variety, the awards fell in order to Mr. Harrison, Dr. Gostling, Mr. A. H. Hatting, The Nest, Hornchurch, and Mr. S. Hibbins. In the class for three bunches, distinct, Mr. E. M. Allen again led from twenty-one other competitors; Mr. S. Hibbins, Mr. L. H. Hatting, and Dr. Gostling taking the other awards. Mr. Allen was also successful for three bunches of waved varieties, with Bobby K, George Herbert, and Mrs. Henry Bell; Mr. G. A. Hill, Mr. Harrison, and Mr. Hibbins secured the remaining awards.

DECORATIVE SECTION.

The table decorations were fairly good throughout. Miss N. H. Cole, Feltham, secured the first prize with a pleasing design in pink and white flowers, associated with smilax and small ampelopsis leaves. Miss Jessie Cuthbertson, Mark's Tey, second; Mrs. A. Robinson, Park Hill, Carshalton, third; and Miss C. B. Cole fourth. In the epergne class Miss C. B. Cole again led with cream and pink flowers skilfully and gracefully arranged with grasses; Miss Jessie Cuthbertson second, Messrs. G. and A. Clark third, and Mrs. H. L. Sell, Luton, fourth. In the vase class Miss Cuthbertson led, and was followed in order by Miss C. B. Cole, and Mr. T. Cross, Bury St. Edmunds.

NON-COMPETITIVE.

There were many beautiful non-competitive displays, and to these awards were made as follows:—

Special Gold Medal.—Messrs. James Carter and Co., Holborn; Messrs. R. H. Felton and Son, Hanover Square, W.

Gold Medal.—Messrs. Dobbie and Co., Rothesay; Messrs. E. W. King and Co., Coggeshall; Messrs. G. Stark and Son, Great Ryburgh; Messrs. Hobbies, Lim., Dereham; Messrs. H. Cannell and Sons, Swanley; Messrs. Bakers', Codsall.

Silver-gilt Medal.—Messrs. E. Webb and Sons, Stourbridge; Mr. W. J. Unwin, Histon, Cambs; Mr. C. W. Breadmore, Winchester.

Large Silver Medal.—Messrs. Jones and Son, Shrewsbury; Mr. Henry Eckford, Wem, Salop.

Silver Medal. — Messrs. Jarman and Co., Chard; Mr. Robert Sydenham, Birmingham; Messrs. G. and A. Clark, Dover; Mr. W. J. Godfrey, Exmouth; and Mr. Wm. Deal, Kelvedon.

DINNER AND EVENING MEETING.

At the close of the exhibition the committee, judges, and a few guests dined at Fumigalli's Restaurant, Victoria Station. Mr. Wm. Cuthbertson presided; several ladies were present. Dr. and Mrs. Miller and Mr. A. M. Kirby, all from America, were guests of the evening.

After dinner and the usual loyal toasts Dr. Miller neatly proposed "Success to the National Sweet Pea Society," and in so doing expressed his great admiration for British parks, and for British florists, and his surprise at so large and beautiful an exhibition as that of sweet peas from which they had come. Mr. W. P. Wright, chairman of the Floral Committee, replied to the toast.

The next item on the programme was a most interesting one, and consisted of a presentation to the hon. secretary, Mr. Charles H. Curtis. This consisted of a beautiful album of photographs of sweet peas, and sweet pea notabilities, and a cheque for £60, subscribed by the officers and members of the society. The inscription in the album ran: "To show their appreciation of his services as their honorary secretary, this album along with a purse of sovereigns was presented to Charles H. Curtis, Esq., by the members of the National Sweet Pea Society, 24th July, 1908. Wm. Cuthbertson, President."

In a very kindly speech the President referred to the ever increasing work that fell on the secretarial shoulders, and to the great increase of membership and prestige the society had gained during recent years, and to the enthusiasm and activity of the hon. secretary. Mr. Curtis, in accepting this handsome testimonial, said that words failed him with which to convey adequately to the officers and members his sense of the great honour they had paid him. He did not despise money, he was delighted with the album, and still more pleased to hear, as the President had hinted, that Mrs. Curtis was to share in the presentation.

Mr. Edward Sherwood then presented Mrs. C. H. Curtis with a gold bracelet, as a token of the members' appreciation of the services she had rendered to the society by assisting her husband. The other toasts were: "The Judges," proposed by Mr. T. Stevenson, was replied to by Mr. Kirby. "The Competitors and Exhibitors," proposed by Mr. C. Foster, was responded to by Mr. Wm. Deal and Mr. R. E. Felton. "Donors of Special Prizes," was proposed by Mr. J. S. Brunton, and Mr. Robert Sydenham responded. Mr. S. B. Dicks proposed "The Ladies," to which Mrs. Miller most ably responded. "The Chairman," given by Mr. H. J. Wright, was duly honoured.

Royal Horticultural Society.

SCIENTIFIC COMMITTEE, July 21.

Present: E. A. Bowles, Esq., F.L.S. (in the chair); Prof. G. S. Boulger; Rev. W. Wilks; Messrs. Fawcett, Hales, Worsdell, Bennett-Poë, Fraser, and Chittenden (secretary).

PELORIC PANSY.—Mr. Hales exhibited flowers of pansy showing regular peloria. Many had but four petals, others had five, and each petal was spurred. Only one plant out of a batch of seedlings had exhibited this phenomenon, which appears to be very rare in the pansy, though well known in Linaria, etc.

MYOSOTIS.—Mr. Bowles exhibited an inflorescence of the common forget-me-not from the plant which he showed last year, and which then had the calyx much enlarged; this year, however, the calyx was of normal size.

CYPRIPEDIUM WITH DOUBLE LIP.—From H. J. Allwood, Esq., of Acocks Green, came a specimen of Cypripedium Lawrenceanum, normal in all respects except in the labellum, which was double, as though it had been cleft deeply in its very early stages of growth. This, and a curious form of Cattleya Harrisoni, were handed to Mr. Worsdell for further examination.

BLUE SWEET PEAS.—Mrs. Biffen, of The Gables, Histon, Cambridge, sent specimens illustrating blue forms of the "Spencer" type of sweet pea, together with an account of their pedigree:—

> The various blue shades of waved peas have resulted from crosses between Zoe, a medium blue pea, and Paradise, John Ingman, and an unnamed rose-coloured variety practically identical with the original Countess Spencer. A similar series as far as colour goes, but less waved, has been given by a cross between Zoe and Gladys Unwin. Navy Blue crossed with Paradise has also given the same series, and it is probable that any shade of pink or deep rose and Navy Blue would also give them. In each case the first generation was a deep purple blue with deep blue wings. The self seeds from these purple hybrids (Zoe x John Ingman) gave a rather complex generation consisting of bronze purple, purple with blue-purple wings, navy blue, Zoe blue, Zephyr blue, pale blue, lavender (probably Mrs. C. Foster), John Ingman colour, deep rose, pale rose (various shades of), tinged white. These various colours were present in both flat and waved forms, and farther as flakes on a white ground. The cultures raised were not sufficiently large to give reliable statistics, so the figures are not quoted here.

The behaviour of each of the types mentioned in the third generation has been traced in some detail, but attention is only called here to the blue shades. Anyone who has grown the mixtures known as Prince of Asturias, Rosie Adams, The Marquis, Silas Coie, etc., can readily trace the gometic constitution of the heterozygous purples, whilst the pink and rose shades behaved much as the first stocks of Countess Spencer. It should be noted, though, that each of these purples can apparently be obtained in a fixed form.

The various blue shades either bred true to type or gave definite series of "sports" in definite proportions. The analysis of the whole set of statistics has not been completed yet, but the colours are given in the order of their frequency.

Zoe shade.—(1.) Breaks into Zoe, navy, Zephyr, bluish pink, pale blue, and pale pink. (2.) Gives the blue series just mentioned and no pinks. (3.) Breeds true (Zoe, Countess form of, specimens exhibited).

Navy shade.—(1.) Breaks into navy, Zephyr, and the same two pink shades as the above. (2.) Gives navy and Zephyr. (3.) Breed true (specimens exhibited).

Zephyr shade.—(1.) Breaks into Zephyr and pale pink only. (2.) Breeds true (specimens exhibited).

Pale blue.—(1.) Throws Zephyr (no case yet met with). (2.) Breeds true (specimens exhibited).

The Spencer, the Unwin, and the flat standard types all behave in the same fashion, and what evidence has been obtained at present shows that the corresponding flaked colours give the same results. A few of the flaked types were exhibited for comparison with the whole colours. It should be noted that flaking is not visible in either parent. When it appears it has always acted as a simple recessive to the corresponding whole colour. Thus a deep purple flake might split into purple, blue, and pink types, but each would be flaked and no self colours would occur.

It is rather a curious fact that whilst a long series of pinks, orange, white, and yellow shades are known in a fixed condition, no waved blues have yet appeared in commerce with the exception of Mrs. C. Foster. This latter is heterozygous, and may be left out of account. It would seem to point to the fact that the Spencer forms are not so readily cross fertilised by bees as is generally stated. If they were so, we might fairly expect that the blue shades would be as well, or, knowing the partiality of bees for blue flowers, better represented than the pinks.

Chipping Norton and North Oxon Rose Show.

JULY 16.

Very showery weather attended the holding of this society's fifth exhibition. Fortunately, the shelter of the Borough Town Hall had been secured, otherwise the heavy rains would have rendered an outdoor show most uncomfortable. The entries created a record, but several traders were unable to compete owing to the weather. Nearly 1,[illegible] specimen blooms were staged, and it was noticeable that several dark roses were presented in great number, notably Horace Vernet, which variety secured two medals. Twelve classes were open, and a like number limited to local productions.

In the class for forty-eight blooms (two dozen H.P.'s, one dozen each of T. or N. and H.T.), the challenge cup, £30, and cash [illegible] was secured and won outright by Messrs. Alex. Dickson and Sons, Newtownards, Ireland, with large blooms; very fine [illegible] Duchesse de Morny, Pierre Notting, [illegible] Drew, Gustave Piganeau, J. B. Clark, [illegible] of Dufferin, Caroline Testout, Florence [illegible]berton, Horace Vernet, Reynolds Hole, Marchioness of Dufferin, John Cuff, Mrs. [illegible] Kennedy, Mrs. J. Laing, Dean Hole, Dr. O'Donel Browne, etc.; Messrs. F. Cant and Co., Colchester, second, staging grand ex-

examples of Hugh Dickson, Mrs. Theodore Roosevelt, Lady Moyra Beauclerc, J. B. Clark, Mildred Grant, Pride of Waltham, White Cochet, F. K. Druschki, Horace Vernet, Dean Hole, Caroline Testout, Mad. J. Gravereaux, Bob Davison, Mrs. E. Mawley, William Shean, and Oberhofgartner Terks; Mr. John Mattock, Headington, third. For two dozen single trusses, the chief award went to Messrs. A. Dickson and Sons, whose Horace Vernet (selected as the N.R.S. medal), F. K. Druschki, Duchesse de Morny, Dupuy Jamain, and Marchioness of Dufferin, were very noticeable: the second prize going to the King's Acre Nursery Company, Hereford, and Mr. H. Drew, Longworth, Berks, third. For a dozen trebles, four boxes were staged, Messrs. A. Dickson and Sons leading, the King's Acre Nursery Company second, and Mr. H. Drew third. For two dozen teas or noisettes, Mr. H. Drew scored a premier with a strong set, and Mr. J. Mattock was a good second.

For a dozen H.T.'s, Messrs. A. Dickson and Sons once again headed the list, their flowers being very fine, and among others were Papa Lambert, Gladys Harkness, F. Pemberton, Mrs. W. J. Grant, George Dickson (new), and W. E. Lippiatt; Messrs. F. Cant and Co. second, with J. B. Clark, Killarney, W. Shean, and C. J. Grahame. For a dozen roses of any one variety, Messrs. Dickson and Sons were first for both dark and light forms, with Horace Vernet and Bessie Brown; Messrs. F. Cant and Co. second for J. B. Clark and Dean Hole; Mr. H. Drew third for light roses with White Cochet; other forms staged were Queen of Spain (2), Her Majesty, Dean Hole, and Earl of Dufferin.

In the amateur section, Mr. F. Dennison, Rose Croft, Kenilworth, set up a very excellent box of four dozen blooms; very beautifully formed were C. J. Grahame, the two Cochets, F. K. Druschki, G. Piganeau, Mildred Grant, Ulster, Horace Vernet (N.R.S. medal bloom), Comtesse de Nadaillac, Bessie Brown, Helen Keller, Dean Hole, and W. Shean; this exhibitor also led for six trebles, and a dozen of any variety (F. K. Druschki). For a dozen forms, the first award fell to Mr. H. W. G. Morris (hon. sec.), who was strong with Mamie, Victor Verdier, White Cochet, and F. K. Druschki; Mr. W. N. Rowell, Ivy-[illegible], and Mr. W. Hughes, Hook Norton, taking the lower cards. For twelve teas, Messrs. G. Mace, H. W. G. Morris, and W. N. Rowell divided the honours with excellent blooms; and for nine varieties and six of one variety, the awards went to Messrs. G. Mace, C. Surman, and S. E. Groves, Milton-under-Wychwood. A large number of boxes of six, one variety, were staged, six prizes going to F. K. Druschki, and two to Maman Cochet, in classes for amateurs limited to the number of trees grown. A very good class was the one for eighteen blooms, not less than twelve varieties, Mr. W. Guy, Kingham, leading with good flowers of Bessie Brown, F. K. Druschki, Lady Moyra Beauclerc, Kaiserin A. Victoria, Queen of Spain, Mad. C. Joigneaux, and White Maman Cochet; Mr. C. F. Richardson, Chastleton House, second, his F. K. Druschki being selected as the N.R.S. medal bloom.

Eighteen bouquets of garden roses were admirably set up by Mr. John Mattock, who secured the £3 prize with a varied collection. For a basket of roses, Miss Cooper received the only award made, she also winning first for a vase of roses.

Handsworth Horticultural Society.

JULY 24 and 25.

The annual floral fête of the Handsworth Horticultural Society was held under the most favourable auspices; the weather was fine, the character of the exhibition high, and the attendance of visitors large.

There were five contestants in the class for a group of plants arranged for effect, with [illegible] straight fronts, to occupy an [illegible] square feet. The first prize was [illegible] a silver challenge cup, value 10 guineas, to be won two years in succession, or three times in all. The effect presented by the five groups was very imposing, and the premier award was made in favour of Messrs. Cypher and Son, of Cheltenham, whose arrangement was of an exceptionally high order of merit, and remarkable for the beautiful orchids it contained; Mr. J. S. Macdonald, gardener to G. H. Kenrick, Esq., Whetstone, Edgbaston, was a close second; the third prize fell to Mr. W. Vause, Leamington; and the fourth to Mr. G. Hancox, West Bromwich.

Messrs. Cypher were facile princeps for twelve stove and greenhouse plants (first prize £10), with two grand specimens of Statices profusa and intermedia, Ixora Duffi, I. salicifolia, I. Williamsi, Bougainvillea Cypheri, Allamanda Hendersoni, Allamanda nobilis, Clerodendron Balfouriana, Erica Aitoniana, and E. Parmentieriana; Mr. W. Vause, Leamington, was placed second with a collection of good specimens.

For a collection of fruit, not more than twelve kinds, winner to receive a silver challenge cup value 20 guineas, must be won three years in succession or four times in all before becoming the property of the winner, each collection to be decorated with flowering or foliage plants, Mr. J. H. Goodacre, Elvaston Castle Gardens, was the winner, having seventeen bunches of white and black grapes, nine fine melons, two dishes of apples, four large dishes of peaches, two of nectarines, two of plums, and one of figs; Mr. T. Bannerman, gardener to Lord Bagot, Blithfield Hall, Rugeley, was the only other exhibitor, and was awarded second prize. These two exhibitors were also alone in the grape classes. For six bunches (three black and three white), Mr. Goodacre was to the fore with well-finished Muscat of Alexandria, possessing the desirable amber tint, and Madresfield Court, fine bunches, good in size of berry and colour; Mr. Bannerman second with very fine bunches, with large, uniform berries, and perfect bloom.

There was a very keen contest in the class for floral table decorations (orchids excluded); there were fifteen tables, all possessing more or less merit; Miss M. Clarke, Sparkbrook, Birmingham, scored with an elegant combination of light-pink hybrid tea roses and a profusion of slender spikes of Francoa racemosa; second, Mr. S. Gibbs, gardener to Miss Normansell, Edgbaston, with light pink sweet peas; and third, Miss E. Jenks, Codsall, with an artistic arrangement of pink peas.

The roses were capitally staged, excepting that in several instances evidence of unfavourable weather was apparent. For twenty-four varieties, distinct, Messrs. A. Dickson and Sons, Newtownards, were awarded the first prize for finely developed blooms; Messrs. Perkins and Sons, Coventry, were a very close second with neat and fresh flowers; third, King's Acre Nurseries, Hereford. For twelve roses, distinct, Messrs. Perkins were first with a superb lot; second, Messrs. A. Dickson and Sons; and third, Mr. Geo. Prince, Oxford, both staging good blooms. For twelve bunches garden roses, distinct, Messrs. G. Prince, W. Mattock, and J. Townsend and Sons, Worcester, were placed in the order named, all with excellent exhibits. For twelve tea roses, distinct, Messrs. A. Dickson and Sons, J. Townsend, and G. Prince were the respective winners.

Sweet peas formed a good feature, the contest keen, and the blooms of high quality. In the class for twenty-four bunches, Mr. T. Parry, gardener to Alfred Hughes, Esq., Knowle, was placed first with a splendid lot of flowers, excellently staged; second, Mr. A. Langston, Droitwich; third, Mr. Geo. Turley, jun., King's Heath. Hardy border flowers were effectively staged, but carnations and picotees were not numerously shown. In the class for twelve yellow-ground carnations or picotees, distinct, Mr. G. R. Rudd led with very good blooms; second, Mr. G. D. Ford. For twelve white-grounds, Mr. A. R. Brown, King's Norton Nurseries, scored with a superb stand; second, Mr. R. G. Rudd, with excellent flowers. For twelve bunches of violas, Messrs. W. Pemberton and W. Chipman were the respective winners.

In the gardeners' class for a group of plants, arranged for effect, Mr. Joe Winter, gardener to C. A. Palmer, Esq., scored with an attractive presentment possessing considerable originality; second, Mr. W. Tompkins; and third, Mr. E. Collett. In the gardeners' division there was also a large display of plants, cut flowers, fruits, and vegetables. Non-competitive exhibits were numerous, and of much merit.

Chippenham Rose Show.

JULY 15.

Early closing day enabled a large number of the residents of this "milk and flour" district to visit the fifth exhibition of the "queen of flowers." Fortunately the rain clouds had rolled by, cheering the hearts of the executive, who the past two seasons had experienced wet days. The show was located in Mr. Cleaver's grounds, near the Great Western Railway Arches. A good attendance was noticeable during the afternoon, and during the evening hours there was a crowd.

Nurserymen's classes were well filled with exhibits of high quality, the competition being keen, as there were ten cups and several medals offered. Entries were a few less than last year. The Colchester, Cirencester, and Hereford firms were in force, but Mr. John Mattock secured the cup for the most points in division 1; Mr. W. S. Chapman, Warminster, was awarded the King's Acre Nursery Cup (and a gold medal) for the best box in the amateurs' section, with two dozen single trusses of fine form and size; and Rev. G. T. W. Henslow, Stanton St. Quinton, won the President's cup for the highest number of points in the amateur division.

The schedule provided fifteen open classes for roses, the whole of the awards (two firsts and two seconds) for local traders going to Mr. Geo. Humphries, Kington Langley, who put up two dozen single trusses, twelve H.P. or H.T., twelve T. or H.T., and six trebles; he also scored premiers for nine bunches of sweet peas and a table decoration. The N.R.S. silver medals were awarded as follows: To traders, premier H.P. or H.T., the King's Acre Nursery Company, Hereford, for Horace Vernet; tea or noisette, Messrs. F. Cant and Co., Colchester, for Mrs. E. Mawley (a remarkable bloom). To amateurs, H.P. or H.T., Rev. G. T. W. Henslow, for Marie Verdier; T. or N., Mr. W. T. Coleman, Kington Langley, with a fine development of White Maman Cochet.

In the trade classes Messrs. F. Cant and Co. were first for forty-eight single trusses (winning the Wiltshire Ladies' Challenge Cup); eighteen teas or noisettes, and twelve of one variety of T. or N. Mr. John Mattock, Headington, was placed first in the classes for thirty-six single trusses, eighteen H.P.'s or H.T.'s, twelve bunches of garden roses, a basket of roses, bouquet of roses, and a vase of roses. Messrs. B. R. Cant and Co., Colchester, led for a dozen trebles, Messrs. J. Jefferies and Son, Cirencester, taking second prize for thirty-six singles and eighteen varieties. In the amateur section Mr. W. S. Chapman was first for two dozen singles and four trebles; Rev. R. Powley, Upper Scudamore, led for twenty-four teas; and Miss Ashe presented the premier nine bunches of garden roses. Amateurs limited to a ten-mile radius, included Rev. G. T. W. Henslow, who led in the classes for two dozen singles, eighteen H.P.'s or H.T.'s, and twelve teas or noisettes.

The cottagers produced any number of plump blooms, Mr. William Smith, Box, scoring firsts for eighteen singles, six trebles, and vase of roses. Miscellaneous premier awards for which classes were provided included pansies from Mr. L. Lent, Cumnor Place, Berks; herbaceous perennials, liliums, and table plants, from Messrs. W. and J. Stokes, Hilperton Marsh; begonias (single and double varieties), and strawberries, from Mr. J. Pitts, gardener to Colonel Sir A. Neeld.

Non-competitive exhibits comprised an extensive collection of herbaceous perennials and hybrid water lilies from Messrs. Barr and Sons, Surbiton (certificate of merit); roses and border flowers, from Mr. A. A. Walters, Bath; roses, from Messrs. Geo. Cooling and Sons, Bath, and the King's Acre Nursery Company; seedling sweet peas, from Mr. L. Loat, Cumnor; and a grouping of pot plants, arranged by Mr. Richardson, florist, London Road, Chippenham.

Huyton and Roby.

JULY 23.

The annual summer exhibition of this society was held in the grounds adjoining the public offices in charming weather, the exhibits showed a decided advance upon those of previous years, and the society is to be congratulated upon its efforts in the furtherance of horticulture. Only the first prize in the chief of the classes can be noticed out of the very extensive schedule. To the group class Mr. J. George, gardener to Thomas Henshaw, contributed an artistic arrangement, which included well-grown palms, ferns, crotons, carnations, etc. For the best stove or greenhouse plant in flower this exhibitor led with a well-flowered specimen of Clerodendron Balfouriana. Mr. George was also first for four caladiums with large plants. Mr. H. McFall, gardener to Mrs. Harding, had well-grown plants, which secured the leading awards for three ferns and a single specimen, two palms, and for a foliage plant. Mr. D. Hunter, gardener to W. D. Roberts, Esq., staged a fine pyramidal fuchsia. Mr. E. Bridge was again victorious with zonal pelargoniums. Mr. W. Lyon, gardener to Miss Preston, secured the chief award for a well-grown begonia. Mr. J. Copple, gardener to T. Biddulph, Esq., had the best coleus.

Mr. J. Burrows gardener to W. H. Crook, Esq., led in the class for twelve roses, and Mr. T. Bagnall, gardener to C. F. Boston, Esq., in the smaller class.

Fruit was of good quality, and Mr. W. Oldham, gardener to J. Beecham, Esq., secured premier honours for a collection, staging Madresfield Court Grapes, Hero of Lockinge melon, Gros Mignonne peaches, and Violette Hative nectarines. Mr. D. McKelvie was a good second. Mr. W. Oldham had the best white grapes, the variety Buckland Sweetwater, and Mr. D. McKelvie the best black, with Black Hamburgh.

The vegetables were excellent, Mr. J. George being the most successful exhibitor for the collection; Mr. H. McFall second.

Pereskia Godseffiana. — This pereskia is apparently a form of the old West Indian Pereskia aculeata that has long been employed as a stock on which to graft epiphyllums, but from an ornamental standpoint has not been considered of any account. The variety Godseffiana is remarkable for the rich coloration of the leaves, which are marked in a varying manner on the upper surface with red, yellow, and green, the underside being uniformly purplish crimson. As heat and sunshine are so necessary to bring out its brightest features, this pereskia must not be grown in a shaded structure, but for furnishing the sunny end of a warm house it should prove a decided acquisition. Given a very hot dry summer, it may perhaps be a useful bedding plant; at all events, in warm, dry soils. Grown in a suspended basket in a light position the colour will be well developed, and another advantage is that being of a half-succulent nature, it is not likely to suffer if the soil about the roots is allowed to become dry, a thing which frequently happens when baskets are suspended in a lofty structure. Apart from all these considerations, there is no doubt that under the influence of a tropical sun it would form a really brilliant feature. With regard to its culture, I have had no practical experience of Pereskia Godseffiana, but the typical form is so little exacting in its requirements that there is no doubt this variety will prove of easy culture.—W. T.

ANSWERS TO CORRESPONDENTS.

DAMAGED GRAPES.—F. B., Essex: The low night temperature would contribute to the failure, but the chief cause of shanking is overcropping in your case. The remedy is obvious.

SCORCHED CUCUMBER LEAVES.—S., Isle of Wight: There is a thinness about the leaf sent which we do not understand, provided the usual conditions of heat and moisture are provided. The leaf suggests great heat and lack of moisture. Perhaps the foliage is too close to the hot-water pipes. Send us several leaves showing various stages of the scorched appearance.

STRAWBERRIES FOR MARKET.—J. T. J., North Wales: Some strawberries do well in one district and not in another, and at the moment of writing we cannot tell whether the varieties mentioned do well where you live. However, a little careful inquiry would, doubtless, elicit the information from local gardeners. Sir Joseph Paxton and Royal Sovereign are the two best market strawberries, and, given a few selected sites, the latter comes quite early. Givon's Late Prolific is a fine free-fruiting late variety, that is ready just as Royal Sovereign finishes. Laxton's Latest is another good late strawberry, with very dark-coloured rich fruits. For general market use we cannot recommend an earlier variety than Royal Sovereign.

VINE LEAVES.—E., South Wales: Overcropping is probably the cause of weakness. Stop the drip. When growing freely give frequent light surface dressings; remove the old inert surface soil when preparing the vinery for next season, and add rich, sound material that will encourage roots to the surface.

WIRING SWEET PEAS.—R. S., Luton: We have looked through the regulations for exhibitors in the schedule of the National Sweet Pea Society, and we find no reference whatever to wiring flowers. We remember, some years ago, several competitors used wires pushed partly up the flower stems to secure additional length and elegance for the sweet peas arranged in the decorative classes. In many cases the stems were quite out of water, and so the flowers soon withered, and, as a consequence, the regulation that "the flower stems must be in water or wet sand" was made. Wiring is distinctly objectionable, and we have no doubt that the authorities will take steps to stop such a practice.

MARKETING FRUIT AND VEGETABLES: M. E., Lechlade: A very useful and handy book, dealing with the packing, grading, and marketing of fruit and vegetables, and one that is especially suitable for small holders, is Mr. R. L. Castle's "Packing and Selling Fruit and Vegetables," 1s. 3d.. post free, from the GARDENERS' MAGAZINE Office, 148, 149, Aldersgate Street, E.C.

OFFICES: 148 and 149, ALDERSGATE STREET, London.

WINTER-FLOWERING SWEET PEAS.—G. L. C., Limpsfield: The sweet peas referred to in the article that appeared in our columns recently belong to a distinct race that is, as yet, not widely grown. Seed can be obtained, however, through the leading seedsmen, as several of the wholesale houses hold stocks. A sowing should be made in September to secure flowers at Christmas or the New Year. Your plan should prove successful, but a little more warmth, permitting ventilation during the dull, cold weather, would be an improvement.

HEART AND DART MOTH.—G. F. H., Monkton: The specimen sent is a small one of the Heart and Dart Moth (Agrotis exclamationis). The dull lilac, yellowish-marked caterpillars of this moth are voracious feeders, and very few crops in the kitchen garden escape their attention. Cabbages, turnips, and leeks they seem especially fond of. A full fed caterpillar enters the soil and makes for itself an oval cell of earth, wherein it changes to the chrysalis form, and from which it emerges as a moth about June of the following year. The grubs do an immense amount of damage by eating through the crown or collar or root, as the case may be, and they feed at night, hiding beneath soil lumps, etc., during the day. It is quite certain that one of the best means of keeping crops free from the pest is thorough surface cultivation; hoeing unearths the grubs, and if it does not kill them it exposes them to the kindly (or deadly) offices of the birds. Where there has been an infestation gas liming is the best method of cleaning the land, after the crop has been gathered.

CARNATION FLY.—F. P. J., Norwood: This pest (Hylemyia nigrescens) is extremely difficult to combat; indeed, as the Board of Agriculture recently pointed out, the only measures practised hitherto with any success being of a preventive character. For example, finely powdered soot or lime may be scattered over the plants when they are wet with dew; this may prevent egg-laying by the flies. A mixture of soot and lime, in the proportion of one bushel of lime to three bushels of soot, may also be used. Egg-laying may also be prevented by spraying the plants with a paraffin and soft soap emulsion, or carbolic acid and soft soap, as advised for the celery fly. Growers have found the carnation fly a very troublesome enemy, and some believe that mixing soot with the soil previous to layering acts as a preventive.

UNSATISFACTORY MEADOWS.—R. M., Leicestershire: The meadows under your charge have probably become impoverished owing to your having taken several crops of hay from them in consecutive years, and if this be the case, they will steadily decrease in fertility, unless steps are taken to enrich the soil. Phosphatic manures are the best to apply to grass lands, and if the soil is heavy they will suffice; but where the soil is light a potash manure should be used in addition. On heavy soils phosphatic manures promote the growth of clover and other leguminous plants, and these collect nitrogen in considerable quantities from the air by means of their root nodules. Bone-meal and basic slag are both excellent fertilisers for grass land on heavy soils, but the last named is preferable, being more quick in action. We suggest that in the autumn you give the meadows a dressing of basic slag at the rate of 10cwt. per acre; and if the soil is light, apply in addition a dressing of either muriate of potash or kainit, the former at the rate of two cwt., and the latter at the rate of six cwt. per acre. When the fertility of the grass land has been restored, it may be maintained in excellent condition by a dressing every third year of basic slag at the rate of four or five cwt. per acre, supplementing this, if your soil is light, with an application of kainit at the rate of two cwt. per acre. If you have a liberal supply of farmyard manure available, you might give a good dressing of that instead of the potash manure.

BENGER'S

Food
for Infants,
Invalids,
and the Aged.

The particular and important feature of Benger's Food is that it can be prepared to suit any degree of digestive power, according to the directions on each tin. In this way it wins back health and strength.

The "Lancet" describes it as "Mr. Benger's admirable preparation."

NOTES OF THE WEEK.

Curiosities at Flower Shows.

Within a comparatively recent period many improvements have been effected in the conditions under which the exhibitions of the smaller local societies are held, and as the result the usefulness of these gatherings has been greatly increased. Schedules are now more carefully drawn, and with a clearer statement of the regulations governing the competitions, a considerable proportion of the difficulties with which exhibitors and judges had to contend have been removed, or so materially lessened as to render it a comparatively easy matter to surmount them. Greater regard is now paid to the importance of punctuality, and the judges, instead of having to wait an hour or more before commencing their duties, are, as a rule, able to enter upon them within a few minutes of the time stated in the schedule. This is as it should be, in the interest of all concerned, and especially in that of the exhibitors, who, strangely enough, like to remain in the tents as long as possible. It is sometimes asserted that exhibitors must have considerable grace allowed them, but surely if exhibitors at the large shows can complete their arrangements by the prescribed time, those at small ones should be able to do so. We have no doubt as to their ability in this respect, and for the information of those responsible for the exhibitions at which the old order still obtains, we would mention that there is less bustle when the tents are cleared at the time fixed than when exhibitors are allowed to remain an hour or so afterwards. Another noteworthy improvement is that made in the methods of staging adopted by cottagers, who contribute so freely of the products of their gardens and allotments to the lesser shows. Not so many years ago they paid but little regard to the quality of their products, or to neatness in staging, but now the quality is usually high, and the arrangement tasteful. Although so much improvement has been effected, it is necessary that those who are responsible for the management of flower shows should be ever on the alert, and to make from time to time such alterations in the rules as may be rendered necessary by the changes that are continually in progress. We have been impressed by the necessity for this being done by a few "curiosities" that have come under our notice during the present season. One of the greatest of the curiosities has been the inclusion of Asparagus Sprengeri, popularly known as the "asparagus fern," in collections of ferns. To enable the judges to deal effectually with a matter of this description does not require any alteration in the regulations, and we refer to it for the purpose of pointing out that judges fail in their duty when they allow an asparagus to be shown as a fern, because the exhibitor possibly did not know that it was not one. We have also noticed at several exhibitions a tendency on the part of some of the exhibitors to increase their collections of vegetables in a manner not contemplated by the schedule. In each case the class was for "a collection of vegetables, six kinds," and the exhibitors who deviated from the usual course included a second variety of one or more of the kinds, and they did so without risk of being disqualified. There was not any stipulation as to the number of dishes or of varieties, and as there was no limit as to quantities, the only justification for disqualification would have been "custom," and that would have been unsatisfactory. The practice of duplicating varieties in collections in which the number of kinds is fixed could be easily checked, and checked it certainly should be by adding "One variety of each" and we would strongly advise this addition being made. The word "herbaceous" is not a curiosity in schedules, but its free use therein has given rise to the curious practice of judges giving awards to collections of flowers staged in classes for "herbaceous plants" of which several are not herbaceous, i.e., do not die down every year. It it quite time this curiosity should be banished from flower shows, and we suggest that they happens, the judges interpret the schedule strictly, disqualification follows, and much unpleasantness arises. The time has come when the use of "herbaceous" should be discontinued, and "perennials" be substituted. Were this to be done makers of schedules would obtain exactly what they wish to have contributed to their shows, and we suggest that they should ask for "Twelve bunches of cut flowers, hardy perennials," and to make it quite clear that they require the flowers of hardy perennials as ordinarily understood, it will be advisable to add, "Flowers of trees and shrubs excluded." Another "curiosity" that has been met with on several occasions has been the inclusion of such plants as petunias and verbenas in collections of annuals, and within the past few weeks we saw a collection of twelve to which a first prize had been awarded that contained the flowers of nine plants of this class. An annual is defined as a plant that completes its life cycle within the year, or to give a fuller definition, an annual is "a plant that is raised from seed, blooms, and ripens its seeds, and dies down within the year." Therefore, when prizes are offered for annuals the flowers of plants that are strictly annual in duration should alone be allowed, and it is the duty of judges to see that perennials which can be raised from seeds sown in the spring, and flowered

MR. JOSEPH BURTON.
Superintendent of Public Parks, Leicester.

in the following summer, do not receive prizes. It is in all cases advisable to closely follow the regulations, as when awards are made to collections that do not comply therewith there is a possibility of exhibitors, in the course of a few years, failing to pay due attention to them, and with a loose system of staging the risk is ever present of difficulties arising on the day of the show. Annuals, by reason of their distinctness and beauty, and the facility with which they can be grown, are deserving of all the encouragement they could well receive, and no other flowers should take their place in classes specially provided for them.

Mr. Joseph Burton, whose portrait we give herewith, has long occupied an important position in the management of the Leicester public parks, and in the exercise of his skill, judgment, and taste has contributed in no small degree to the fame which the town so deservedly enjoys for the beauty and interest of its fine open spaces. Mr. Burton, who obtained his horticultural training in some of the leading establishments in the United Kingdom, received an appointment in the Abbey Park soon after it was opened, and this was held with so much credit to himself, and advantage to the town, that on the retirement of Mr. John Burn some years ago, he was appointed by the Parks Committee, of which Mr. Councillor Hawkes is the chairman, to the important position of superintendent, an appointment which has been amply justified by the splendid condition of the beautiful Abbey Park, the breezy Victoria Park, and the other open spaces under his charge. In addition to his other duties Mr. Burton is the superintendent of the Abbey Park Flower Show, which, annually held on the Tuesday and Wednesday following the August Bank Holiday, has so grown of late years that it has now become one of the most important of the horticultural exhibitions held in the provinces. This exhibition, although not associated with the Corporation finances, is under the management of the Parks Committee, who have taken, and continue to take, a generous view of the requirements of the public in the matter of open spaces, and have endeavoured, with much success, to foster a taste for gardening among the masses. Here, as in his other duties, Mr. Burton has achieved much success, and by no one is his splendid services more highly appreciated than by the members of the excellent committee under whose control the public parks of Leicester have been placed.

The August Bank Holiday, as in the case of that associated with Whitsuntide, was favoured with exceptionally fine weather, and in all parts of the country full advantage was taken of such opportunities as presented themselves for enjoying the beauties of the country, and the charms of the public parks and gardens. In and around the Metropolis the public parks and gardens were crowded throughout Monday, and, according to the official returns, there were upwards of 98,000 visitors to the Royal Gardens, Kew. It is estimated that between 70,000 and 80,000 persons visited Hampton Court, and that about the same number went to Epping Forest.

Club Root in Brassicas.—For some years past experiments of a comprehensive character have been conducted on the Cockle Park Farm under the direction of Professor Gilchrist, chief of the Armstrong Agricultural College, Newcastle, for the purpose of determining the best remedy for club root in turnips, cabbages, and other allied crops. The prevention and cure of the disease caused by the slime fungus Plasmodiophora brassicæ is a matter of considerable practical importance to both the gardener and farmer, for many thousands of pounds are annually lost owing to the ravages of this fungus. Lime has long been recognised by cultivators as the only material that is effectual in combating the disease, but it is not generally known that the beneficent effects are only obtained under certain well-defined conditions. According to the results obtained in the Cockle Park experiments, a dressing of lime of about ten tons per acre the first year, followed by dressings of five tons and two and a-half tons in the third and fourth years, have been the most effective. In the third and fourth years dressings of lime mud, at the rate of ten tons per acre, at about one fifth the cost of the ten tons of lime, have been very effective. It has been fully demonstrated at Cockle Park that some time elapses before the lime is able to check the spread of disease to any appreciable extent. The lime must have time to become thoroughly incorporated with the soil before it can have a repressive effect upon the fungus. From the particulars given of the plots in 1904 and three following years, we learn that there was not a turnip free from disease on any one of the plots in the first year. The following year there were a few sound roots in the plots that had been limed, and in the third and fourth years there were marked improvements. The results obtained suggest the advisability of growing on ground infected with the germs of the club root disease, crops not subject to it for at least one year after the dressing of lime has been applied.

Southwark Park's New Lake.—The new lake in Southwark Park is rapidly nearing completion. The work was begun at the end of January, and over a hundred men, selected from the ranks of the unemployed, have found work and wages here. The London County Council has spent about £2,000 on material for this new lake, and it proposes to purchase twenty skiffs, and place them on the water ready for the opening day, August 29.

Electricity in Gardening.—In a very interesting account of the effect of electricity on growing crops, Sir Oliver Lodge states that the experiments which have been carried out on a farm near Evesham during the past few years for the purpose of determining the influence of electricity on plant growth, have proved so successful that the experimental apparatus has been replaced by a permanent installation. Impressed by the results obtained by Professor Lemström, a distinguished Swedish scientist, in the course of his experiments a few years since, and the results obtained by themselves in the course of some preliminary experiments they conducted at Bitton, Mr. J. E. Newman, of Gloucester, and Mr. R. Bomford, of Salford Priors, determined to conduct some experiments on a large scale. They applied to Sir Oliver Lodge for advice and assistance, which he gave, and sent his son, Mr. Lionel Lodge, to superintend the experiment. The method adopted was to stretch over the field in which the experiment was carried out a number of wires on poles high enough for loaded wagons to pass under the wires. The wires are supported on the posts by high tension insulators, are thirty feet apart, and extend over the whole area under experiment. The system of conductors was then connected at one post with a generator supplying positive electricity at a potential of about 100,000 volts, and with sufficient power to maintain a constant supply of electricity at this kind of potential. "Leakage," we are told, "immediately begins, and the charge fizzes off from the wires with a sound which is sometimes audible, and with a glow which is sometimes visible in the dark." In 1906 an increase of 40 per cent. was obtained in the yield of red, and 30 per cent. of white wheat, over crops growing in the control plots. Strawberries and raspberries were treated electrically on another plot, and the first-named fruits showed an increase of 33 per cent., while the latter showed a marked improvement in the new canes, but hardly any in the old. It is further stated by Sir Oliver Lodge that Mr. J. E. Newman, in his experiments at Bitton, in 1904, obtained the following increases per cent.: Cucumbers, 17; celery, 2; carrots, 50; beet, 33; strawberries (five year plants), 36 and strawberries (one year plants), 80. In broad beans there was a decrease of 15 per cent., but the crop was ready for gathering five days earlier, and cabbages were ready ten days earlier, but in tomatoes there was no difference.

Instructor in Horticulture in Cheshire.—The Cheshire County Council have appointed Mr. A. Calderbank, gardener to A. H. Crossfield, Esq., M.P., Glenfield, Altrincham, as county instructor in horticulture, and superintendent of the experimental gardens at Holmes Chapel. Mr. Calderbank is well known as a successful exhibitor and judge, and has been greatly sought after as a lecturer. He takes a great interest in hybridising and raising new plants, and his genial manner should prove helpful to him in his new sphere.

The Tree Question in United States.—A writer in an American contemporary estimates the standing timber of the States at between fourteen hundred and two thousand billion feet. He adds: If we use forty billions per annum, we can run thirty-five to fifty years at the present rate, provided we do not have any waste. If we use one hundred billions per annum our timber will last fourteen to twenty years, on the same basis. If we use one hundred and fifty billions per annum in nine to thirteen years our timber will be all gone! We have now about 165,000,000 acres in our national reserves. If we had three times that much we should not have enough. If it costs twenty acres a Sunday or forty acres a week, or 2,080 acres a year to print one daily newspaper, what does it cost in acreage to print all the newspapers in all the cities and towns of America? Add to this the enormous editions of our magazines. The total staggers the imagination, and yet the amount of timber cut for pulp in the United States annually is less than five per cent. of what is cut for lumber. Last year we made more than 315,000,000 lead pencils. A lead pencil is not very large, but the total number of lead pencils required 7,300,000 cubic feet of cedar. We have cedar enough to last us just twenty years. More than 100,000 acres of timber, in the whole United States, are cut over every working day. We use many times more timber per capita than any other nation. We have left not over 450,000,000 acres bearing commercial timber.

Gooseberry Mildew in Kent. We learn that the destructive American gooseberry mildew has broken out badly in some parts of Kent, and that the County Council authorities are making strenuous efforts to prevent the disease from spreading.

DUBLIN FLOWER SHOWS.

Royal Horticultural Society of Ireland.

The annual autumn exhibition of this important Irish society was held in various parts of the University buildings on Wednesday, August 5. Competition in the several sections devoted to fruit, flowers, and vegetables was not so keen as might have been expected, but the quality in several of the rose classes, grapes, hardy annuals, double tuberous-rooted begonias, and small fruits was excellent, and compensated largely for the comparative lack of contestants. The provincial exhibition of the National Sweet Pea Society was held in association with this show, and of this a report will be found in another column. The arrangements, in the hands of the newly-appointed secretary, Mr. E. Knowldin, were admirably carried out.

The weather during the past few weeks has been the reverse of favourable to roses, but many really superb blooms were staged in the single truss and other classes. For seventy-two blooms, Mr. Hugh Dickson, Belfast, was a splendid first with a bright, fresh set, among which Ben Cant, Madame Eugene Verdier, Etienne Levet, Hugh Dickson, Her Majesty, Suzanne Marie Rodocanachi, and Bessie Brown, were conspicuous; Messrs. Alexander Dickson and Sons, Lim., Newtownards, were second, with Mrs. John Laing, Frau Karl Druschki, Mildred Grant, Ulrich Brunner, and Queen of Spain as some of their best. The same order was maintained for twelve distinct varieties introduced since 1904, Mr. Hugh Dickson showing Joseph Hill, J. B. Clark, Mrs. Stuart Clark, and Hugh Dickson in fine form; while Messrs. A. Dickson and Sons had Joseph Hill, Queen of Spain and Hugh Dickson in good condition. Messrs. A. Dickson and Sons were the only exhibitors in the class for twenty-four teas, and were awarded the premier prize.

Mr. W. H. Calvert, Helens Bay, was first for twenty-four blooms, not less than twelve varieties; his Madame Hoste was magnificent in form and colour, while Ulrich Brunner, Frau Karl Druschki, and Hugh Dickson were also good; Mr. J. S. B. Sarnior, Helens Bay, Co. Down, was second. In the class for twelve hybrid teas, Mr. R. J. C. Mannsell, Celbridge, was first with J. B. Clark and Lyon Rose as his best blooms; Dr. O'Donel Browne, Naas, was a good second. A novices' class for twelve blooms was won by Mr. T. F. Crozier, who had splendid Niphetos and Betty. An amateurs' class for twelve found Mr. A. Panton, Clontarf, to the fore, with Mr. S. S. Miller, Dartrey, following. For six roses shown in vases, the Hon. Mrs. Barry, Castleknock, was the only exhibitor, and received the first prize. In the class for a table of roses, arranged for effect, Mr. Hugh Dickson was a splendid first, and Messrs. A. Dickson and Sons, Lim., a most creditable second.

Captain Lewis Reall, Old Connaught Hill, Bray, was first for a collection of hardy cut flowers. Romneya Coulteri was the best bloom; the Right Hon. Lord Plunket, Bray, was second. Dr. O'Donel Browne was a grand first for twelve bunches of annuals, and the Hon. Mrs. Barry was second. Mr. H. J. B. Clements, Calbridge, was first for twelve vases of asters, with superb blooms; Mr. S. H. Cochrane and Mrs. Blyth were second and third as named.

In the class for twelve zonal pelargoniums, single trusses. Mr. Ernest Bewley, Danum, Rathgar, was first, and Mr. F. V, Westby, Roebuck Castle, a good second. Mr. E. Bewley also was first for double zonal pelargoniums and for plants in pots, showing strongly in each instance. For thirty-six tuberous-rooted begonias Mr. G. C. Stapleton, Killiney, was first with superb blooms, and Mr. R. H. Stubber, second. For twelve Mr. T. F. Crozier, Stillorgan, was first, and Mr. R. J. C. Mannsell second. Mr. R. H. Stubber, Durrow, won for twenty-four cactus dahlias with Mrs. Edward Mawley, Mrs. Winstanley, J. H. Jackson, Dreadnought, and Gabriel among his best. Mr. C. M. Doyne, Govey, took the second place. Mr. W. Ross, Dalkey, went ahead for six vases of cactus dahlias. Messrs. A. Armstrong and H. F. Carroll were respectively first and second for twelve vases of carnations or picotees, neither showing very strongly. For twenty-four bunches Mrs. Tackberry, Ballsbridge, received the premier award.

The Lady E. Howard, Bury, secured the leading prize for two bunches of white grapes with Muscat of Alexandria, splendid alike in colour, size, and bunch. Mr. F. V. Westby was second, and the Earl of Meath third. For two bunches of Black Hamburgh Messrs. F. V. Westby, W. Fry, and E. Bewley were the successful exhibitors, in the order here given. In the class for any other black Mr. E. Bewley was first with finely-finished Madresfield Court, and Lady E. Howard, Bury,second with Appley Towers. In the smaller fruit classes Mrs. Goodbody, the Right Hon. Lady Annaly, the Earl of Drogheda, Mrs. Blyth, Miss Roberta F. M. Doyne, Lady Rathdonnell, Mrs. Morgan, Mrs. M. Coffey, the Earl of Meath, and Messrs. R. White, T. Walsh, W. Murphy, J. B. Clements, H. O. Broomhead, S. H. Cochrane, and F. V. Westby all staged excellently. For a collection of six vegetables Mrs. Hone, Raheny, was first, and Dr. O'Donel Browne second.

Non-competitive exhibitors were well represented, and the plants and flowers staged were of excellent quality. Messrs. Hogg and Robertson, Dublin, showed gladioli in fine variety and condition. Messrs. W. Ramsey and Son, Balls Bridge, arranged a group comprising crotons, palms, liliums, roses, sweet peas, and begonias. Messrs. W. Watson and Son, Dublin, contributed carnations, sweet peas, roses, Kochia scoparia, and Asparagus Sprengeri. Messrs. A. Dickson and Sons, Newtownards, exhibited splendid bunches of such hardy plants as phloxes, pyrethrums, pentstemons, veronicas, and others, with Chrysanthemum Mrs. Lothian Bell in grand condition. Mr. W. Usher, gardener to Mrs. Keith, Brennanstown, Cabinteely, staged well-grown tydæas, caladiums, and palms. Messrs. W. Drummond and Sons, Dublin, had gaillardias, alstromerias, roses, funkias, coreopsis, and sweet peas. Messrs. Dicksons, Lim., showed fine phloxes, liliums, pentstemons, snapdragons, roses, and gladioli. Messrs. J. Carter and Co., Holborn, had an attractive group containing asters, larkspurs, gladioli, and mignonette, with tomatoes, peas, onions, cucumbers, turnips, carrots, cauliflowers, and vegetable marrows.

National Sweet Pea Society.

PROVINCIAL SHOW, DUBLIN,

AUGUST 5.

The second provincial show of the National Sweet Pea Society, held at Dublin on August 5, in conjunction with the Royal Horticultural Society of Ireland's Autumn Show, was a great success, and proved once again the popularity of the fragrant annual. The quality of the flowers, considering the lateness of the date, was wonderfully good, and the competition in most of the classes was excellent.

The show was held in the University Buildings, Earlsfort Terrace.

IRISH GROWERS.

The most attractive class in the section devoted to Irish growers only was the one for twelve bunches, distinct, the premier award being the Dickson Cup, presented by Messrs. Alex. Dickson and Sons, Newtownards and Belfast. There were twenty-one competitors, and the most successful one was Mr. E. Cowdy, Greenball, Longhall, Co. Armagh, who had fine bunches of magnificent blooms of Mrs. Hardcastle Sykes, Menie Christie, H. A. Linzee, Prince of Asturias, Crimson Spencer, Yellow Spencer, John Ingman, The Marquis, Helen Lewis, Evelyn Hemus, and Marjorie Willis. Second prize fell to Mr. King, gardener to Lord Dunleath, Ballywater Park, for Audrey Crier, Queen Alexandra, St. George, Sutton's Queen (fine), Helen Lewis, Countess Spencer, Mrs. Collier, John Ingman, White Spencer, Marjorie Wells, and King Edward. Miss Osborne, Dardistown Castle, Drogheda, third; and Mr. Mitchison, gardener to Col. the Hon. C. F. Crichton, Mulleboden, Ballymore Eustace, fourth.

The N.S.P.S. silver medal for six bunches, distinct, was won by Mr. Davies, gardener to Mrs. Goodbody, Obelisk Park, Blackrock, who scored with Mrs. Hardcastle Sykes, Helen Lewis, King Edward VII., Countess Spencer, Queen Alexandra, and Etta Dyke; Mr. H. J. R. Digges, Dunkerron, Eglinton Road, Donnybrook, second; and Mr. A. Phipps, St. Anne's, Teremure, third. The class for three bunches, distinct, created for small growers, brought out six competitors, and here the silver medal offered (with cash) as a first prize, fell to Mr. James Hall, Moy, Co. Tyrone, for Countess Spencer, Dorothy Eckford, and Helen Lewis in fine condition; Mr. Simmons, gardener to F. V. Westby, Esq., Roebuck Castle, Dundrum, second; and Miss A. L. M. Smyth, Newtown, Drogheda, third.

Two classes were set apart for Irish growers who had never previously won a first prize for sweet peas at a show of the Royal Horticultural Society of Ireland, but they were permitted only to show in one of these classes. For a dozen bunches, distinct, the silver medal and first prize was won by Mr. Reid, gardener to J. L. Richardson, Esq., D.L., Lissue, Lisburn, Co. Antrim, with bright, substantial blooms of Queen Alexandra, Mrs. Hardcastle Sykes, St. George, Mrs. Collier, Countess Spencer, Henry Eckford, Lord Nelson, Frank Dolby, Helen Lewis, Dorothy Eckford, Black Knight, and Miss H. C. Philbrick; second prize was awarded to Mr. Sutton, gardener to the Marquis of Ormonde, Kilkenny Castle, Kilkenny, for an excellent showing; Mr. J. Furzell, gardener to Captain Green, The Curragh Grange, The Curragh, third. The best six bunches, distinct, came from Mr. Davies, gardener to Mrs. Goodbody, whose varieties were Countess Spencer, Queen Alexandra, Dorothy Eckford, Frank Dolby, Helen Lewis, and George Herbert. There were a dozen entries, and Miss S. C. White, Glew Druid, Shankill, came second, and Mr. Ahern, gardener to R. J. C. Mannsell, Esq., Oakly Park, Celbridge, third.

PROVINCIAL CUP CLASS.

For the first time the National Sweet Pea Society offered a handsome Provincial Challenge Cup (presented by E. J. Edwards, Esq., Eastcote, Middlesex), for a dozen bunches of sweet peas selected from America. Audrey Crier, Black Knight, Dorothy Eckford, Earl Cromer, White Waved, Frank Dolby, Gorgeous, Gladys Unwin, Henry Eckford, Helen Lewis, Helen Pierce, Horace Wright, King Edward VII., Lord Nelson, Mrs. Collier, Princess Victoria, Queen Alexandra, Queen of Spain, Etta Dyke, and Mrs. Hardcastle Sykes—a fine selection. There were nine competitors, and here Mr. T. Stevenson, gardener to E. Mocatta, Esq., Woburn Place, Addlestone, Surrey, came first, and brought the cup back to England with a beautiful fresh set. The second prize fell to Mr. King, gardener to Lord Dunleath, Ballywater Park; Mr. James Reid, gardener to G. T. Richardson, Esq., Lissue, Lisburn, was a good third, with Mr. L. Quinane, gardener to H. E. White, Esq., Clonaglera, fourth.

TRADE EXCLUDED.

The Edmondson Cup class for eighteen bunches, distinct, was very popular, and there was a keen competition for the Edmondson Challenge Cup (presented by Messrs. Edmondson Brothers, Dame Street, Dublin, and the gold medal of the N.S.P.S. There were eight entries, and Mr. Cowdy, Greenball, Longhall, was the winner with lovely specimens. Mr. J. Mitchison was a good second, and he had Rose Spencer very fine; Mr. T. Proctor, Zealand Conyers, third.

There were but four entries in the Special Audit Class for fifteen bunches, selected from the varieties that headed the list in their colour classes in the 1907 Audit. Premier place fell to Mr. King; Mark McDonald, Esq., N.B., Portaferry, Co. Down, came second, his Jeannie Gordon being very good; Mr. Caster, gardener to Mrs. Alfred West, Kilcroney, Bray, third; and Mr. Murphy, gardener to Lady Barrington, Glenstal, Limerick, fourth.

The best twelve bunches, distinct, came from Mr. Kirk, gardener to H. J. B. Clements, Esq., Killadoon, Celbridge; Mr. J. Milne, Gortnagrena, Naas, second; Mr. Mitchison, third; and Mr. J. Quinane fourth.

In the class for six bunches, distinct, provided by Messrs. Dobbie and Co., Rothesay, to consist of at least three of the following varieties—The Marquis, Princess Victoria, Prince Olaf, Menie Christie, and Hannah Dale, there were eight competitors; here Mr. Stevenson carried off the premier award.

Mr. Mitchison scored in the class for six bunches with a very clean, creditable set of Clara Curtis, Mrs. Hardcastle Sykes, Purity, Helen Lewis, John Ingman, and Mrs. Henry Bell (very fine); Mr. Andrew Hoggan, Strathyre, Busby, came second. In this class Mr. R. Bolton, Carnforth, gave the prizes. In the class for six bunches, distinct, to include one bunch of Devonshire Cream, Mr. G. H. Mackereth's prizes were won by Mr. W. Moran, Maudlins, Naas.

For Mr. H. J. Wright's prizes for six bunches of sweet peas, with waved standards, Mr. Milne, gardener to O'Donel Browne, Esq., M.D., Gortnagreena, Naas, led.

OPEN CLASSES.

In the open division Mr. C. W. Breadmore, High Street, Winchester, was the only entrant in the classification class for eighteen bunches, each to represent a colour class in the N.S.P.S. classification.

Messrs. C. C. Morse and Co.'s prizes for twelve bunches of sweet peas, distinct, waved standards, were won by Mr. C. W. Breadmore, who staged Elsie Herbert, Audrey Crier, Mrs. C. W. Breadmore, Mrs. C. Foster, King Alfonso, Marjorie Linzee, Etta Dyke, George Herbert, Primrose Waved, and Kitty Crier.

SINGLE BUNCHES.

In the class for Sutton's Queen there were eleven entries, Mr. Cowdy leading, and Mr. D. Behan, gardener to Mrs. Robertson F. M. Doyne, Seafield House, Gorey, second. There were two entries of Audrey Crier, Mr. Doran and Mr. Davies coming first and second. Mr. Quinane led for Etta Dyke, followed by Mr. Doran. Mr. Quinane was the only exhibitor of one bunch of Mrs. C. W. Breadmore, and he gained first prize.

For one bunch of any white variety Mr. T. Stevenson led with Nora Unwin; Mark McDonald, Esq., second, with Burpee's White Spencer. For a blush variety Mrs. Hardcastle Sykes won first place for Mr. Stevenson, and Mr. Doran. For a crimson variety Mr. Cowdy scored with Queen Alexandra, and Mr. James Hall, Moy, Co. Tyrone, came second with King Edward VII. Mr. Hall and Mr. C. W. Breadmore secured the prizes for a cerise variety, with Coccinea.

For a rose or carmine variety Mr. J. Simmonds scored with George Herbert, and Mr. Andrew Hoggan came second with good John Ingman. Pink shades were well represented, Mr. Stevenson winning with Paradise, and Mr. Doran coming second with Countess Spencer; thirteen entries. For an orange variety Mr. Stevenson led with Helen Lewis in fine colour; Miss J. Cullinson, second with the same variety.

For a buff variety, Mr. Stevenson scored with Mrs. Collier, and Mr. King was second with the same variety. In the lavender class Mr. Stevenson led with Frank Dolby, and Mr. C. W. Breadmore came second with Mrs. C. Foster. In the blue class, Mr. Cowdy led with Lord Nelson, and Mr. Jas. Hall came second with the same variety. For a mauve variety, Mr. Stevenson won with A. J. Cook, and Mr. Doran came second with The Marquis. The best purple was Duke of Westminster, shown by Mr. J. Parleton, Mr. Jas. Hall coming second. Mr. Stevenson scored for a maroon variety with Black Knight, and Mr. Davies followed with the same variety. Mr. Jas. Hall had the best magenta, a George Gordon; Mr. Breadmore second.

Mr. Stevenson led for a picotee-edged variety with Evelyn Hemus, Mr. Doran coming second with the same variety. For a red-flaked variety, Mr. Davies led with America, and Mr. Breadmore came second with Jessie Cuthbertson. For a blue-flake, Mr. Hall scored with Marbled Blue, and Mr. Breadmore came second with the same variety.

The best bicolor was Jeannie Gordon, shown by Mrs. J. Cullinan, Mr. Stevenson following with the same useful variety. For a marbled variety, Mr. Breadmore scored with the fine Helen Pierce, and Mr. Doran was second. Mr. Stevenson led for a fancy with Sybil Eckford, and Mrs. Cullinan came second with this variety.

FLORAL DECORATIONS.

There were eleven dinner-tables decorated with sweet peas, and the designs were good, indifferent, and very bad. First prize was awarded to Mr. J. W. Parker, Tintagel, King's Road, Knock, Belfast, for a fine arrangement of pink and orange flowers.

NON-COMPETITIVE.

There were not very many non-competing exhibits of sweet peas, but those staged added materially to the extent and beauty of the display. The best exhibit was without doubt the one set up in one of the gallery halls by Messrs. Alex. Dickson and Sons (gold medal). Mr. C. W. Breadmore, Winchester, had a goodly display in the spacious gallery (silver-gilt medal).

Mr. Robt. Bolton, Warton, Carnforth, had an unfortunate position, in a semi-dark corner, near the staircase, but he had a fine display; this stand could have only missed the gold medal by a very little (silver-gilt medal). Messrs. Hogg and Robertson, Mary Street, Dublin, had a display of sweet peas in considerable variety in the large hall (silver medal).

SIBERIAN IRISES.

Although Iris sibirica has responded in full measure to the hybridist's art, inasmuch that where four varieties once composed the group there are to-day twelve or more, these later hybrids are such great improvements on the earlier forms that the species is unrepresented in many gardens of note.

It is decidedly an artist's flower, possessing that excellence of form that is fortunately a characteristic of most grassy irises, save our native one, and it is probably the most floriferous that can be grown. Its easy adaptation to all manner of soils and positions is so marked that one may regard it as practically amphibious; it will grow actually in water and also on a dry bank; it will thrive in a root run of rich peat and leaf-soil, and struggle bravely to live in a running sand or obstinate clay, and succeed. The reason for neglect of such an accommodating plant is not easy to discern. Probably typical Iris sibirica, the wilding of Asia, is not so attractive as many irises; its flowers are small, but profusely borne, and literally borne in sheaves, and what they lack as individuals they make up collectively, providing a haze of blue that distance improves rather than diminishes, and if it had no other use, typical Iris sibirca would still be the blue flower, par excellence, for the bold informal grouping that has become almost a law in waterside planting.

One finds in various parts of the country ponds and watercourses within the boundaries of private estates that would be utterly spoiled in the rugged aspect and freedom from restraint that constitute their most charming features, if they were converted into gardens containing hundreds of different plants. If the planter studied for a while the way in which Nature clothes broad expanses of water and its margins with hundreds of willow herb, meadow sweet, and lythrum, sedges, and rushes, he would forego the hundreds of units, and welcome a few hundred Iris sibirica as a means of transplanting to the waterside a note of blue few other plants can give in such a happy way. What the squill does for woodland, the neglected Iris sibirica can do for the waterside.

Nor is this all. The man whose mind is so attuned that every warm colour note can appeal to him, will welcome the broad patch of ruddy brown seared foliage in winter, and when the floral display has passed, he will find pleasure in the forest of round-headed stems studding the grey-green foliage that glints as though burnished in the sunlight. If he delights in wild waterfowl he will value Iris sibirica as "cover." If he desires variety of colouring, there is the lovely white form that is not one whit more costly than the blue, and in these two colourings he has no cause to fear a garish display that does not accord with the environment.

For the garden proper, whether plant border, formal pond, or shrubbery belt, there is a choice of variety that should satisfy the most exacting. A giant blue will be found in Baxteri, whose fall petals are very broad, white, with blue reticulation, and the foliage weeps. Alba grandiflora is just as great an improvement upon the white sibirica. Its flowers have broad, fall petals, with a touch of gold and bronze at the throat. Lactea has soft white flowers, with ruddy spathes and ruddy-veined "fall" petals, and it grows to a yard in height. Thalia is similarly habited, but there is a faint flush of lilac throughout the flower that proves very attractive.

The dwarfer section that have sprung from the Japanese I. orientalis, are splendid garden plants everyone can appreciate. Typical orientalis is quite good. It has weeping foliage in spreading tufts, conspicuous bracts stained with claret-red that have earned for it the name sanguinea, now superseded; and large blue flowers, with articular "fall" petals, twice the size of the upper ones, and they nestle among the taller leaves. A form of this, with its flowers well up above the foliage, is a Japanese seedling named Blue King or Purple King. It has pale violet flowers of perfect finish that are superior to any other "Siberian" iris. Still another, and in this case the best white, is Snow Queen. It has pure white flowers, broad-petalled, and of perfect finish, the white being relieved by a signal patch of yellow. The plant is so robust as to suggest hybridity with Iris Kæmpferi, the foliage being particularly broad and stout, the flowers upstanding and massive.

Snow Queen, Blue King, or Purple King, Thalia, and Alba grandiflora are worthy of the best position the garden affords; the others are accommodating plants the gardener may use just where he thinks they will look their best. Cultivation in respect of Iris sibirica is simply accommodation—the rarer sorts where they can be looked after, the commoner sorts where they can look after themselves.

G. B. Mallett.

SWEET PEAS TO PERFECTION.—The new work, Sweet Peas and their Cultivation for Home and Exhibition, by C. H. Curtis, hon. secretary, National Sweet Pea Society, contains full information as to the selection, planting, and general management of sweet peas. The price is 1s. net (by post, 1s. 2d.), or bound in cloth, 1s. 6d. (by post, 1s. 8d.), from W. H. and L. Collingridge, 148, Aldersgate Street, London.

CUT FLOWERS IN SUMMER.

(Concluded from page 590.)

Poppies.

Having referred—and space permits of little more—to the rose, the sweet pea, the lily, and the carnation—typical of the season of sweet-smelling flowers—a few more must be briefly noticed. Poppies, especially the Iceland and the Shirley varieties, which, properly treated, provide some of our most graceful indoor decorations. They need to be cut in the early morning, before the sun is on them, taking care to cut those blossoms only which, it can be seen from the stamens, have opened the same morning, and putting them into water, preferably warm, before the milky sap has time to dry on the cut ends. In this way they will often last a couple of days without hanging their heads or shedding their petals. Here again, as in sweet peas, I would not advocate the use of extraneous matter for a setting, unopened buds being beautiful in themselves, and sufficient for the purpose, but if something must be added wild grasses in flower can hardly be improved upon.

Violas.

Violas, or tufted pansies, have become very popular of recent years, though probably they are not generally regarded as adaptable subjects for cutting. This, however, is a mistake. When growing in a somewhat damp or shady place, and becoming straggling in growth, long stems may be cut off from the root, or as much shorter as may be wished, and arranged a few together in trumpet-shaped vases, or a large number of pieces in a wide-mouthed vessel, with the help of some floral aid contrivance. With a little care an effect may be obtained as of a well-grown plant set in a vase. They may be all of one colour, though a mixture of china blue and yellow is very fine. Those who try this once will do so again.

Annuals and Biennials.

There are some useful subjects for cutting amongst the annuals, especially when they are autumn-sown, so as to have longer and stronger stems. One of the best of these is the tall double larkspur, which, in the damp summer of 1907, grew five feet high with me, and produced an abundance of material for cutting from the end of June to the beginning of August. The annual chrysanthemums, too, provide a great quantity of blossom, especially C. coronarium, if given plenty of room. C. segetum, the wild corn marigold, also makes immense plants under good cultivation, its yellow flowers mixing well with the blue flowers of love-in-a-mist or Delphinium Belladonna, or the pink and purple flowers of the larkspurs. Among others that might be mentioned are the miniature annual sunflowers (varieties of Helianthus cucumerifolius), coreopsis (cut with large sprays of flowers and buds), scabious, lupins, jacobæas, eschscholtzia, etc. One of the secrets of success with all annuals grown to provide material for cutting, is to give them plenty of space and good cultivation, another secret being early sowing, if possible in the autumn.

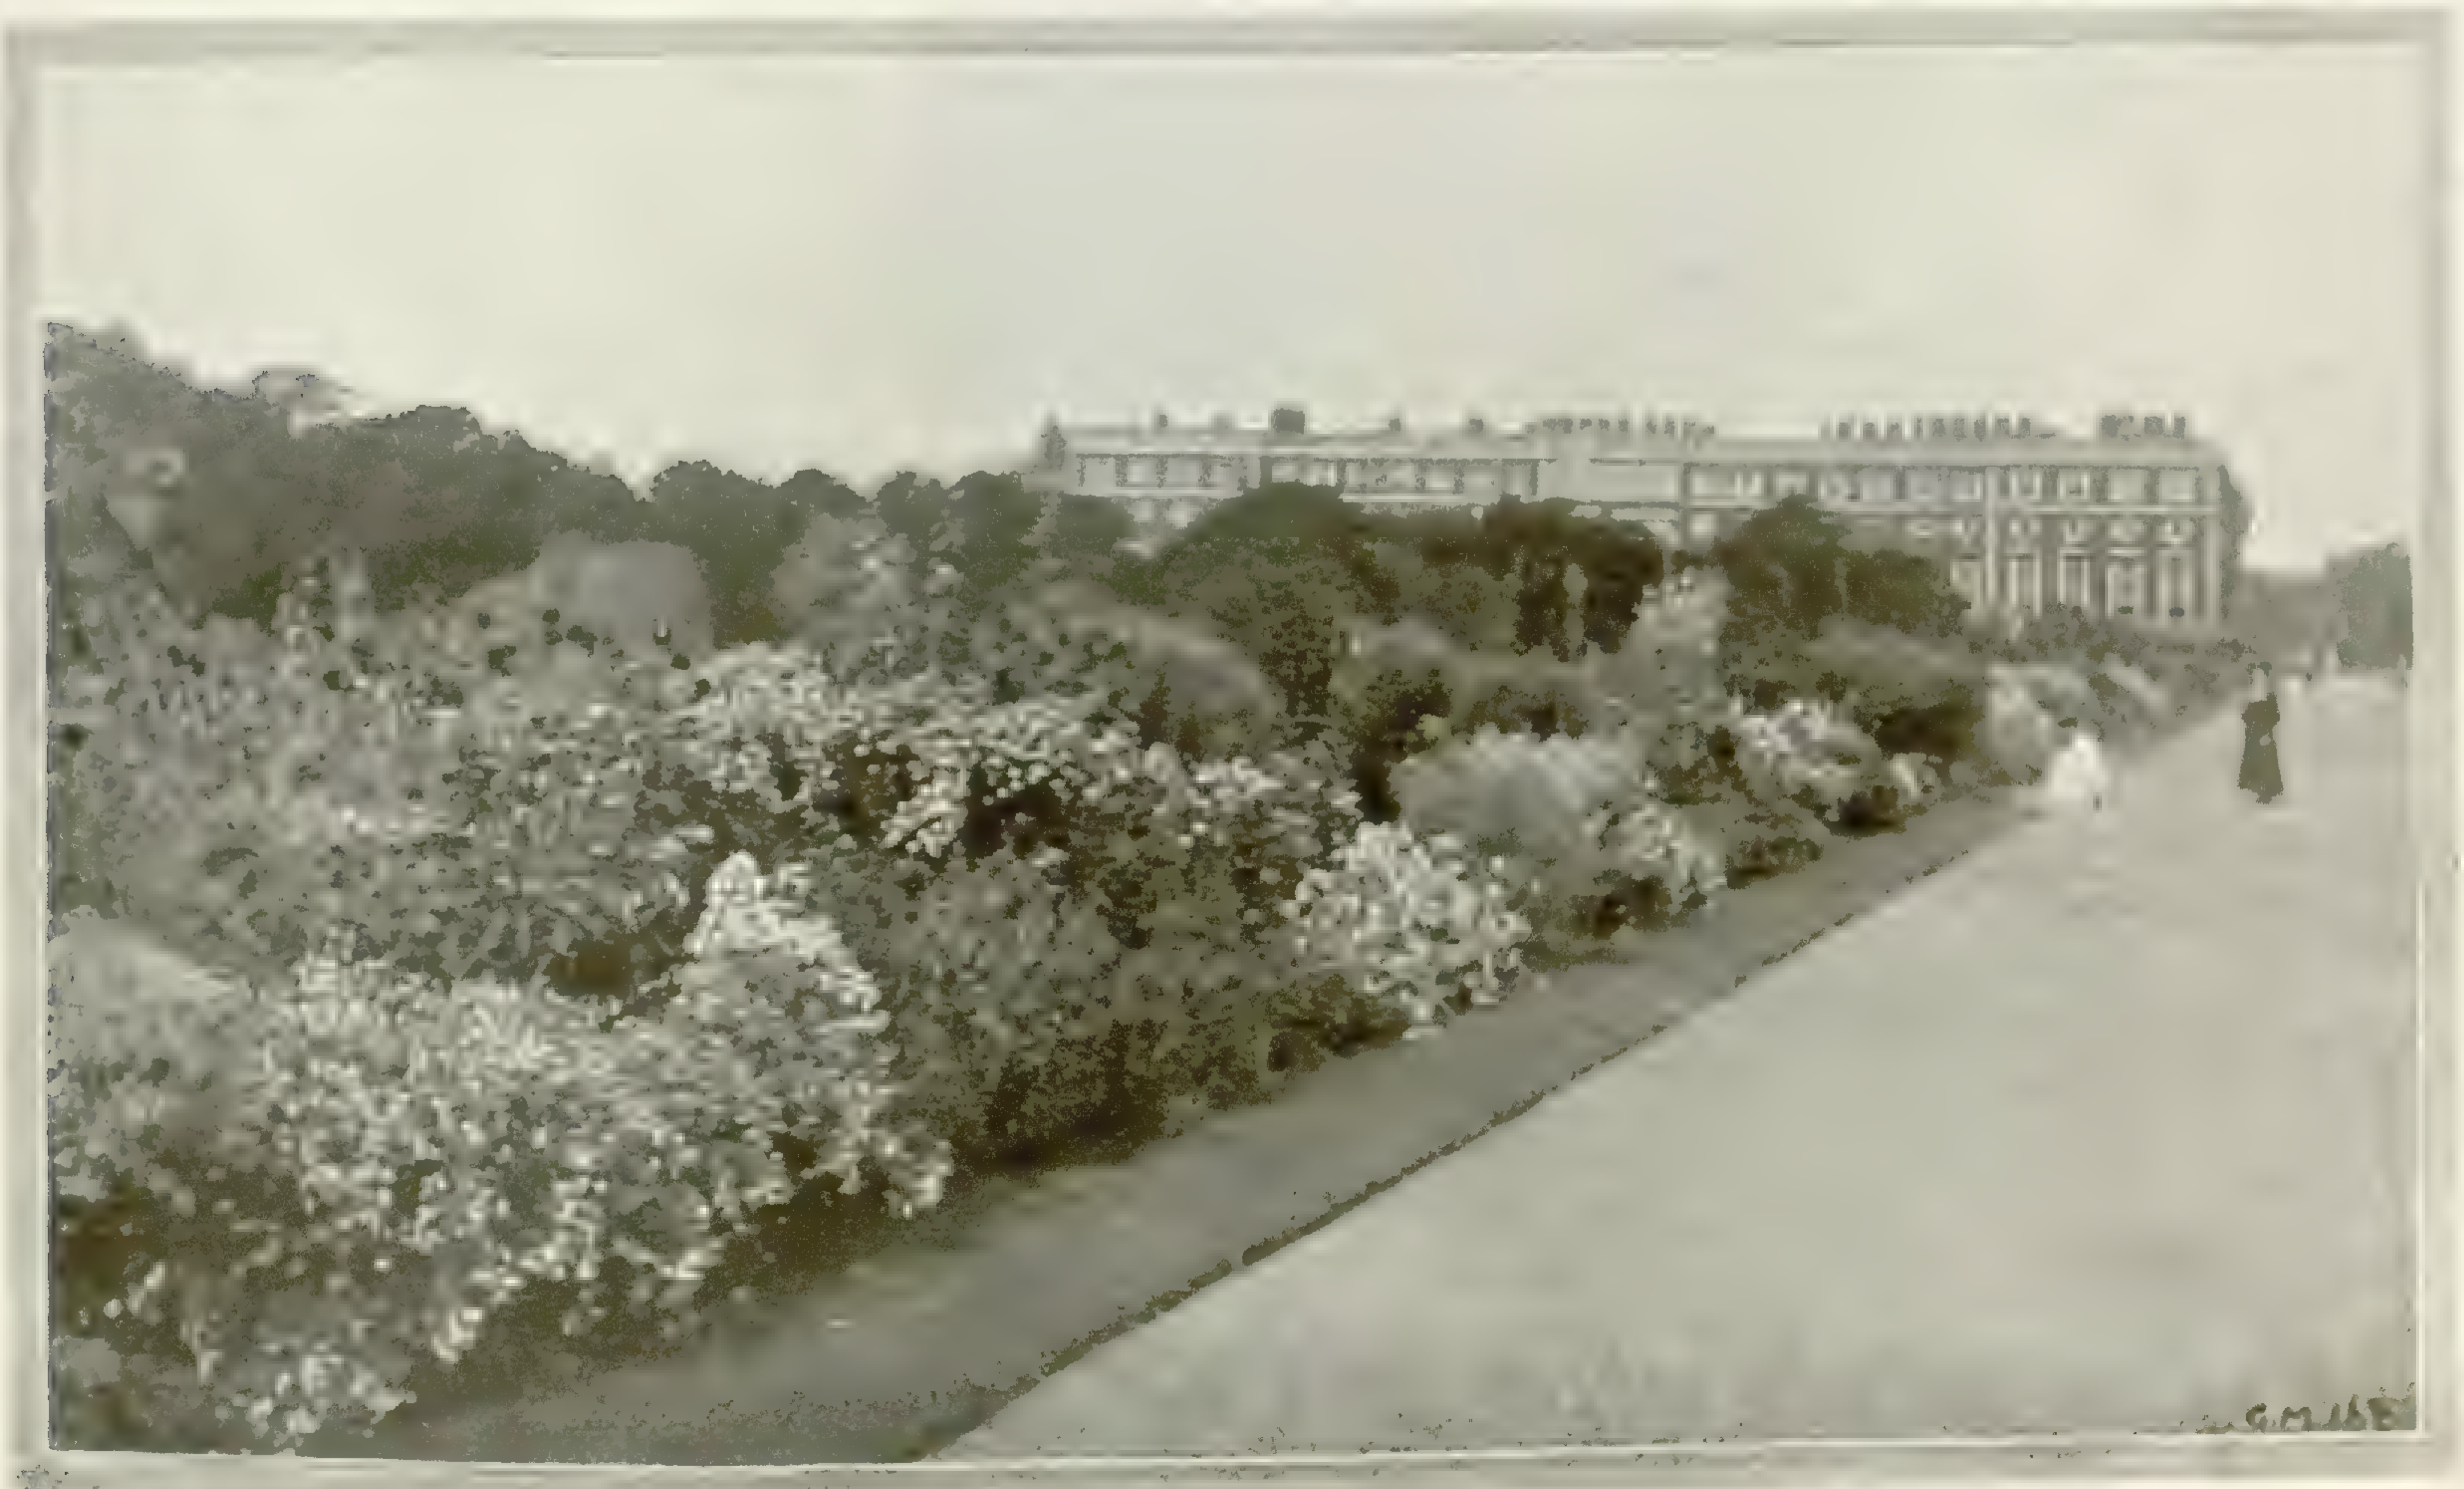
Some biennials claim notice, notably the gaillardia, treated as such. Sown in June, or earlier, it produces a ceaseless supply of flowers for cutting from June to September. The grandiflora hybrids are the best, especially those with a glowing crimson centre and a deep golden edge. Another good biennial is one of the pure yellow flowers referred to, Coreopsis grandiflora. It should be sown in May or June, and after flowering done away with.

The hardy perennials must have brief mention. The white everlasting peas, cut with long sprays, and mixed with sweet williams, produce an effect which is good both in colour and form. The great family of perennial sunflowers, including the nearly allied heleniums, rudbeckias, etc., produce flowers which last better now than a month later. The thalictrums, especially T. angustifolium and T. flavum, produce a beautiful effect with the Cambridge blue delphiniums, especially the smaller growths of D. Belladonna. Achillea Ptarmica fl.-pl., especially the variety called The Pearl, is quite a change, with its pure white double flowers, from most of the flowers of this season. This, and the various forms of Chrysanthemum maximum, mixed with sober-hued subjects like the sea hollies, or the paler colours of campanulas, make a good composition. Alstromerias, with their various colours of soft shades, are a contrast to the preceding, all colours going well together.

Alger Petts.

THE HERBACEOUS BORDER AT HAMPTON COURT.

On Monday last, when many thousands of people were enjoying a brief holiday in Wolsey's grand old palace at Hampton Court, or in its fine gardens, the long herbaceous border that extends in a line with the garden front of the palace was the subject of considerable attention and admiration. Whether the northern end be inspected, or whether the portion that extends down to the river is considered, there is much to admire, interest, and instruct in every yard of the border. The walls are amply clothed with clematis, roses, Polygonum Baldschuanicum, passifloras, jasmines, Tecoma radicans, and other beautiful climbers, while the border proper is the home of a whole host of summer and autumn-flowering plants, with groups of tender subjects planted to heighten the general effect. We have on a previous occasion pointed out the one weakness of this extensive floral display, i.e., its narrowness. A yard more of width would make a wonderful difference, but even as it is the border is a fine feature, and one of the most attractive of the many attractive garden features at Hampton Court. Another great attraction is the famous vine, with its two hundred clusters of black grapes.



SOUTHERN PORTION OF THE LONG HERBACEOUS BORDER AT HAMPTON COURT.

THE SOLIDAGOS.

The solidagos, which add much to the attraction of the flower garden late in summer, do not need a rich soil. Under natural conditions they are rampant growers, and thus heavy manuring would but induce excessive growth. To obtain the best results they must be divided and transplanted every year, placing them, if possible, in fairly heavy or retentive soil. By division and transplanting you not only keep the golden rods fresh and young, but you obtain dwarfer plants, which are better habited and better flowered. If any doubt the correctness of this statement, may I urge him to test it for himself. I have had old established clumps grow to twice the height and produce but half the blossom of my annually lifted and divided plants. In addition, the old-established clumps generally lose the greater portion of their foliage during the summer heat, and become less attractive. Of course, the height of some of the taller solidagos would exclude them from small borders, but even this difficulty may be overcome by stopping the growths late in the spring. Last season I treated several plants in this manner, taking out the point of each growth when about two feet high. The result was to effectually check the shoots and encourage them to produce later a host of young growths from the axils of the upper leaves. These soon assumed the form of flowering shoots, developing into shapely heads of "gay gold."

NEW SWEET PEA, CONSTANCE OLIVER.

Received an A.M. in N.S.P.S. trial at Reading. Bright pink, with cream-yellow at base of wings and keel.

Solidagos revel in a moderate amount of moisture in the soil, and are pre-eminently sun-loving, so give them your sunniest positions, where they will have room for their development.

There are several species and varieties in cultivation, and with a little care in selection, one can have golden rods in blossom from July to the end of September. A notable variety which received the R.H.S. Award of Merit was shown as late as October 9 and October 15, under the name of Golden Wings. It is probably a seedling from the late-flowering S. sempervirens, but may be regarded as a much finer form. It is a tall grower, and by reason of its graceful habit and lateness, it should find a place in many gardens.

S. serotina is a handsome species with dark stems and large pyramidal heads of flowers. S. multiradiata, which is sometimes regarded as a variety of sempervirens, is a charming form, with large branching heads of blossom. S. ulmifolia, sometimes known as S. multiflora, is a showy and interesting species.

S. virgaurea and its varieties rank among the best known of the golden rods, the flower heads are of very compact formation, and the habit of the plants is close and bushy. Cambrica and nana are the principal varieties, and S. prostrata—a dwarf creeping Norwegian species—is regarded by some as a variety of virgaurea.

Other notable solidagos include the well-known Canadian Golden Rod, S. canadensis. S. Shorti, a strong golden-hued form, blooms in September, and may be regarded as one of the best. S. Buckleyi is a dwarf, sturdy, yet withal showy species from the Rocky Mountains, and the giant S. rugosa or S. altissima will complete a group sufficiently large to permit of a useful selection being made. It may be remarked that the nomenclature of the genus is somewhat confused, and rather apt to mislead by reason of the variation in different lists, but apart from this, planters of herbaceous borders would do well to bestow a little attention on the showy golden rods.

P. S. Hayward.

NEW PLANTS, ETC.

SWEET PEAS.

Constance Oliver.—Another delightful sweet pea, bright pink, with a charming creamy-yellow glow at the base of each segment. A.M., N.S.P.S., July 10, at the Reading trials. Mr. W. Lumley, Dawn Nurseries, Denvilles, Hants.

Paradise Ivory.—Pale cream-yellow, with a blush or pink tinge showing faintly and evenly all through. A pretty flower. A.M., N.S.P.S., at the Reading trials. Miss Hemus, Holdfort Hall, Upton-on-Severn.

TILLANDSIA BLOKII.

A handsome species of large growth, fully developed specimens attaining a height of five or six feet. The leaves have a length of thirty to forty inches and a breadth of six inches, and are pale green freely blotched with purple-red. The flower stems are erect and freely branched, the bracts bright crimson, and the flowers rich yellow. The origin of the plant appears to have been unrecorded, and the first time it was exhibited in Europe was at the Ghent Quinquennial in 1898. It has since flowered at Glasnevin, and the specimen figured was supplied by Mr. F. W. Moore, V.M.H. Under cultivation it takes, according to Mr. W. Watson, these big tillandsias about twenty years to reach a flowering size. "Bot. Mag.," t. 8,192.

WILD ROSES.

How many people of these flower-decked islands, not excepting even those who spend the greater part of their lives in the perpetual society of wayside blossoms, are aware that in Great Britain alone we have at least six or seven different species of hedgerow roses? The professional botanist will go further and assure you that this number very inadequately represents the true extent of the large family of British roses, and this without entering a single garden beyond that which Nature herself has planned and planted. But, except for purposes of scientific study, none of us need bother about the endless divisions and sub-divisions into which enthusiastic students like Hooker, with his twenty-nine varieties, have split up the obviously distinct sorts that can be named offhand by the ordinary dabbler in British wild-flower study. Life is too short to attempt to follow the endless ramifications of each floral family, and no one, unless he becomes a specialist in some particular order of botany, can hope to unravel all the mysteries of innumerable crosses between the members of each genus.

But nearly every one of us has the opportunity each summer of forming a closer acquaintance with the wild flowers of wayside and coppice, and few people who have not yet tried to increase their knowledge of the little everyday blossoms that grow around them, have any idea how fascinating, even to an urban mind, the study of Nature's garden can become. One could hardly make a better beginning than with the emblem of England, as one may justly describe the hedgerow rose.

The dog rose—the Rosa canina of the botanist, who might surely have given it a prettier name—was growing wild in England long before the hand of man ever attempted to set out a garden, and it grows to-day all over the country, brightening our wayside hedges with its myriad blossoms from early in June to late in August, and caring nothing for the showers of dust that every passing vehicle scatters on its comely face. Everybody knows this rose, but not everybody can distinguish it from a rather near relation—the white-petalled field rose (Rosa arvensis) as it is called. The petals of the dog rose proper are always pink, five in number, and notched: the field rose is colourless, and bears its blossoms, not singly as the dog rose usually does, but in clusters, so that when you pick it, you get a whole posy of buds and blossoms with a single stroke of the knife. It is to these two roses in particular that we owe the welcome appearance of the brilliant scarlet "hips" that brighten the hedges of every country lane long after the leaves have fallen, and supply such a feast for the birds during severe weather.

Much less common than either of the foregoing, though still widely distributed, is the Scotch or Burnet rose, which has earned its Latin title of Rosa spinosissima on account of its prickly stem, which is covered all over with multitudes of straight spikes that vary in their composition from practically harmless glandular hairs to extremely offensive thorns and bristles. One may go far and never be introduced to this hostile little shrub, whose favourite habitat is the open heath on sandy or chalky soils, especially within reach of the salt-laden breezes of the ocean. Its flowers are either white or pink, and its fruit, instead of being pitcher-shaped, as in the case of the dog-rose, is nearly globular. It blossoms, too, at an earlier date than the others, and does not last in flower so long.

And now we come to the sweetest of all our native roses—the sweet briar. By any other name than Rosa rubiginosa it would doubtless smell as sweet, but, as all the world knows, it owes its fragrance rather to its leaves than to its blossoms. The scent of the sweet briar is one of the first things to arrest one's attention during a country walk in spring, and in some of the chalky lanes of Hampshire and Sussex the perfume is almost overpowering when the young leaves first begin to open. Except in the South of England the sweet briar is not a common plant, and if it were not for its fragrant leaves, its presence would often go undetected even where it is quite common, for it loves to grow in company with other members of its family, whose blooms are far more conspicuous than the little pink rosettes of the sweet briar.

There is no need to bewilder the inexperienced student of wild flowers with a description of other varieties of roses which he is hardly likely to meet with. The differences between some of them are so slight that no one but a learned botanist would detect them, and they could only be shown on paper by an elaborate system of diagrams and copious explanations. And even were any enterprising enthusiast to master to his satisfaction the subject of roses proper, he would then be only at the beginning of his task. The order of the Rosaceæ is an almost inexhaustible family, for besides including all the varieties of plum, cherry, blackberry, strawberry, apple, hawthorn, and medlar, it embraces among the smaller plants such large sub-families as the spiræa (of which the meadow-sweet is the most familiar), the potentillas (represented by the cinquefoil and silver-weed), and such familiar weeds as salad-burnet, and herb bennet.

East Sussex.

NEW SWEET PEA, PARADISE IVORY.

Received an A.M. in N.S.P.S. trials at Reading. Pale cream-yellow with pink suffusion

ARMERIA LAUCHEANA.

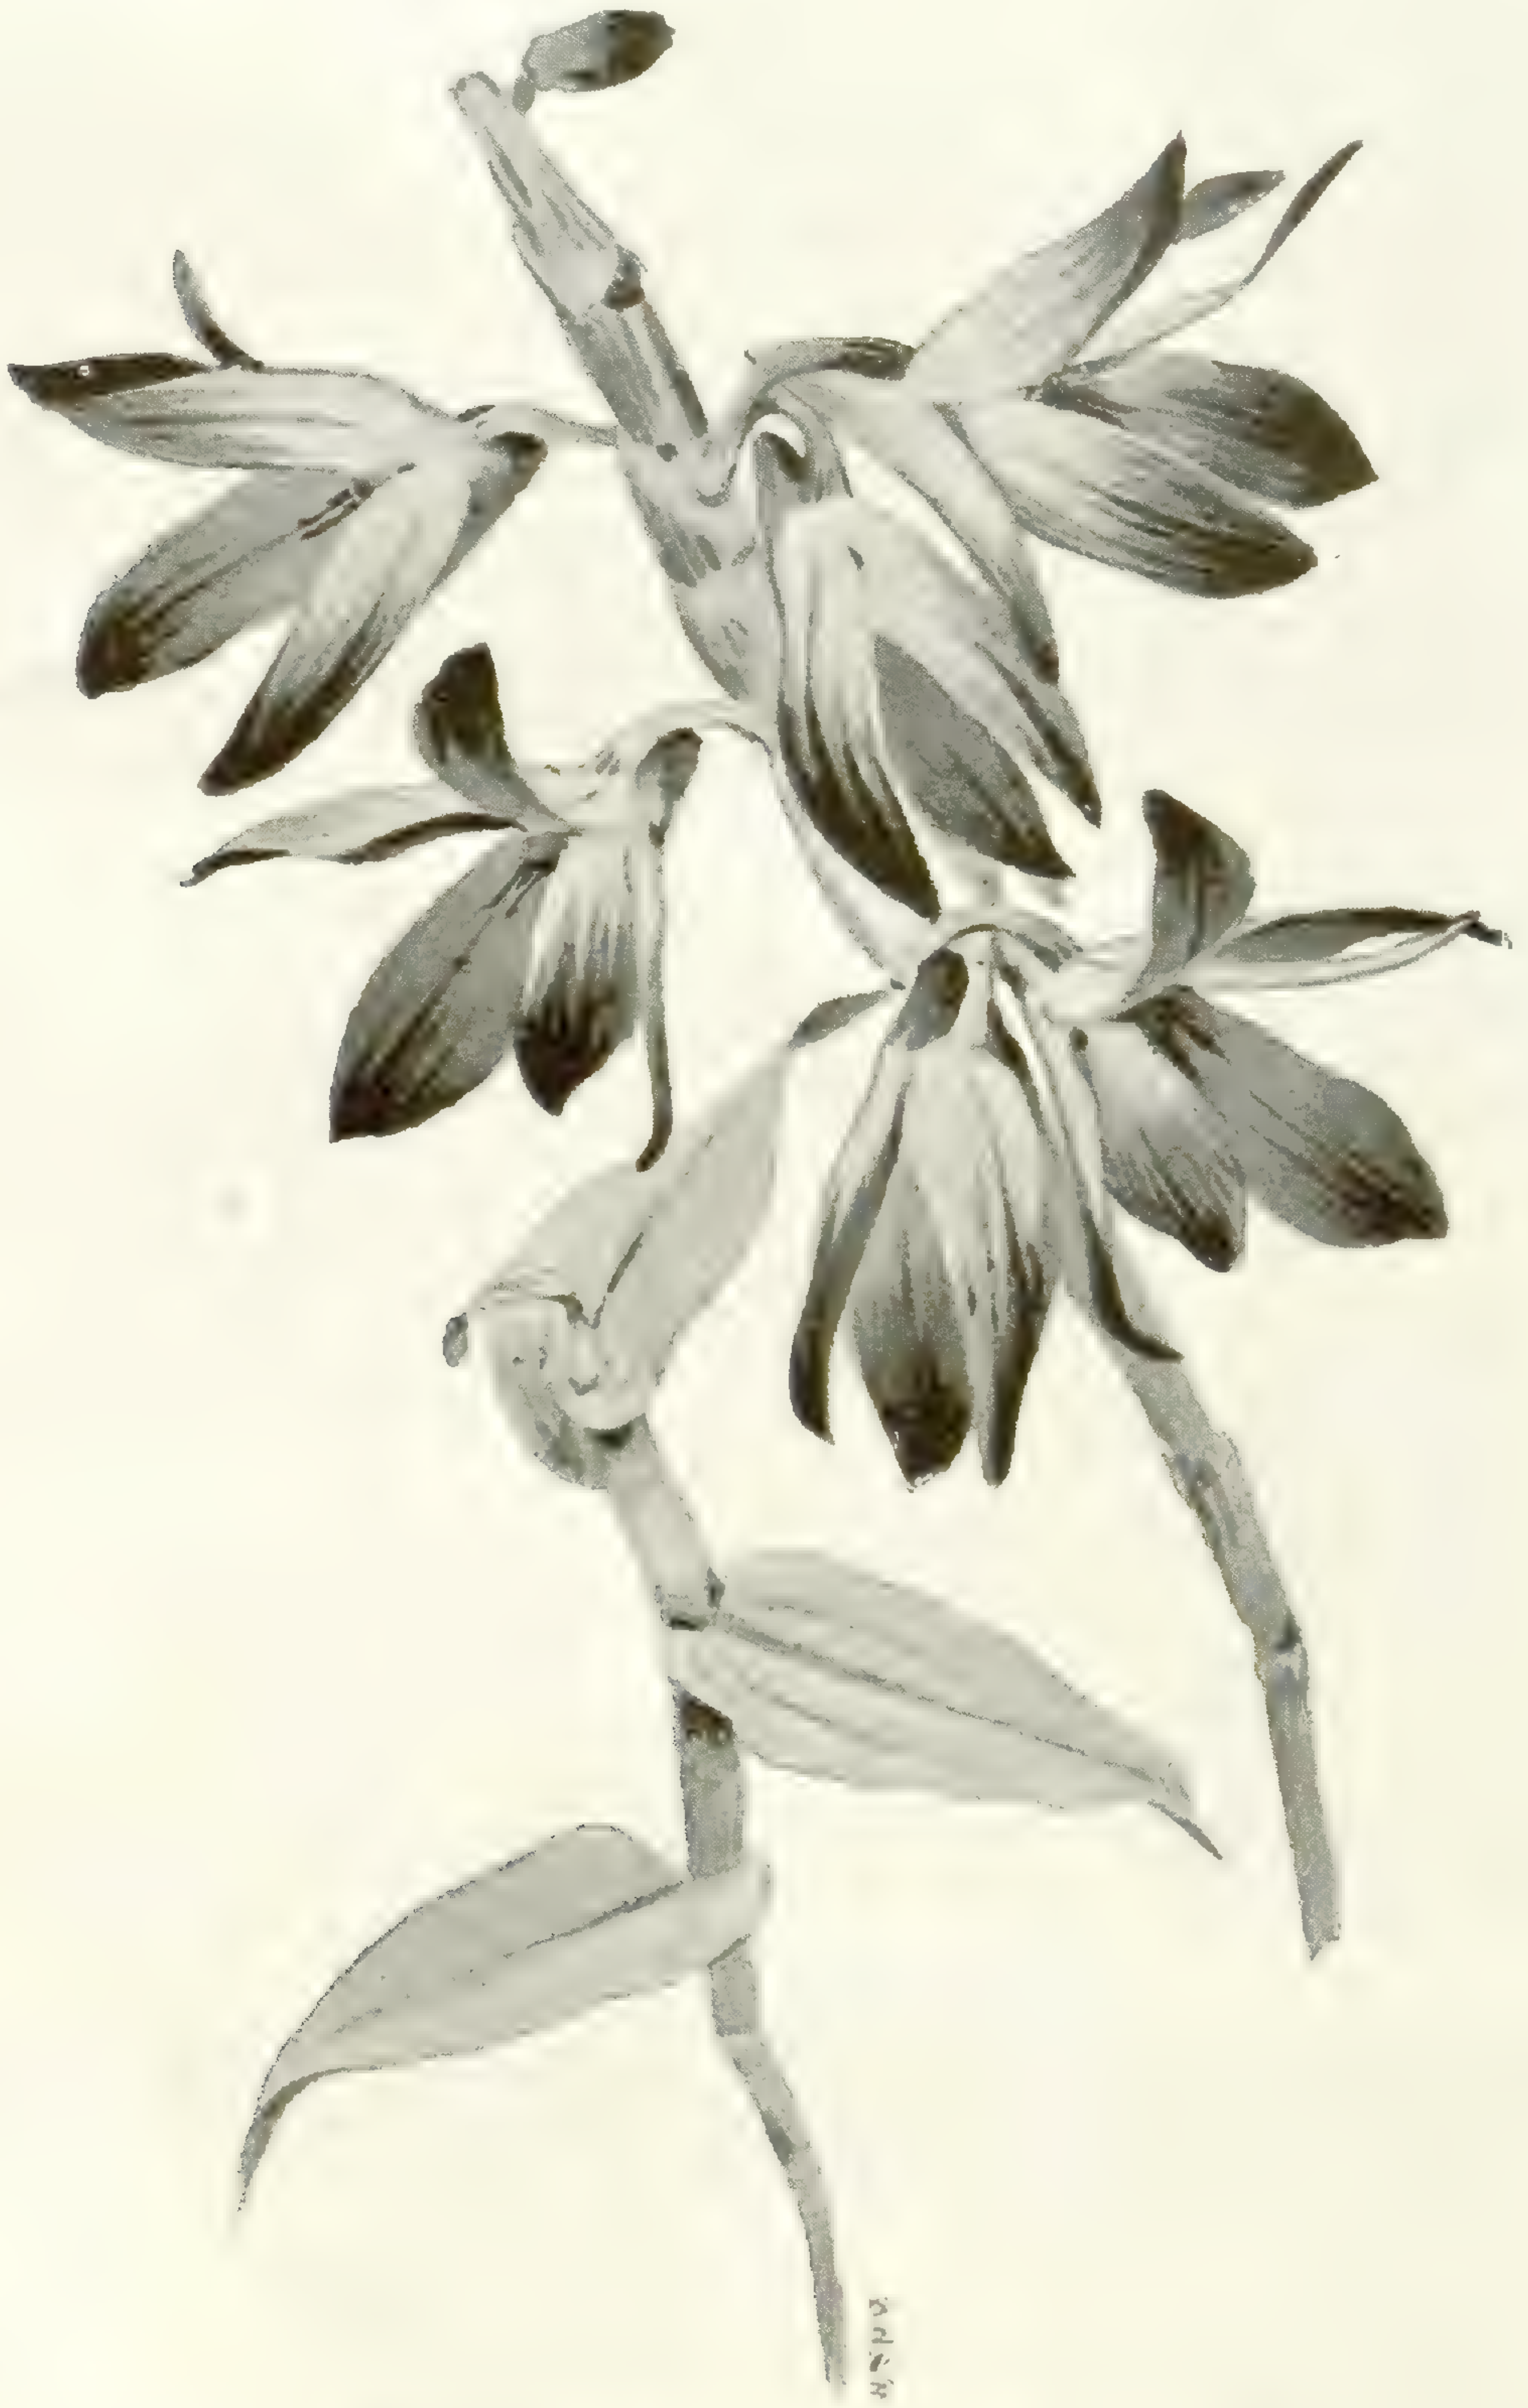
As edging or rock plants the armerias, or thrifts, are deservedly held in high favour, and in places where they do well they are sometimes usefully employed as edgings to borders or beds, especially where there is a stone margin over which they can grow, this "stiffening" them up considerably, and giving them that support they should have when grown as edgings, although this is not essential.

None of the varieties of Armeria maritima, the well-known thrift, or sea pink, of our own coasts, is better for an edging than that variety called A. m. Laucheana, although most commonly called A. Laucheana alone. The white variety, maritima alba, is pretty in its way, but for brilliant colouring there is no other thrift I know which equals the first-named form. Its flowers are called crimson—a term which is difficult to improve upon, although one accepts it with some reluctance, as it has a tinge of deeper hue about it which makes it more inclined to purple. It is very dwarf—about six inches high only—and of close growth and easy to grow.

I have had at times various other varieties to test alongside of my own plants of A. Laucheana, as I have known it for many years, and none of these was equal to it in colour. Last year a friend sent me one which he said was the deepest coloured one he knew. It was disappointing to find that it was paler than this old Laucheana. This year I bought plants of a form called purpurea, but it, also, is lighter and much less effective. If any reader purchases a thrift as A. Laucheana which is of poor colour, he may blame the nurseryman, much as I deprecate blaming that much-harassed individual, and not me, as the true plant is of excellent colour, and is as yet unsurpassed in this respect by any other species or variety.

It is easily increased by dividing it up in spring or autumn, and I observe that seeds are sometimes offered for sale. Let me caution the reader not to depend upon all the seedlings coming true to colour. I have self-sown seedlings beyond the reach of other varieties which are far inferior in point of colour to this good plant. It is not very particular as to soil, but should have sun, although this is not quite essential.

S. Arnott.



DENDROBIUM VICTORIA REGINA. ½

Leeks.—Another batch of these may now be planted, and, if all the best positions are being filled up, some may be put out between the potato rows, and these come in very useful in the late spring.—T. W. B.

DENDROBIUM VICTORIA REGINA.

We have in D. Victoria Regina one of the most distinct and pretty species found in the whole genus. It was introduced from the Phillippine Islands in the year 1897, and received an Award of Merit when exhibited by Mr. T. Statter on August 10 of that year. The deep blue and white flowers characteristic of the species are an attractive feature, and always the subject of admiration to those interested in orchids. When first imported it was generally distributed throughout orchid collections in this country, and was exhibited extensively for a year or two afterwards, but it appears to have now almost disappeared, for we rarely meet with it in cultivation. It appears from the first to have been by no means an easy plant to deal with, for those who did succeed with it generally differed widely in their methods of culture.

I distinctly remember a fine plant, which, I believe, is still in a vigorous state, in Sir Trevor Lawrence's garden, where Mr White succeeds in growing it under practically cool conditions. The plant we have here flowered satisfactorily last autumn, having been suspended in a basket from the roof of the plant stove during the time it has been in my charge. With such varied conditions it is difficult to advise what methods are likely to be successful, and I think the whole matter must be left to the discretion of the grower. I find it a species that must not be kept severely dry when in a dormant state, but when growing have liberal supplies of water, indeed, almost aquatic conditions of moisture are desirable, and at no period of the year should atmospheric moisture be withdrawn. When the flowers expand, if the plants are removed to cooler conditions, they last for a long time in perfection.

H. J. Chapman.

Oakwood Gardens.

A ROSE NOTE.

When budding standard briars the growth on which the bud is being inserted should not be shortened, as this would cause an undue flow of sap to the bud, and produce premature growth. The object should be to secure a freshly united but practically dormant bud until the following season; if the bud starts into active growth this season, and sharp frosts follow, it would in all probability be destroyed. When budding, bind up closely, but guard against binding over the bud; if raffia is used it will work easier if kept damp; this can be done by cutting it into required lengths and keeping it in a vessel of water. Growths that buds are being taken from should also be kept in water. So far the growth of roses has been very satisfactory, and the rosarian may rejoice in a good season if genial weather continues. Richmond is proving a good acquisition, and if the new Mrs. J. Lowe merits all that is said for it, it will be another desirable variety. The good, well-tried Caroline Testout still seems one of the best roses, and other favourites, such as Viscountess Folkestone, Gruss an Teplitz, Mrs. Sharman Crawford, Gloire Lyonnaise, Killarney, and others of that section, retain the affection of growers, especially in localities that are not kind ones for roses. Ours is not a good rose district, and many varieties are not a success with us, Mrs. W. J. Grant, Bessie Brown, Perle d'Or, L'Ideal, the common China or monthly, Laurette Messimy, and other weak-growing ones being quite a failure. Gloire Bourg de la Reine, tried in two beds for the first time this year, is so far doing very well.

E. F. Hazelton.

Knowsley Gardens.

THE PAVIAS.

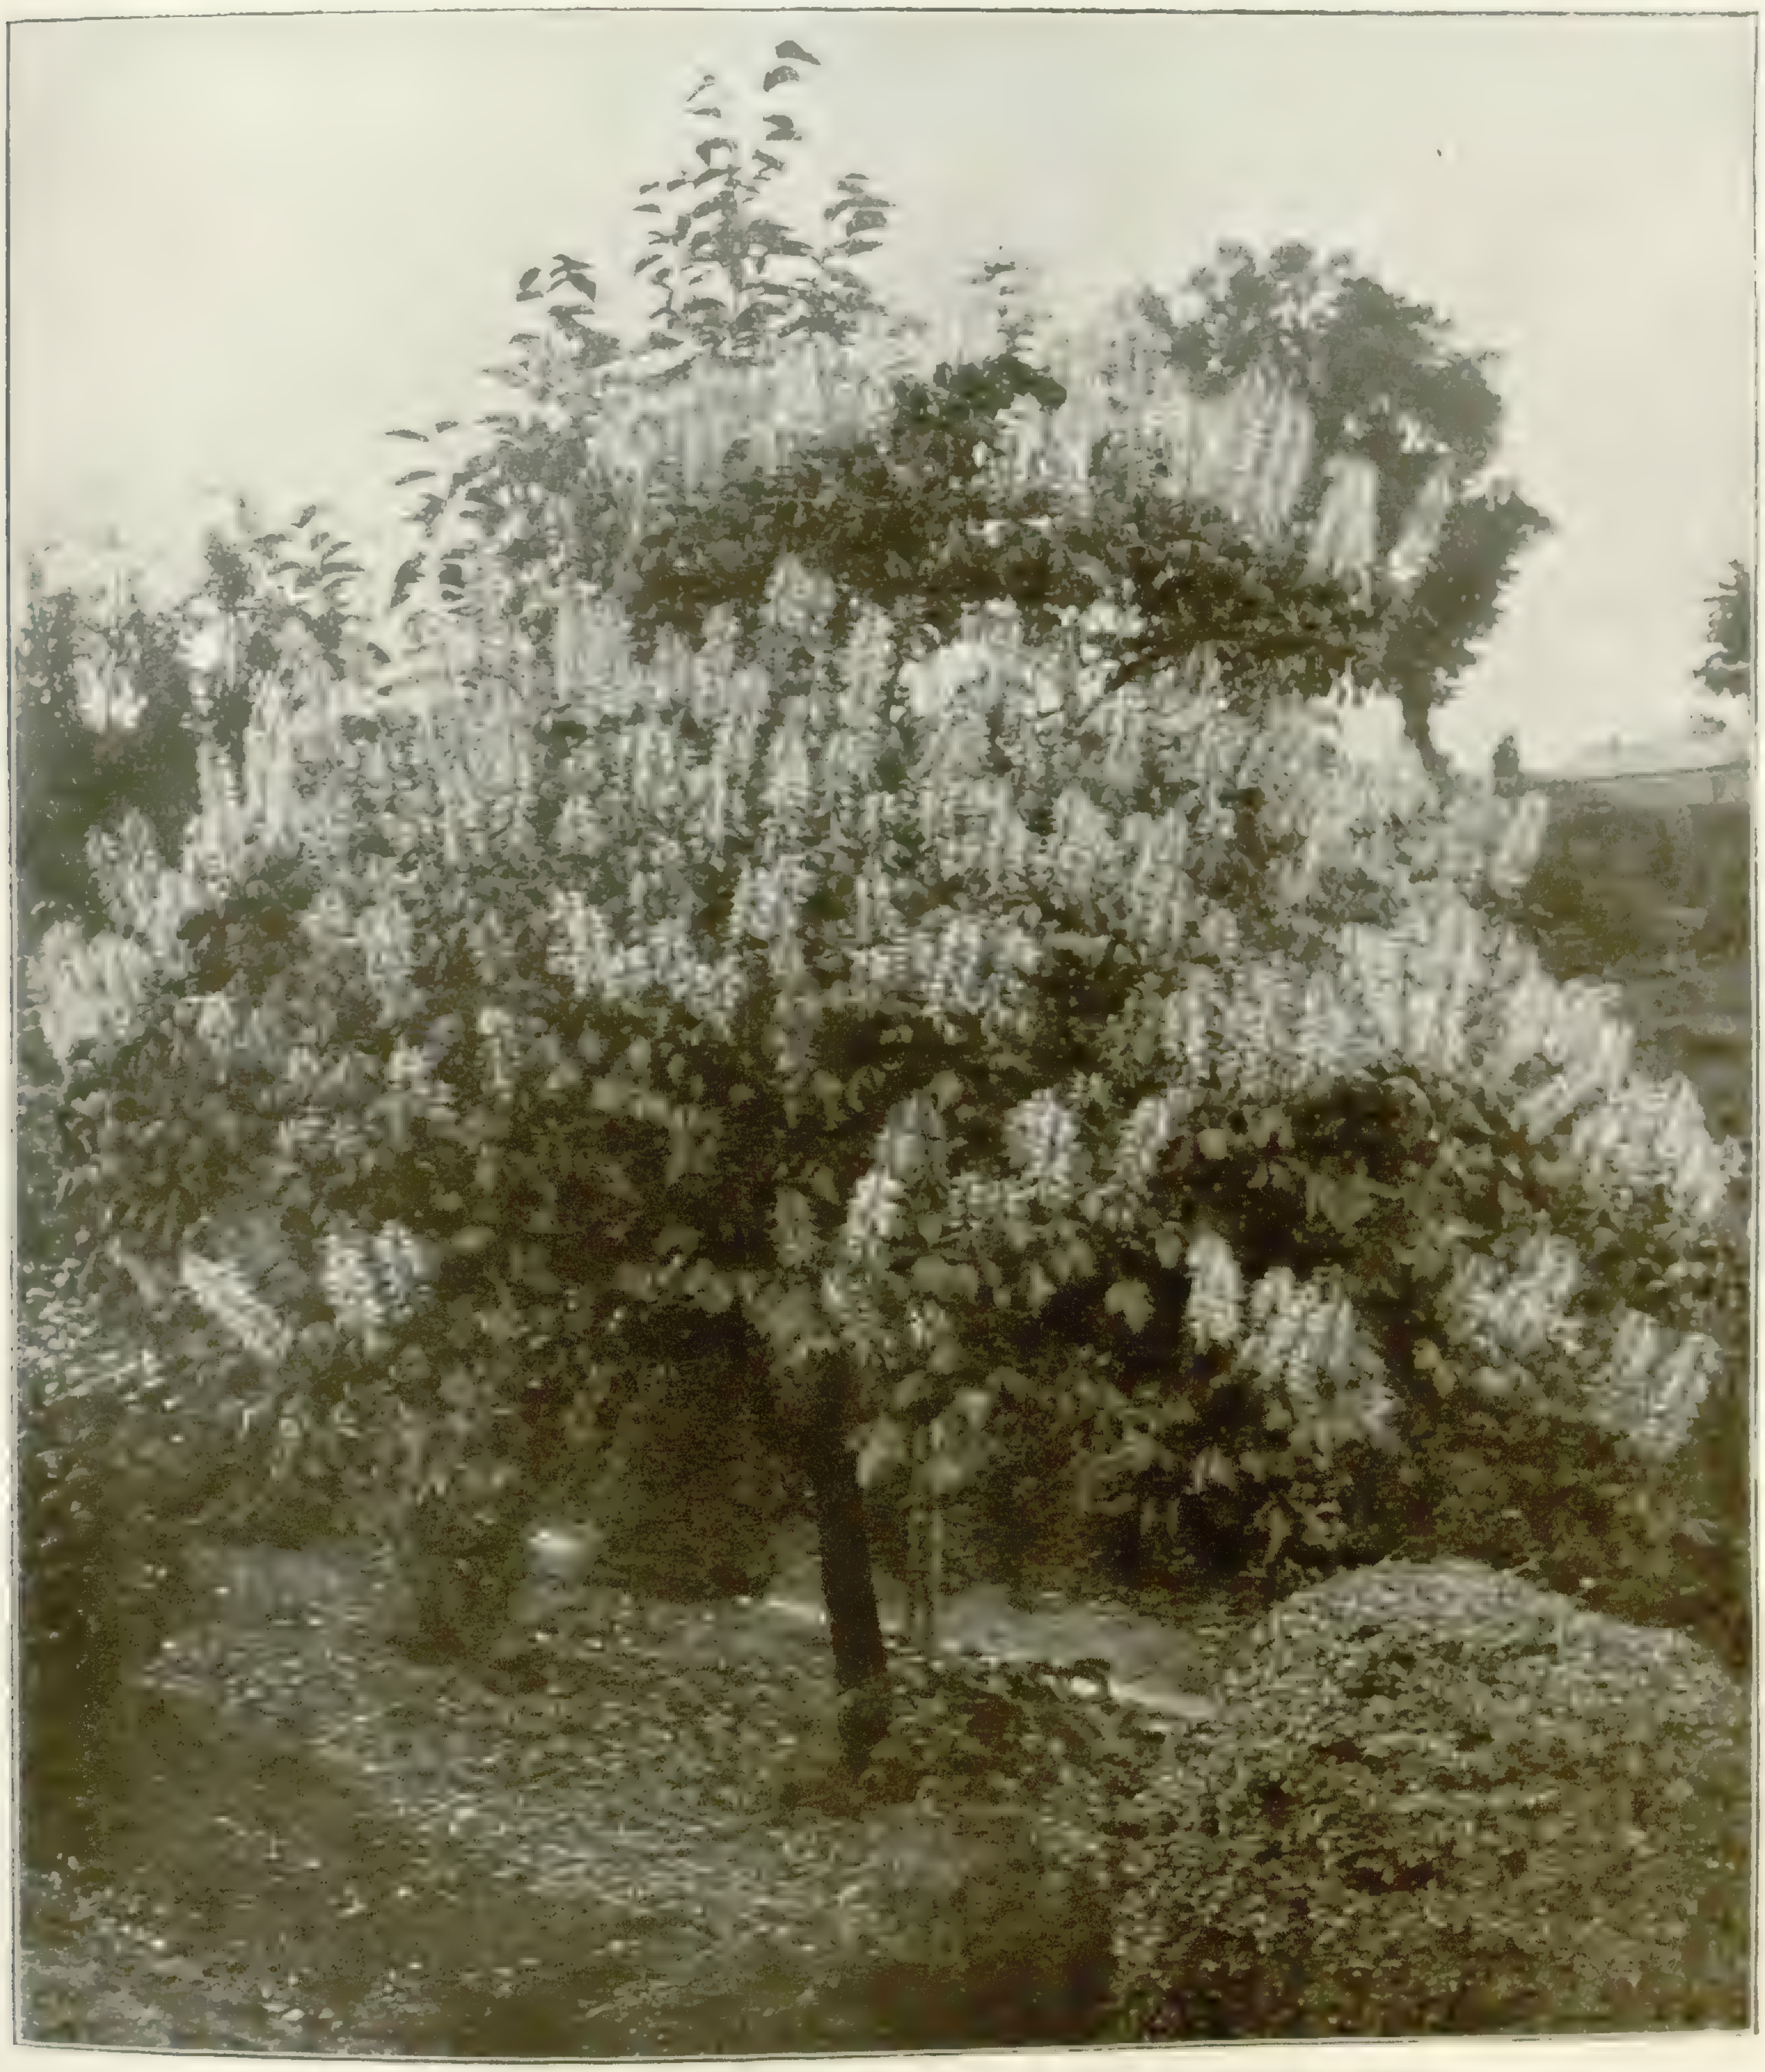
Although, correctly speaking, the genus Pavia is obsolete, the name is still recognised in some commercial establishments, in consequence of which certain trees and shrubs are known under this name only in various parts of the country. The plants that are included under this generic title are, strictly speaking, species of æsculus, and do not differ to any material extent from the common horse chestnut. The name was originally adopted for several species on account of their smooth, spineless fruits, comparatively low stature, and smaller leaves and flowers than are possessed by such trees as Æsculus hippocastanum, Æ. indica, etc. There are, however, numerous intermediate stages between the two groups, and scientists nowadays recognise but the one genus—Æsculus. In the present article pavia is kept up simply as a guide for those who are in the habit of keeping the name distinct; correctly, however, all should be called æsculus.

Several species blossom at a later date than the ordinary horse chestnut, and on this account alone, are admissible in the garden, whilst one species, P. macrostachya (Æsculus parviflora), of which an illustration is here given, is one of the best late summer flowering shrubs we possess. All thrive in ordinary garden soil, and, though they attain the greatest dimensions in that of good quality, they give a fairly good account of themselves in that of a sandy nature. Some ripen seeds in this country, and propagation may be effected by their means, though it is usual to graft or bud them on to stocks of a stronger-growing species, a method which is not free from defects, for stock and scion grow at different rates, and ugly swollen bases result. One species, P. macrostachya, suckers freely, and increase of stock may be obtained by detaching these suckers and planting them separately.

The kinds included under this heading are all of North American origin, and are as follows: P. californica, P. flava, P. glabra, P. Lyoni (hybrid), P. macrostachya, and P. rubra.

P. californica (Æsculus californica), commonly called the "Californian horse chestnut," forms a low-growing, bushy-headed tree rarely exceeding 20ft. in height in its natural habitat. Under cultivation it forms very little trunk, but the head has a very wide spread. The leaves are five-parted, and distinct in appearance. The flowers are borne in dense racemes in July. They are white in colour, and are peculiar by reason of the terminal blossom opening some days in advance of any other. It was first cultivated by Messrs. Veitch, and blossomed in July, 1858, for the first time in England.

P. flava is known as the "Yellow-flowered horse chestnut" and "Sweet Buckeye." It



A FINELY-FLOWERED SPECIMEN OF PAVIA MACROSTACHYA
In Messrs. J. Veitch and Sons' Nurseries, Coombe Wood.

is distributed from Western Pennsylvania to Georgia and Texas, where it is said to inhabit rich and fertile valleys. At its best it forms a tree of considerable proportions, being met with up to 80ft. in height. Large trees are scarce in this country, though, if planted in good soil, there is no reason why it should not attain its largest size. The leaves are handsome and composed of usually five, occasionally seven, leaflets. The flowers are yellow, and borne in upright racemes in April and May. Its correct name is Æsculus flava, and in addition to the name which heads this description, it has a great many synonyms. A variety is known under the name of purpurascens, which has red and yellow flowers. It is sometimes spoken of as Pavia discolor. Other varieties are sanguinea and Whitleyi.

P. glabra, the Ohio Buckeye, forms a low tree with a spreading head. The leaves are rather larger than those of P. flava, and are glabrous. The flowers are not very conspicuous, being of a greenish yellow shade. It grows rapidly when young, and flowers in a small state. Among other synonyms, it has been known as P. ohioensis and P. pallida. There is a specially strong-growing variety known as arguta.

P. Lyoni is a somewhat rare plant, and is considered to be a hybrid between Æsculus Pavia (syn. Pavia rubra) and Æsculus (Pavia) flava. It is not a very strong-growing plant, resembling most closely the first-mentioned species.

P. macrostachya (or Æsculus parviflora) is a good plant, and a glance at the accompanying illustration is sufficient to convey an idea of its floriferous nature to those who do not know it. The picture does not, however, represent the plant as it is usually met with, for, instead of forming a single stem with a large head, as seen in the picture, it grows into a large, wide-spreading bush, suckering freely, and increasing in width rapidly. The specimen here shown has probably been grafted or budded on to a stem. The leaves are large, rather thin in texture, glabrous, and composed of five or seven leaflets. The flower heads are borne freely during July and August, and may be anything up to a foot in length. The flowers are white, relieved by reddish anthers. It is a native of the South-eastern United States, and an invaluable shrub for late summer.

P. rubra, the Red Buckeye, has been named and renamed many times, one authority being responsible for no less than five different names. It is a not well-known plant, and is rare in cultivation. It forms a small tree with a bushy head of rather weak growth. The leaves are rather small, and five-parted. The flowers are red and produced rather sparingly in small racemes.

Although several other chestnuts have been mentioned under the name of Pavia, those in the above list are the ones usually referred to. W. Dallimore.

Kew.

Ferns.—In the fernery most of the season's growth will be in a forward condition, and to prevent the new fronds damping off the plants should be divested of most of their remaining old fronds. Adiantum fragrantissimum, and A. cuneatum hold a foremost place as pot plants, their light green elegant fronds are most attractive when grown in pots for house decoration. We have some nice plants in 6in. pots, they are good growers, doing well in sandy loam with a little peat. I find many of these free-growing ferns grow amazingly when the pots are full of roots, if watered frequently with liquid manure, but treated thus they are of no use to pot on.—T. B. Field.

ROUND THE VILLAGE GARDENS.

It does not matter what the name of the village is, nor where it is situated, but suffice it to say that it exists, and is typical of scores of other old world places to be found in every county of this fair land of ours. It possesses its Manor House, the gardens of which enjoy a fame of more than local character, a grey old church and rectory, a few habitations tenanted by what are called "better-class folk," and for the rest, well, the village is made up of cottages, most of which look half as old as time itself, and in some cases are occupied by the third or fourth generations of the families who were the original tenants. Every cottage, of course, has its garden, and in addition there is a field of allotments, which was provided by a former squire, where the villagers can hire 20 rod plots at a rent that is by no means excessive. No one remembers the time when the cottage gardens in the village were not well kept in a general way, but a new spirit was introduced some years ago, when, as the result of a general meeting, and a good deal of discussion amongst the women at home, and the men under the yew tree which stands at the corner of the straggling street, and where, by the way, many a knotty question has been fought out, it was decided to start a horticultural society and have an annual flower show. That spirit has grown, the annual event is known in the village as "our show"; the sturdy men folk look upon it as being something peculiarly their own.

At some future time I may be privileged to describe the show, but my office now is to say a word or two about the gardens; and what I know about them was gathered a few days ago when I was asked to judge them for prizes offered by the society. I felt a sense of responsibility in undertaking the task, because there is a certain freemasonry amongst the villagers, who visit each others' gardens on Sunday evenings to compare notes, and they have competed long enough with each other to know pretty well which is the best. Still, they are content to abide by the decision of the "genelman who comes to judge," and, though there may be some secret heart-burnings when the results are made known, these are kept in the background when the successful ones receive their prizes from the hands of squire's lady on show night.

"I didn't think o' puttin' th' garden in this time," said one grey-headed old fellow who hobbled down the path after me, while I was taking down notes of the different crops, "but th' old woman said I'd better. You see, I be eighty-five, and I can't do it as well as I used to, though I keeps potterin' about, and should be alright if it worn't for these plaguey rheumatics. I'm powerful fond of a bit o' gardenin', and 'ave bin all my life, but I can only potter about like now."

Just then a grey head and a wrinkled face appeared at the cottage door, and a time-worn female voice explained: "Bless you, sir. I can't keep him out o' th' garden, and he'd put it in if only to show some o' th' young 'uns as he ain't worn out yet. But when you've done, sir, would yer mind comin' and 'avin' a look at my bits o' flowers. They ain't quite what they would ha' bin, but its bin so dry, and I can't carry water same as I'd used to do." You can picture the flower garden—just a border in front of the cottage door, containing a mixed medley of old-fashioned things that seem to belong absolutely to cottage gardens, a honeysuckle clambering over the doorway, and bright scarlet geraniums peeping at you through the window. "Come in, sir, an' 'ave a look," was the genial invitation, and I stepped on to the stone floor that was spotless. "There, sir, wot do you think o' that for a geranyium?" said the old lady, taking hold of a pot that had been coloured outside with raddle till it was almost as red as the flowers. "I'm going to put that in th' show, and it'll take a good 'un to beat it. I've growed it from a slip as my daughter brought me when her youngest was a baby, and he's five come Michaelmas." But time pressed and I could stay no longer. "Good-day, sir," said the old pair in chorus, "and please God we hope to see you round again next year."

A pathetic instance occurred at the next garden we visited. A man met us at the gate with a troubled look on his face. "It's no good you goin' round this time, sir," he said, "as I ain't bin able to do anything. We put th' garden in as usual, and then she took ill. She's up there" (pointing to the upper window) "and th' doctor says there ain't no hope, but she doesn't know it, and if she thought I hadn't done th' garden, and it worn't bein' judged, she'd be troubled like, so p'raps you'll just walk round, so as I can tell her you've been." It was not much to ask, and I willingly assented, listening all the while to apologies for the unavoidable neglect. It was a real trouble to the man that the garden was not what he would have liked, but "she doesn't know," he said, as he rubbed a tear from his cheek with the back of his rough hand. There is pathos in garden judging sometimes.

In a keen competition the highest points were gained by an agricultural labourer who earns fourteen shillings a week, and I never hope to see a better cottage garden. "It's a wonder how he does it," said his wife, after she had instructed a child of about eight to look after little Teddy, and see that the baby didn't fall in the wash-tub. "He starts work at six, and often ain't done before dark, but he loves his garden, and he's in it every mornin' afore four o'clock all through the spring and summer." There was evidence of the love in the cleanliness, order, system, and appearance of every crop. "Thank you, sir," said the women when I paid her a well-deserved compliment, "he works hard and deserves all he gets, but I don't know what we should do without th' garden on his money, wi' six children to pervide for. There ain't much for th' public-house, sir, and it wouldn't go there if there was, 'cos he wants nothing but his garden in his spare time, and I 'elps him after th' little 'uns are in bed."

Evidence of the ruling floral passion was to be seen when we called on the individual who mends the shoes in the parish, for there we found a spare little man attired in his professional apron looking over the top of a pair of bright rimmed spectacles at a sweet pea flower, which he held in his hand. "That ain't bad for a novice," he said, "four flowers on a stalk, and I 'ope to 'ave a lot like it for th' show. I'm goin' to see if I can't take th' shine out o' that police-constable down the road, who I hear is a don hand at sweet pea growing." The shoemaker had given up a square piece of ground in front of his shop entirely to his favourite flower, and these were grown in clumps, twenty varieties in all, so he informed us, every hole trenched three feet deep with a barrowful of good manure in the bottom, and a "bit o' summat else to encourage 'em." There were not many flowers on the vigorous plants, but there was a purpose in this, for they had been pinched off, and the man of leather informed me if I hap pened to be in the village on show day he would show me a few.

At most of the calling-places the men were away at work, but the women took care that nothing was overlooked in the inspection, and one of them spoke her mind emphatically on the value of competitions. She didn't expect to get a prize because they hadn't been able to get the garden quite up to the mark, but she was determined that it should be put in, because the last two seasons they hadn't entered it, her husband had been a bit slack, and she hadn't had half the vegetables for the children as when the garden was in competition. "He's got something extra to work for now," she said, "and whether he gets a prize or not, there'll be more stuff in th' garden. I can't keep the children well fed wi'out plenty o' vegetables." This was a plain statement, made by a woman who was speaking her mind, but it was as good a testimonial for the utility value of cottage garden competitions as anybody could wish for.

Being the middle of the day the allotment field was almost deserted, but conspicuous cards marked the plots that had to be judged. Apart from the numbers, however, these were hardly necessary, as the plots in competition were so marked from the rest, and, as we were coming away, one man, who had evidently been watching our movements from the other side of the hedge, sidled up in an unconcerned-looking manner (but with an apparent air of anxiety nevertheless), and, "beggin' pardon," asked if we had seen "his marrers, as they were at the back of the rhubub," and might be overlooked. We assured him on the point, and he went away happy.

With episodes cropping up at every place of call, the round of inspection was continued, and with the genuine good-heartedness of country folk, that was destitute of any idea of bribery, many an offer of a glass of home-made wine or cup of tea was made, and, apart from seeing some excellent gardening, the opportunity was not lost of observing some traits in the human side of garden competitions. H.

LUPINUS MOERHEIMI.

This handsome and useful lupin differs from the true polyphyllus forms in its manner of growth, this being very much more compact and erect, so much so that supports for the spikes are rarely necessary. The other point of difference is worthy of note, and this is that the lower flowers, which are the first to open, are very long lived, and they remain fresh until practically all the blooms have expanded, and by this means a very effective length of flower is produced for a long time. In polyphyllus varieties the lower flowers have faded some time before the topmost flowers have opened. L. Moerheimi is very free flowering, and of a beautiful soft pink hue. Some idea of its freedom and effectiveness may be obtained from the accompanying illustration, which represents a batch of plants growing in Messrs. G. Bunyard and Co.'s nurseries at Maidstone.

Dahlias.—Continue to tie in or support all growths to prevent damage by winds and storms. Disbud if large or exhibition blooms are required, and keep well supplied with moisture. The beautiful cactus type, in most varieties, still seems too modest to show above the foliage as one would desire, thus hiding many of its charms. The scarlet [illegible] is one of the least offenders in [illegible].—E. F. Hazelton.

LUPINUS MOERHEIMI.
In Messrs. G. Bunyard and Co.'s Nurseries, Maidstone.

WORK FOR THE WEEK.

CONSERVATORY AND GREENHOUSE.

WINTER CARNATIONS.—The violent thunderstorms which have prevailed lately, accompanied by heavy downpours of rain, and sometimes of hail, have made it difficult to prevent plants outdoors becoming saturated. This is one of the worst things that can happen to carnations, as the soil is turned sour with the superabundant water, and rendered unfit for the roots. Should the weather continue so unsettled, I should advise the early removal of the plants into their winter quarters, or into sunny frames, keeping them cool for the time being, and using very little shade. Great care in the use of the water-pot will be necessary, the object being to induce hardness of growth without absolutely stunting it altogether. No artificial manure should be given at present; this will be better applied when the plants are entirely under control.

POT ROSES.—Often at this busy season roses in pots are neglected. The plants are probably forced into flower early in the year, and when this is over and the plants once more turned out of doors, little attention is paid them beyond occasional watering. Plants treated thus are seldom worth the ground they cover, and can never be profitable in the future. A rose that has been forced into bloom three or four months before its natural time, should be treated considerately for that very reason, and if carefully tended, kept free from weeds, and watered as necessary, good results may reasonably be looked for another year. A great point with pot roses that have been forced at the present time, is giving them plenty of room in an open spot where the sun may have ready access to the branches, and so thoroughly ripen them; and this ripening should be done as early as possible. Weak liquid manure should be given at every other watering, as the pots are now full of roots. Take care that none of the plants become dry enough to permit of the soil contracting from the side of the pots. Should this occur it must be remedied at once, otherwise the water will pass away rapidly without benefit to the plants. Greenfly must be kept down, or it will do considerable damage. A little soft soap dissolved in soft water nearly boiling, to which a little paraffin has been added, will make an excellent insecticide at a trifling cost for syringing the plants. If repeated two evenings in succession, this will invariably effect a clearance, even when the plants are badly infested.

MARGUERITES, OR PARIS DAISIES.—Cuttings of the white and yellow, inserted in sandy soil at once, and kept moderately close, moist, and lightly shaded for the first fortnight or so in a cool frame or pit, will seldom fail to root at this season, and will make grand stuff for either bedding or pot culture next spring. These succeed almost equally well in pots, boxes, or just dibbled out closely in a bed of light sandy soil; but for convenience sake, one of the two first methods is to be preferred.

CHRYSANTHEMUMS.—Be on the look out for, and try to ward off, the attacks of mildew by frequently dusting underneath the foliage with black sulphur, which is best done early in the morning while the dew is on them, or during evening after the plants have been syringed. Damping over the plants with the syringe or garden engine three or four times during hot weather is most beneficial, especially after the buds are taken, as it materially assists them to swell kindly. Watch minutely for rust, and isolate any which may be affected, placing them well away from the main batch; pick off any traces and burn immediately.—T. B. Field, Ashwellthorpe, Norwich.

THE ORCHID HOUSES.

STANHOPEAS.—The numerous members of this genus are not so extensively cultivated as their merits deserve. They form a class of orchids easily grown where the ordinary conditions of a plant stove are available, and they occupy but little space, as they are best suited when grown in baskets and suspended from the roof. The varieties of S. occulata, S. tigrina, and S. Wardi, that have recently passed out of flower, should now be examined, and repotted where necessary. They do not require annual repotting, and many of them resent being disturbed, so should be left alone, unless the potting compost is decayed or the plants have outgrown their baskets.

WHERE REPOTTING IS NECESSARY carefully turn the plants out of their baskets, pick away the decayed compost, and remove any dead bulbs and roots at the base of the plants. The pseudo-bulbs should be carefully examined, and any scale or other insect pest should be cleaned away. Baskets of suitable sizes having been selected, the drainage must be carefully placed, as the flower scapes are generally produced from the base of the pseudo-bulbs, and they penetrate through the potting compost, and find an exit through the drainage and the bars at the bottom of the baskets, so that if the drainage is laid in flat there is every possibility of the spikes being obstructed.

THE POTTING COMPOST should be of a durable nature, and we find good fibrous peat and chopped sphagnum moss, with a few broken leaves intermixed, a suitable material, sufficient broken crocks and sand being added to render it porous. This compost should be pressed moderately firm, and when potting is completed water with rain water, wetting the compost through. Repotted plants should be shaded from too strong light until the new roots get established in the compost. Lightly syringing overhead two or three times a day in bright weather will assist the plants to keep plump. Where plants do not require repotting, any dead pseudo-bulbs may be removed, and the decaying portions of the compost also; this latter may be replaced with fresh compost.

TO INCREASE THE STOCK.—This is best done by divisions made at the time of repotting, the rhizomes having been severed between the pseudo-bulbs, the leading growths and back bulbs attached may be potted up separately. There has been very little hybridising done among stanhopeas, so that there is every possibility of the production of new kinds, if anyone is sufficiently interested to undertake the work. There also appears to be no reason why bigeneric hybrids should not be procured. There can be no doubt that if we could combine the quaint and attractive features of the stanhopea with some of our more showy orchids the result would be a welcome addition to our gardens. The resting period of stanhopeas is generally prolonged throughout the winter months, so that after growth is completed and root action has ceased, only sufficient root moisture is necessary to keep the pseudo-bulbs in a normal state; every facility must be afforded during the resting season to enable the plants to thoroughly mature their pseudo-bulbs, or satisfactory flowering will be impossible.—H. J. Chapman, Oakwood Gardens.

THE FLOWER GARDEN.

FLOWER BEDS.—These should now be at their best, and proper care should be given to retain them in good condition as long as possible. Do not allow seed pods to form on anything, as this would soon weaken and impoverish the plants, so that they cease to produce fresh flowers. Pick off all old flowers and decaying leaves, and keep everything well supplied with moisture. Carpet bedding plants must be kept well pinched in, and the design strictly adhered to. Now is a good time to consider the effect of the season's summer bedding, and make notes of any desirable alterations for another year, or make a general plan of next season's arrangements. Some of the new introductions may not have quite realised expectations, or the position given them has proved unsuitable, but by arranging now, while the beds are filled with summer occupants, a change of design can more easily be made, and the approximate number of plants required of each variety to carry out the plan can be ascertained.

PROPAGATION.—It is rather early yet to commence the general propagation of bedding plants, but cuttings of any scarce or choice subject may now be taken as opportunity occurs, so as to obtain as many as possible. The last supply or change of established plants in pots may now be put out in the principal beds, where a continuous good display has to be maintained in succession to those now passing their best. Kochia scoparia should now be assuming its best colour, and form a nice contrast to Hydrangea paniculata.

IN THE SUB-TROPICAL GARDEN close attention must be given to see that nothing lacks moisture; a good watering in the evening of a hot day, and gentle syringing overhead will be most helpful. Support anything requiring assistance, and remove any dead or decaying leaves or flower stems which detract from good appearance. Should any specially good variety have appeared among seedling cannas, mark or label it for special care when lifting.

WILD GARDEN.—This should still be attractive and pleasing if suitably planted with foxgloves, mulleins, cranesbills (or geraniums), solidagos, hypericums, lythrums, pernettyas, Cytisus nigricans, and, in the most open spaces, cistus in variety, Colutea arborea, hemerocallis, anchusas, epilobiums in masses, Chrysanthemum segetum, and others. If there is not already a good proportion of these in suitable places, arrange for them to be added during the planting season. The very anticipation of these additions adds zest and charm to the work. The pernettya flowers, although individually not large, are produced in such profusion as to be quite noticeable, and they are followed by the pretty berries in autumn. The fruits of the various barberries are already most attractive.

HERBACEOUS BORDERS.—Continue to pay strict attention here; remove all old flowers and seed pods, neatly stake all flower spikes or growths, and keep everything well watered; a mulching of some sort greatly helps to conserve the moisture around any gross-feeding subject. Delphiniums will soon be over, and any inferior variety may be entirely removed; label all the best for division later on. The border should now be reaching its most beautiful stage; phloxes, helianthus, chrysanthemums, heleniums, erigerons, rudbeckias, monardas, lychnis, and others are all helping the display. Here also notes of any desirable change should be made, such as of lack of harmony in colour, height of plants, or apparent unsuitability of soil.

PANSY SEED may be sown, or if plants from earlier sowings are ready they should now be pricked off in the open border about six inches apart each way. Viola cuttings may now be inserted; these root best if put in a cool, close frame and shaded from the sun. If a frame is not at liberty they may be put in on the open border, and a temporary arrangement made for shading them. The soil should be prepared either by being broken up finely or sifted; if very heavy sifted leaf-soil and sand should be added, with a good sprinkling of sand on top. Take cuttings from three to four inches long, remove the lower leaves, and dibble into well-firmed soil three or four inches apart; sprinkle overhead or water every evening when the weather is at all dry.

PIPINGS OF PINKS may also be taken now, and these must be placed in a cool close frame either in pots or boxes, or in soil in the frame. Shade from sunshine, and keep just nicely moist, but not too wet.

ROSE GARDEN.—Keep close watch for any suckers that may appear, and carefully remove them; where pegging down is practised the old growths should be removed as they finish flowering. Remove all old flowers, and insure a good supply of moisture at the roots.—E. F. Hazelton, Knowsley Gardens.

HARDY FRUITS.

RASPBERRY BEDS.—As soon as the crops have been gathered the old canes that have fruited should be promptly removed, so that all the strength possible may be thrown into the fruiting canes for next season. When removing them be careful not to break the leaves of the young growths; sever them at the bottom, and draw them carefully downwards. All young growths not wanted should be removed, leaving, if trained to stakes, from five to seven, if on wires, about six inches apart. Firm, well-matured canes by the end of the season are only secured by light, sun, and air being freely admitted. On light soils, should the weather prove dry, a good soaking or two will greatly assist growth; farmyard liquid, or a good dressing of Clay's, sprinkled over the roots, and then washed in, and, if desirable, another coating of manure will be found very helpful. On deep loam, should the growth be inclined to be coarse, manure should be less used. Our crop this season has been heavy, Superlative being the best, and Antwerp the sweetest varieties.

LOGANBERRIES.—These may be treated much like raspberries, viz., removing the old fruiting wood, and replacing it with fresh healthy growth to fruit next year. Feed these plants liberally on porous soil, and mulch well with decayed manure.

WALL FRUITS.—Peaches and nectarines bearing heavy crops need to be well supplied with nourishment at the roots; a good dressing of some patent manure will greatly assist the trees and the fruits. Do not overcrop the trees; it is far better to reduce the number and get size, in preference to a quantity of flavourless fruit. In dry, hot weather syringe the trees well with clean water; remove at intervals a few growths that can be spared, so that not much pruning is needed in spring. When the fruits have been cleared give the trees a few good syringings with some approved insecticide to free the foliage of red spider, if such be present; in any case, such dressings will be helpful and encourage the wood to fruit better next year. All the early American peaches are better when taken from the trees a little under ripe, and allowed to ripen in a well-ventilated fruit-room. If left to ripen on the trees the outside flesh becomes soft before the inside, near the stone, is fit for eating. When gathering peaches for bottling, or for packing for travelling, the fruit should always be a little under ripe, otherwise they show the bruises, no matter how carefully handled. We pack a very large quantity, and use fine, soft wood wool with every satisfaction.

PLUMS.—Some of the trees this year are bearing heavy crops, in fact, for the last three years our trees, with few exceptions, have borne heavily. We thin the fruits of some sorts as soon as they are fit for tarts, and feed the roots well with liquid manure, both before and after the crops are gathered. Do not forget to preserve some of the young wood, this, tacked to the walls between the main branches, frequently produces a heavy crop when the old spurs fail. All bush fruit of apples and pears, if bearing good crops, will be all the better if well soaked with liquid manure. If other work is very pressing a few of the trees bearing the heaviest crops might be done at intervals until the whole has been completed. — H. Markham, Wrotham Park Gardens.

Berberis Darwinii in Fruit.—When speaking of Berberis Darwinii, we usually associate it with evergreen or flowering shrubs, and it has many points in its favour which place it in the front rank of both these sections. There is, however, another aspect from which we may look at the species, and that is from a fruiting point of view. The fruits are very ornamental when at their best, being of a blue-black colour, or black with a rich bluish bloom. Although a fair quantity of fruit is usually produced, the current year's crop is more plentiful than usual, and every bush is thickly covered, making the plants conspicuous from a considerable distance. B. Darwinii is one of those shrubs which is equally in place planted to form beds in conspicuous places on lawns, or to brighten up shrubberies. In addition to the type there is a dwarf variety of very distinct appearance, which is well worth growing.—W. D., Kew.

"CHRYSANTHEMUMS AND HOW TO GROW THEM FOR EXHIBITION," by J. B. Wroe. Fifth Edition, revised to January, 1908, and including the new varieties.—Full details on timing and stopping for Northern, Southern, and Midland growers, [illegible] of the best varieties, illustrated instructions on taking the buds, cuttings, staging, etc. Prices 1s. net, by post 1s. 2d.; cloth, 1s. 6d., by post 1s. 8d., from W. H. and L. Collingridge, 148 and 149, Aldersgate Street, London.

READING HORTICULTURAL
SOCIETY'S
52ND GREAT OPEN SHOW OF
FLOWERS, FRUIT, and VEGETABLES,
WEDNESDAY, 26th August.

Entries close Saturday, 22nd August.

A handsome NEW CHALLENGE BOWL offered for the first time for Group of Plants. Open to all.

[illegible] exhibits not for competition) invited and same will be duly recognised by awards according to merit.

Full particulars and Schedules may be obtained from the Secretary,
CHAS. J. HOWLETT.
Victoria Chambers, Queen Victoria Street, Reading.

SANDY, BEDFORDSHIRE,
40th ANNUAL SHOW, August 27th, 1908.
PLANTS, FLOWERS, FRUIT, VEGETABLES, Etc., [illegible] CATS, RABBITS, POULTRY, PIGEONS, Etc.
Prizes value £1,000, including £8, £7, and £5 for Ten Stove and Greenhouse Plants; £9, £7, and £6 for Group of Plants. Entries for dead stock close August 20th, 1908. Schedules and Entry Forms of W. GREEN, Sec., Sandy.

EXHIBITIONS AND MEETINGS.

◆

Royal Horticultural Society.

The exhibition held on Tuesday in the Horticultural Hall was small in extent and attended by few visitors, both of which circumstances were no doubt influenced by the [illegible] following a popular holiday. Notwithstanding that the building was not entirely filled, there were many good exhibits, all sections of horticulture being represented by [illegible] groups.

FLORAL COMMITTEE.

Small pot plants of eucalypti were displayed by Messrs. Barr and Sons, King Street, Covent Garden, London, W.C. They were raised from seed sown in January last, and embraced such species as E. globulus, E. [illegible], E. amygdalina, E. coccifera, and E. [illegible]dora. Messrs. Webb and Brand, nurserymen, Saffron Walden, the hollyhock specialists, showed beautiful and improved varieties of this popular flower, none of the plants showing a trace of the disease which has proved such a scourge to the mallow tribe. The [illegible] used by Messrs. Webb and Brand [illegible], one bushel; slaked lime, one bushel; [illegible] flowers of sulphur, and 2oz. of copper sulphate, the whole mixed and dusted over the foliage and stems. The best varieties were Apple Blossom (pink), Miss Lizzie King [illegible], alba superba (white), Venus (salmon), [illegible] Meyer (a delicate shade of pink), Luna ([illegible] yellow), Black Knight Improved [illegible], and Delicate (cream with a faint [illegible] rose). On a table opposite to the hollyhocks was a fine show of gladioli put up by Messrs. Kelway and Son, Langport, Somerset. There were more than 150 vases of these [illegible] flowers, the collection affording a wide range of colouring. As a selection, we may [illegible] Langport White, a new variety; Lady Rachel Bruce, yellow segments and [illegible] tinted lip; Ian Kelway, mauve with [illegible] markings on the lip; Huish Beauty, rose and yellow; Lord Courtney, rose with striped white, and a pale lip; Admiral Togo, [illegible], and Taunton Deane. Choice ferns and small palms were used by Messrs. H. B. May and Sons, The Nurseries, Edmonton, as a setting to groups of Campanula isophylla, ixoras, and Lapageria rosea. The campanulas were about the same number each of blue and white varieties, C. isophylla Mayi, both the white and the blue kinds, being very profuse in flowering. The ixoras were nice plants, dwarf, yet well flowered; and the lapagerias were shown in the white flowered as well as the type form.

Dahlias from Messrs. Jos. Cheal and Sons, Lowfield Nurseries, Crawley, Sussex, reminded one of the approaching autumn, the [illegible] being set off by a number of vases of [illegible]. The dahlias were arranged in [illegible] and single flowered varieties only were shown, the former embracing such fine things as Mrs. H. L. Brousson, Ivy Shoesmith, Lustre, Mrs. Seale, Avoca, and Hilda Shoesmith; whilst of the single-flowered type were seen the peerless Columbine, Kitty, Leslie Seale, and Mrs. T. G. Randall.

A showy exhibit of sweet peas was staged by Messrs. John K. King and Sons, Coggeshall, Essex, most of the best varieties in commerce being represented by good spikes of bloom. Hardy plants and flowering sprays of shrubs were shown by Mr. G. Reuthe, Keston, Kent. Small, but very pretty leaved caladiums were presented by Messrs. W. Bull and Sons, King's Road, Chelsea. The plants were in small pots, three or four being bedded in moss in pans. A row of aralias of the digitata type was at the back.

The great beauty and variety of the garden phlox, P. decussata, was exemplified in a fine exhibit from Messrs. T. S. Ware, Lim., Feltham, Middlesex. They staged large bunches of such handsome varieties as Coquelicot, Flambeau, Espérance, pale mauve with white centre; Leonard de Vinci, Miss Pemberton, reddish orange; Lady Napier, and a fine white kind labelled Friefraulein von Lassburg. A delphinium of the Bella Donna type was exhibited to show its second flowering in the one season. Messrs. Hugh Low and Co., Bush Hill Park, Enfield, staged sprays of Buddleia variabilis, and spikes of blue and white Agapanthus umbellatus. Two fine antirrhinums were shown by Messrs. Dobbie and Co., Rothesay, in Moonlight, yellow with reddish tube; and Brilliant, carmine tube and yellow mouth. Very large spikes of iberis, labelled Snow Queen, were put up by Mr. W. Deal, Kelvedon, and vases of border carnations came from the gardens of W. A. Watts, Esq., Bronwylfa, St. Asaph, North Wales. Mr. T. Challis, Wilton House Gardens, near Salisbury, showed a new border carnation named Countess of Pembroke; the colour is almost white, there being a trace of a pink shade (A.M.).

ORCHID COMMITTEE.

Messrs. Armstrong and Brown, Tunbridge Wells, showed a small but select group. They staged a fine specimen of Cypripedium gigas Sanderiana, with a strong inflorescence carrying six well developed blooms; C. Callo-rothschildianum (C. callosum x C. Rothschildianum), a magnificent plant having two robust spikes, each with three blooms, the largest being eight inches across; the upper sepal is marked with reddish brown lines, and the side petals are blotched with chocolate; C. niveum, C. bella, C. Pankhurstiana (C. speciocissima x C. Harrisonæ), the petals being finely coloured with mauve, the elegant lip being yellowish in the centre, and margin edged with a broad band of rose. There was also a good spike of a fine form of Odontoglossum crispum. Adjoining this group was a small exhibit of choice plants, shown by M. Maurice Mertens, Mont St. Amand, Ghent, Belgium. In the front were seven plants of Miltonia vexillaria, the best having a fine white lip. It was labelled M. v. robusta Victoria. The deepest coloured flowers were those of the variety Dulcis. The odontoglossums in this exhibit were choice; we noticed a plant of O. altrum (O. ardentissimum x O. Halli). The spike had twelve expanded blooms, and three in the bud stage. It has a grand lip, coloured deep claret on a white ground, showing a trace of yellow; beneath the column the lip is a rich yellow. A plant of O. percultum had twelve finely developed blooms, coloured mauve with pale brown spots; the lip is marked with yellow. Other good things in this group were O. Wiganianum, O. amabile, and a richly coloured variety of Cattleya Whitei.

Messrs. Sander and Son, St. Albans, had several uncommon plants in a group of moderate dimensions, and special mention must be made of a grand specimen of the rare Jamaica species—Lælia monophylla. The specimen bore seven flowers. Two remarkably well flowered plants of Lycaste tricolor were shown by J. Bradshaw, Esq., Southgate; one plant of the variety albeus had twenty-nine flowers (F.C.C.). Mr. James Douglas, Edenside, Great Bookham, exhibited a dwarf, small-flowered, unnamed angræcum with paper white flowers.

FRUIT AND VEGETABLE COMMITTEE.

Excellent fruit trees in pots were shown by Messrs. James Veitch and Sons, Chelsea. The group was a very large one, and contained figs, peaches, apples, pears, plums, and gooseberries. The figs were placed at either end of the exhibit; Brown Turkey, Negro Largo, Bourgassotte Grise, and Black Ischia, were all carrying heavy crops. Well-balanced trees of pears Souvenir du Congres, Dr. Jules Guyot, and others; apples Chas. Ross, Gascoigne's Scarlet, and Cox's Orange Pippin; plums Denniston Superb and The Czar, the latter being very heavily fruited; with peaches Royal George, Marquis of Downshire, Prince of Wales, and a magnificent specimen of the variety Thos. Rivers, made an exhibit of considerable importance.

An exhibit of considerable educational value was seen in Messrs. Jas. Carter and Co.'s collection of dwarf beans. A selection of the best kinds as shown embraces those following: Longsword, Wythes' Early Gem, Canadian Glory, Holborn Wonder, Leonard's Stringless, these three last-named being of the stringless type; and Golden Wax, a butter-bean.

CERTIFICATES AND AWARDS.

First-class Certificate.—Sophro-cattleya x Warnhamensis J. M. Black, shown by R. G. Thwaites, Esq., Streatham.

Award of Merit.—Vanda amœna var. Sanderæ (Roxburghi x cœrulea), exhibited by Messrs. Sander and Sons, St. Albans; Carnation Countess of Pembroke, shown by Mr. T. Challis, Wilton House Gardens, Salisbury; Rose Paula, from Messrs. Paul and Son, Cheshunt.

Botanical Certificate. — Listrostachys Whytei, from Mr. White, gardener to Sir Trevor Lawrence, Bart., Dorking.

Cultural Commendation.—Lycaste tricolor albeus, exhibited by J. Bradshaw, Esq., Southgate.

MEDALS.

Silver-gilt Knightian.—Messrs. James Veitch and Sons, Chelsea.

Silver-gilt Banksian.—Messrs. Kelway and Son, Langport, Somerset.

Silver Flora.—Messrs. May and Son, Edmonton; Messrs. Webb and Brand, Saffron Walden; Messrs. Sander and Sons, St. Albans; and Messrs. Armstrong and Brown, Tunbridge Wells.

Silver Knightian. — Mrs. W. H. Plowman, Westminster, for jams, etc.

Silver Banksian.—M. Maurice Mertens, Mont St. Amand, Ghent; Messrs. T. S. Ware, Lim., Feltham, Middlesex; Messrs. John K. King and Sons, Coggeshall, Essex; and Messrs. James Carter and Co., High Holborn, London.

Bronze Banksian. — Messrs. Cheal and Sons, Crawley.

Midland Counties Sweet Pea Society.

Held in the Drill Hall, Wolverhampton, on July 29, the first show of this very enthusiastic young society was a revelation of the hold that sweet peas have upon growers of all grades. The big hall was well filled with beautiful flowers, and in nearly every one of the forty-one classes the competition was keen. Some very fine flowers were shown by Mr. Silas Cole, Mr. W. Marpee, and Mr. T. Jones.

OPEN MEMBERS' CLASSES.

Two classes were open to all members of the society, and here the competition was splendid. In the leading class for two dozen bunches the premier award carried with it the National Sweet Pea Society's silver medal, and this was won by Mr. Silas Cole, gardener to Earl Spencer, K.G., Althorp Park, Northampton, with grand bunches of Sea Foam, Prince of Asturias, Mrs. Hardcastle Sykes, Elsie Herbert, Lady Sarah Spencer, Earl Spencer, John Ingman, Althorp White, Mrs. Dels. Spencer, Lady Althorp, Frank Dolby, G. C. Waud, Miss Lavinia Spencer, Helen Lewis, Silas Cole, Gladys Cole, Countess Spencer, Lord Althorp, Althorp Cream, and several seedlings. Mr. C. W. Breadmore, High Street, Winchester, came second; Messrs. G. Stark and Son, Great Ryburgh, third; and Mr. W. S. Heslington. Littlethorp, Ripon, fourth.

The second open class, for twelve bunches, brought out three competitors, Messrs. G. Stark and Son securing first place withBeauty of Fife, Dorothy Eckford, Enchantress, Helen Lewis, Mrs. C. W. Breadmore, Menie Christy, George Herbert, Mrs. H. Bell, A. J. Cook, Paradise Ivory, F. Dolby, and Jeannie Gordon. Mr. W. S. Heslington second, and Mr. G. J. Kerkland, Burleigh Road, Wolverhampton, third.

TRADE EXCLUDED.

The best eighteen bunches, distinct, were from Mr. C. Barrett, Mancroft Road, Tettenhall, whose leading varieties were Helen Pierce, Mrs. Hardcastle Sykes, Jeannie Gordon, Helen Lewis, and Sybil Eckford. Other prize-winners in order of merit were Mr. W. L. S. Loat, Cumnor Place, Oxford, and Mr. W. S. Heslington. Five competitors came forward in the class for a dozen bunches, distinct, chief honours falling to Mr. W. Leonard S. Loat, Cumnor Place, Oxford, for Helen Lewis, Jeannie Gordon, Lord Nelson, Chrissie Unwin, Frank Dolby, Queen of Spain, and Agnes Eckford in good form and colour. The remaining awards were won by Mr. W. S. Heslington and Mr. Wakeman, Fern Terrace, Finchfield, Wolverhampton.

The class for nine bunches, distinct, proved a very popular one, competitors coming forward. The winning set was set up by Mr. F. W. Kendrick, Eagle Terrace, Tettenhall, Mr. W. E. Lowe, North Street, Shrewsbury, second, and Mr. W. L. S. Loat third. Another popular class was the local one confined to competitors residing within a five-mile radius of the exhibition hall. The class specification was for twelve bunches, distinct. First prize was here won by Mr. H. Bott, gardener to E. J. Forsyth, Esq., The Dell, Tettenhall, who had Prince Olaf, The Marquis, Frank Dolby, and other popular kinds; Mr. F. Davis, Grange Road, Tettenhall, second, and Mr. W. Jones, Bank Cottage, College Road, Tettenhall, third.

For half-a-dozen bunches, distinct, waved varieties only, Mr. William Marple, Penkridge, Staffs, led from six other competitors with splendid blooms of Audrey Crier, Mrs. Chas. Foster, Mrs. H. Sykes, White Spencer, John Ingman, and Paradise; Mr. A. W. Thorpe, South View, Birmingham Road, Lichfield, second; and Mr. W. L. S. Loat, third.

SINGLE BUNCH CLASSES.

Twelve classes were provided for single bunches of sweet peas, one variety only. White sweet peas were best shown by Mr. W. Marple, Penkridge, who scored with Nora Unwin; the best blush or pink sweet pea was a grand bunch of Paradise shown by Mr. W. Marple; Mr. Thomas Jones scored for a scarlet or crimson variety with King Edward VII., grandly shown and in fine colour; the class for a rose, carmine, or cerise variety proved a little troublesome owing to its wide colour scope; Mr. L. S. Loat came first with John Ingman in good form; the best bunch of an orange variety was Henry Eckford, shown by Mr. Thomas Jones.

In the yellow or buff class Mr. T. Jones led with beautiful blooms of Clara Curtis; for a lavender or pale blue variety, Frank Dolby won the first place for Mr. W. L. S. Loat; in the class devoted to blue, purple, and mauve varieties, Mr. Evans, The Gardens, Newbridge Crescent, Wolverhampton, scored with Lord Nelson; for a maroon sweet pea, Mr. T. Jones, Ruabon, secured the chief award with Black Knight; the best bicolor variety was adjudged to be Jeannie Gordon, as shown by Mr. Richard Maybury, Church Cottage, Codsall; for a striped, flaked, or marbled variety, Mr. T. Jones won first prize with a fine bunch of Helen Pierce, the variety mostly shown.

DECORATIVE CLASSES.

The trade were excluded from this section, but non-members were admitted on payment of an entrance fee. The leading class was for a decoration of sweet peas for a dinner table, the space allowed being 8ft. by 4ft. There were six competitors, and the competition was keen. First prize fell to Mr. W. Marple for a design in Paradise sweet peas, a rather tall arrangement; Mr. F. C. Woodward, York Avenue, Wolverhampton, second, with cream and pink; and Miss F. Jeaks, Codsall, third, with a fancy pink form. The best epergnes were those staged by Mr. F. C. Woodward, Miss Jenks, and Mr. J. T. Simpson, Mount Road, Tettenhall End. Bowls of sweet peas were shown by five competitors, the leading awards being secured by Mr. W. Jones, Bank Cottage, Tettenhall; Mr. E. Deakin, Hay Hall, Hay Mills, second; and Miss Thomas, The Highfield, Wolverhampton, third.

SPECIAL PRIZES.

Numerous classes were provided by seedsmen.

Mr. Eckford gave prizes for novelties, and the first prizes were awarded as follows: Mr. R. Maybury, Church Cottage, Codsall, for Mima Johnston; Mr. R. Maybury, for H. J. R. Digges; Mr. T. Jones, for James Grieve; Mr. T. Jones, for May Perrett; Mr. T. Jones, for Princess Victoria; Mr. T. Jones, for The Marquis; Mr. T. Jones, for White Waved; Mr. T. Jones, for Primrose Waved; Mr. T. Jones, for Prince Olaf; Mr. T. Jones, for Hannah Dale; and Mr. T. Jones, for St. George.

Messrs. Bakers' prizes for twelve varieties were won by Mr. Wm. Marple, Mr. T. Jones second, and Mr. W. E. Lowe third. The same firm provided a class for six varieties, open only to gentlemen's gardeners. Mr. T. Davis, Grange Road, Tettenhall, led with fresh flowers of popular varieties.

Mr. C. W. Breadmore gave prizes for nine varieties, and here the awards fell in order to Mr. T. Jones, Mr. C. Barrett, The Gardens, Mancroft Road, Tettenhall; and Mr. W. S. Heslington. Messrs. W. Atlee Burpee and Co., Philadelphia, contributed prizes for six bunches of sweet peas, Countess Spencer type, these being won in order of mention by Mr. W. Marple, Mr. T. Jones, and Mr. W. L. S. Loat, who all showed the Burpee Spencer varieties well.

Mr. H. Bott was successful in Mr. J. E. Knight's class, and Messrs. T. Jones, W. Marple, and W. Maybury secured the awards in order of mention in Mr. Sydenham's class, Mr. Marple coming first for Millie Maslin, and Mr. T. Jones first for Herbert Smith. Mr. T. Jones led in Mr. W. J. Unwin's class, and in Messrs. E. Webb and Sons' competition for nine bunches of twelve spikes each, Mr. A. Ashworth (gardener to H. Shaw), Horsley Hall, Gresford, was a good first, Mr. W. S. Heslington second, and Mr. G. H. Adams, Copthorne Road, Wolverhampton, third. In the class for six bunches, distinct, provided by Mr. H. J. Wright, the prizewinners were Mr. Marple, and Mr. M. J. Foden, 11, Bedford Street, Basford, Stoke-on-Trent. For six bunches of Miss Hemus varieties, Mr. T. Jones was successful.

MEDALS AWARDED.

The following awards were made to the trade displays that did so much to extend and beautify the show:

Gold Medal.—Mr. C. W. Breadmore, High Street, Winchester; Messrs. Bakers, Wolverhampton; Messrs. Jones and Sons, Shrewsbury; Messrs. J. Simpson and Son, Birmingham.

Silver Medal.—Messrs. Dobbie and Co., Rothesay; Mr. J. E. Knight, Tettenhall, Wolverhampton; Messrs. G. Stark and Son, Great Ryburgh; Mr. R. Sydenham, Birmingham; Messrs. T. B. Dobbs and Co., Wolverhampton.

British Gardeners' Association.

At the monthly meeting of the association, Mr. E. F. Hawes in the chair, 17 new members were elected, bringing the total up to 1,325. The solicitors were instructed to proceed with the case in which a member was entitled to £11 as wages. Grants of £2 each were made to the London and Blackburn branches to carry on propaganda work. The cases of lapsed members were considered, and it was decided to strike them off the list of members. They were comparatively few.

Leicester Flower Show.

AUGUST 4 and 5.

The flower shows in the Abbey Park, Leicester, have been remarkably successful from the time of their institution upwards of twenty years ago, but during the past three or four years they have increased by leaps and bounds, both in extent and attractiveness. On this occasion the progress that has been made was most marked, and as a proof of the rapidity with which these exhibitions are increasing in extent and popularity, it may be mentioned that on this occasion there were 316 exhibitors as compared with 257 last year, and that there were 2,700 entries, representing an increase of about 25 per cent. during the past three or four years. Another proof was to be found in the fact that this year the number of judges was increased to twenty. The Abbey Park, in which the flower shows are annually held, is one of the most beautiful and best managed parks in the provinces, and on the two days in which the exhibition is held, is closed to the public except on payment, and the thousands who crowd the tents and the magnificent open space show that the people of Leicester have no objection to paying for admission. The shows are under the management of the Parks Committee of the Leicester Corporation, and the profits derived from them are devoted to providing high-class music in the public parks during the summer months. As for some years past, the Deputy Town Clerk (Mr. J. Staynes) is the hon. secretary of the show, and Mr. J. Burton, the superintendent of the public parks, the superintendent, and the excellent manner in which the arrangements are carried out testify in no uncertain manner to the ability with which the duties of the respective offices are performed.

Roses constituted, as usual, a great and highly attractive feature, for a large number of classes were provided, and in the whole of them the entries were numerous and the competition was of the keenest. The quality of the blooms in the trade classes was hardly so high as we have seen it at Leicester, but this was probably due to the heat of the two weeks preceding the show.

In the open class for thirty-six roses, distinct, Messrs. Alex. Dickson and Sons, Newtownards, occupied the premier position with blooms, not over large, but finely finished; conspicuous in the collection were the blooms of Her Majesty, Frau Karl Druschki, Mrs. J. Laing, Etienne Levet, Alfred Colomb, Lady Basham, Beauty of Waltham, Hugh Dickson, and Dr. Andry; Mr. W. H. Frettingham, Beeston, was second with excellent blooms; and Messrs. Perkins and Son, Coventry, were third. For twenty-four blooms, the exhibitors last named obtained first place with brightly coloured blooms of A. K. Williams, Comte de Raimbaud, Madame Eugene Verdier, Ulrich Brunner, and other well-known varieties; Messrs. John Jefferies, Cirencester, followed closely for second place, staging Madame Jules Gravereaux in especially fine condition. For twelve teas or noisettes, Messrs. D. and W. Croll, Dundee, and Messrs. J. Jefferies and Son were first and second with good blooms. In the class for twelve blooms of one variety, Messrs. A. Dickson and Sons were first with Bessie Brown, and Messrs. D. and W. Croll second with Frau Karl Druschki. Messrs. J. Jefferies and Son scored in the class for twelve blooms of any one tea or noisette, with Marechal Niel, bright in colour; Messrs. D. and W. Croll were second with White Maman Cochet.

Roses were finely shown by private growers, and in the open classes for amateurs and gentlemen's gardeners the Rev. J. H. Pemberton, Havering-atte-Bower, Romford, achieved much success, his blooms being remarkable for their superb finish. He was first for twenty-four roses, distinct, for eighteen roses, for six teas, and for twelve blooms in four varieties, and second for twelve blooms. Mr. F. Dennison, whose blooms had suffered somewhat from the weather, was second for twenty-four, eighteen, and six teas, and first for twelve. Mr. W. Boyes, Middleton, Driffield, was third for twenty-four and eighteen, and was awarded the [illegible] offered for the best bloom in the section, for a perfect example of Marie Baumann.

There was a strong competition in the [illegible] classes provided for roses grown in the county of Leicester, and the more successful of the competitors were Mr. G. [illegible], Market Harborough; Mr. W. Up[illegible], Mr. M. Whittle, and Mr. J. T. Chap[illegible]. We should like to refer to the roses in this section in detail, but space will not admit of our doing more than briefly mention that the above-mentioned were the principal prizewinners.

Sweet peas were largely and finely shown, and constituted an important and highly-attractive feature. There was a very strong competition for the prizes offered by Mr. R. [illegible] for eighteen vases of sweet peas, and the premier award was made in favour of Mr. G. E. Lewis, Ansty, who had splendidly developed blooms admirably arranged. [illegible]k Dolby, Helen Lewis, Primrose Spencer, and Bolton's Pink were conspicuous in the collection. Mr. W. Butter, Oadby, followed closely for second place, his blooms being remarkable for high quality and tasteful setting up. Mr. H. B. Howe, Bushby, and Dr. Phillips, Kibworth, were third and fourth, staging excellent examples of cultural skill. In the class for six bunches Mr. [illegible] Wagstaff was the most successful of the several competitors, and Mr. J. Bates was second, both staging well. For twelve bunches of sweet peas Mr. O. Morris was first for splendidly grown examples of well-known varieties, and Mr. F. W. Wagstaff and Mr. A. Lewis shared the remaining prizes, both staging well.

[illegible] arranged for effect formed a [illegible] feature, and the interest they created was evidenced by the crowded state of the immense marquee devoted to them. At the head of the seven or eight competitors in the class for groups occupying a space of [illegible] feet, superficial measure, were Messrs. J. Cypher and Son, Cheltenham, who were awarded the first prize of £20, with one of the most beautiful arrangements they have yet presented to public notice. The group was rich in colour, but the colours were admirably contrasted, and the plants were so arranged as to produce a light effect. Mr. [illegible]ause, Leamington, was second; Mr. W. [illegible], Coventry, third; and Mr. H. Rogers, Leicester, fourth; and with reference to these it must be said that, although differing in merit, they evinced great taste, and deserved much praise. This year a class was provided for groups occupying 80 feet superficial, and in this the two most successful competitors were Mr. W. Weston, gardener to C. J. Oliver, Esq., Knighton Park Road, Leicester, and Mr. W. S. Bolton, gardener to W. Buckler, Esq., both of whom had effective arrangements.

Miscellaneous plants, in collections of [illegible], were well shown by Mr. H. Keeling, Mr. A. Grace, and Mr. W. H. Steeples. [illegible] the several collections we noticed [illegible] specimens of the fragrant Stephanotis floribunda and several bush specimens of zonal pelargoniums. Fuchsias were shown by Mr. H. Wright, the plants leafy and finely flowered. Of ferns there were several remarkably good collections, the best being that from Mr. W. S. Bolton, who [illegible] fine davallias. Mr. Manning, Dudley, was a close second. Mr. Weston scored with [illegible], his bush-trained specimens being large in size and splendidly coloured. [illegible] was a good second with pyramidal [illegible], also highly coloured.

Hardy flowers constituted a feature of much interest, for in addition to the contributions to the competitive classes, Mr. Bouskill, of Market Bosworth, staged an immense collection, that formed a big bank 50 or more feet in length. Mr. Bouskill was first for twelve kinds, with a collection of exceptional merit, and the second and third prizes were awarded to Messrs. H. Wright and Son, Leicester Abbey, and Mr. Weston, both of whom had [illegible] of much merit. Very attractive were the annuals, and for twelve kinds Mr. [illegible], Industrial School, Desford, was first, and Mr. E. Wright, second, both contributing excellent collections. Many other good collections were staged, and the stocks, for which special classes were provided, were of great excellence. Violas are seldom seen in such fine condition as at Leicester, and Messrs. Pemberton and Son, Walsall, who were first, had splendidly developed blooms, staged in a very tasteful manner. The same firm was also first for fancy pansies. Carnations and picotees were contributed in considerable numbers, and in a high state of development, the principal exhibitors of these flowers being Mr. R. Makepiece, Mr. E. Herbert, Mr. J. T. Ward, Mr. J. Ward, being the most successful of the numerous exhibitors.

Fruit was not, perhaps, quite so plentiful as on some previous occasions, but the quality was high. There were two classes, one for nine dishes, and the other for six dishes. and each collection had to be decorated with plants, flowers, and foliage. Two sets of prizes were offered in each class, one for the fruit and the other for the decorations, and in both Mr. J. H. Goodacre, Elvaston Castle, Derby, was first for fruit. In the class for nine dishes, he was first for decorations, using small salmon-coloured carnations with singularly good effect, and in the smaller class he was second for decorations. In the class for six dishes, Mr. Ireland, Newstead Abbey, Notts, was first for decorations, and in both classes he was second for fruit. These exhibitors, and Mr. T. Sims, Thorpe Satchall, were the most successful of the competitors in the classes for grapes, peaches, and nectarines.

Vegetables were plentiful and good, but we cannot do more than state that Mr. John Hudson was first in the class for twelve varieties, in Messrs. Webb and Sons' class for six kinds, and in Messrs. Sutton and Sons' class for six kinds; Mr. F. Hoe was first in Messrs. Pringle's class for a collection, and in Messrs. Harrison and Son's class for a collection of ten varieties the premier award was made in favour of Mr. Owen, Hurlsten.

Miscellaneous contributions were numerous, and contributed liberally to the interest and attractiveness of the show. We hope to give the principal awards for these in our next issue.

Southampton Carnation Show.

JULY 28.

The tenth annual exhibition was held on the Royal Pier, and was a success in point of quality. Sweet peas were as usual exceedingly fine, and non-competitive exhibits added much to the interest of the display. Mr. C. S. Fuidge, the secretary, made admirable arrangements, and the show was well attended during the day.

For twelve distinct carnations five competed. Mr. C. H. Herbert, Acocks Green, Birmingham, was first with desirable blooms of Gordon Lewis, G. Rudd, Lord Salisbury, Sportsman, Guardsman, R. Houlgrave, Master Fred, Arthur, Meteor, W. Skerring, and J. H. Heddersley; Mr. C. F. Thurston, Penn Fields, Wolverhampton, was a close second with but slightly inferior blooms, and Mr. A. R. Brown, Crompton Nurseries, King's Norton, was third. For six, distinct, Mr. J. Fairlie, 13, Mayfield Road, Acton, W., was first with a good set; Mr. Ransom, gardener to C. A. Linzee, Esq., Bramdean Lodge, Alresford, second.

For twelve distinct white ground picotees five again competed. Mr. A. R. Brown was again successful with handsome blooms of Maud Brown, Lady Louisa, Thos. William, John Smith, Lucy, Fortrose, Brunette, and Pride of Leyton as the best; Mr. C. Thurston second, and Mr. Herbert third. Mr. J. Fairlie, amongst five entrants, won the premier place for six blooms with desirable blooms of popular varieties. Mr. W. Neville, gardener to F. W. Flight, Esq., Cornstiles, Twyford, Winchester, a close second.

Six staged in the section for yellow-ground picotees, Mr. A. R. Brown winning with desirable blooms of Archie Brown, Olivia, Victoria, Beatrice, Leonora, and Cymbeline; Mr. Hayward Matthias, Medstead, Alresford, was second, and Mr. Thurston third. As many as seven competed with six blooms, distinct, and Mr. J. J. Keen, 37, Avenue Road, Southampton, was first with Leonora, Goblin, Vera, and Togo in good condition. Mr. Cousens, gardener to J. A. Fort, Esq., Kingsgate Street, Winchester, second.

For twelve dissimilar fancy carnations six entered the list. Mr. C. Herbert won with very fine specimens of Lord Steyne, Eldorado, Sam Weller, Iris, Liberté, Erl King, and Horsa; Mr. H. Matthias was a close second. Seven entered for six distinct, and Mr. J. J. Keen won easily with desirable blooms of Elaine, Sam Weller, and Highland Lass; Mr. J. Fairlie second.

Mr. H. Matthias was the most successful with selfs, winning with good blooms of Her Grace, Daffodil, Miss Willmott, Medoc, and Mrs. Flight in the class for twelve distinct; Mr. C. Thurston second. Mr. Fairlie won for six with desirable blooms.

For twelve distinct of fancy carnations or yellow-ground picotees, undressed, six of each, to be arranged with their own foliage in separate vases, Mr. H. Matthias had much the best exhibit with Baldur, Benbow, Pro-Cooper, Argosy, Plato, Highland Lassie, King Solomon, and Agnes Sorrell. Mr. A. R. Brown second. Mr. H. R. Taylor, Oakleigh, Cheam, won for six with a desirable exhibit.

Ten classes were devoted to one vase each of distinct colours, and here Mr. A. R. Brown won with Snowdrift as a white, Mr. Flight had the best blush or pink in Mrs. F. W. Flight. The rose or salmon class was won by Mr. H. R. Taylor. Mr. Fairlie won for a scarlet with Duke of Norfolk. Cecilia was the best yellow self, staged by Mr. A. R. Brown; white for Mr. Fairlie, Benbow won in the buff or terra-cotta section.

For one vase containing twenty blooms of carnations or picotees on stems not less than twelve inches long, arranged for effect, with their own foliage, nine competed, and Mr. A. E. Usher, gardener to Sir R. Baker, Ranston House, Blandford, was first with a good exhibit.

Premier Blooms.—Bizarre—R. Houlgrave, from Mr. C. A. Linzee. Flake—Meteor, from Mr. C. H. Herbert. Self—Maud Allan, from Mr. Taylor. Fancy—King Solomon, from Mr. A. R. Brown. Heavy edged white picotee—Lady Sybil, from Mr. A. R. Brown. Light edged white picotee—Mrs. C. H. Herbert, from Mr. Herbert. Heavy edged yellow picotee—Togo, from Mr. Hayward Matthias. Light edged yellow picotee—Leonora, from Mr. Brown.

For three varieties of American tree carnations three blooms of each, arranged in separate vases, Mr. Usher secured the leading place with a good exhibit.

Dinner table arrangement with carnation or picotee blooms brought seven entrants. Mrs. E. Ladhams, Fairlea, Bellemoor Road, Shirley, was first with an effective display; Miss E. Burt, Manor House, Winterbourne, second. Mrs. E. Ladhams also won for one vase or stand of carnations or picotees with a good exhibit.

A first-class certificate was awarded to carnation Maud Allan, a yellow self shown by Mr. Taylor.

Sweet peas made a huge display. For eighteen distinct varieties there were five entrants, and Mr. Usher followed up his previous successes with this flower by winning handsomely both in this and another large class. Mr. J. Hughes, gardener to A. P. Ralli, Esq., Twyford, was second. Mrs. R. H. Jeffery, Nursling, had the best decorated dinner table of sweet peas.

Manchester Show.

JULY 30 to AUGUST 3.

The Royal Lancashire Agricultural Society may be congratulated upon this year's innovation in the form of a horticultural exhibition. Liberal prizes were offered, and to these exhibitors responded most heartily, bringing out a collection which should satisfy the council.

For a group of miscellaneous plants of 300 square feet, Messrs. J. Cypher and Sons occupied the premier position with an artistic arrangement; Mr. Holmes, Chesterfield, was second; Mr. J. W. Smith, gardener to J. Brown, Esq., Heaton Mersey, took the remaining prize. For a group of 100 square feet (trade excluded), Mr. J. W. Smith secured the leading prize. Mr. F. E. Hazelton, gardener to the Earl of Derby, Knowsley, had a beautiful group, not for competition, and was awarded a gold medal.

For a collection of hardy perennials, twelve feet frontage, Mr. G. Gibson secured the leading prize with a showy bank of excellent flowers. For twelve stove and greenhouse plants, not less than seven in bloom, Messrs. J. Cypher and Sons led, their flowering plants being excellent, and including Ixora Williamsi, I. Duffi, I. salicifolia Shawi, Erica Aitoniana, Statice intermedia, and S. profusa; Mr. J. Duckworth, gardener to W. Cookson, Esq., Heaton Mersey, and Mr. A. R. Kelly, gardener to H. Brocklehurst, Esq., Fallowfield, took the remaining prizes. For eight stove or greenhouse plants in pots not exceeding twelve inches diameter, Messrs. J. Cypher and Sons were again well to the fore with excellent plants. For six exotic ferns, Mr. W. A. Holmes won with smart, medium sized plants of Nephrolepis todeaoides and N. Piersoni; Mr. R. R. Kelly second.

For six caladiums, Mr. W. Cookson led with good plants; and for six tuberous begonias Mr. J. Howarth, Tollington, had the leading awards. For twelve table plants, Messrs. W. J. Garner, W. A. Holmes, and J. Vickers, gardener to Dr. Brooke, were placed as named.

For six orchids, Messrs. J. Cypher and Sons were again to the fore, staging Miltonia vexillaria, Cattleya Emperor, Vanda suavis, and Lælio-cattleya Radium; Mr. W. A. Holmes, gardener to J. McCarthey, Esq.; Bolton, second. For the best specimen, the Messrs. Cypher won with a fine Epidendrum prismatocarpum; Mr. Holmes second.

For a table arranged for effect, Mr. W. J. Garner won with a charming arrangement of rambler roses, sweet peas, and carnations; Mr. J. Atkinson, Stockport, being second. For one bride's bouquet the prize-takers were Messrs. W. J. Garner, J. Mosley, and R. Robinson. For an arrangement of sweet peas suitable for a dinner table, Mr. A. Aldshead won with pink and white flowers; Mr. R. Robinson and Mr. J. Garner following. Collection of eighteen distinct varieties of sweet peas, Mr. T. Jones, Ruabon, staged in his best style, having Prince of Autumn, Constance Oliver, Menie Christie, Mrs. H. Bell, John Ingman, St. George, Etta Dyke, Helen Lewis, etc.; Mr. T. Bolton, Carnforth, was second. For a collection of twelve varieties, Mr. Bolton led, and Mr. F. J. Harrison was second. For a collection of twelve varieties, trade excluded, the winners were Messrs. T. Proctor, A. Whitley, and B. Birch.

For a collection of carnations, five feet by three feet, Messrs. Youngs, West Derby, won with a charming display, having telling blooms of Lusitania, Viscountess Ebrington, Black Prince, etc.; Mr. R. Robinson second. For a collection of tree carnations, Mr. C. F. Waters, Balcombe, won with fine blooms of The President, Enchantress, Harry Fenn, Mrs. A. Patten, and others. For twelve bunches hardy flowers, Mr. J. Howarth won with a telling display, and Mr. W. Cookson was second.

The best twenty-four roses came from Messrs. A. Dickson and Sons, Newtownards, who won with bright blooms of Her Majesty, Gustave Piganeau, Etienne Levet, Caroline Testout, Marie Rady, A. K. Williams, Annie Wood, etc.; Mr. G. Gibson and Mr. C. Burgess second and third. For twelve blooms, distinct, the winners were Messrs. A. Dickson and Sons, Mr. G. Gibson, and Mr. F. C. Harrison.

For twenty-four blooms of cactus dahlias, Messrs. B. Stringer and Sons won with a telling stand, including Purple Jackson, Mrs. McMillan, Ajax, Monarch, J. H. Jackson, etc.; Mr. W. Woodward, Birmingham, second. For twenty-four show or fancy varieties, Messrs. B. Stringer and Son were again the winners, their best blooms being Crimson King, Mr. Glossock, Chieftan, R. T. Rawlings, etc.

For a collection of twelve dishes of fruit, Mr. G. H. Goodacre, gardener to the Earl of Harrington, Derby, won with a strong stand, having Muscat of Alexandria and Black Hamburgh grapes, Countess melon, Negro Largo figs, Nectarne peaches, Elruge nectarines, Golden Gage plums, Bellegarde peaches, Spencer nectarines, etc.; Mr. J. E. Hathaway, gardener to J. Brennaud, Esq., Thirsk, followed.

In the class for a collection of nine kinds of vegetables, Mr. B. Ashton won with an excellent lot, including Autumn Giant cauliflower, Exhibition runners, Sensation tomato, Masterpiece peas, Monster White onions, etc.; Mr. J. George, gardener to T. Henshaw, Esq., Huyton, second. For a collection of nine varieties, Mr. B. Ashton again had the best; and for a collection of eight varieties Mr. W. Cheesborough, Macclesfield, took the lead.

FOR PRESENT SOWING.

CABBAGE.

JOHN K. KING & SONS' READING DEFIANCE.

The Best ever introduced. Sown now, ready end of May. Splendid Hearts. Exquisite Flavour, Good Quality.

From Mr. JOHN DANCE, Barholm: "I have been a grower of Cabbage for the past 29 years; the last three years I have grown your 'Reading Defiance,' and it has given me the greatest satisfaction. I cannot praise it too highly."

Price 1s. per oz. Post Free. Cheaper per lb.

JOHN K. KING & SONS' QUEEN OF SPRING.

Very early, dwarf, and distinct. Recommended.

Price 1s. per oz. Post Free. Cheaper per lb.

ONION.

JOHN K. KING & SONS' GOLDEN GIANT ROCCA.

Very large; delicate flavour; certain cropper.

THE HARVEST.
A LANCASHIRE DUCK FARM.
FOUL CHOLERA.

SOLD BY ALL NEWSAGENTS.

OFFICES: 148 and 149, ALDERSGATE STREET, London.

ANSWERS TO CORRESPONDENTS.

DUBLIN SWEET PEA SHOW.—E. A. B., Armagh: Particulars were posted to you at once, but we expect they did not reach you in time to be of service. You should have written to the secretary, R.H.S. of Ireland, 5, Molesworth Street, Dublin.

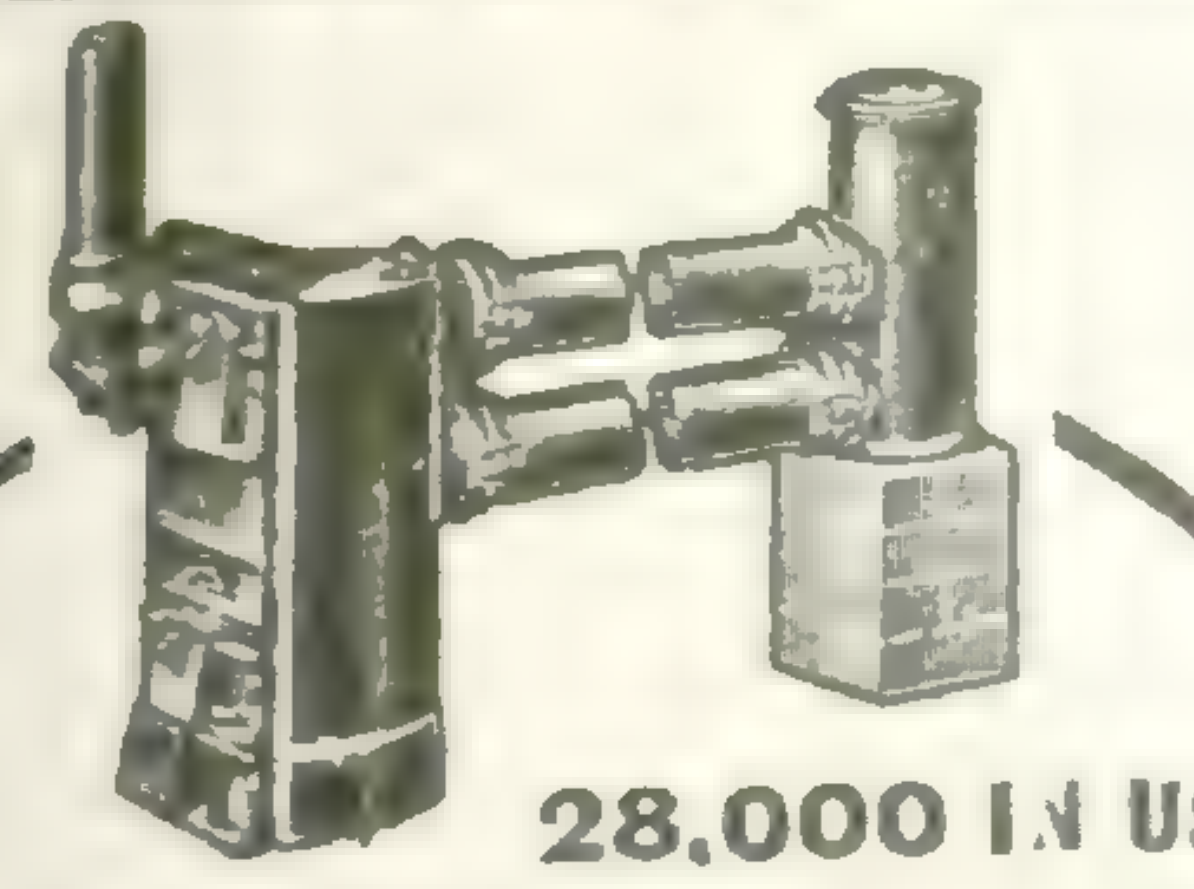
BLACKENED FERN FRONDS.—B. S., Zaraisk: The cause of the blackening is a fall of temperature, combined with excessive moisture in the atmosphere. You will find that if you maintain a suitable temperature, using the ventilators to dispel excess of moisture, that you will not be troubled with blackening of the fronds. You may have noticed that where there is a drip from the roof bars blackening invariably follows after a spell of cold weather and low temperature. Less watering and damping will suffice in cold weather. If the houses lie low and damp, the difficulty is greater, and heating and ventilation must be used together to dispel the moisture.

ZONAL v. IVY-LEAVED PELARGONIUMS.—J. C. B.: The inclusion of a zonal pelargoniums in a class for three ivy-leaved pelargoniums would lead to disqualification, as also would the inclusion of an ivy-leaved variety in a class for zonals. For show purposes as for general use, these two classes of pelargoniums are quite distinct.

SMALL GRAPES.—F. R., Devon: It is too late now to do anything that will make the berries appreciably larger. Nitrate of soda would encourage growth, whereas the finishing and ripening of the growth are matters that will be needing early attention. Your partial failure is, we think, due to overcropping and lack of food. Let us know the condition of the vines, house, and border, and give us some idea of the treatment followed, and we will do our best to set you right for another year. The thinning you have given the bunches should react helpfully upon the vines themselves.

BULBS FOR EARLY FORCING.—F. R., Devon: You may obtain daffodil flowers in November, but it will be very much better if you wait until December before bringing them into bloom; indeed, in all but the larger establishments where there is a huge demand and ample conveniences, Christmas and the New Year are early enough for forced bulbs and tulips. Chrysanthemums and salvias, etc., should fill the bill during November. However, obtain the bulbs as quickly as possible, and at once pot them up and stand them on a hard ash base in the open, covering them with five or six inches of old sifted ashes. If the soil is comfortably moist when potting is done—and it should be done in August—then no water need be given, as the moist ashes will keep the soil from drying. Good daffodils for early forcing are Henry Irving, Queen of Spain, Golden Spur, Sir Watkin, Emperor, Empress, Horsfieldi, Barri conspicuus, Beauty, Stella superba, P. R. Barr, and Victoria. There are other and more expensive kinds of considerable value, but those named will do for a start, and until you gain experience. Let the bulbs remain under the ashes until they commence to make leaves, then remove them to a frame, and from these take them in batches to a warm greenhouse. Hard forcing defeats the end in view; 65 deg. should never be exceeded, and 55 to 60 is better. Do not attempt to force the bulbs until they have had about twelve weeks in which to become thoroughly well rooted. Try a few freesias, potting them two inches deep, but do not cover them with ashes. stand them in a sunny spot out of doors until the weather threatens to be cold, then move them to frames or the shelf of a sunny greenhouse. Potted early, freesias may be had in flower by Christmas. Roman hyacinths may be treated in the same manner as daffodils, but they must be potted early if they are to be flowered early. Due Van Thol, Pottebakker, Vermilion Brilliant, and Mon. Tresor tulips, may be treated similarly, but they need a fairly stiff soil. These may be had at Christmas if potted early.

The Loughborough BOILER



28.000 IN USE.

GLOBE ARTICHOKES.—M. C., Wallingford. There are numerous varieties of the Globe artichoke, and our French friends recognise and catalogue a considerable number. This vegetable varies considerably when raised from seed, hence the advisability of propagating by division or suckers from a good stock. A variety with broad-based heads, and rounded, fleshy scales, is far more useful than one with pointed heads and narrow, stiff scales. Your broad variety is one commonly grown in English gardens, but it is hardly so fine as Large Paris Green, so extensively grown around Paris, and frequently seen in greengrocers' shop windows here. Your pointed, coloured variety is probably the Florence artichoke, a variety that is best used when the heads are quite young, these being boiled and eaten whole.

LANDSCAPE GARDENING.—J. Y. L., Savanna: You will readily understand that it is no easy matter to advise you on the evidence of a brief letter and two picture postcards, much as we should like to be of real assistance. Nothing should be done to spoil the splendid natural features of the place, and where trees and shrubs threaten to hide the wonderful stones these should be cut out, leaving only the small plants and tiny shrubs to colour and beautify these features. Cut a path from the lowland up to the top of the bluffs, securing as easy an ascent as possible, and arranging that here and there along the route there are openings among the trees through which the more important views can be obtained. These openings should be by way of surprise and encouragement, but the great panorama should only be obtainable from the summit. If there is room, and a suitable position on the summit, arrange a garden there, using low-growing flowering shrubs and the hardiest of herbaceous and bulbous plants, grouping these in large irregular masses. Such a garden should have as much shelter as art and Nature can afford, because here visitors will rest after the climb, and their surprise and pleasure at the splendid view they find will be increased if rest is provided for them amid beautiful surroundings. Trees that will stand the exposure of sun and wind should be encouraged around such a garden; indeed, no tree or shrub should be removed from this point until you are quite sure its removal will be an improvement. Where a root hold can be found for them various vines should be planted along the cliff face, where they will drape a portion of the stone and not hide any prominent feature. With a fine river at command it should not be difficult to provide pools of water for aquatics and moisture-loving plants at suitable points in the lowland. The extent of the water gardening must depend largely upon the extent of the park, and the ease with which water can be obtained. A waterfall is always an attraction, and if art can be employed to assist Nature in providing one it appears to us you have ample opportunities; the water could flow out from between your natural rock, and be conducted to the lake, and thence to the smaller pools. Plant a double avenue along the river bank, with a central roadway and two side paths, and if favourable situations are available along the route then plant these with groups of various plants and shrubs, filling some of these areas with the gayest of flowers. In the broad, open, low parts allow free stretches of grass land, and plant a few specimen trees, and a few groups of trees where they will develop freely, and where they will mark the boundary line, and eventually give to the park a suggestion of far greater extent than it possesses. A flower garden near the entrance, after passing between the bluffs, seems to be the right thing, but it must be a free, bold affair, or the heights will kill its effect; but the great flower garden feature must be further in the park, where there is ample room for its inspection and enjoyment. We hope these suggestions will be of use to you, and, needless to say, we shall be glad to hear from you, and about your work, at any time.

ROSE NOT FLOWERING.—A. M., Swinton: We do not know why the rose failed to flower. Perhaps cold winds nipped the earlier growths, and so severely checked them that they did not bloom. Do not pinch the strong growths that are being made now, they may flower at the ends next month, but if not you will have some grand shoots for pegging down, and these will flower from every bud next year, and when they have flowered they may be cut hard back. Pinching would result in side growths of no value.

DISEASED APPLE SHOOTS.—E. E., Essex: The apple shoots sent are very badly affected by mildew, caused, no doubt, by the dry weather experienced of late. Spray the trees with a solution of potassium sulphide (liver of sulphur), at the rate of one ounce of sulphide to 2½ gallons of water. A little soft soap in the water will render the mixture slightly adhesive. Spray again in the course of a week or ten days. See that the young trees are not suffering from lack of moisture at the roots, as this lack will encourage mildew by reducing the vitality and working capacity of the leaves. Cold winds also encourage mildew.

NAMES OF PLANTS.

F. G. E., Radnor.—1, Lychnis chalcedonica; 2, Cuphea Roezli.

H. H., Dunstable.—1, Adiantum pedatum; 2, Campanula isophylla.

G. A., Durham.—Evidently both are forms of Odontoglossum odoratum.

C. C., Farnham.—The large flower is probably Senecio clivorum; the other we do not recognise.

S. E. P., Cheriton.—1, Solanum jasminoides; 2, Tecoma Smithi; 3, Asclepias curassavica; 4, Hoya carnosa.

N. L., Ulverston.—1, Levcesteria formosa; 2, Jasminum nudiflorum; 3, Cedrus Deodara; 4, Adiantum macrophyllum.

I grew 100 000 plants from the seed I had from you last year, and they came in very early, when the prices of spring cabbage were high. I had them all cut in time to plant Potatoes."

SUTTON AND SONS, THE KING'S SEEDSMEN, READING.

HARDY BORDERS for colour effect, to give a succession of flowers for many successive seasons. Write at once with particulars of space to be filled, and on order selections will be prepared and packed ready for planting in September, on Kelway's "Artistic" border system. KELWAY and SON, Langport.

FOR AUTUMN PLANTING.
PLANTERS of FRUIT TREES should write for our fully descriptive catalogue and supplement.

Well-ripened trees of all kinds, and our large, developed specimens of Vines, Figs, Peaches, and Nectarines, are especially good.

An inspection solicited.
GEORGE BUNYARD and CO., Ltd.,
The Royal Nurseries, MAIDSTONE.

SOW CYCLAMEN SEED NOW, of our fine giganteum strains, and finest of all "Low's Salmon King" of the Begonia Gloire de Lorraine colour, which glows by artificial light. Seed in packets, 1s. 6d. and 2s. 6d.; also Perpetual Flowering Carnation Seed in packets, 2s. 6d.; Schizanthus Wisetonensis, 1s., 1s. 6d., 2s. 6d.
HUGH LOW and CO., Bush Hill Park, Middlesex.

NOTES OF THE WEEK.

Nitrogen.

The nitrogen gas which forms about four-fifths of our atmosphere is a very peculiar one. So far as the animal world is concerned as regards its breathing, it is the other fifth, the oxygen, which is all important, and the nitrogen appears to be merely useful in diluting it, since without such dilution our lungs would be practically burnt up, and we should speedily die of an overdose of vitality. Every spark would become a raging fire, and even the metals would share in the general conflagration in an atmosphere of pure oxygen. On the other hand, an atmosphere of pure nitrogen would be an entirely neutral one; as a mere gas, it does nothing but subdue the force of its active companion oxygen, but to deduce from this that it is quite inert and powerless is seen to be absurd, when we call to mind that it is the life and soul of our highest explosives and the basis of the most corrosive acids known. As regards its utility in other directions we have become aware, in these later days, that it is a most potent factor in plant growth when in combination with other elements; and in this connection it seems a curious fact that vegetation actually bathed in an ocean of nutriment, should often be starved for the want of it from a lack of the power of direct assimilation, so that it has to depend upon bacterial aid in some mysterious fashion before it can derive any benefit from the inexhaustible supply in which it exists. This fact seems the more curious when we consider that plants are capable of utilising directly another gas which forms a very much smaller constituent of the atmosphere, viz., carbonic acid, but here we are not dealing with a pure and simple elemental gas, like nitrogen, but really a compound of a gas and a solid, i.e., oxygen and carbon; and precisely as plants are able to deal with nitrogen compounds in the soil, and break them up and recompose them, so are they capable of seizing upon this aerial compound and doing the same thing. In neither oxygen nor nitrogen is there anything, so far, at any rate, as our present knowledge goes, to break up; they themselves are breakers up, and in these attacks they unite themselves with other elements, forming more or less stable alliances which plants may peaceably dissolve, utilising part and rejecting the balance; or in the case of high explosives the alliance, when severed, involves a shattering of everything which stands in the way of the instantaneous wide separation of molecules due to the transformation of a compact, small, solid or liquid body into an enormously greater volume of heated gas, defying all confinement. It is indeed one of the most curious features of chemical combinations that a gas, oxygen, for instance, of great tenuity, can spontaneously, as it were, compress itself into a very small volume, and ally itself with a solid, as, for instance, when iron rusts it only does so by such an alliance with the oxygen around it. Even without actual chemical combination a gas may pervade a solid in a far smaller volume than it would occupy if free; we have only to burn a piece of coal to see hydrogen gas driven out of it in quantities entirely out of proportion to the volume of the coal itself. The mechanical power which would be required to produce similar compression would be enormous, and can only be approximately gauged by that exhibited when liberation takes place on explosive lines, since the expansive force must be equivalent to that originally required for compression. Having thus glanced at the natural forces embodied in thin, impalpable, and invisible aerial gases, and recognised that the seemingly inert nitrogen is by no means so in reality, we may now consider the wonder embodied in the fact that microscopic bacteria can, in some mysterious fashion, induce the aerial nitrogen to form combinations which enable the plants to utilise it by virtue of their decomposing and recomposing faculty already cited. Obviously the knowledge that they can do this, and do do it, is an immense stride in the right direction, and a deep debt of gratitude is due to those who by careful and assiduous study have demonstrated this fact, and by subsequent experiment have proved that these beneficent bacteria can be propagated and supplied where their services are most required, the result being a great increase in the crops produced, and a prospect of entire redemption of vast areas of otherwise poor and hitherto valueless land for agricultural purposes.

[Photo: Davis and Eickemeyer.

SIR JOSSLYN GORE-BOOTH, BART.

Sir Josslyn Gore-Booth, Bart., whose portrait we give in this issue, has for many years past taken a keen interest in flowers and flower culture, and he has devoted much attention, both as a cultivator and raiser, to daffodils, which attain to a high state of development under the conditions of soil and climate that obtain on his extensive estate, which is situate about ten miles from Sligo. When, on the death of his father in 1900, Sir Josslyn Gore-Booth came into possession of the Lissadell estate, which has an area of about 30,000 acres, he, fully realising the responsibilities associated therewith, at once proceeded to give practical expression to his views with regard to the development of their natural resources. In the preparation and carrying out of his plans he very clearly showed that he was imbued with a desire to assist in the revival of agriculture in the West of Ireland, and to give increased employment to the people in the district, as well as to more profitably utilise his property. Attention was first given to tillage farming and stock breeding, and as evidence of the advanced views held by Sir Josslyn, we would mention that an experiment was at once made in the cultivation of early potatoes for market. This proved so successful that annually an extension has been made in the area under this crop. Being well acquainted with the suitability of the soil and climate for the cultivation of daffodils, or, to be more correct, the various narcissi, a bulb farm was commenced, and this was so great a success that it has been rapidly extended, and immense numbers of bulbs are grown, and these, when they reach a flowering size, and also the flowers, are distributed through the usual trade channels. The Lissadell bulb farm is situate near the sea shore, on the north side of Sligo Bay, and here, in the spring months, great breadths of flowers of all the inexpensive varieties, and of surprisingly large numbers of the majority of the recent and costly introductions may be seen. The establishment of the bulb farm was followed by the development of a commercial garden, a nursery for hardy plants, a forest nursery, a poultry farm, the conversion of his extensive saw mills into a business, and the further development of the barytes mines and mills at Gleniff. From the first Sir Josslyn recognised the importance of the several schemes being conducted on strictly business lines, and the results have fully justified the views he holds on this point. Each department is kept distinct, with an experienced head, and Mr. J. A. Cooper, the agent, is the general manager. Sir Josslyn does not limit his activities to his estate, as evidenced by the fact that he has taken a leading part in establishing several co-operative creameries, is chairman of one of the local railways, a member of the Irish Board of Agriculture, and his interest in sports is shown by the fact that he was one of the first employers in the West of Ireland to give the Saturday half-holiday.

Fruits of Foreign Growth were plentiful in British markets during July, and their value was considerably in excess of that of the fruits imported in the corresponding month of last year. The imports of apples amounted to 46,192 cwt., of the value of £21,082, or an increase in quantity of 12,636 cwt., and in value of £4,011. Of apricots and peaches the imports were 22,362 cwt., of the value of £41,683, these figures representing a small decrease. In the imports of bananas there was a decrease of 46,102 bunches, the aggregate having been 661,429 bunches, of the value of £181,305. Cherries, as the result of the heavy crop in British orchards, were imported in smaller quantities than for several years past, the total imports having been 40,873 cwt., of the value of £41,094, as compared with 68,740 cwt., of the value of £71,759, in the corresponding month of last year. The imports of currants were 91,900 cwt., of the value of £108,785, or a decrease in quantity of 2,854 cwt., and in value of £15,721. Gooseberries, on the other hand, show a small increase, the aggregate imports having been 25,006 cwt., of the value of £13,339. In the imports of grapes there was a relatively large increase, the total having been 8,956 cwt., of the value of £10,925. Lemons and the various kinds of nuts were imported in increased quantities, but in the imports of oranges there was a big drop. Pear imports increased from 13,967 cwt., of the value of £15,307, in July, 1907, to 31,012 cwt., of the value of £38,635 last month, while in the imports of plums there was an increase in quantity of 75,225 cwt., and in value of £91,010, the total having been 110,939 cwt., of the value of £147,239. The total value of the fruit imports for July was £838,024, or an increase of £61,113.

The English Walnut Crop is very heavy this year, and there is a promise of the nuts being of high quality. On a Berkshire farm which recently came under our notice, there are nearly fifty trees which are more heavily laden with nuts than they have been for at least a quarter of a century.

British Association Meeting.—Social functions have a prominent position in the programme of the British Association meeting at Dublin, and are sufficiently numerous to form a good relief to the scientific discussions. On the opening day (Wednesday, September 2) the Lord Mayor and Lady Mayoress will be at home from 3 to 6 p.m., at the Mansion House, in Dawson Street. On the following day the Provost and Senior Fellows will give a garden party at Trinity College, from 3.30 to 6.30 p.m., and on the same day there will be a conversazione at Leinster House, the historic home of the Royal Dublin Society, commencing at 8 p.m. On Friday (September 4) there will be receptions by the Dean of St. Patrick's at his deanery, by the Irish Astronomical Society at Dunsink Observatory, and by Miss White at Alexandra Colleges. Saturday (September 5) will be almost wholly given up to excursions, but the Classical Association of Ireland will give, in the evening, a conversazione in the hall of the Royal College of Physicians. On Monday (September 7) Lord and Lady Ardilaun will give a garden party at 3.30 p.m. at St. Anne's, Clontarf. On Tuesday (September 8) the local committee will give a garden party at the Zoological Gardens, at 3.30 p.m., and at 8.30 p.m. Lord and Lady Iveagh will hold a reception at 8, St. Stephen's Green; and on Wednesday (September 9) Lord Lieutenant and Lady Aberdeen will give a garden party at the Vice-Regal Lodge, Phœnix Park.

Vegetable Imports were considerably smaller in July than in the corresponding month of last year. The imports of potatoes aggregated 891,473 cwt., and of this quantity Germany sent 144 cwt.; France, 565,005 cwt.; Channel Islands, 149,438 cwt.; and other countries, 176,886 cwt. The value of the potato imports was £205,126. Of onions the imports were 593,431 bushels, of the value of £64,182, these figures representing substantial decreases. Tomatoes, on the other hand, were imported in increased quantities, the total having been 171,978 cwt., of the value of £118,634.

Artificial and Natural Modes of Propagation.—In our reference to the paper read by Mr. C. Sherry, at a meeting of the Andersonian Naturalists, we expressed the opinion that he had been incorrectly reported, and, as will be gathered from the following note, we were right in our surmise. Mr. Sherry writes: I am sorry in having incurred the criticism of the Gardeners' Magazine by the few notes which I recently read before the Andersonian Naturalists on "Artificial and Natural Modes of Propagation." The criticism is based on an inaccurate report. What I actually did say was: "The late Professor Balfour, in his 'Class Book of Botany,' states that 'the higher class of plants may be considered as consisting of numerous buds united on a common axis. These possess a certain amount of independent vitality, and they may be separated from the parent stem in such a way as to give origin to new individuals.'" I did not intend to suggest that propagators, as a rule, placed little value on buds as a means of increase, but that the attention of propagators was mostly devoted to certain classes of plants which were more or less of commercial value. The latter, including those referred to by the Gardeners' Magazine, were specially mentioned by me.

Epping Forest Ferns.—Two men were summoned at the recent Epping Petty Sessions for taking ferns from Epping Forest. A cross summons was subsequently withdrawn, and the defendants were fined 10s., and 2s. costs.

A Plague of Butterflies has been recently experienced in Bohemia, and while the insects themselves did no damage to the crops, they deposited millions of eggs upon the various plants, and when the caterpillars hatch out they will, it need hardly be said, do such injury as to inflict heavy losses upon the cultivators whose gardens and fields come within the range of the visitation.

Canadian Apples.—To the annual report of the Ontario Fruit Growers' Association Mr. W. T. Macoun, of the Experimental Fruit Farm, Ottawa, contributes an interesting paper on new fruits, and in his introductory remarks states that in the early part of the nineteenth century, 80 per cent. of the apples in cultivation in North America were European; now scarcely 10 per cent. are of European origin. This means, he says, during the past one hundred years, Americans have found out that fruits originated in the United States are better suited to their conditions than those that are imported. The result is that the European varieties are gradually passing out. When settlement began in Ontario, the nearest source of supply for fruit trees was the United States. For that reason nearly all the varieties are of American origin, such as Greening, King, Spy, Ben Davis, and Baldwin. In Eastern Ontario the growers have developed some excellent apples of Canadian origin, such as St. Lawrence, McIntosh Red, Fameuse, and Baxter.

Conserving Soil Moisture.—We have so persistently advocated surface tillage as an efficient means of checking excessive evaporation from the soil that we are especially interested in what is being done in North America in connection with this important detail. It was long a matter of common belief in America, as elsewhere, that irrigation was the only means by which land in arid climates could be profitably cultivated. Where the conditions are favourable irrigation will yield such splendid results as to give an ample return. But there are many districts where irrigation is impracticable, owing to the deficiency of water or unsuitability of soil, and in British Colombia and the United States there are many large tracts of land that hitherto have not been cultivated owing to the liability of the crops to injury from excessive drought. Professor Campbell has devoted much attention to these lands, with a view to their amelioration, and, as the result of his investigations has formulated a method of procedure by which they can be successfully cultivated without being irrigated. This consists simply in so cultivating the land as to produce a fine tilth to a depth of five or six inches. In America, where the climatic conditions are less variable than in this country, there is less difficulty than here in converting the soil into a fine state, and the benefit therefrom is more marked.

But in this country the advantage of a fine surface tilth is great, and in a dry season it would be difficult to over estimate its value, especially in fruit plantations.

Woodlands of Southern England will form the subject of a paper that will be read by Mr. A. G. Tansley, before the botanical section at the British Association meeting at Dublin next month. Mr. Tansley will deal in his paper with the work that has been done under the direction of the Central Committee for the survey of British vegetation, by which a classification of these woods has been arrived at.

Botley Photographs. — As a centre of the Hampshire strawberry growing district, Botley is of much interest to those who are concerned with the culture of strawberries. We have therefore derived much pleasure from two excellent photographic postcards that Mr. A. Jenkyns, of [illegible], Botley, has kindly sent us. One of these represents the High Street as it appeared on April 25 after the snowstorm, and the other taken during the height of the strawberry season, shows the railway station in which is a long train that is being loaded with fruits from a dozen or more carts and vans.

Which is the Worst Weed?—The question is raised by a correspondent of the "Agricultural Gazette," who puts the field convolvulus, commonly known as "bindweed," or "bellbine," in the first place for badness. Probably, observes our contemporary, farmers and gardeners in different parts of the country would give different answers to the question, as one weed is most troublesome in certain districts and another elsewhere. To reply to the question with good judgment, however, each weed that is in the running must be considered where it is at its worst, from the farmer's or gardener's point of view, due regard being paid alike to the injury it does to cultivated crops, and to the difficulty of extirpating it. But on the latter point the farmer and the gardener would not agree, because, while bindweed, for example, is one of the worst, if not the worst, of all weeds, to destroy permanently in a garden, it is not so in a field, which can be laid down in grass for a time—a plan fatal to this weed. Probably most farmers would declare couch grass to be the worst of farm weeds; but it can be eradicated from a garden with much less difficulty than bindweed can be got rid of—the latter can be permanently destroyed in a field. Any weed can be destroyed in the ground by very frequent and persistent hoeing, as no plant can flourish if never allowed to make growth above the surface. But bindweed roots among the roots of shrubs and flowers, and in rows of culinary vegetables, such as peas, where the hoe cannot be used,or the spade either, without uprooting the shrub, flower, or other plant.

Healthy Occupations.—It has long been a matter of common knowledge that gardening is conducive to health and longevity, and by those well acquainted with rural life, gamekeepers, farmers, and agriculturists are regarded as enjoying much the same advantages in this respect as gardeners. But it comes as a surprise to find brick manufacturers and railway engine drivers and stokers in the same category. In the report of Dr. John Tatham to the Registrar-General on the mortality in various callings, seven classes are included in the healthiest section of all, and these are brick manufacturers, [illegible], engine drivers and stokers on railways, gamekeepers, gardeners, farmers and farm labourers.

SWEET PEA JOTTINGS.

The great exhibition is now only a memory. It was not so large as that of 1907, and this was due more to the curtailment of the schedule than to any other thing. The deletion of all the single-bunch colour classes was a sweeping action on the part of the committee of the N.S.P.S., but some such action was absolutely necessary, because in 1907 the resources of the Royal Horticultural Hall were taxed to their utmost, and the exhibits were uncomfortably crowded. This year there was comfortable room for the flowers, and all were accommodated on the ground floor. As is usual at exhibitions of this character, several competitors dropped out at the last moment, but directly judging was finished the stewards and officers of the society quickly spaced out the exhibits present, and so filled up the few gaps that would otherwise have been apparent.

The arrangement of the exhibition was a great improvement on previous years. We live and learn. The trade displays formed a fine setting or framework for the competitive entries, and down the centre of the hall the dinner-tables and the tables entered for the Burpee Cup made a fine display. Two striking features were the central display by Messrs. J. Carter and Co., and the arch of sweet peas arranged inside the entrance by Messrs. R. H. Felton and Son. Palms of varying size were set along the centre of each long exhibition table, and these relieved the display from flatness. The society's trophies and cups, arranged at the top end of the hall, with the newly certificated sweet peas in front of them, proved a great attraction. This is the first time the society has made a display of its "family plate."

About a hundred and twenty different competitors came forward, several coming from Wales, one from Scotland, several from the Liverpool district, one from Northumberland, and many from the Midlands; but the greater number were southern growers, and their success was remarkable in such a season as this, and proves that, if generous treatment is given, and thin sowing or planting is practised, the sweet pea is accommodating on Surrey sands even in a dry, hot season. Twenty-eight judges got through their work in about three-quarters of an hour or so, and as they began directly after eleven o'clock, and the show did not open until half-past twelve, there was time for the executive to put the finishing touches to a charming display before the public were admitted. About 1,500 bunches of sweet peas were entered in the competitive classes.

Three exhibitors stood out very prominently among the successful ones, and two of them were new members and new exhibitors of sweet peas. When, a few minutes after the opening of the hall, I congratulated Mr. Francis Wellesley on winning the Eckford Cup, he was the most surprised person present, as he had not then reached the exhibit so admirably grown and staged by his gardener, Mr. W. Hopkins. Mr. Edgar Allen, of Formby, a new grower, was also very successful, but the lion's share of leading awards fell to Mr. Usher, gardener to Sir Randolf Baker, Bart., of Ranston House, Blandford. Mr. F. J. Harrison, of Ulverston Show fame, was also very successful, and Messrs. T. Jones, T. Stevenson, C. Breadmore, and S. Cole, gained a fair share of awards. Two ladies, Mrs. Tigwell, of Greenford, Middlesex, and Mrs. Pellier, of Abbot's Kerswell, Devon, showed finely and successfully, the latter bringing up and staging her own flowers. The splendid Burpee Cup Mr. Bolton has taken to Carnforth, and Mr. Basile has, for the second time, taken the Horace Wright Cup back to Weybridge. On the whole, honours have gone round again, and it is a pleasant thing to note how new enthusiasts are coming forward.

Although the exhibition was not graced by the presence of any member of the Royal Family, there were many well-known society folk present, and a large attendance of members of the N.S.P.S. and R.H.S. Sweet pea lovers from the United States, from British Columbia, France, Germany, and far New Zealand were present, and all expressed their surprise at the extent and beauty of the display. Notwithstanding the great attraction of the Marathon race, and the largely increased membership of the society, the takings at the door amounted to £30, as against £28 5s. 6d. in 1907.

Concerning the show, the flowers, the new varieties, and the willing helpers, it were easy to write at some length, but a profound sense of great honour done to me, a very lively appreciation of the goodwill the members of the N.S.P.S. have towards their hon. secretary, and gratitude for the tangible evidences I and mine have received of that goodwill and satisfaction, compel me to add a few words, that will, however, but poorly represent my feelings. To all the members of the society I beg to tender my sincerest thanks for the very generous manner in which they have acknowledged the services I have been able to render as hon. secretary. No other society has accomplished so much in so short a time as the N.S.P.S., and if the enthusiasm of the members continues it ought to be the largest of the floricultural societies in a very few years.

How one's ideas and words are turned topsy-turvy sometimes! I suggested the accumulation of a reserve fund, and Messrs. W. Cuthbertson, Leonard Sutton, and E. Sherwood turned the idea upside down, and made it into a "Curtis Testimonial Fund." If this is the way my brilliant ideas are to be confounded, I must keep my tongue quiet, or heaven only knows what will happen next. But, seriously, I am proud of my association with good-hearted and hard-working officers and committee, and of a young society that acknowledges the work of its hon. secretary—and, believe me, it is no light work—to the generous extent of a beautiful album of views, a cheque for £60, and a gold bracelet for his better half. Here's to you, my friends. May we all prosper.

Since writing the foregoing notes (which limits of space excluded from a previous issue), the second provincial show has also come and gone. As the report of this fine exhibition appeared on page 605, it is not necessary to write much of the display. In general effect, it was not a great success, owing to the fact that the exhibits were arranged in two halls and in the wide galleries of the University buildings. Mr. E. Knowldin and Mr. F. W. Moore did all that was humanly possible to make our show a success, and the sweet peas filled the best positions, and were a great attraction. It is a thousand pities the shows of the Royal Horticultural Society of Ireland are not better patronised, for, with its climate and variety of soils and situations, Ireland can produce the finest of produce, but this is not likely to be exhibited if folks will not come to see it. Of one thing I feel quite sure; if some of our Irish friends were to put as much enthusiasm to the culture of sweet peas as growers this side of the Irish Sea do, they might come over here and win their expenses handsomely, and probably take back a cup or two.

The two outstanding prize-winners at Dublin were Mr. Cowdy, of Greenhall, Longhall, Co. Armagh, and Mr. Thos. Stevenson, gardener to E. Mocatta, Esq., Woburn Place, Addlestone. Mr. Cowdy was a silver medalist in 1907, and this year he won both the Dickson Cup and the Edmonton Cup, in classes open to Irish growers and members. He showed splendid flowers, and set them up beautifully. Mr. Stevenson — whose flowers, cut at 8 a.m. on the Tuesday, were perfect on Wednesday morning, despite their long journey—won the new Edwards Challenge Cup, presented by our present chairman of committee, Mr. C. W. Breadmore.

and Mr. Procter, of Yealand Conyers, were other successful English growers, and once again Mr. Andrew Hoggan, of Busby, did battle right royally for Scotland. Mr. King, gardener to Lord Dunleath, Ballywalter Park; Mr. Reid, of Lisburn, Co. Antrim; Mr. H. J. R. Digges, of Donnybrook; Mr. Davies, of Blackrock; Mr. Sutton, of Kilkenny; and Mr. Mitchison, of Mullaboden, were the leading Irish prize-winners after Mr. Cowdy; but Mr. Stevenson was the hero of the show, as he won fourteen first prizes with flowers that had travelled many hundreds of miles by rail and sea.

There were several disqualifications at Dublin, and it were well to point out here that, while Elsie Herbert and Evelyn Hemus are quite distinct, one having a white ground and the other a cream ground, the two have been placed together in one vase several times this season. At night or in the dim early morning light such a mistake is not hard to make, but exhibitors should always allow themselves sufficient time to carefully examine their exhibits before these are finally left for judgment.

A year or more ago I ventured to assert that the seedsmen who could send out true high-class stocks of known varieties of sweet peas, with a guarantee of 90 per cent. of fixity, would prove more successful in the sweet pea trade, than one who hastened to send out new varieties at a high price, and unfixed. In the "Sweet Pea Annual" of 1908 Mr. W. P. Wright preached a most emphatic little sermon against "mixity," and at the close of the London exhibition the other day, the complacency that is supposed to follow a good dinner did nothing to soften his words or reduce his opinions. As nearly as I can recollect, he said, "Unless raisers are prepared to hold their stocks of new varieties until they are fixed, they will ruin the sweet pea trade and the Sweet Pea Society." I cordially agree. This is the only path along which real danger lies; sweet pea "streak" is as nothing to this.

If raisers will not heed this warning it will be still open to the society to make drastic laws that would hold matters in check; but such laws would be so severe that many raisers would not remain under them, and so a very difficult position would be created. I wonder whether it would be possible for raisers to combine, and agree not to distribute a variety until its fixity, as shown by the Reading trials, reached a certain standard. We all know the great advertising value of novelties, but many of us also know the confidence of the buyer is lost when the novelty, purchased at a high price, is disappointing. Confidence in the flower and confidence in the seller alike suffer.

Chas. H. Curtis.

Nitro-Bacterine.—It would be interesting to know what results have been obtained by the use of the above in the growth of sweet peas. I have been experimenting with it this season with a view to ascertain whether its use would be advantageous. Seeds of one variety were dressed with the mixture, and planted by the side of another variety the seeds of which were undressed. This was done in different parts of the garden, the varieties being properly labelled and noted in our trial book. I am disappointed in seeing no benefit accruing from the use of nitro-bacterine. This, however, may be no fault of the mixture, as I believe the circular sent with it stated that the best results would be obtained where there was a lack of nitrogen. It may be, therefore, that in some soils it may be more beneficial than in others. If this is so, it can only be ascertained by experience, and as bought experience is most appreciated, or should be, that experience is most convincing. Soil constituents are sometimes very perplexing, judging by the growth of some plants, even of the same species, when growing side by side, and in the same kind of soil.—T. H. Slade.

OVERHANGING TREES.

A correspondent writes with reference to his legal rights in relation to trees that overhang his garden, and as the question is one of general interest, we give the following extract from the paper contributed to the "Journal" of the Royal Horticultural Society (Vol. XXX., Part 1) by Mr. H. Morgan Veitch, solicitor, on "The Amateur and Horticultural Law."

The subject of interference by neighbours leads us up to consideration of the remedies available when trees overhang a boundary wall.

If the trees are of such a poisonous nature as to injure a neighbour's horses or cattle which may be likely to feed upon them (in the case of yew trees, etc.), an injunction can be obtained against the person on whose land the trees stand, compelling him to cut the trees back to his own boundary, even if the trees have overhung for more than twenty years. Again, the Courts recently granted an injunction against a landowner who allowed his elm and ash trees to overhang a boundary fence in such a way as to interfere with the growth of his neighbour's crops. The Court held that the neighbour was entitled to protection, and compelled the owner of the trees to cut back the overhanging branches. It will be noticed that in this last case the Court interfered expressly because the overhanging trees caused actual damage to the person owning the land on the opposite side of the boundary fence. The Court would not have been so willing to interfere if the trees caused no damage, or were unsightly, or because some capricious objection was taken to the overhanging. Even in cases where no damage results there is, however, a legal remedy, because if your neighbour's trees overhang your land you are entitled to cut off the overhanging branches, and it has been held that one may cut a Virginian creeper which overreaches in the same way. If you cannot do this without going on to your neighbour's land for the purpose you must be careful to notify your neighbour beforehand of your intention to go on his land with this special object. I must warn you, however, that if you cut off any more than what actually overhangs, you may incur heavy penalties. There is another reported case where a grower allowed thistles to multiply on his property to such an extent as to blow on to his neighbour's land and damage his crops. In this case the grower was restrained by the Court from permitting the nuisance to continue.

In exercising one's rights to cut the overhanging branches of a neighbour's trees it is necessary to bear in mind that the boughs when cut off still belong to the owner of the tree, and it would therefore be wiser to ascertain whether he wishes them to be returned to him. On the same principle it has been held that if trees growing in a hedge overhang another man's land, and the fruit of them falls on the other's land, the owner of the fruit may go in and retake it if he makes no longer stay than is convenient, and does not break the hedge. The owner of the trees has the same right if they are blown down by the wind or fall over by any other inevitable accident. Before going on to one's neighbour's land, however, in order to take back fruit or branches which have fallen in this way, it is necessary first to ask for permission to enter on the adjoining land, but if the request be refused then the owner of the fruit may enter and take his fruit without permission. Of course, it often happens that it would be very unwise to exercise one's strict rights in this respect, because if friction were to arise the owner of the adjoining land might have the trees cut back by way of reprisal, and one therefore comes back to the point that the wise man is he who acts reasonably towards his neighbour without casting round to see what may be his strict rights or how far the law may permit him to cause annoyance.

With regard to trees overhanging highways, it has been said that if the occupier of land suffers his trees so to protrude over the highway as to inconvenience passers-by it is a public or common nuisance, and the trees may be lopped sufficiently to avoid the evil by any of the public passing that way, for anyone may justify the removal of a public or common nuisance which is so remediable; it has indeed been stated that by the old law nobody was bound to cut his trees that overhung the road, and therefore anyone might do it.

It is, however, extremely doubtful whether this can now be taken to be an accurate statement of the law, and I should advise you to be very cautious about accepting it. But even if it be correct, any person who proposes to act as a public benefactor in this matter would do well to bear in mind that the person who abates a public nuisance in this way must show special damage arising from the nuisance, and can only interfere with the nuisance so far as is necessary to the exercise of his own right of passing along the highway, and he must not do any unnecessary damage. Probably the safest plan, therefore, is to invoke the aid of the highway surveyor, who in a proper case can obtain a justice's order under the Highways Acts directing the owner of the offending trees to lop the overhanging branches. If this notice is neglected for ten days the owner is liable to a penalty, and the surveyor is authorised to cut or trim any offending trees or hedges himself, the expenses of so doing being made recoverable from the defaulter; so that a complaint to the local authorities is by far the cheapest and most convenient way to obtain redress.

It is, however, worth noticing that these powers only apply in the case of carriage-ways or cart-ways, and not in the case of footpaths. Moreover, trees planted for ornament and for shelter to any hop ground, house, building, or courtyard of the owner thereof are exempted from the operation of this enactment, and it is expressly provided that no person shall be compelled nor any surveyor permitted to cut or prune any hedge at any other time than between the last day of September and the last day of March.

A question sometimes arises as to who is the owner of a tree standing near a boundary line where this tree grows and expands so as to encroach on to the neighbour's land. If the tree is only growing near the confines of the land of the two parties, then, although the roots may extend into the neighbour's soil, the tree still continues to belong to the owner of that land in which the tree was first sown or planted; but one learned author lays down that a distinction must be made when a man plants a tree upon the extreme limit of his land so that the tree in the ordinary course will necessarily grow on to the neighbour's land. In this case— that is to say, where the tree is planted on the boundary line itself—the trunk must in the natural course of growth stand and grow on the land of both the man who plants it and on the land of his neighbour, and the roots in such case will inevitably penetrate into the soil of each. It is therefore reasonable to assume that the man who planted the tree must have anticipated and intended this result; consequently the tree must be deemed to be the common property of the two adjoining owners. The same author is of opinion that it has yet to be judicially decided beyond any question or doubt whether one proprietor can in the absence of an agreement compel another to have his land burdened with the roots of his neighbour's tree. A right of this kind could only be acquired adversely by an enjoyment which was open and as of right. Still, the law not requiring impossibilities but recognising the course of nature, it seems reasonable to suppose that the right in question may be legally acquired by prescription, i.e., adverse enjoyment, and the author in question remained of this opinion although in one reported case the contrary was suggested by one of the Judges. However, this suggestion was by way of obiter dictum only, and the point was not actually decided.

STANHOPEAS.

The genus Stanhopea include a number of striking and interesting species which are not so extensively cultivated as their merits deserve in prominent orchid establishments. They are, strangely enough, are frequently met with in the ordinary plant stove in gardens where there is often no pretence to cultivate orchids. Stanhopeas are most attractive, and it may appear rather strange that I should say that I have never met with a variety of stanhopea that I did not consider worthy of cultivation. Some are more richly tinted than others, but the quaint characters found in them all renders them most desirable. As I have quite recently referred to the cultivation of stanhopeas in last week's work of the orchid house, I shall now confine myself to an enumeration of some of the best-known and useful among the species and varieties in cultivation.

S. Devoniensis is one of the oldest of the species in cultivation. The flowers are produced generally in twos or threes. The sepals and petals are light fawn-yellow, spotted with purple-brown. The lip white spotted with purple. The horns of the mosochil and the sides of the epichil are ivory-white, with a few purple spots on the basal half of the latter.

S. eburnea is a beautiful species with large ivory-white flowers, with a few purple markings. It is one of the most peculiar shaped and fragrant of the genus.

S. insignis produces from two to four large flowers, very fragrant. The sepals and petals are dull yellow, spotted with purple. The lip white, spotted with purple. The sub-globose hypochil deep purple beneath.

S. Lowi.—This species produces several flowers on the scape, which are large and fragrant. The sepals and petals very pale yellow, the petals dotted with brown-purple in the centre. The lip ivory-white, hypochil globose, with an incurved yellow tooth on each margin; on the upper half inside are rows of suffused maroon spots.

S. Lowi, var. Amesiana, has deliciously fragrant white flowers, the inside of the hypochil being suffused with rose.

S. oculata has large, many-flowered racemes. It is exceedingly variable, but may usually be detected by the numerous ocellated red spots on the light yellow segments. This is one of the most common stanhopeas in cultivation.

S. tigrina is perhaps the most attractive and beautiful of the genus. The flowers are large and showy, also very variable. Sepals sanguineous red, blotched and spotted on the lower portions with yellow. Petals generally yellow. The lip orange-yellow, blotched with maroon-purple, misochil short with white spotted purple horns.

S. tigrina superba.—This handsome variety, of which a characteristic illustration is given herewith, was exhibited at the R.H.S. meeting on July 21 last, by Messrs. J. Charlesworth and Co., Bradford, when it was awarded a First Class certificate by the Orchid Committee. It has exceptionally large and brilliantly coloured flowers.

S. Wardi is a well-known species, with golden-yellow, purple-spotted segments. It is one of the most desirable of the several forms.

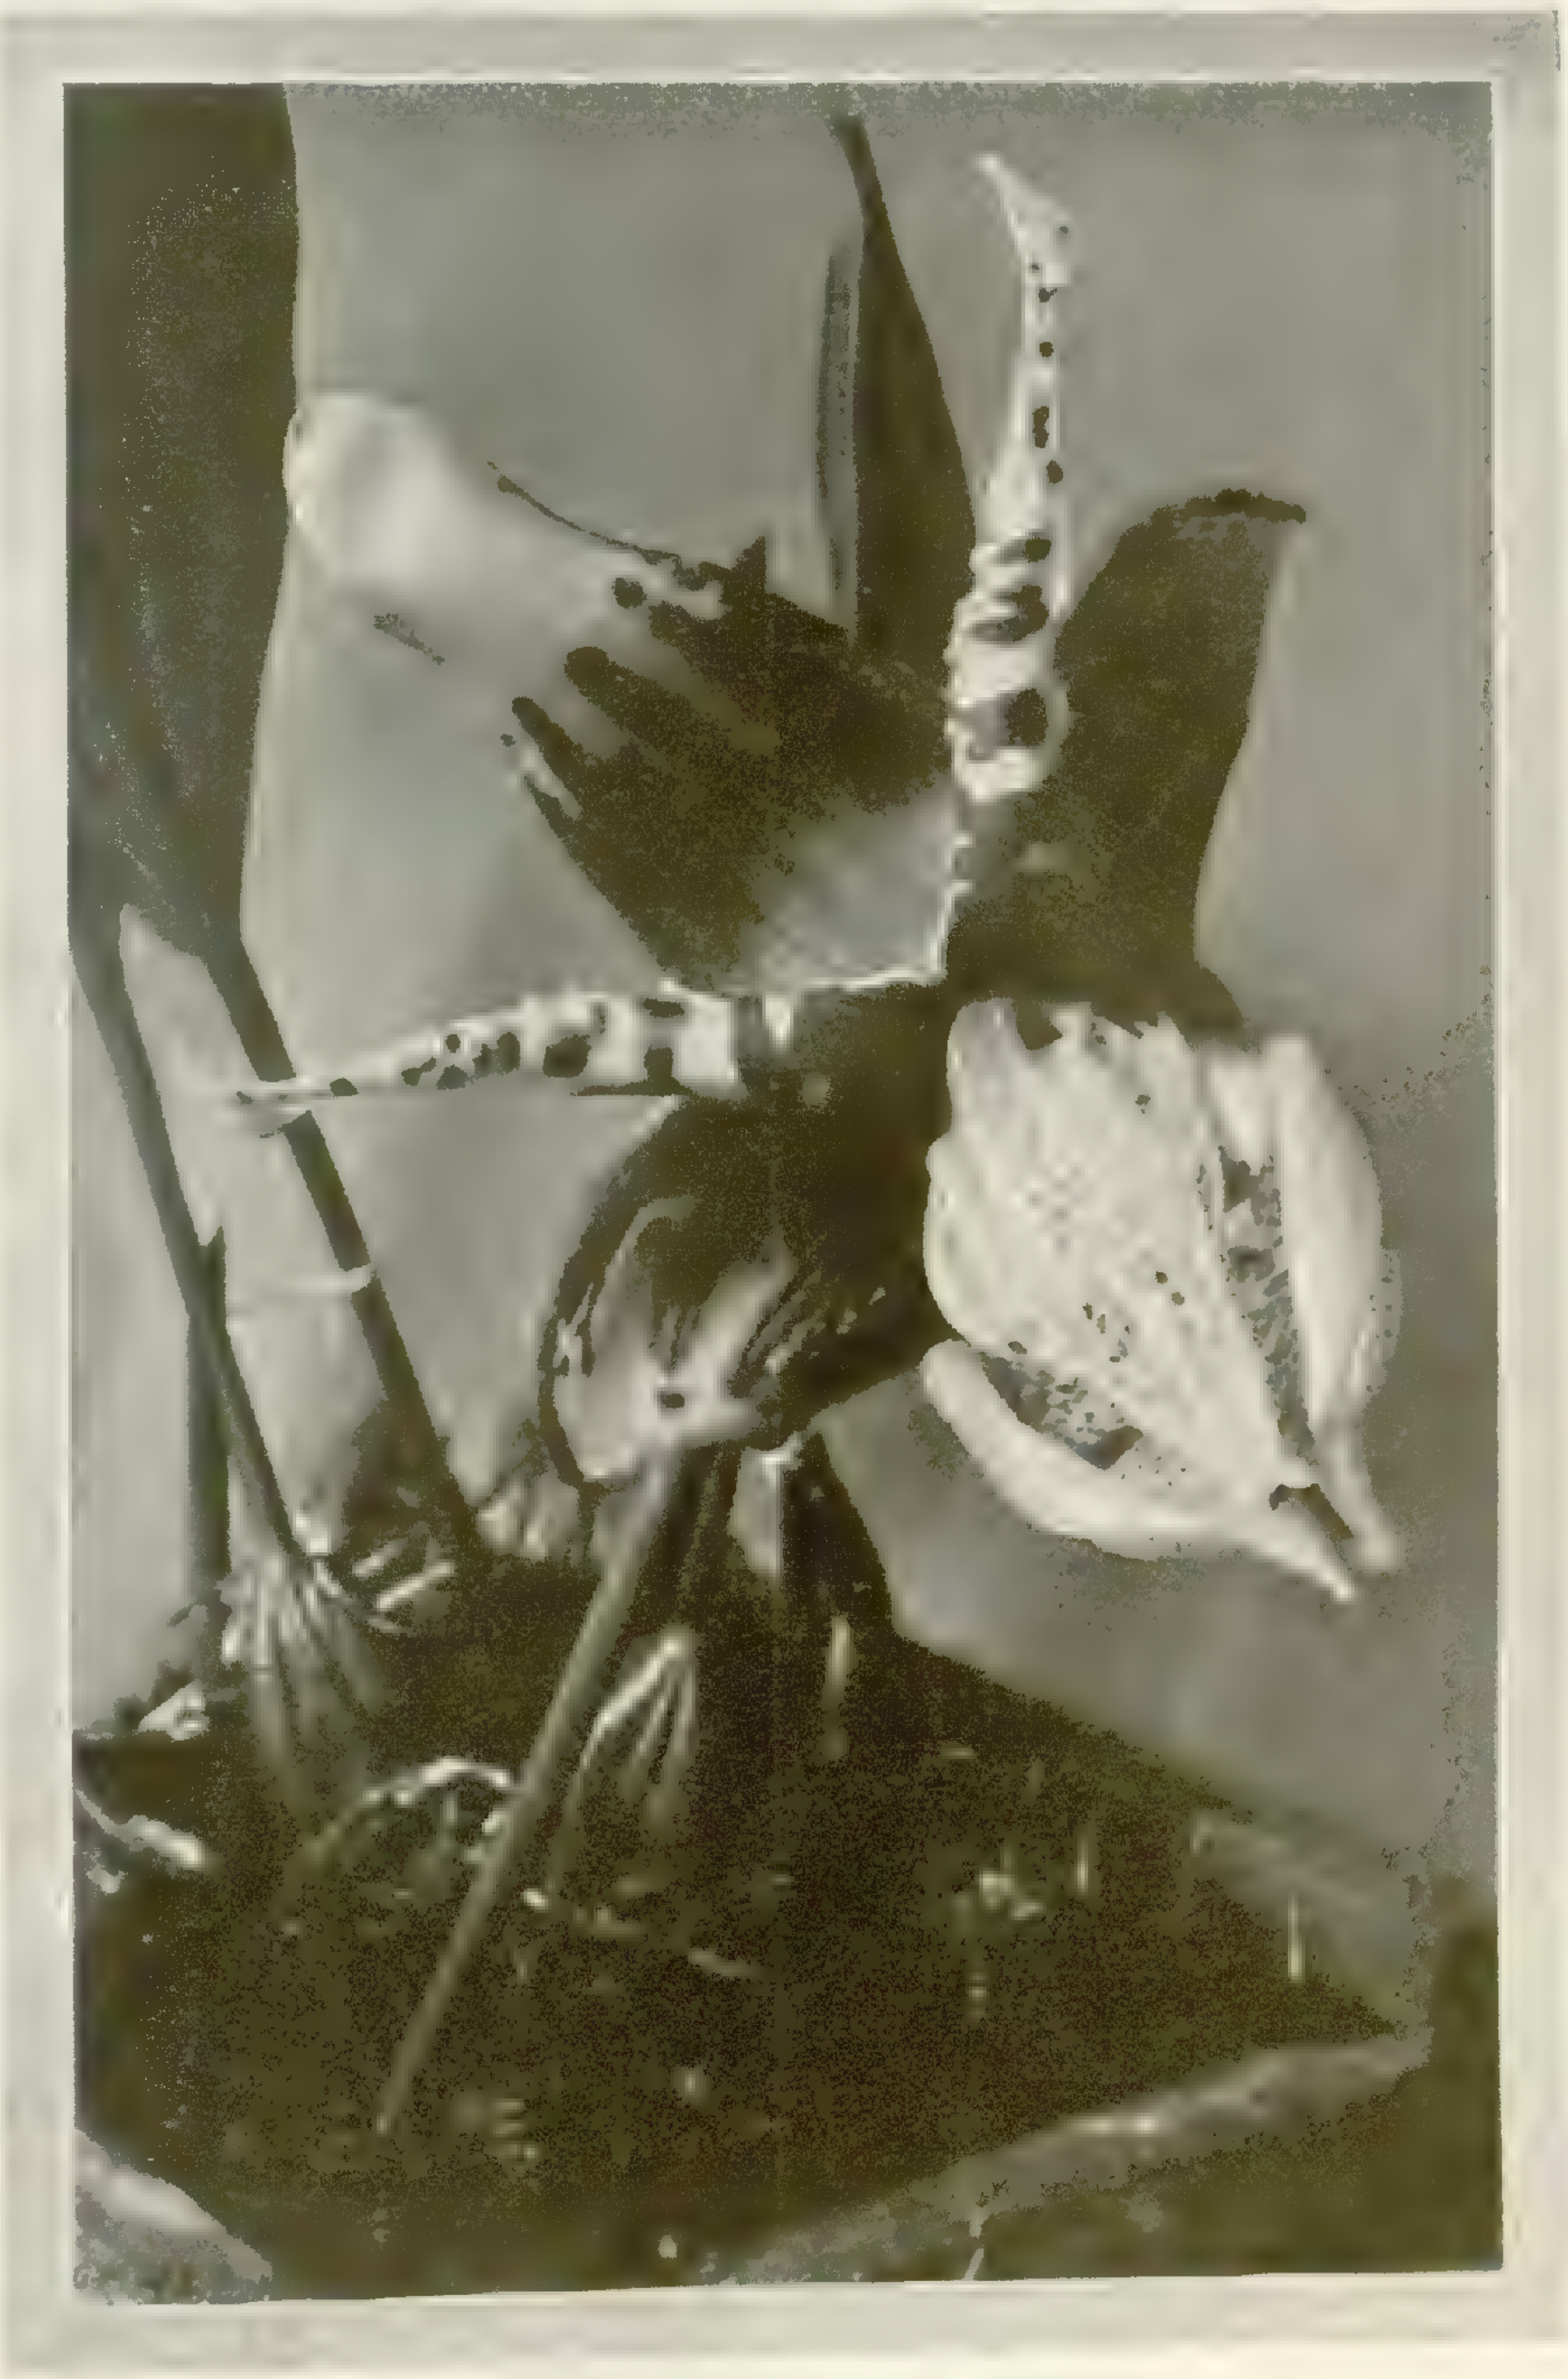
H. J. Chapman.

Oakwood Gardens.

Coleus.—A further stock of these may now be raised from cuttings. These will easily be housed during winter and spring, and will remain in good condition throughout the winter months.—J. Donoghue.

ANNUALS AT KEW.

Throughout the summer a long border at the foot of the wall separating the grounds formerly attached to Cambridge Cottage from the rest of the gardens, has been very gay with a selection of annuals or of plants usually treated as of annual duration. They are disposed in good-sized masses or clumps so that the general effect produced by each kind can be readily seen. Some of them that were very beautiful a month ago are now decidedly past their best, still, even as late as August there is a fine show, and that, too, after the exceedingly hot and dry weather that we have experienced. Chief among those still in good condition are: Verbena erinoides, a native of Peru, with prettily cut leaves, and clusters of lilac-purple coloured flowers; Linum grandiflorum coccineum, one of the showiest of annuals, being quite a mass of its brilliant scarlet flowers; Brachycome iberidifolia (Swan River Daisy), whose deep bluish-mauve coloured flowers are borne in great profusion, and present a decidedly uncommon appearance; Alonsoa Warscewiczi compacta, the orange-scarlet flowers of which somewhat suggest those of a chorizema; Portulacas, in variety, whose bright coloured blossoms are well served by the vivid sunshine we have lately experienced; Tagetas signata pumila, which presents quite a mass of its small golden-yellow blossoms; Tagetes Silver King, pale yellow, and velvety brown; Tagetes Legion of Honour, rich gold, and reddish brown, a striking flower; and Phlox Drummondi in variety.



STANHOPEA TIGRINA SUPERBA.

Awarded F.C.C. at R.H.S. Meeting, July 21. Flowers large and richly coloured, crimson, maroon, and yellow.

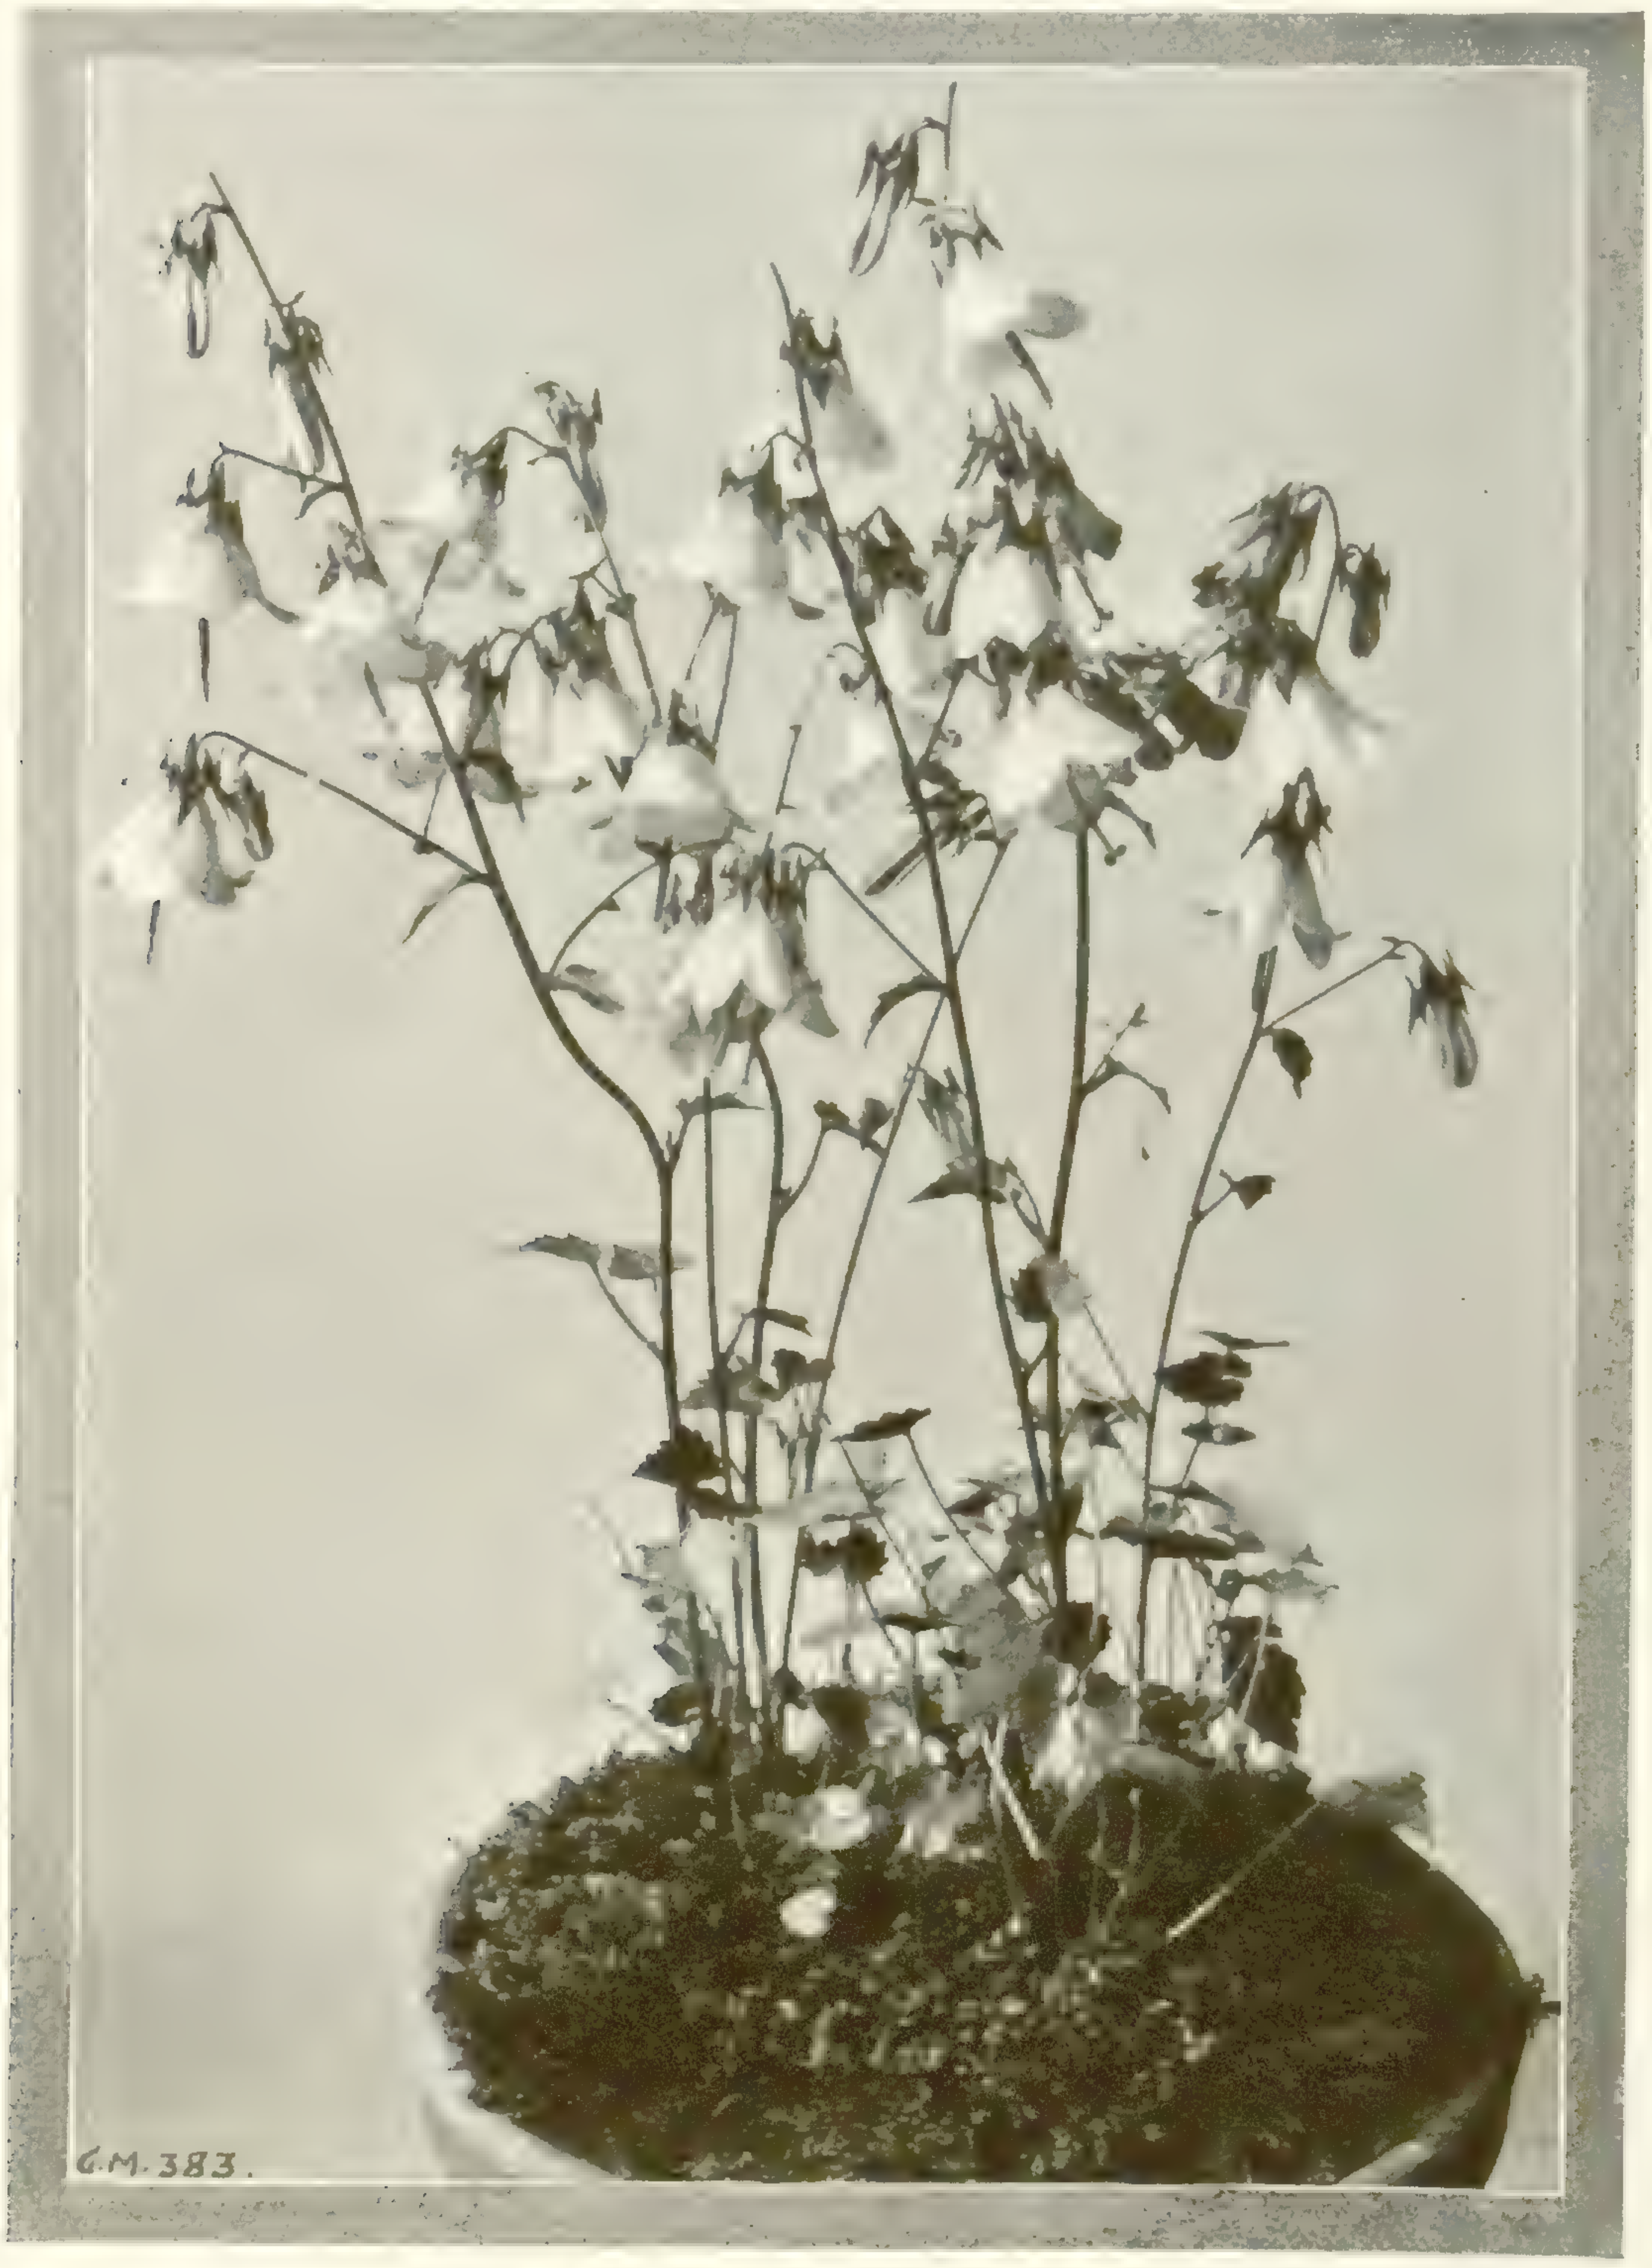
Iberis (candytuft) Empress, a grand variety with massive heads of pure white flowers, and Little Prince, also white, but a smaller grower. The comparatively new Rose Cardinal has but a few flowers left, but a month ago it showed that it was entitled to rank as one of the finest of the candytufts. Linaria Crimson and Gold, the colour of whose flowers is well expressed by the varietal name; Convolvulus minor, in its various shades, among which rich blue and purple predominate; Calendula officinalis (marigold), Orange King, whose colour is indicated by its name; and Meteor, pale yellow, striped with white; Godetia Sunset, one of the most brilliant of all the godetias, the colour being a kind of dazzling ruby crimson; Matricaria inodora plena, plentifully sprinkled with double white daisy-like flowers; Impatiens Holsti, a true perennial, but it may be treated as an annual. In the border its bright vermilion coloured flowers are very effective.

A very pretty but uncommon annual is Emilia flammea, a member of the vast composite family. It is a native of India, and is, I believe, largely grown in many tropical countries. In general appearance it somewhat resembles the double red hawkweed, the closely-packed heads of flowers being about three-quarters of an inch across, and bright scarlet in colour. Apart from these a great variety of annuals are scattered through the gardens disposed in various ways.

A very effective bed is one planted with the compact variety of the American Rose Vervain (Verbena aubletia compacta), which was given an award of merit by the Royal Horticultural Society last year. The bed in question is simply a mass of bright coloured flowers, whose tint is very difficult to define, being a kind of deep rose-magenta. K.

ALSTROMERIAS.

There are but few of our hardy plants that are more useful in the border or for supplying cut flowers than these, and the wonder is more of them are not grown where large quantities of flowers are required for decorative purposes during the hot weather in July, as they last such a long time when cut and put in water. Belonging, as they do, to the lily family, and having the clusters of flowers produced on the upper portion of the stems, make them very valuable for filling large vases. The well-known Alstromeria aurantiaca, or aurea, is a very handsome border plant, and when planted in bold masses is very showy during the latter part of the summer, and where the soil is of a rich, light, loose nature, the roots spread rapidly, and produce stems from three to four feet high, which, if not too overcrowded, grow stout enough to support themselves without any staking. When once established there is no difficulty in keeping up a stock, as the thick fleshy roots run in all directions.



CAMPANULA RADDEANA.
Received an Award of Merit at the Royal Horticultural Society's Meeting on June 23, 1908. Flowers violet-purple.

Where the soil is cold, and of a retentive nature, ample half-decayed leaf-soil and sand should be worked into it to make the whole as light and porous as possible. Should the situation be a wet one, sufficient drainage must be given to allow the water to pass away quickly, as stagnant moisture about the roots in winter would cause them to rot. Some cultivators have an idea that the alstromerias are not hardy, but I have never known the roots suffer in the least during the most severe winters. The white fleshy roots of strong plants are about the thickness of a lead pencil, and being very brittle, are, on that account, difficult to lift in their whole length, but every bit will grow and form a shoot, just the same as seakale and horseradish. In preparing the ground for these roots it is far better to remove a portion of the soil to the depth of three or four inches, then scatter the roots evenly over the surface, and afterwards return the soil that was removed, and cover with two or three inches of decayed manure. The result will be a thicket of young growths the following spring. There is a patch of A. aurantiaca in the garden here, and though it has been dug up several times, and the roots picked out, it comes up as strong as ever each spring, producing an abundance of its richly coloured flowers during the summer.

Though the alstromerias resent a wet position in winter, they require abundance of moisture during the growing season, and if well watered with liquid manure once or twice a week during hot weather the stems will be both stouter and longer, and the flowers larger and more abundant. Where the plants do well the roots are apt to become matted together. When this is the case a portion should be forked out in the winter, when those left will grow stronger and bloom more profusely. If the flowers are allowed to remain on the plants until they fade seed will be produced very freely, and as this will germinate readily when sown in the open ground there is no difficulty in working up a stock in this manner.

In cold, wet districts the soil about the roots should be covered in winter to the depth of three or four inches with half-decayed manure. This will not only exclude the frost, but will help to enrich the soil, so that the shoots will grow more robust in spring. When raising plants from seed scatter the seeds thinly over the surface, and cover the same with light soil to the depth of about two inches; these will form fine clumps in about two years, and though the flowers may vary somewhat in colour from the original, some being lighter, while others are darker, all are very beautiful. There are also several hybrids that are very pretty, but these do not grow with us like the old kind, requiring a warm, sheltered place, whereas A. aurantiaca will grow in the open borders without the least protection whatever, and so increase in size that it is necessary to dig some of the roots up to keep them within bounds.

No garden should be without a few good clumps, as their flowers are most useful at a time when flowers that last are by no means plentiful. If planted at any time during the winter after the foliage has died down, they will make good clumps in the course of the following summer and autumn.

H. C. Prinsep

CAMPANULA RADDEANA.

Among the many campanulas, or bell-flowers, now in cultivation there is surely ample variety even for the most devoted admirer of this indispensable and beautiful genus, which offers few plants not worth growing. Numerous as they are, however, each fresh introduction finds favour, and, provided it is distinct, makes its way into the best gardens. The latest recruit to the ranks of the campanulas introduced to the United Kingdom is Campanula Raddeana, shown at the meeting of the Royal Horticultural Society on June 23, when the Floral Committee gave the exhibitor, Mr. G. Reuthe, an Award of Merit for this campanula. The illustration gives an excellent idea of the plant exhibited, which was between nine and ten inches high, but which would probably have grown a little taller in the open bed or border.

This species was first described by Trautvetter, in the "Bulletin" of the Academy of St. Petersburgh, X. (1866), 395, from specimens from the Caucasus; the specimen illustrated was raised from seeds received from the Ural Mountains. C. Raddeana has small, crenated, oval leaves, and deep violet-purple blooms of drooping habit, and having the yellow pistil projecting beyond the corolla. As will be gathered from the illustration given herewith, this bellflower is of slender habit of growth, and should be a good ornament to the border or larger rockery. It is understood to be perfectly hardy, but has not been sufficiently tested in this country to enable one to speak regarding this with any certainty.

S. Arnott.

HARDY FLOWERS are always popular, as they make the garden bright and attractive, and require but little attention. All the information required for their successful culture is given in Easily Grown Hardy Perennials, by G. H. Vos. Price 5s. net, by post in box, 5s. 6d., from W. H. and L. Collingridge, 148 and 149, Aldersgate Street, London.

SPARROW CATCHING IN SUMMER.

However useful the common house sparrow may be within the confines of a town, where, it may safely be argued, he does some service as a scavenger, there can be no doubt that in rural districts his room is generally preferable to his company. In common with all other living creatures—man not excepted—the sparrow falls a ready victim to temptation directly it comes in his way, for which reason he has by degrees almost entirely forsaken that useful calling for which, no doubt, Nature in her wisdom intended him at the beginning. It is much more agreeable to the sparrow to take his meals comfortably and expeditiously at the gardeners' and farmers' expense, and to fill his crop two or three times a day with corn, than to work laboriously all day long to find a living among the grubs and insects of the garden and field, which require so much catching, and the same thing applies to the seeds which the gardener has sown with so much care, and to the peas in the pod which he has spent so much time in bringing to perfection. The sparrow's first object in life is to provide himself with daily sustenance with the least possible trouble, and here, perhaps, although we must admit that this is a sign of his depravity, he is a little human in his habits; but his degeneration from a once useful position does not end here.

There is, one regrets to say, a marked streak of devilment in his composition, and he finds an outlet for it in a hundred different ways. The proverb which asserts that "Satan finds some mischief still for idle hands to do" might equally well be applied to the sparrow's beak, which is mischievously employed at most seasons of the year in committing damage of one kind or another. In the winter he is perpetually at work among the buds of the fruit trees, and other birds frequently get a large share of the blame which, in this direction, should be laid to the sparrow's charge, and in the spring and summer he is frequently to be observed nipping off the heads of crocuses, primroses, and other flowers. That he is actuated chiefly, if not entirely, by mischievous instincts in so doing, seems to be beyond a shadow of doubt, for, like the rat, the sparrow destroys five times as much as he actually devours, and it is for this reason, even more than on account of his appetite, that the bird has come to be regarded by the majority of mankind as a pest of the worst description.

If it were not for the fact that the sparrow's habits of life make it possible to attack him in a variety of different ways, the scourge of his presence in every part of the kingdom would become intolerable, and it could only be a question of time before certain branches of the farmers' and gardeners' calling were brought to naught. As it is, however, it is possible by waging perpetual warfare upon him, to keep the sparrows' numbers from increasing at their natural rate, although there can be no doubt that in some parts of the country specially suited to him the bird will quickly get the upper hand directly the measures taken for his suppression are in any way relaxed.

A widespread impression still obtains that the only time to catch sparrows in quantity is the winter, but this is a great mistake. By all means let as many be destroyed by nets, shooting, and trapping in various ways during the cold weather, when the birds are more gregarious in their habits, besides being more tame, and, therefore, more easily caught, but it should be remembered that old birds are not so easily caught as young ones, and if the latter can be taken before they grow up a very considerable saving of damage must necessarily be made. The taking of eggs or young birds from the nest is, of course, a most useful proceeding, but to be of real value the operation must be carried out systematically, at regular and frequent intervals. It is also worth remembering that sparrows do least harm when they are occupied in rearing a family. The food which they require for their brood is insectivorous, and although, no doubt, useful, as well as injurious insects find their way into the throats of the nestlings, one may take it that more good than harm is done by a pair of sparrows while they are bringing up a brood of young ones.

But, however careful one may be to destroy all the nests that can be discovered, there will be several that will hatch off successfully, and the real opportunity for reducing the numbers of the birds arises when the young ones have left the nest. For every brood that has been destroyed in the egg or nestling stage there will probably be half a dozen that have managed to evade capture, but these birds may be taken after they have left the nest with even less trouble and waste of time than they could have been before. It is practically impossible to take the old ones at this season, but the young ones are easily caught before they understand the danger of a trap, and when their sole object in life is to satisfy an ever-ready appetite.

PERGOLA AND BOWLING GREENS AT RUSKIN PARK.

For taking young sparrows during the summer there is nothing to equal the cage trap constructed on the self-acting principle. There are various patterns of these, but the best known and most effective are those known respectively as Newton's wire sparrow trap and Gilbertson and Page's basket trap. These should be set (for it is a good plan to have one of each pattern) in any open space where the young birds are likely to find the food placed within them. A little corn or meal, mixed to a crumbly state with water, should be used as bait, some being sprinkled about outside and near the entrance to the traps as well as within. The traps require no attention beyond baiting and the periodical removal of the birds, but it is a good plan not to leave them too long in one position. The captives should be taken away and killed somewhere out of sight, and if one or two are left in the trap as a decoy the efficiency of the contrivance is much increased.

East Sussex.

THE FANCY PELARGONIUM.

The somewhat delicate constitution of this old-time section of pelargoniums militates against its popularity, but at the same time it is gratifying to know that the section is represented in most gardens, and oftentimes in the shape of a collection. It would be idle to say the plants are very showy; in fact, they sink into insignificance when compared with other types, but points in their favour are that the whole character of the plants is ornamental, that they bloom over a very long period, and, further, that shades of colour are found in them that are utterly unknown among other kinds, the intermingling of which, in some instances, is exquisite.

Until recent years fancy pelargoniums were grown in the temperate house, the cool conditions which prevail in the ordinary greenhouse not being thought suitable, but, like many another plant that has been misjudged, they luxuriate in the last-named structure. It will be found that they thrive infinitely better in comparatively small pots, than when given an unrestricted root run, and, provided liberal supplies of liquid manure are given, they will bloom abundantly in a potbound condition.

The best time to repot is at the end of August or very early in September, and a good deal of the old compost should be removed. As regards compost, a quantity, nearly one-third, of short, well-decayed manure may be added to turfy loam, together with powdered charcoal and coarse sand. A thorough syringing morning and evening, given until the plants are re-established, is distinctly beneficial. This opportunity should be taken to remove or shorten growths that tend to destroy the symmetry of the plants, and nothing further beyond this is necessary; but subsequently, as new growths are made, they should be pinched from time to time in order to maintain a bushy compact habit. These pelargoniums enjoy almost entire immunity from insect pests, and it may be pointed out that cuttings struck in early spring, and potted on as they require it, form valuable material for winter blooming. They may be kept in a cold frame during summer, with abundance of ventilation, and, when housed in October, a warm position, free from draughts, together with the soil being maintained in a moist condition only, will ensure a continuous display throughout the dull season.

A few beautiful varieties are Princess Teck, Roi des Fantasies, Mrs. Alfred Wigan, Delicatum, and Princess Helena. I commend the cultivation of these unique plants to amateurs generally.

Walter H. Aggett.

FLOWERS IN THE LONDON PARKS.

At the present moment all the London parks are gay with flowers, and each and every one of them contributes very largely to the pleasure of Londoners, and the many country cousins and foreign friends now in the great Metropolis. How valuable our great public parks and gardens are no one can really tell, but the air space they afford, the restfulness they provide, and the beauty and pleasure they dispense, make up a sum total of usefulness that far outweighs the cost of their upkeep.

Of Hampton Court, which is scarcely a London park, we have already spoken. In Regent's Park there is a fine display of flowers of many kinds, and the great attractions are the huge vases of plants, the sub-tropical beds, and the splendid specimen and other fuchsias. Concerning Hyde Park we have little to say, not because there is any lack of summer beauty there, but because Mr. Gardiner, like the late Mr. C. Jordan, is a past master in the art of decorating a big park, and from Hyde Park Corner to the Marble Arch there is a continuity of splendid beds, and a whole series of floral surprises.

Battersea Park is always a favourite one with us. It has a spaciousness that appeals strongly to every visitor, and its summer displays are varied, distinct, and widely separated. Last season we gave special prominence to the sub-tropical effects and the bolder beds of summer flowers, and now we draw attention to the sunken flower garden near the Bridge Road entrance. This garden is known as the Bull Ring, and it probably has a historical association with the ancient, but not very pleasant, pastime of bull baiting. Be that as it may, there are nothing but pleasant associations with the Bull Ring now, and the beds of flowers here grouped form not the least of the many distinct and beautiful features of summer gardening at Battersea.

At Brockwell Park the various notable features are widely spread, and one of these differs very materially from any feature we have seen throughout the London parks. This is the Shakespeare Garden, and it is arranged within walls, and has radiating straight walks that pass between ample beds and borders, in which are planted examples of every kind of plant and flower and tree mentioned in Shakespeare's works. The association is a pleasing and vastly interesting one. Here is a memorial to our great national poet and writer, and one about which little fuss is made. A teacher, or parent, or friend, with a small party of lads and lassies, and a copy of Canon Ellacombe's "Plant Lore of Shakespeare," would certainly be able to spend a most interesting and instructive half-day in this novel garden at Brockwell Park.

THE SHAKESPEARE GARDEN AT BROCKWELL PARK.

Ruskin Park is one of the smaller spaces, and it is quite juvenile, as compared with the better-known parks. But it is a charming spot, with ample room for games, a splendid old avenue down its centre, beautiful bowling greens, and fine herbaceous borders, a rhododendron and azalea garden, and a very large and substantial pergola that is now being fast taken possession of by the varied climbers planted against it. Ruskin Park should not be excluded from a list of London Parks to be visited.

C.

THE COLOURS OF ROSES.

To the inexperienced gardener a pink rose is but a pink one, a yellow but a yellow, a crimson either light or dark crimson, but directly rose culture is taken up with enthusiasm the grower begins to discern what immense differences there are even in the hues of varieties all described as pink, or red. A familiar example is easy to suggest; compare the bluish-pink of La France with the shell pink of Captain Christy, and it will be at once seen that the latter is a far more delicate shade; I have found it a rose that actually looks well upon a red-brick wall—in its climbing form, of course—whereas La France is utterly spoilt in colour by juxtaposition with red brick. A bed of roses made of alternate standard Captain Christy and bush William Allen Richardson has quite a novel and pleasing colour [illegible], whereas standards of La France [illegible] used would be inartistic, the best accompanying dwarfs being white roses, Frau Karl Druschki, for instance, or rich crimson ones such as Alfred Colomb or Captain Hayward.

THE BULL RING FLOWER GARDEN AT BATTERSEA PARK.

Apricot roses are well shown up by white, or blue flowers massed beneath, behind, or beside them; one of the best rose beds I ever saw was made of bushes of Madame Falcot with a carpet of Royal Blue lobelia. Taller, more robust apricot-orange roses, William Allen Richardson for example, could bear being carpeted with Phacelia campanularia or dwarf cornflowers, while standards would look handsome with tall cornflowers beneath them. White violas as a carpet to a border which contains many climbing W. A. Richardson roses always ensures an admirable show in front of a red brick wall, but where similar roses climbed a stone wall I would use either one of the blue annuals described, or else a blue viola or pansy such as Kaiser Wilhelm.

Cherry coloured roses demand white or pale lemon associates, yet one bed of them carpeted by the lavender-blue viola Blue Gown will give an original and pretty display, some blue asters, or ageratum being added in the centre spaces if the trees are standards. Lemon Iceland poppies are lovely among strong growing bushes of Helen Keller, and these poppies do no harm to roses of even less robust nature; orange Iceland poppies with white roses constitute a gorgeous feature in more than one garden known to me, while white Iceland poppies may be used to advantage with all the deep rose, carmine, or maroon roses as well as with more delicate pink shades, apricot, and yellow.

The shades of tea roses vary in most bewildering ways, for while Sunset is described as apricot its hue is so much duller than William Allen Richardson or Saffrano that it is killed by contrast with these. Sappho is an excellent rose to grow with Sunset, or Sunrise may be chosen. Again, a rose of mingled hues such as Madame Cusin is easily spoilt by its neighbours; the petal ground is a bluish-shaded dull rose, paling off through yellow to white in the centre, and any ordinary pink or crimson rose destroys its peculiar beauty. The rose L'Ideal in a bed of other red roses is utterly out of place, since they will not show its marvellous orange-vermilion flushings, yet it is one of our loveliest varieties.

Reine Marie Henriette is commonly catalogued as "crimson," but its hue is unlike any other crimson rose, I believe; the peculiar cerise-rose of its flowers, especially the half-opened ones, makes it one of the first rose varieties that the amateur can distinguish anywhere. Nothing suits it so well as cream or primrose close by, and though there are violas of the tint I annually sow the hardy little "cream cups," or Platystemon californicum over the surrounding soil. This is an annual with grey-green foliage, of spreading or almost trailing habit, that thrives in dry soil and full sunshine.

No description can do justice to the hues of some roses, yet I think catalogues might be more intelligently worded for the benefit of buyers who are ignorant of the roses named, and I would suggest that extra care should be taken in efficiently describing such new roses as are winners of honours each year, and are therefore destined to play important parts in rose history.

M. H.

POTATO NOTES.

◆

Potato Disease and Lifting and Storing Crop.

After a period of such excessive heat, as we have experienced this season, the ground will stand at a higher temperature than usual, and should a period of cool, wet weather follow for any length of time the humidity therefrom will be conducive to the spreading of the spores of the potato disease, more especially on strong, low-lying lands. These positions appear peculiarly favourable for attack, and the whole crop is often seriously affected in a surprisingly short time by this most damaging, and often ruinous disease. The spraying system that is now largely carried out, as far as my experience goes, is only partly successful in combating it. It certainly will materially check the progress of the disease, and prevent it taking such an active course as when spraying is not adopted, and as a prevention of virulent attacks I am convinced that it is quite worth the time and expense in applying it.

Where there are any signs, even of the slightest, of the crop being affected with disease, and the tubers are fairly matured, lose no time in having the parts marked out, and the haulms cut and removed from the quarters and burnt, to avoid, as far as possible, further contamination. Lift the affected parts of the quarter first, pick out the damaged tubers, and store the sound ones by themselves, to be used first.

This will principally apply to the early and second early supplies; the late ones will not be sufficiently forward for lifting yet. They are only just developing their tubers, and a great waste will result in taking them up before they have completed their growth. In all cases where disease has attacked the plants very little indeed is gained in leaving them to fall prey to further attack. In the case of seed potatoes it is best to have well-ripened and matured sets, and they must have time in the ground for this to take place, but for eating purposes one often sees crops that would be very much better lifted and stored than remaining in the soil until the autumn rains have had an opportunity of unfavourably influencing them.

Providing ordinary care is used in the taking up and storing of potatoes in not bruising their skins unduly, there are several advantages in removing them from the soil when once they have completed their growth. The site, if necessary, can be used for another crop, the weather is invariably better and drier, and the work be more readily carried out. The tubers of Snowdrop that were lifted as soon as they had reached their normal size, and the skins had set firm enough, kept better and were of higher quality than those lifted later. Scottish Triumph, the best of all winter potatoes, in my opinion, for table quality, on most soils, gave very similar results, but not to the same extent. This variety seems, at any rate in this part of the country, to be a first-rate keeper. In fact, my employers prefer it at the beginning of the year to the new forced ones. The variety Duchess of Cornwall appeared last year to be a good disease-resisting variety, probably a little too large and coarse for a gentleman's table on some land, yet it is a very useful potato, and will be more extensively cultivated when better known, both for its cropping and keeping qualities.

Those who have a suitable potato house in which to store the tubers find it very useful and handy, as on spare days the tubers may be easily examined and all diseased ones promptly removed. Potatoes do not keep specially well in these places, and should the atmosphere be too dry, or charged with an excess of moisture, they become more or less unsatisfactory. A moderately cool, light building, with a good layer of material over the tubers, is the best. Given sound tubers, and they are stored dry, there is no better plan of keeping potatoes than the old method of clamping.

The principal points in clamping are to choose a dry situation, and to give an ample covering of straw, which is a good non-conductor. Keep the sides of the clamp fairly sharp, and finish off the covering of soil in a manner that the rains cannot enter it. This can be done by firmly patting the sides when the soil is sufficiently moist to prevent it adhering to the spade.

In a gentleman's garden possibly the better plan is to store the earliest crops in the potato house, so that the daily supplies may be easily obtained from store, and to clamp the late crops to draw from during the winter, after the first crops have been exhausted. Examination will be necessary from time to time to remove decayed tubers, should decay set in. Even experts are sometimes deceived in finding unexpected decay when apparently the tubers were stored in a sound state, and if not quickly looked to great loss is experienced. In cases of the tubers wintering too moist, a slight dusting of quicklime is effectual in putting them right if applied early. C. Flack.

PUTTING GREENS.

In most establishments of any size it falls to the lot of the head gardener to be responsible for the mowing and general attendance of the cricket ground, tennis lawn, bowling green, and croquet lawn. In many very large establishments the mowing is a very big business. At one of my early situations there were two 48-inch machines required all the summer, besides the hand machines that were used amongst the flower beds; and in two others we had always one 48-inch mower in use as well as smaller ones.

Nowadays more ground can be got over with the wheel machines, but I prefer a heavy English-made mower with rollers which compress the grass and make the lawn so firm. In the time of mowing with scythes, before the art of lawn mowing with that implement was lost, it was always noticed that the more a lawn was rolled with a heavy iron or stone roller the better it looked. I do not know the reason, but a very nice lawn, well mown, is always admired; but it must be borne in mind these grand old lawns are not kept in a high state of perfection without a considerable deal of expense, for grass, like any other crop, wants assistance, and if it is mown regularly and the grass carted away and nothing returned to it the end of it is a yellow-looking, impoverished lawn, perhaps full of weeds, which put an indelible stamp of poverty on the place. My real object, however, is to draw attention to another kind of lawn that comes within the province of the gardener's duties in certain cases, i.e., putting greens on golf links. Though a very ancient game, the game of golf has latterly eclipsed to a great extent lawn tennis, croquet, and bowls, and, of course, most people are drawn into the vortex of anything that is popular.

In our case we were rather inconveniently situated with regard to the accessibility of golf links, to the S.E. it is four miles to the nearest green of a popular club, westward it is 3½ miles to another, and nothward nearly five miles to another. That being the case it was decided to form a new local club, and ground was secured so that the nearest green is just within a mile from us. My employer, who takes a great interest in golf, and is a member of several very large clubs in different parts of the country, was elected first president of the newly-formed club, and on June 24, 1906, we took possession of the ground, which is very hilly, but situated amidst beautiful scenery. I was consulted about forming the greens, and I viewed the site several times, and at last we decided where to make the greens for a nine hole course, as I found we could not emulate Southport, Lytham, St. Anne's, and other places, and have an eighteen hole course, as our boundary was only about one mile in length and about a quarter of a mile wide.

The ground being of an uneven, hilly nature quite different to the ground depicted in the "G. M." of December 21, 1907, to illustrate the excellent article on the "Game of Golf," by C. E. Shea, Esq., I had to inquire what was the very smallest putting green that it would be practicable to play on. I found that thirty feet each side of a square was the minimum, so when a peg was driven into the centre of the proposed site it was measured off fifteen feet from it. I then calculated each site of the nine proposed greens seriatim, as to the probable cost of levelling, and then invited tenders from local jobbing and landscape gardeners for the work, and I found my estimate was very close to all theirs. We had three tenders, and when one was accepted the work was at once commenced. The rough turf was taken off, the site levelled, and in four or five cases drained, and the best turf that could be found was laid level for each green. This work occupied most of the autumn of 1906, and in the winter the greens were left to settle and consolidate. On March 25, 1907, we appointed a very useful practical man, who for several years had worked on a farm, as groundsman, and, under instructions, he commenced at once to put the roughly levelled greens in order. We fitted him up with all sorts of necessary implements for the purpose, and by dint of great perseverance he made the greens ready for a good covering of renovating grass seeds by the end of April. We chose a mixture prepared for golf putting greens, and sowed it on the turf very thickly and covered it over lightly with fine soil, and the result was a very green and luxuriant square of grass in the centre of a comparative waste.

Since then, as time and circumstances have permitted, the greens have been enlarged and avenues or wide paths mown and cleared from one green to another.

The game of golf differs from most games as it is played all the year round, and this fact makes it necessary that the greens should be firm and clean in wintry, wet weather. This is best effected by having each green well-drained so that water does not stand on it.

Of course one feature of the new links was the erection of a pavilion of the usual style for such a purpose, and round that we have planted a great variety of flowering trees and shrubs, and on the verandahs we have trained various climbing plants. Between the greens, in suitable places, we have planted several beds of flowering bulbs, in grass, and from a horticultural point of view we have tried to make the links as interesting as possible. The "G. M." is not a paper in which to discuss the game of golf, that is, how or by whom it should be played, but the greens and the arboricultural details are within its province, and if I have firstly broken the ice perhaps some very experienced golfers will send a few notes on the horticultural embellishment of golf links which will add one more subject of great interest to the very wide field of horticultural subjects the "Gardeners' Magazine" already embraces, and so very ably treats upon.

Perhaps the most interesting part of the whole business is the best method of preserving the putting greens in the highest state of perfection for regular use. This resolves itself into which is the best kind of grass seed tc sow, and also the best kinds of manures to use. Naturally, golf greens cannot be covered with rotten manure at any season of the year, as it would impede the players, so artificial manures seem most appropriate, as they are clean. The name of such manures is legion. At present we have only applied top-dressings of bone-meal.

I found a very considerable diversity of opinion existed amongst the gentlemen who constituted the first committee of management as to how often the putting greens should be mown. Some recommended twice a week, which, perhaps, in showery, warm weather is not too often, but we have found, speaking generally, once a week sufficient, as it is not so necessary for the game of golf to have the grass so very short as in the game of bowls on a well-kept bowling green. If the grass is allowed to grow a little more natural, it is a decided advantage, as very close mowing takes the centre out of every little grass plant, and it has no chance to grow and look green. Many people do not think that turf is really an assemblage of grass plants growing very closely together.

Cheshire.

BEETLE REVELATIONS.

(Concluded from page 365.)

◆

Blue Beetle.

Horseradish, as well as mustard and cress, are occasionally subject to the direful attacks of a small oval beetle of a highly polished blue, or blue-green lustre, about one-sixth of an inch long, which is hemispherical, like a ladybird. Its grub is dirty white, and covered with black, regularly placed swellings and hairs. They both feed on the leaves of the plants, and while not so prominently destructive as some of the other beetles here described must be reckoned with. The beetles hibernate through the winter, and at first feed on wild growths, but a second generation of them appears when summer has well advanced, and these give attention chiefly to cultivated vegetation. About the only effectual remedies are to pull up infested plants and either burn them or bury them very deeply in the soil. Dressings may sometimes be advisable, but are, as a rule, of little consequence.

General Remarks.

As in battle it is considered excusable to praise the good points of an enemy, so we may glance at some of the more striking characters in structure of these unconscious antagonists.

The most noticeable feature of the beet beetle is the comparatively small size of its head in contrast to the bulkiness of the rounded body.

When magnified there is no fear of mistaking the clay-coloured weevil for a bit of earth. Its whole body is densely clothed with tubercles, pits, scales, and hairs symmetrically arranged. These sparkle in a good light like jewels, and almost serve to compensate, through inspection, for the artfulness of the creature's ways.

Parallel lines, pits, and an abundance of neatly upstanding stiff bristles are the conspicuous property of the pea and bean weevil.

What shows as eight yellow dots on the surface of the asparagus beetle when viewed from above are really continuations of pale stripes which border its sides, so that when it is seen sideways, instead of appearing dark with light spots, it stands as a yellow specimen with dark spots.

Although the cabbage gall weevil is so small it is covered with very pretty rows of scales. Its oddest property is the long snout, resembling an elephant's trunk, but having no analogy with that sort of organ. It is really a long throat, and at its free end bears the jaws. Food has to pass along the whole length of this tube before it can be consumed. The antennæ project from its middle instead of from the insect's forehead. The side view given explains how grotesquely this snout-throat looks when inspected sideways.

The blue beetle, although to the naked eye it is apparently merely a hard polished surface, reveals tiny punctures placed along a series of grooves down the wing cases.

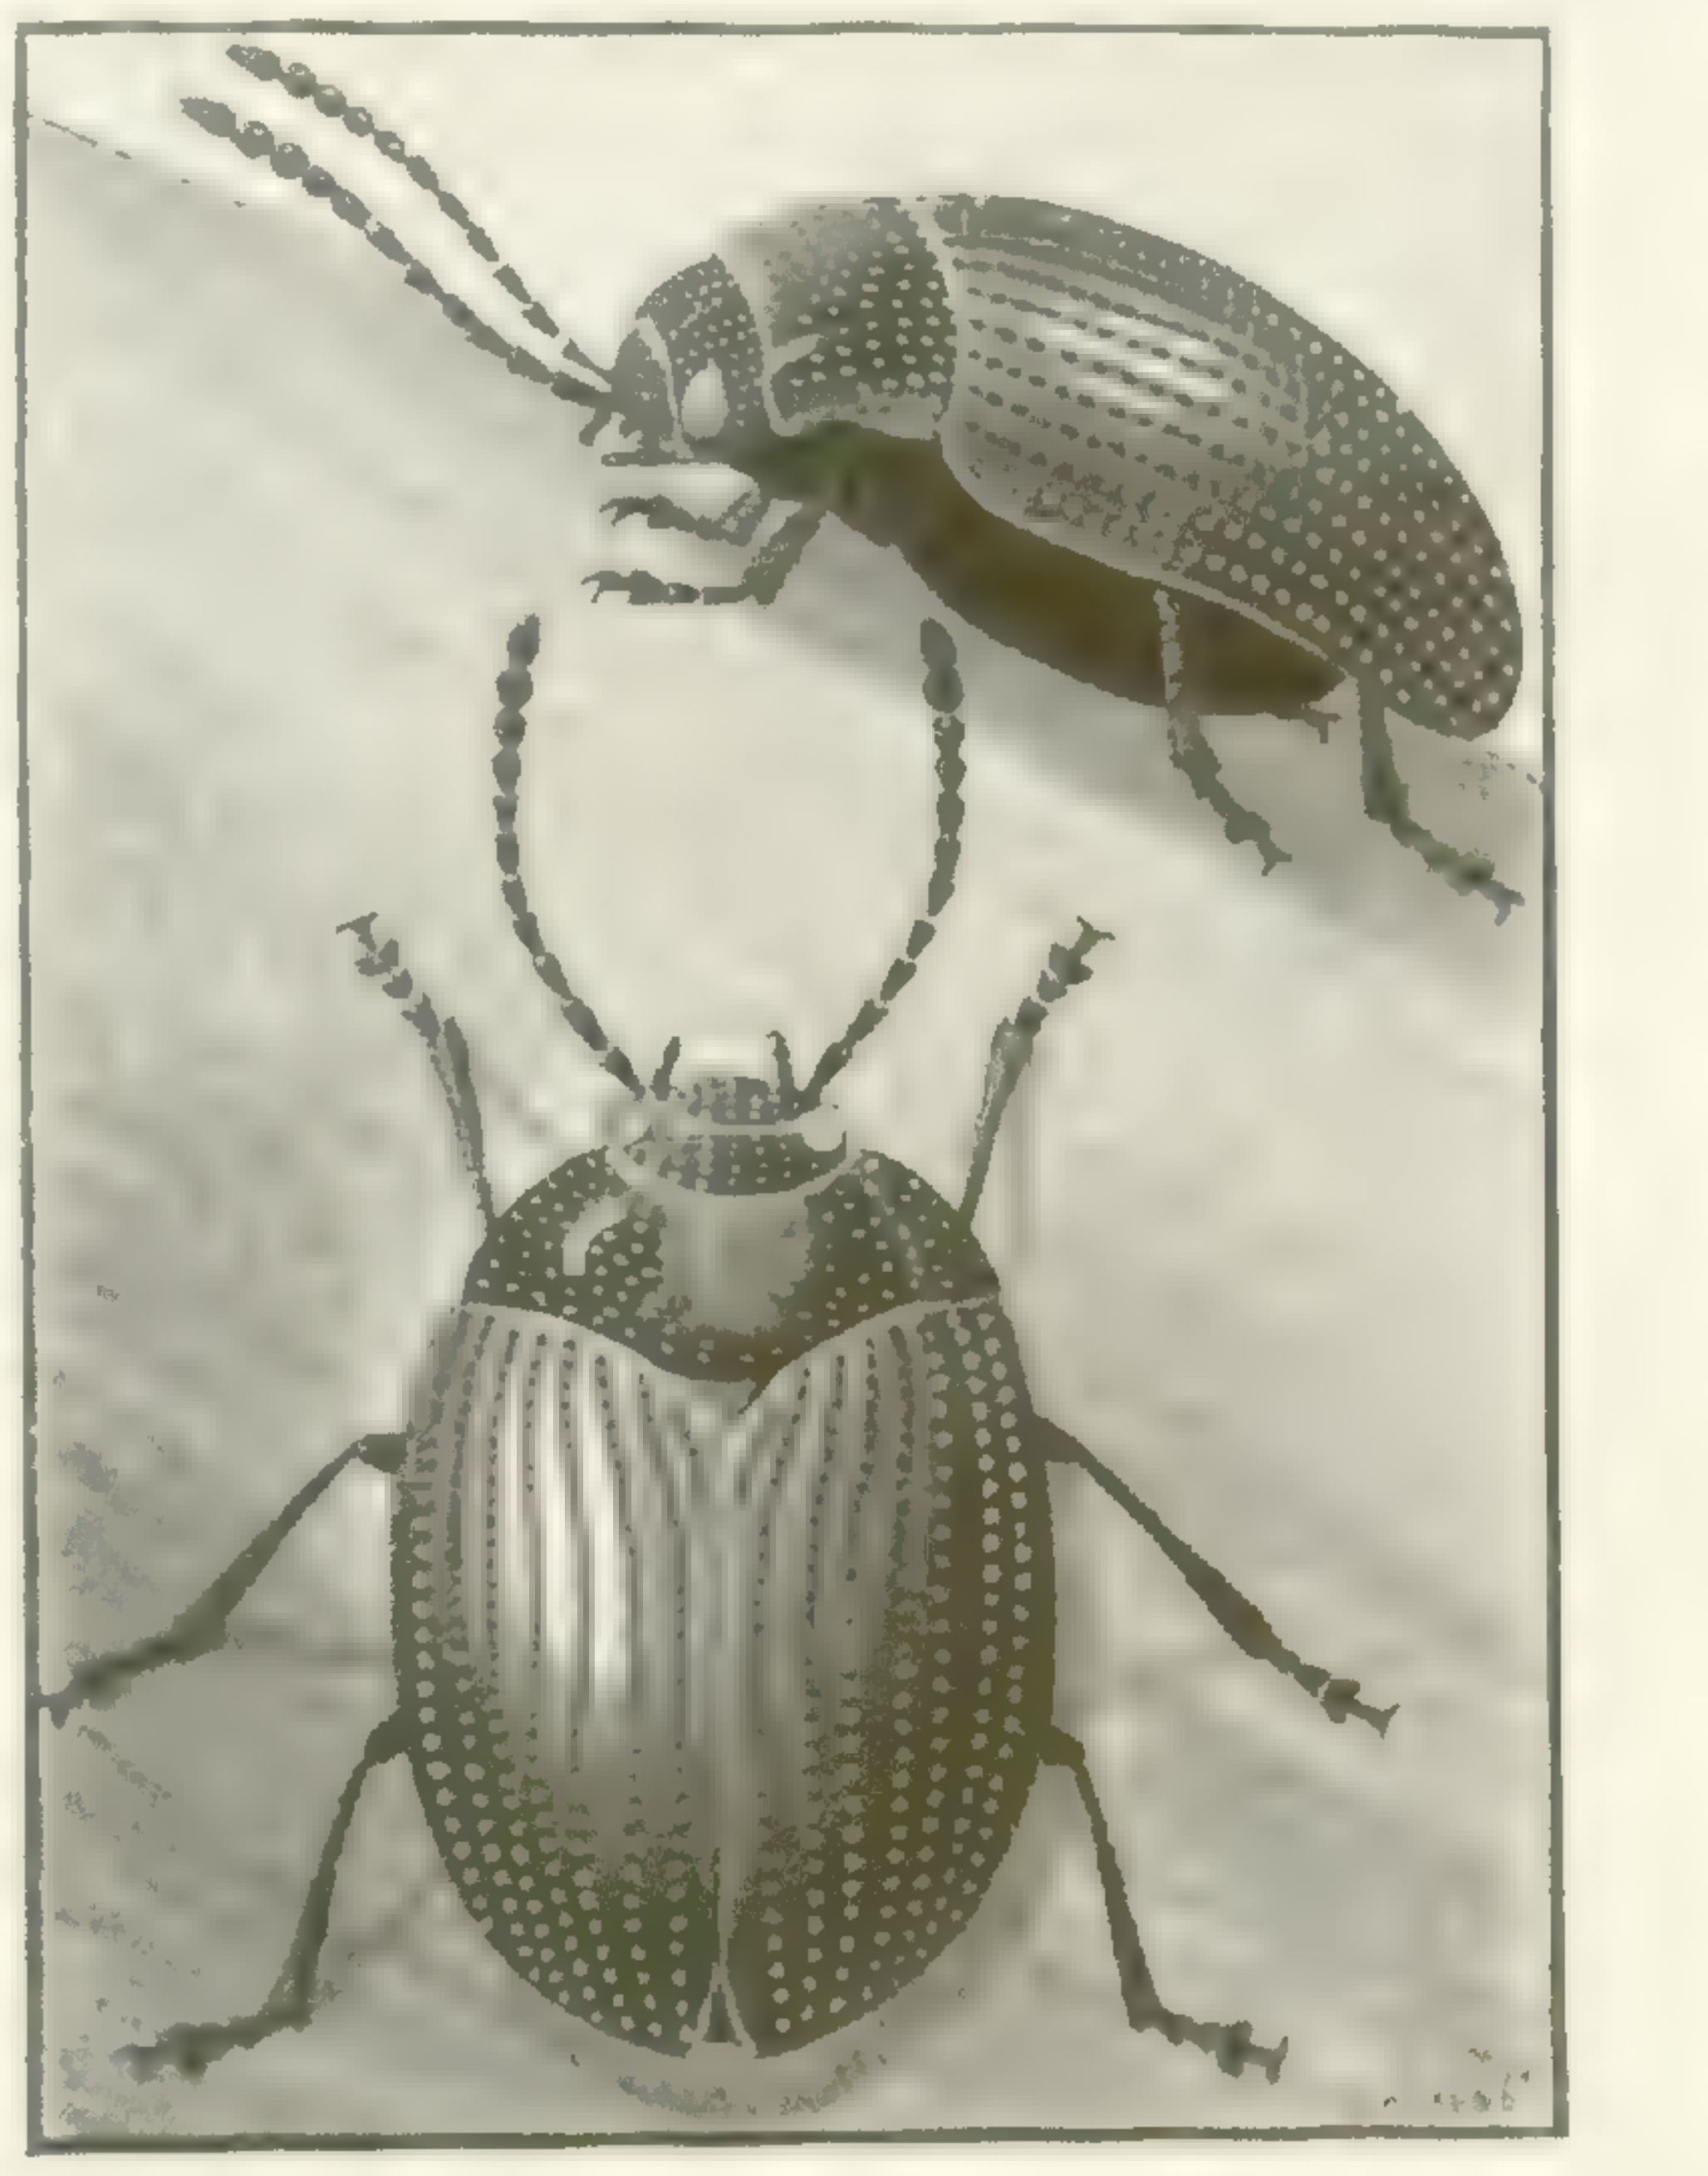
Were the gardener to make a more intimate association with his pests, he would not only be greatly attracted by their quaint beauty, but his observations would tend to strengthen his memory concerning them, and render recognition far easier than is now sometimes the case.

James Scott.

ÆSCULUS CALIFORNICA.

This, the Californian horse chestnut, is a tree of considerable interest, being distinct in habit and general appearance from other species of Æsculus. Although it has been known for upwards of 50 years, and flowering examples were reported as occurring in Messrs. Veitch's nursery in 1858, it never appears to have been widely planted, and is still a rare tree. Under cultivation it forms a low tree with a wide spreading head, whilst Californian grown examples are stated to "rarely exceed 20ft. in height." The branches are strong and rather unwieldy in appearance, and are clothed with five parted leaves, the leaflets being 3 to 4in. long and 1 to 1½in. wide, with serrated margins. On the upper surface they are quite glabrous, whilst on the under side they are slightly pubescent.

The flowers are white and borne in dense terminal panicles, a succession of blossoms being kept up for several weeks. A peculiarity of the inflorescence is the fact of the terminal flower opening in advance of any others, and it is no uncommon thing for the fruit of the terminal flower to be well advanced before the majority of the blooms expand. Like other chestnuts it thrives in ordinary garden soil. Many chestnuts will stand hard pruning to throw height into the trunk whilst young, but in the case of the tree under notice it is inadvisable to prune severely, but rather let the head develop early in life.



THE BLUE BEETLE.
Both insects much enlarged.

Kew. W. Dallimore.

Notes on Hardy Annuals.—Hardy annuals are extremely beautiful and useful additions to the flower garden, and are always in great request for cut flowers, for these reasons every effort should be made to prolong their season of usefulness. Sowing at intervals will give an extended season of bloom, yet where it is only practicable to make a single sowing an enormous difference is seen if the plants are frequently attended to, and all faded flowers and seed pods removed. By this means the strength of the plants is concentrated upon developing the flowers, consequently there are more of them, and finer blooms are produced. Frequently annuals are allowed to develop their growth haphazard, but if some small pieces of brushwood are inserted among them before they close in on each other, the danger from windbreaks is lessened, and they present at all times a neater appearance.—Thomas Smith, Walmsgate Gardens.

WORK FOR THE WEEK.

◆

THE ORCHID HOUSES.

LATE SUMMER-FLOWERING CYPRIPEDIUMS.—The different species and hybrids that may be included under this heading are not so popular with orchid growers as the winter-flowering sections, but they are none the less beautiful, and are exceedingly useful for decorations and for exhibition in the autumn. Their durability is most remarkable, and the flowers are exceedingly useful when cut. The hybrids derived from C. Rothschildianum as one of their parents are particularly worthy of attention, and I would specially mention the different varieties of C. W. R. Lee. These are undoubtedly some of the most free-flowering specimen plants, they bloom with us annually, and produce from four to six flowers on the scape. The hybrids produced from the influence of C. philippinense, such as C. Youngianum superbum, C. Bryan, C. Warnhamsense, and others, also possess free-flowering characteristics, and, as they bloom at a period when there is but few orchids in flower, they are worthy of every consideration. All the forms belonging to this section thrive in a warm intermediate or stove house temperature, and require ample moisture both at the roots and in the atmosphere at all seasons of the year.

REPOTTING REQUIREMENTS are best attended to when the young roots are in an active state, or immediately after flowering, say, about the end of the present month. Annual repotting is not desirable, as the plants more or less resent being disturbed, so that unless the compost is passing into an advanced stage of decay, or the plants have outgrown their pots, they should be left undisturbed. Where repotting is necessary, select pots of ample size to accommodate the plants for at least two seasons. See that the drainage used is clean, and sufficient to fill the pots to nearly one-third their depth. The compost selected should be of a durable nature, with a view to its keeping in good condition for two or three seasons. We find a compost consisting of fibrous brown peat, turfy loam, and chopped sphagnum moss a suitable mixture for these plants, sufficient sand and broken crocks being added to render the compost porous. Make the compost firm about the roots when repotting.

PROPAGATION.—Increase of stock must have attention where there are a number of back growths on the plants that have flowered. In my opinion such growths after root action has ceased are more of a burden than assistance to the plants, and it is seldom they are induced to break into new growth unless the rhizome connecting the growths has been severed. It is a good plan to cut between the growths with a sharp knife a few weeks before the plants are repotted, it will then be found that, in many cases, such separated growths will be emitting breaks from their base at the time of repotting, so that where a larger specimen is desired they may be placed again in the pot with the other portions, or where it is desirable to increase the stock they may be potted up separately. Young growths produced in that way, from this particular section of cypripediums, usually take two seasons to produce growths sufficiently matured to flower. Divided plants should be kept in a warm, moist atmosphere.—H. J. Chapman, Oakwood Gardens.

STOVE PLANTS.

ACHIMENES.—As the earliest batch of achimenes pass out of bloom they ought to be brought to a state of rest by a gradual reduction of water to their roots, and then placed in a position where they will be exposed to the light, with a free circulation of air. As soon as the foliage has become thoroughly ripened, and the roots decayed, the corms may be removed and stored away in dry sand, where they may remain until required again for starting into growth.

ACALYPHAS.—Examples of this useful foliage subject which have lost their leaves at the base, may now be notched and mossed around the stems, and if kept in a brisk temperature, with a moist atmosphere, the tops will quickly form roots, after which they may be taken off and potted up. If kept growing throughout the autumn they will form serviceable stock for the new year. The stems may afterwards be cut into lengths and placed in the propagating pit, where they will soon start into growth again.

BOUGAINVILLEAS that have been flowering in a cool conservatory for a considerable time may, as soon as they have completed their flowering season, be hardened off outside. This practice thoroughly ripens the wood, and the plants, in consequence, are in a better condition for passing through the winter. Although I have observed little or no damage done in cases where bougainvilleas have been subjected to a few degrees of frost, I would recommend them to be stored in a greenhouse where the temperature does not fall below 45 degrees.

CALANTHES.—An application of diluted liquid manure will prove of great assistance to calanthes at this season, when the formation of the new bulbs is almost completed, and the soil has become somewhat impoverished. In cases which have come under my observation where this operation has been neglected the result has been premature ripening of the bulbs and weak flower spikes. As the leaves show signs of ripening the plants ought to be more fully exposed to sunlight.

EUPHORBIA JACQUINIFLORA.—Small plants, raised in accordance with previous directions, are now ready for their final shift into pots from four to five inches in diameter. Large specimens will require pots ranging from eight to nine inches in diameter. A suitable compost for this shift is good fibrous loam and peat in equal parts, with enough coarse sand and charcoal thoroughly incorporated to keep the soil porous. Pot firmly, and shade from the hot sun until the plants have recovered from the check received in repotting. As the season advances thoroughly expose to the light, and keep as near as possible to the glass.—JOHN DONOGHUE, Bardon Hill Gardens.

FRUITS UNDER GLASS.

EARLY POT VINES.—Those intended for early forcing should be well looked after in the matter of watering, and during the hot weather it is an advantage to have the pots plunged in ashes. Syringe them overhead twice a day in bright, dry weather. Liquid manure and soot water may be given.

LATE VINES.—Borders that are well-drained will soon become dry in hot weather, and they should have copious supplies of liquid manure and clear water. As soon as the berries begin to colour a little front air should be admitted during the night; and the ventilation be free through the day. Regulate the growing shoots, and stop before they attain a great length. Examine the bunches for seedless berries, and take out any that may be found. Lady Downes should have the leaves left over the bunches as much as possible, as the berries are liable to scald, especially if the sun shines fully upon them while they are damp in the morning. If the borders are outside they should be watered, and some long litter laid on the surface to check evaporation.

EARLY PEACHES AND NECTARINES.—During hot weather the trees will require an abundance of clear water and liquid manure. from neglect of watering many failures of peach growing occur. Shallow borders should be well mulched with long litter, and the trees be well syringed twice a day. Expose all the shoots to the sun, and if they become crowded with young shoots, a few of them should be thinned out.

PEACH DYMOND.—For a second early cropper this is difficult to surpass, being a free setter, good in colour, and richly flavoured. It will succeed either as a standard, dwarf, or pot tree. If the sun is very hot a slight shading of thin tiffany may be placed on the roof during the hottest part of the day. The fruits should be gathered early in the morning when they are cool.

PINEAPPLE NECTARINE.—This variety, under good cultivation, gives large fruits of good colour and flavour. In watering, this variety requires great care, and water should be withheld when the fruits are ripening, as they are liable to crack. The syringe should not be used freely when they commence to colour.

ORCHARD HOUSE.—Closely attend to watering and mulching, as any relaxation in watchfulness at this time of the year will have unsatisfactory results. Apricots are a good crop, and well repay being planted inside; these are best with a slight shade in hot weather, as the upper side of the fruit ripens before the under, and is liable to scald. These like plenty of moisture after the fruit is gathered. Pears are swelling up fast, and may be given liquid manure. Cherries that have finished growing will be developing up their buds, and should be well syringed and watered. Keep the borders loose on the surface by lightly forking it if it has not been mulched. Where the soil is getting green or stagnant from frequent waterings a little fresh lime may be dusted over them. A sharp look out must be kept for robins, as they soon spoil fruit, especially in dry weather.

MELONS IN FRAMES.—With flow and return hot-water pipes round the frame, good fruits will now be ripening off. A little air may be given at night to maintain a nice temperature. If the plants are strong and in good condition, liquid manure may be given to those swelling their fruits. This should be withheld as soon as they show signs of ripening, or they will crack. A little fresh lime should be placed round the stem of the plant to prevent injury from an excess of moisture. Shade a little in very hot weather. Melons grown in frames are, as a rule, better flavoured than in houses. They cannot be rushed, and consequently take more time to mature and obtain their proper flavour.—A. B. WADDS, Paddockhurst Gardens.

THE KITCHEN GARDEN.

WINTER SPINACH.—The time has now arrived when a good breadth of this most useful vegetable should be sown. If the seed is sown too early the plants develop so quickly that flower stems are likely to form. To obtain good succulent leaves the ground should be well prepared a considerable time beforehand. Sow the seeds in drills two inches deep and about eighteen inches apart, previously giving the drills a good watering if the soil is dry. When the young plants have made one or two leaves give a sprinkling of soot between the rows to prevent wireworm and slugs injuring them. The prickly spinach is one of the best varieties to sow for winter use. Last year I made sowings on south, east, and west borders, but the plants on the east border came through the winter the best.

TURNIPS.—To have a continuous supply throughout the winter it is necessary to make a good sowing at once on a piece of well-tilled ground. Choose such well-tried varieties as Orange Jelly and Chirk Castle, bearing in mind to thin out the seedlings early before they become drawn and weakly.

LETTUCE.—Make another good sowing to furnish plants for the winter's supply. There are a number of good varieties, but I prefer All the Year Round for this sowing; in fact, it is excellent for any season of the year.

FRENCH BEANS.—These are always appreciated whenever they can be obtained, and if some are picked now and placed in earthenware jars, with a little salt between each layer of beans, they will keep very well, and be most useful later on. Some seeds should be sown now in cold frames to come in after the outdoor crop is finished. Osborne's Prolific is suitable for sowing at this period.

RUNNER BEANS are giving excellent produce, and they may be helped by a supply of liquid manure once or twice a week. Later batches should be syringed in the evenings after hot days, which will assist them in setting the pods. Make the rows secure against strong gales by placing extra supports to them.

TOMATOES FOR WINTER.—Those recently potted may still remain out in the open, sheltered from strong winds, but with full exposure to the sun. Place a strong stake to each plant, and keep all sub-lateral growths pinched out.

OUTSIDE TOMATOES.—Plants that are growing at the foot of south walls may be assisted in swelling their fruits by giving them light applications of bonemeal, and occasionally liquid manure. Keep all useless growths cut out.

COLEWORTS.—These should be planted out without delay. If the weather is dry they may be put out towards evening, and be well watered in. Give them a distance of a foot each way.

ENDIVE.—The early batch of endive is coming on rapidly, and blanching must be commenced. If the plants are strong enough they can be tied up with matting, and the smaller heads can have empty flower pots placed over them. This is a good method, and especially later on, when frosty nights are expected.—T. W. BIRKINSHAW, Hatley Park Gardens, Sandy.

GOOSEBERRY "CLUSTER-CUP" DISEASE.

The disease known as Gooseberry "Cluster-Cups" (Puccinia Pringsheimiana, Kleb.) is one of those sporadic diseases which are present during certain seasons in considerable abundance, and then entirely disappears for years. This behaviour on the part of many parasitic fungi is at present inexplicable; there is no reason for suspecting climatic conditions to be the cause, and the requisite host plants are equally available every season.

Characteristics of Fungus.

The fungus forms bright orange patches on the leaves and fruit, the patches eventually being covered with minute cup-like bodies with white fringed edges and filled with orange-coloured spores.

It has been proved that other stages in the life-cycle of the gooseberry cluster-cup grow on living leaves of sedges (carex), appearing under the form of minute brown or blackish streaks resembling in general appearance wheat rust (Puccinia graminis, Pers.). The winter spores produced on sedge leaves infect gooseberry leaves and fruit, and give origin to the "cluster-cup" form of fruit. Although this is undoubtedly true in some instances, the fact that "cluster-cups" appear on gooseberry bushes growing in gardens far removed from the vicinity of sedges, suggests that under certain conditions the "cluster-cup" condition can directly reproduce itself without the intervention of another form of the fungus, as has been proved to be the case with other rusts.

Prevention and Remedy.

1.—The disease, says the Board of Agriculture, rarely assumes the proportions of an epidemic, and the most satisfactory method of arresting its spread is by collecting and burning infected leaves and fruit.

2.—Sedges growing in the vicinity of gooseberry bushes should be cut and burnt in the spring, before the winter form of the rust matures on the leaves.

GRAPES AND HOW TO GROW THEM.—An illustrated guide to propagation, culture, and management in vineries, greenhouses, and in the open air. By J. Landell, F.R.H.S. Price 1s. net, by post 1s. 2d.; cloth, 1s. 6d., by post 1s. 8d., from W. H. and L. Collingridge, 148 and 149, Aldersgate Street, London.

DERBYSHIRE AGRICULTURAL AND HORTICULTURAL SOCIETY.

ANNUAL SHOW,
OSMASTON PARK, DERBY,
August 28th and 29th, 1908.

Groups: £25, £18, £12, £8, £5, £4.
Two Gold Medals for Trade Exhibits.
Best Collection of Roses, £5, £3, £2.

Schedules (stating section), and all particulars from
SIDNEY BURTON,
Secretary.
Canal Office, Derby.

SANDY, BEDFORDSHIRE,
40th ANNUAL SHOW, August 27th, 1908.
PLANTS, FLOWERS, FRUIT, VEGETABLES, Etc., DOGS, CATS, RABBITS, POULTRY, PIGEONS, Etc.
Prizes value £1,000, including £8, £7, and £5 for Ten Stove and Greenhouse Plants; £9, £7, and £6 for Group of Plants. Entries for dead stock close August 20th, 1908. Schedules and Entry Forms of W. GREEN, Sec., Sandy.

HORTICULTURAL SHOW ADVERTISEMENTS are inserted in this column at Ninepence per line, the minimum charge being Five Shillings. Offices, 148 and 149, Aldersgate Street, London, E.C.

EXHIBITIONS AND MEETINGS.

◆

Royal Horticultural Society.

SCIENTIFIC COMMITTEE, August 4.

Present: Mr. E. A. Bowles, M.A., F.L.S. (in the chair); Messrs. Fawcett, Bennett-Poë, Douglas, Holmes, Massee, Crawshay, Fraser, Shea, Saunders, and Chittenden (secretary).

"BLACK-EYE" OF CARNATIONS, ETC.—Mr. Massee, V.M.H., showed flowers of various species of dianthus, including carnations, affected by the fungus Ustilago violacea, which develops its spores in the anthers of different species of Caryophyllaceæ. The fungus is common on wild plants belonging to the order, but is less common on cultivated plants. The mycelium is perennial in the tissues of its host, and therefore it is useless to attempt a cure; affected plants are best destroyed. The host plants can only be attacked when in the seedling stage or in the young shoots, and nothing can be seen of the fungal attack until the fruiting stage is reached in the anthers of the host. It is then known by the blackish dusty mass of spores in the centre of the flower.

AN UNCOMMON FUNGUS.—Mr. Holmes, F.L.S., showed numerous specimens of the curious saprophytic fungus Geaster Bryanti, which had occurred in a dry border recently manured with farmyard manure in his garden at Sevenoaks.

LISTROSTACHYS FORCIPATA. — Mr. Douglas, V.M.H., showed a plant of this rare and beautiful little orchid bearing several of its curious delicate white flowers, the perianth of which is apparently but one cell in thickness. The plant is a native of dense forests at Buea, Cameroons, at an elevation of 4,200ft. (see Kranzl in Engl. Jahrb. xix. 254; Flora Trop. Afr. viii.). A botanical certificate was unanimously recommended for this plant.

SWEET PEAS DYING.—Mr. Fraser also showed sweet peas with prematurely yellowed foliage. The root had been attacked by the fungus Thielavia basicola, a species which is apparently very common this year.

SALIX UNDULATA. — Mr. Fraser also showed two specimens of willow shoots cut from the same bush at different periods in the year. In April the ovary was completely glabrous, but in August the ovary had become pubescent, a character typical of S. undulata.

VARIATION IN PLANTS. — Mr. Shea made some observations upon this subject, exhibiting variegated leaves of a sunflower. Last season one side (that towards the magnetic north pole) had shown variegated leaves, the remainder of the foliage being normal. He had saved seeds from that side of the inflorescence, and the seedlings were weaker and bore variegated leaves throughout, while seeds from other parts of the inflorescence produced quite normal plants. Mr. Shea said that he had observed in other cases that variation had been confined entirely to the side of the plant towards the magnetic north pole.

VARIATION IN DELPHINIUM "CARMINE QUEEN."—From Messrs. Veitch, Chelsea, came inflorescences of this delphinium showing some flowers of a beautiful violet blue, others of a pinkish tinge, and others again streaked and splashed with both colours. All the flowers of some shoots were of one colour, of others the two colours were restricted to separate flowers, and in others the whole of the flowers were of both colours intermingled. It was noticeable that there were no intermediate shades of colour.

VARIETIES OF EPILOBIUM HIRSUTUM.—Mr. Bowles, M.A., showed specimens of the normal form of E. hirsutum, a very hairy form with deeper flowers from South Europe, a form with white petals and rosy stamens, a form with white petals and stamens (the ovary, however, showed the usual red tinge), and a virescent form.

ANTS AND APHIDES.—The following interesting communication was received from the Rev. H. E. Bishop, M.A., Middleton Vicarage, King's Lynn. "Some gooseberry bushes are trained on a north wall in my garden. During the wet weather I noticed that many shoots were encrusted with sand and lime (somewhat in the manner of the case of a caddis worm), and on breaking this away we were surprised to find the shoot covered with aphides and the ants busy among them. After examination we came to the conclusion that the ants had constructed the cases to prevent the aphides being washed away by the rain. The piece broken away was repaired the next day. The upper leaves seemed to serve as a roof, and the sand built round left a clear passage way round the aphides. Since the settled fine weather the casings have been completely cleared away." Mr. Chittenden observed that he had seen a similar thing in a greenhouse, where the ants constructed a covering over aphides on the stem of a cineraria.

Midland Carnation and Picotee Show.

AUGUST 6 and 7.

The eighteenth annual exhibition of this society compared most favourably with its predecessors, both in regard to the quantity and quality of the exhibits, and the attendance of visitors, although confined principally to Midland growers, and only one from the south, in the person of Mr. Hayward Mathias, Alresford; an additional attractive feature was formed by the sweet peas. Much credit was due to Mr. T. Humphreys, the hon. secretary and treasurer, for the complete arrangements of the show.

CARNATIONS.

The self carnations, though in several instances very good, were hardly up to the standard of those staged on certain previous occasions, but this falling off was due to the season, the delicate quality and colouration of the self blooms being apparently more affected by the heat than in the case of the fancies and other kinds. Mr. C. F. Thurstan, Wolverhampton, was the champion in the class for twelve self carnations; his flowers were W. H. Parton, Sir Galahad, Miss Willmott, Edward Kenyon, Mrs. Eric Hambro, Pink Pearl, Carabas, Daffodil, Ensign, Mrs. F. W. Flight, Mr. L. E. Best, and Sir Bevys. Mr. A. R. Brown, King's Norton, was a close second; and Mr. C. H. Herbert, Acocks Green, was a good third. For six selfs the Rev. C. A. Gottwaltz, Droitwich, led with a very good collection, comprising blooms of Helen Gottwaltz, John Pope, Daffodil, Major Galton, Miranda, and Hadzor. The second award was made in favour of Mr. F. W. Goodfellow, Walsall. Mr. Harry Skeels, Walsall, was a close third

For the prizes for twelve fancy carnations there was a keen contest. Mr. A. W. Jones was placed first with fine blooms of Lord Steyne, Sam Weller, Billy Barlow, Professor Cooper, Queen Bess, Mandarin, Bombastes, Liberté, Lara, R. A. Rowberry, and Highland Lass; Mr. A. R. Brown second with good blooms. For six fancies the Rev. C. A. Gottwaltz was accorded premier honours with excellent examples of Lord Steyne, Margaret Thurstan, Cecil Pemberton, Voltaire, Hanno, and Lara; Mr. Harry Skeels was second, and Mr. Goodfellow third.

The bizarre and flake flowers were well represented. For twelve varieties Mr. C. H. Herbert led with grand blooms of Admiral Curzon, Sportsman, Meteor, Gordon Lewis, J. S. Hedderly, Master Fred, William Skirving, C. H. Herbert, Robert Lord, Mr. T. Lord, Lord Salisbury, and Ella; Mr. Brown was second with an excellent collection; the third and fourth prize takers were Messrs. Thurstan and Mathias. For six varieties Messrs. W. Derry, G. D. Ford, and C. J. White were the successful competitors with good examples.

In the six classes for single blooms of carnations Messrs. A. W. Jones, A. R. Brown, C. H. Herbert, C. F. Thurstan, F. J. Spinks, and W. Derry were the principal winners.

PICOTEES.

The white ground picotees were admirably staged. For twenty-four varieties Mr. A. R. Brown was the leader with W. E. Dickson, Maud Brown, Lavinia, Fair Maiden, Fortrose, Brunette, Mrs. Chaundy, Miss Evelyn Cartwright, Duchess of York, Linda, Lady Sybil, Polly Brazil, Amelia Brown, Mollie Dalrymple, Dalkeith, and J. Brocklehurst; Mr. F. W. Goodfellow second, and Mr. G. D. Ford third.

Yellow ground picotees were excellently staged by Mr. A. W. Jones, Stechford, in the class for twelve blooms, distinct, his varieties including Astrophee, Lady Gascoigne, Leonora, Ida, Sophia, Western, John Brocklehurst, Lucy Galton, Penelope, Agnes; Mr. Thurstan was a close second. The third position was assigned to Mr. H. Mathias, Medstead, Alresford, with good flowers. For six blooms the Rev. C. A. Gottwaltz led. There was a large number of competitors in the class for single blooms of picotees and fancies, also a keen competition in the classes assigned to flowers shown without cards, blooms staged in threes, and single vases, carnation foliage and buds only allowed. There was also a keen contest in the amateur classes. Premier awards were allocated as follows: Bizarre, Admiral Curzon, shown by Mr. C. H. Herbert; flake, Gordon Lewis, shown by Mr. C. F. Thurstan; heavy-edged, white ground picotee, Mrs. H. W. Twist, shown by Mr. F. W. Goodfellow; light, or wire-edged white ground picotee, Mrs. C. H. Herbert, shown by Mr. Herbert; heavy edged yellow ground picotee, Togo, shown by Mr. H. Mathias; light edged yellow ground picotee, Brocklehurst, shown by Mr. A. W. Jones; yellow ground fancy, Erl King, shown by Mr. A. W. Jones; self carnation, W. H. Parton, shown by Mr. Parton; fancy carnation, Lord Steyne, shown by Mr. A. R. Brown; yellow ground picotee, Mrs. W. Heriot, shown by Mr. C. H. Herbert.

Blooms staged in threes were an interesting and well-staged class, as also the single vase classes. Amateurs were well represented in the classes for carnations and picotees.

SWEET PEAS.

These contributed largely to the interest and attractions of the exhibition. The prizes were offered by Mr. Robert Sydenham, and in the class for eighteen bunches the first prize—a handsome silver bowl, value £5—was won by Mr. Thomas Jones, Ruabon, who had a selection of the leading varieties, the stout, tall stalks being furnished with bold and bright blooms; Mr. J. Haycock, Wrexham, second; and Mr. E. Deakin, Hay Mills, third.

In the class for six distinct varieties the first prize, a large silver medal, was awarded to Mr. H. King, gardener to A. E. Butler, Esq., Elmdon, Selly Park, who won the coveted prize with a capital set of blooms, well arranged; Mr. E. Deakin, second; and Mr.

John Sceany, Harborne, third. In the class for one bunch of blooms, Miss Nellie Mashin, Mr. Thomas Jones scored; Mr. E. H. Wells second, Mr. E. Deakin third, and Mr. J. Haycock fourth. For one bunch of Countess Spencer, Messrs. J. Haycock, Thomas Jones, and E. H. Wells won in the order of their names. For one bunch of Primrose Spencer Mr. Thomas Jones was awarded the first prize, Mr. John Sceany second, and Mr. E. H. Wells third.

The non-competitive exhibits formed a glorious setting to the contributions to the competitive classes. A gold medal was deservedly awarded to Messrs. Gunn and Son for a grand display of climbing and other roses, phloxes, and other garden flowers. Mr. S. Mortimer, Farnham, had a large collection of show and cactus dahlias, and was awarded a silver-gilt medal. Messrs. W. H. Simpson, Birmingham, were accorded a silver-gilt medal for an attractive arrangement of sweet peas. Mr. Robert Sydenham was accorded a silver-gilt medal for a tasteful arrangement of sweet peas. The champion prize, a handsome silver medal, for the greatest number of points in classes ranging from 1 to 41, was awarded to Mr. A. R. Brown, who had 132 points.

Walsall Florists' Society.

The twenty-ninth annual exhibition of this society was recently held in the picturesque and extensive aboretum (Hanley's Public Park), under much more favourable conditions than that held last year, when the event was completely spoiled by the wet weather.

There were four groups of plants arranged for effect, contributed by well-known Midland exponents, and in a keen contest the "blue riband" fell to Mr. J. G. Macdonald, gardener to G. H. Kenrick, Esq., Edgbaston, with one of the most artistically arranged creations he has yet exhibited. His crotons were richly coloured, and the fine specimens of C. Warreni were absolutely perfection. There were also finely developed plants of oncidiums in variety, the almost indispensable Fuchsia triphylla (of which Mr. Macdonald is a successful cultivator), with its bright coral-red flowers and dark bronzy-green foliage, and numerous other suitable subjects. The second prize was awarded to Mr. G. Hancox, West Bromwich, for an excellent exhibit, the crotons being noble examples of cultural skill, but, owing to overcrowding, the group did not present the light and elegant aspect of that of his rival. The third prize was annexed by Mr. W. Finch, Coventry, and the fourth by Mr. W. Vause, Leamington. Specimen plants were of an ordinary character, and did not call for special mention. In the open class roses were not numerously shown, but very good examples were staged by Messrs. Perkins and Sons, Coventry, and Messrs. Townsend, Worcester, who were first and second respectively. Sweet peas made a beautiful display. The society's prizes for six bunches were awarded to Mr. W. Marple, Penkridge, who had excellent examples of Primrose Spencer, White Spencer, Phenomenal, Countess Spencer, Dora Breadmore, and John Ingman, all tastefully set up. Mr. T. Parry, gardener to A. Hughes, Esq., Knowle, was second with excellent sprays of Helen Lewis, Nora Unwin, Mrs. W. King, Mr. A. Hughes, Paradise, and Prince Olaf; Mr. E. Deakin, Hay Mills, third. In the class for nine distinct varieties,in which the prizes were offered by Mr. R. Sydenham, Messrs. W. Marple, T. Parry, and A. W. Thorpe, Lichfield, were the prize-takers in the order named, all with meritorious flowers. Dinner table decorations by ladies only constituted a delightful feature. There were twelve competitors, and the arrangements were so good that it was with considerable difficulty the judges made their awards. Pink and white varieties of peas were principally used throughout. The first prize went to Miss L. Deakin, Hay Mills, who selected light rosy pink and cream colours, and Mrs. Marple, Penkridge, a darker pink colour for the second prize.

There were three exhibits of violas, all effectively staged; the premier prize was annexed by Mr. Chapman, New Ascott, with most excellent blooms. Mr. W. Pemberton, Harden Nurseries, and Mr. Ashwell, Walsall, who were second and third, also had good flowers. Mr. C. J. White, Walsall, and Mr. W. Pemberton were the respective winners of the prizes for carnations and picotees. For a collection of flowers of herbaceous plants, Mr. Chipman, of Erdington, won with a well-staged lot, and Mr. W. Pemberton second with a creditable exhibit.

In the open classes for fruit prizes were offered for grapes, and for two bunches of a white variety Mr. T. Parry led with Muscat of Alexandria, full in bunch and berry, but somewhat green; second, Mr. G. Hancox, West Bromwich; and third, Mr. Gibbs, gardener to E. J. Hunt, Esq., Bescot. For two bunches of black grapes Mr. Gibbs won with large bunches and well-coloured large berries of Black Hamburgh; second, Mr. T. Parry, with nearly equal examples; third, Mr. G. Hancox.

In competition for Messrs. Webb and Sons', Wordsley, prizes for vegetables, six distinct kinds, Mr. E. Deakin, Hay Mills, was first, with a highly creditable lot, his Duke of York potatoes being very fine; second, Mr. E.Winchester, Northfield, with a good exhibit.

The trade and other non-competitive contributions greatly enhanced the pictorial aspect of the show.

Royal Botanic Society.

AUGUST 10.

On Monday last the Royal Botanic Society held its 69th anniversary at the gardens, Regent's Park, Mr. C. Brinsley Marley, treasurer, occupying the chair.

The report and financial statement presented by the Council to the Fellows showed that the expenditure was in excess of the income by £470. This was due in part to the sum of £122 having been paid into the sinking fund, and in part to the exceptional repairs. The gross liabilities of the society were £33,915 in 1905, £33,374 in 1906, and £33,733 in 1907, and these figures are of interest as showing that a reduction had been made in two years of £182. The principal liabilities are the debentures, which can only be held by Fellows of the society, the other liabilities being comparatively small. There was a decrease of 98,664 in the number of persons who visited the gardens during the year, and this decrease is attributed to the unpropitious weather. With regard to the prospects of the society, the report states that there is no section of the society's work in which there is not every indication of a period of approaching prosperity. The society is happy in having a united council. The friction arising from inequality of privileges and differences as to the amount of subscription is being done away. The amended regulations as to the use of the gardens by Fellows and their friends have met with unqualified approval. In 1907 only 42 new Fellows were elected. Up to July, 1908, 60 Fellows and members had been proposed for election. Almost as many visitors had visited the gardens up to July, 1908, as visited them in the whole year 1907; and from all quarters the opinion has reached the council that the gardens were never more beautiful or better kept than they are at present. Not even the exceptional interest created by the Franco-British Exhibition has displaced the Royal Botanic Gardens in the estimation of the cultured public.

The report and financial statement were, on the motion of the Chairman, unanimously adopted.

The Duke of Teck and Mr. C. Brinsley Marley were re-elected president and treasurer respectively, and Lord Bredalbane, Lord Howe, Mr. C. Brinsley Marley, Sir W. Dunn, Colonel H. Fortescue, Mr. H. J. Greenwood, Mr. M. Hulton, and Captain J. Sparkes were re-elected members of council.

The meeting closed with votes of thanks to the chairman of council, the officers and staff, and to Mr. C. Brinsley Marley for presiding.

Bishop's Waltham.

JULY 29.

The thirty-fourth annual exhibition was held in the Cricket Field and was a success. In the cottagers' section the exhibits were not so numerous as last year, but in the sections devoted to gardeners and nurserymen there was keen competition. For many years this society has done much to foster the art of arranging flowers for table decoration and in vases, and the neighbourhood has become somewhat noted for tasteful arrangements of flowers in the home. This year to still further this section of the show, the committee made the class an open one, offering the substantial prizes of £5, £3, and £2.

This invitation was readily responded to, sixteen competitors taking part. This, with the other two classes set apart for table decoration and confined to a given radius,brought thirty-one exhibitors, making a huge and interesting display down the centre of the society's marquee. The tables were 6ft. long by 3ft. wide, without any restriction in arrangement excepting that orchids were excluded. After a close inspection, the first prize was awarded to Miss Gertrude Saunders, Wallington, Fareham, who employed a low silver bowl as a centre-piece, with four small trumpet-shaped vases. In this way she did not commit the common fault of overcrowding. The flowers used were Fair Maid carnations, with delightful foliage accompaniment of trails of richly-coloured Ampelopsis Veitchi, croton leaves, Asparagus Sprengeri, and richly-tinted sprays of oak and hornbeam. Taken as a whole it was a charming combination of colour without being in any way overcrowded. Mrs. T. C. Wilson, The Thickets, Bishop's Waltham, was second with Duchess of Fife carnations, arranged in silver bowls, and maidenhair fern and gypsophila. The third prize fell to Mrs. E. C. Peru, Droxford.

For the best decorated table confined to lady members only, there was a spirited competition. Miss Medlicott, Whingarth, Shedfield, was awarded premier place with a pretty combination of pink and white larkspur and suitable greenery. Miss Margery Luttrell, West Leigh, Botley, was second with godetia and clarkia capitally blended.

For the best decorated table with wild flowers nine entered, making a pleasing display. Miss Medlicott again asserted her superiority in winning the first prize with a pretty combination of wild vetch and suitable foliage and grasses. Mr. H. Childs, Meonstoke House, was second. In other sections of the exhibition sweet peas, roses, and herbaceous flowers stood out prominently. In the former Mr. B. Peppler, Bishop's Waltham, won the society's premier prize for twelve bunches with a handsome set. Mr. W. Pawin, Winter's Hill, Bishop's Waltham, won Mr. H. Eckford's prize for twelve bunches; while Mr. W. Cooper, gardener to the Misses Gladstone, Hampton Hill, Swanmore, won Messrs. J. Carter and Co.'s and Mr. R. Sydenham's prizes for six and nine bunches. Mr. G. Ellwood, gardener to W. H. Myers, Esq., Swanmore Park, Bishop's Waltham, won first place for six bunches of roses and also for six rambling roses with delightful sheaves of popular varieties. He was also first in the leading herbaceous flower class.

Fruit, if not specially plentiful, was good in quality. For six dishes Mr. Ellwood was first with Madresfield Court and Muscat of Alexandria grapes, peaches, melons, and cherries. Mr. Ellwood also had the best black grapes, staging good Madresfield Court. For four varieties, grapes excluded, Mr. J. Hayward, gardener to F. H. Christian, Esq., Midlington, Droxford, won with a capital set of peaches, nectarines, and melons. Mr. Childs, gardener to Mrs. Macrae, Meonstoke House, was successful in the single dish fruit classes.

Vegetables were a strong feature. Mr. Ellwood won the first prize in the three special classes in which the prizes were given by seed firms, in all cases staging high-class examples of leading kinds. Mr. W. G. May had the premier award made in his favour in the special class for six kinds.

British Gardeners' Association.

Members of the London branch, to the number of about twenty, visited Finsbury Park and Waterlow Park on Saturday, August 8. Meeting at Finsbury Park at 3.30 p.m., the party were conducted by the genial superintendent, Mr. Melville, through the extensive and well-kept grounds, where at every turn much of beauty and interest was to be seen. The herbaceous borders, filled with broad masses of bright, free-flowering subjects, met with high praise, and several varieties of pentstemons were specially noted. The rock garden had lost something of the brightness which characterised it earlier in the year, but it is a well-planned, imposing piece of work, and in spite of the fact that the plants are overshadowed by big trees, they are evidently perfectly happy. Close by the rockery is the lake, upon which many boats bore parties of merrymakers, but we of the garden craft passed on to view a long series of beds cut out on grass, which are filled with an immense number of capital summer bedding subjects.

Of special merit are the standard fuchsias, which occupy a number of beds, carpeted with dwarfer plants. Heliotropes in standard form are also much in evidence here, and their beauty is supplemented by delicious perfume. Eucalyptus, kochias, begonias, zonal pelargoniums, and many other bright subjects are used here in great quantities, and all arranged in the tasteful style, and growing with the sturdiness that betoken the care of a master hand.

Besides its flower beds and borders Finsbury Park contains hosts of magnificent trees and shrubs. Rambling roses and clematis are freely interspersed among the shrubs, and clambering over rough tree trunks add immensely to the charm of the place. In the large conservatory many fine palms, ferns, and other foliage plants are brightened by bold masses of Campanula pyramidalis in its blue and white forms. An inspection of the reserve grounds, where large stocks of plants are being grown for future use, and some hundreds of chrysanthemums coming along for the autumn show in the conservatory were seen, and these completed an interesting and instructive tour.

Before leaving a cordial vote of thanks was passed to Mr. Melville for his courtesy to the party, both he and Mr. Gorham, the foreman being highly complimented upon the excellent condition of everything under their charge.

On reaching Waterlow Park the party was met by Mr. Phelps, the superintendent, under whose direction the park and the propagating department were visited. The flower beds and borders are just now at their best, and some excellent floral effects were seen. On reaching the Swain's Lane entrance we were met by Mr. H. Witty and Mr. Andrews, and were shown over a portion of the bedding arrangements. Votes of thanks were passed to Mr. Phelps and his assistants, who so kindly entertained us, and a most agreeable and profitable afternoon's outing was thus brought to a close.

West Derby.

The seventeenth annual show was held in a field adjoining the Rectory. The weather was ideal, and the entries satisfactory.

Mr. B. Cunningham secured the silver rose bowl, presented by Mr. C. A. Young, for twelve vases of sweet peas, with a good lot. The groups were well arranged, the prize-takers being Messrs G. Osborne, gardener to Dr. [illegible]; Mr. H. Spencer, gardener to A. H. Jones, Esq., and Mr. J. Ogden. Mr. G. Osborne also secured the chief awards for collection of sweet peas, one pot of liliums, two stove or greenhouse palms or cycads, four stove or greenhouse plants, a collection of vegetables, two begonias, six table plants, and four plants—two flowering and two foliage.

For six kinds of vegetables, Mr. T. F. Edgar, gardener to the Rev. G. Stewart, was first. Mr. W. Teal won in both classes for black and white grapes, and for the collection of four kinds of fruits.

Among the exhibits not for competition, Mr. J. Skitt, gardener to Mrs. Bright, staged a fine bunch of Black Hamburgh grapes, weighing 7lb. 11oz., as well as other fruit and cut flowers. Mr. C. A. Young contributed cut carnations and poppies; and Mr. W. Rowlands sent roses, clematis, etc.

Leicester Flower Show.

AWARDS TO NON-COMPETITIVE COLLECTIONS.

As briefly mentioned in our report which appeared in the issue of the 8th inst., non-competitive exhibits contributed liberally to the interest and attractions of this great gathering. We now give the awards made to these collections.

Gold Medal.—Mr. Walter Bentley, Belgrave, for cut roses; Mr. F. Bouskell, Market Bosworth, for collection of cut flowers of hardy plants; Mr. H. Rogers, Leicester, for group of miscellaneous plants; Messrs. Macrimmon and Fulton, Leicester, for cut flowers; Messrs. W. Wright and Son, Leicester, for miscellaneous plants.

Silver Medal.—Messrs. Blackmore and Langdon, Twerton-on-Avon, for collection of begonia flowers; Messrs. Harrison and Sons, Leicester, for cut flowers and vegetables; Messrs. Kelway and Son, Langport, for collection of gladioli; Mr. C. Holden, for sweet peas; Mr. E. Harris, Aylestone, Leicester, for cut roses; Mr. G. Underwood, for sweet peas; Messrs. J. Lamb and Son, Bingham, Notts., for sweet peas; Mr. J. Barrow, Oadby, Leicester, for cut roses; Mr. W. Wright, jun., Syston, for collection of flowers of herbaceous plants; and to Messrs. Wright and Son, for cut roses.

Bristol Gardeners' Association.

A well-attended meeting was held recently at St. John's Parish Rooms, Mr. A. O. Shelton presiding. It was question night, and various questions were asked, such as the best way to kill red spider on vines; cause of asters dying off in beds this summer; best kind of shading where blinds cannot be used; cause of a plum tree dying off in two nights; should Madresfield Court grapes have more heat than generally given; can ants be exterminated; cause of grapes shanking; can an exhibitor stage, in twelve bunches of hardy perennials, a vase of phloxes with three or four varieties in a bunch; and cause of tomatoes dying off when a foot high. A keen discussion followed each question, and the younger members took a great interest in it.

For a basket of sweet peas Mr. Curtis was first, Mr. Morse second, and Mr. Whiting third. Four new members were proposed.

Prescot.

This usual Bank Holiday fixture was held in glorious weather in the charming park of Knowsley, by the kind permission of the Earl of Derby. The entries were just over 500, slightly less than last year.

For a circular group, Mr. J. McFall, gardener to Mrs. Harding, secured the silver cup, the gift of the Earl of Derby; Mr. J. George, gardener to Thomas Henshaw, Esq., was second. For four stove or greenhouse plants, Mr. McFall was the winner, followed by Mr. D. McKelvie, gardener to J. Stone, Esq. In the class for two palms or cycads, Mr. McFall was again the winner; and for one stove or greenhouse flowering plant, he won with Clerodendron Balfourianum; and for one foliage plant he led with a good croton.

For three caladiums, Mr. D. McKelvie won with large plants; and for three stove or greenhouse ferns Mr. W. H. Roberts, gardener to F. Dixon Nuttall, Esq., took the lead. In the class for six gloxinias, Mr. G. Guy, gardener to Dr. Gaskell, was first. Mr. C. Hulme, gardener to W. E. Parry, Esq., had the best four begonias.

In the fruit section, Mr. H. McFall led for four dishes with Black Hamburgh grapes, Royal Sovereign melon, Royal George peaches, and Pineapple nectarines; Mr. Thomas Eaton, second. For two bunches of Black Hamburgh grapes, Mr. W. Oldham, gardener to Joseph Beecham, Esq., scored; and for two bunches of Muscat of Alexandria, Mr. Jas. Parr, gardener to A. C. Pilkington, Esq., took the lead; while for two bunches of any other black variety, the same exhibitor led with Madresfield Court; and for two bunches of any other white, Mr. D. McKelvie won with Buckland Sweetwater.

The best collections of vegetables came from Messrs. J. George, H. McFall, and J. Lowe.

For eighteen roses, Mr. J. George won, having Killarney in good form. Mr. J. Berry was second in three other classes, the first prize-men being Messrs. J. George, C. Houghton, and F. W. Halsall. For eight bunches of sweet peas, Mr. J. Marshall led with a well-arranged collection. For a collection of herbaceous flowers, Mr. C. Houghton won.

Corbridge-on-Tyne Gardeners' Association.

Through the kindness of J. H. Straker, Esq., the members of the Corbridge Society were able to invite the members of the Hexham and Wylam Gardeners' Mutual Improvement Societies, to join them in visiting the beautiful gardens of Howden Dene on Saturday, July 25. Unfortunately, the weather was very unfavourable, rain falling for the greater part of the afternoon, which not only marred the pleasure of the visit, but prevented many from attending.

The roses, which at the present season are the principal attraction, were admired by all, and many useful hints on the cultivation and most suitable kinds of roses to be grown were given by Mr. J. Winder to those who sought the information. After a visit to the flower garden, the members of the different societies were entertained to tea by Mr. Straker. The weather clearing in the evening, Professor Potter, of Armstrong College, Newcastle-on-Tyne, explained the development of various fungoid diseases in plants, and also explained the principles of "Mendel's Laws," and gave a most entertaining lecture on bacteria. These addresses were greatly appreciated, and from the numerous questions that were asked, there can be no doubt that a good deal of instruction was obtained.

Votes of thanks were given and replied to by Mr. Straker and Professor Potter.

VAGARIES OF HAILSTORMS.

The vagaries of hailstorms are very great, and it is a frequent source of perplexity to those specially interested that they should be very destructive in some gardens and nurseries, while others not far distant wholly escape injury, or only have a few squares of glass broken. The hailstorm experienced within twenty miles or so of London on June 4 illustrated these vagaries in a marked manner. This storm did much damage in the nurseries and market-growing establishments in the vicinity of Orpington, Bromley Common, and Sydenham. Then it visited Hoddesdon some twenty miles north of London, where the glass round and about the chimney stacks in the centre of the nurseries was riddled with hailstones. Passing over Turnford, Flamstead End, Cheshunt, Waltham Cross, Enfield Highway, and Ponders End, where the area covered by glass structures is simply enormous, the storm visited Edmonton and Tottenham, and in these districts did much damage in some establishments, and left the others practically untouched. As evidence of the damage that was done where the effects of the storm was fully felt, we would mention that the Nurserymen and Market Gardeners' Hailstorm Insurance Company paid twelve claims for damage to 21oz. glass, and that many nurserymen uninsured lost heavily.

ANSWERS TO CORRESPONDENTS.

Editorial Communications should be addressed to the Editor of the Gardeners' Magazine, 148 and 149, Aldersgate Street, E.C.

Secretaries of horticultural societies are invited to send early notification of forthcoming exhibitions and meetings, and are requested to advise us concerning changes of dates.

Specimens of plants, flowers, and fruits for naming or opinion should be sent to the Editor of the Gardeners' Magazine, "Endsleigh," Priory Park, Kew, Surrey, and as early in the week as possible. All parcels must be sufficiently prepaid.

The Editor will be glad to receive photographs of gardens, plants, flowers, trees, fruits, etc., for reproduction in the Gardeners' Magazine. He will also be greatly obliged by correspondents sending early intimation of interesting local events relating to horticulture. In sending newspapers containing matter to which they wish to draw attention, correspondents are requested to distinctly mark the paragraph.

CREEPING DAHLIA.—R. C. D., Ryde: We presume you mean the plant frequently referred to as the Climbing Dahlia; if this is so, the name is Hidalgoa Wercklei.

SOLANUM WENDLANDI.—R. C. D., Ryde: When grown in a comparatively cool greenhouse, Solanum Wendlandi is practically deciduous. A little more warmth during winter would be beneficial.

EXACUM MACRANTHUM.—R. C. D., Ryde: This beautiful plant is practically biennial, and an intermediate house is essential for its successful culture. It is propagated from seeds sown in heat, and every care must be taken of the seedlings, because overwatering, injury to the stems, and alternated growth are sure to be followed by damping. Fibrous loam, with some peat and leaf-soil suit the plant, but sand must be added to secure porosity, and ample drainage must be provided.

SPLIT PEACHES.—G. B., Dublin: We have submitted the peaches to further examination, and also to other authorities, and the conclusion arrived at is that the fungi present are only saprophytic forms, and in no sense the cause of the trouble. The damage is evidently due to a cultural error, and we expect it may be traceable to a period of drought followed by copious waterings; and, probably, to heavy watering with liquid manure at a period when the trees were not in a condition to use it up owing to their previous dry condition at the roots.

PLANTAINS ON LAWNS.—P., Bath: The ordinary weeding spud is usually efficient as a tool for the eradication of plantains, if carefully and persistently used. We fear you cannot have used the sulphuric acid aright, for this is a never-failing cure. Fix a handle to a wide-mouthed bottle, and put the acid in the bottle; dip a sharply pointed hardwood stick into the acid, and then promptly push it right into the heart of a plantain. Take a fresh dip for each weed, and if wet weather follows, then repeat the dose. The acid should be at full strength.

AMPELOPSIS ON STONEWORK. — F. J. H., Wheatley: It all depends upon what you mean by injurious. If the small-leaved Ampelopsis Veitchi (heterophylla) was allowed to grow over a statue the latter would be spoiled, not merely in effect by reason of the foliage over it, but the surface would be spotted and roughened by the action of the tiny five-fingered branchlets by means of which this pretty climber attaches itself to anything it can touch. There is no doubt the sucker-like ends of these fingers have an acid action, that is shown in tiny marks on stone and brick, and anything upon which the ampelopsis is climbing. This action is not injurious in the sense that it would cause the building to fall about one's ears ere long, but there is no denying the fact that beautiful carving in stone is marred by this action. The plain stonework around the windows of the room where we write is dotted all over with the marks of ampelopsis fingers, and has been for many years, but we only notice this in winter time. The dead portion of the plant around the chimney will do no harm, but we should have it cleaned off all the same, as its presence is a reflection upon the gardener.

WOODLICE AMONG FERNS.—J. N., Llandudno: Woodlice are scavengers, and attracted by decaying vegetation, especially when this is moderately dry. When the ferns next need water, place them in tubs of water for two or three hours, as that will kill or drive out any woodlice that may be harbouring among the bases of the fronds, or among the crocks. Set traps of dry moss in dirty pots near their haunts, and examine these frequently. If they can be traced to a spot near water pipe connections, etc., where no ill results would follow such a course, pour boiling water down, and it will settle them.

HORTICULTURAL TRAINING.—R. H. L., Essex: The lad is not old enough, nor has he enough experience yet to secure admission to Kew. You should apply for particulars of horticultural training to Mr. Chas. Foster, Horticultural Superintendent, University College Gardens, Reading; to Mr. S. T. Wright, Royal Horticultural Gardens, Wisley, Ripley, Surrey; and to the Director, School of Horticulture, Chelmsford Laboratories, Chelmsford.

REAPING MACHINE.—F. C., Brighton: The first reaping machine of any importance was one invented by the Rev. P. Bell, of Carmylie, Forfarshire. Several specimens of his machine found their way to America through various channels, and, with slight variations in make, new machines were soon sent over from America, but these did not meet with success. It soon became known, however, that on Mr. G. Bell's farm in the Carse of Gowrie, the machine invented by his brother had been in use for fourteen years. Trials were instituted, and Bell's machine became fairly well known. This first machine was constructed about 1838, and the first American machines arrived in 1851. Many years later, when a better method of drainage and cultivation produced a more even surface and fairly level fields, lighter machines of American design became popular.

STAPELIA NORMALIS.—C. H., Loughton: We believe you have not the correct plant under the above name, because you refer to the purple violet flowers, whereas Stapelia normalis has dull yellow flowers freely spotted and thinly lined with dark blood-red. Although they need little water during the winter, stapelias do not "dry up," and there is no need to repot them each year. The hot pipe and hot-water treatment are not conducive to good health for any stapelias with which we are acquainted. Plenty of sunshine, a warm greenhouse temperature, little water in winter, and moderate supplies in summer, are the chief conditions for successful stapelia culture. Sandy loam mixed with crushed mortar rubble make a suitable compost. Shallow pots or deep pans form suitable receptacles. Can you send us a specimen?

HARVEST BUGS.—G. B., Dublin, writes: "What is the best treatment for the prevention or cure of the severe itching caused by harvest bugs, and can a garden be freed of them"? Ammonia is a somewhat severe method of allaying the irritation caused by these pests that swarm in garden and field in some districts, but how to free a garden of them we do not know. Can any of our readers help our correspondent?

HIPPEASTRUMS.—G. P., Bournemouth: The bulbs should remain in the pots in which they were flowered until January, and then be shaken out and repotted, six-inch pots being the most suitable for flowering bulbs of average size; for rather small bulbs, five-inch pots will be sufficient; while for those of extra size pots seven inches in diameter will be necessary. Use a compost of turfy loam six parts, and one part each of well-rotted cow manure, leaf-mould, and coarse sand. The pots must be well drained, and the bulbs should be buried to rather more than one-half their depth, and have the soil pressed very firmly about them. A temperature between 55 deg. and 60 deg. will be the best for starting them into growth, and very little water should be given. When the flower stems have attained their full length, and the buds are beginning to expand, remove them to a warm position in the greenhouse, place near the glass, and give an occasional supply of weak liquid manure.

CORRECTION.—A correspondent points out that in our report of Woodbridge Show (p. 580), the prizes for a group of begonias and for single begonias should have been credited to General Sir Richard Farren. Our representative informs us that the plant tent was densely crowded when he endeavoured to make his notes in it, as a shower of rain had just driven everyone under cover. Evidently the beauty of the East Anglian ladies was more dazzling than the prize slips on the class cards.

SHELL-FLOWER.—A. G. R., Islip: As we previously pointed out, there are several plants that bear the popular name of shell-flower. Your plant is Molucella lævis, a labiate from the Mediterranean region. It is hardy, but is best managed as a half-hardy annual, being raised from seed in heat in spring, gradually hardened off, and planted out in May or early June. It prefers a light soil. The plant, especially the large green, netted calyces, are very suitable for skeletonising. Molucella lævis was introduced about 1570, and so is a quite old plant in our gardens.

NAMES OF PLANTS.

A. G. R., Islip.—Molucella lævis.

W. F. B., Nottingham.—1, Eucomis punctata; 2, Galtonia candicans; 3, Fuchsia triphylla.

F. S., Bristol.—1, Muelenbeckia complexa; 2, Cæsalpinia japonica; 3, Tecoma radicans; 4, Tacsonia van Volxemi.

N. G., Hunstanton.—1, Doronicum hungaricum; 2, Fuchsia fulgens; 3, F. Riccartoni; 4, Statice alata.

J. H. C., Carlisle.—1, Veronica virginica; 2, Cotoneaster frigida; 3, Tetragonia expansa; 4, Nertera depressa; 5, Miltonia spectabilis Moreleana.

W. K. A., Leicester.—1, Cornus Späthi; 2, Taxodium distichum; 3, Ceanothus azureus; 4, Buddleia globosa; 5, not recognised; 6, Cupressus macrocarpa.

M. F. P., Uckfield.—1, Karatas humilis; 2, Opuntia microdasys; 3, Gymnogramme calomelanon chrysophylla; 4, Iresine Herbsti aureo-reticulata; 5, Polygonum cuspidatum; 6, Nuphar luteum.

CATALOGUES RECEIVED.

E. H. KRELAGE AND SON, HAARLEM, HOLLAND.—A general bulb catalogue, but one in which Darwin tulips occupy considerable space, as becomes the firm that introduced these fine spring flowers.

WILLIAM BULL AND SONS, KING'S ROAD, CHELSEA.—A neat and illustrated list of bulbs and flowering roots; varieties for early forcing are given prominence.

JAMES VEITCH AND SONS, LIM., CHELSEA.—A well-arranged, well-printed, and well-illustrated catalogue of fruit trees. It includes a list of new fruits, and is altogether a most useful production.

ANGLO-DUTCH NURSERY CO., CASTRICUM, HOLLAND.—This is, to us, a new catalogue; it is printed in English, and contains, in addition to bulbs, an abridged list of hardy perennials.

SIR JOSSLYN GORE-BOOTH, BART., LISSADELL, SLIGO.—A handy, indexed list of daffodils grown on the Lissadell bulb farm; freely illustrated.

ONE PENNY WEEKLY, by post 1½d.

FARM AND GARDEN

THE DAIRY—POULTRY—PIGS—LIVE STOCK—ALLOTMENTS—MARKET GARDENING, etc.

This week's issue (August 15) contains the following:

HOW TO PACK FRUIT.
ASTERS FOR MARKET.
FRUIT-TREE PLANTING.
WARTY DISEASE OF POTATOES.
TRIPOLI ONIONS.
SEEDING TIME OF WEEDS.
MANAGEMENT OF MILK.
MILK RECORDS.
COWS FOR AUTUMN CALVING.
MILK PRESERVATIVES.
WEEDING OUT THE EWES.
STABLE-MANGERS.
A HOLIDAY FOR THE HORSE.
AUTUMN TILLAGE.

A LANCASHIRE DUCK FARM.
FIELD POULTRY.
HELPFUL HINTS.

SOLD BY ALL NEWSAGENTS.

OFFICES: 148 and 149, ALDERSGATE STREET,
London.

NEW PLANTS, ETC.

SOPHRO-CATTLEYA WARNHAMENSIS J. M. BLACK.

A dwarf and handsome form of the hybrid derived from Cattleya amethystoglossa and Sophronitis grandiflora. For its size it has large flowers, and these are of a deep red-purple colour, approaching a crimson shade. The vivid red of the lip and its yellow disc add to the fine colouring of this orchid. F.C.C., R.H.S., August 4. Mr. J. M. Black.

VANDA AMŒNA SANDERÆ.

A distinct and handsome natural hybrid, that differs from the type, and is probably the result of a reverse cross between Vanda Roxburghi and V. cœrulea, the latter being, supposedly, the seed parent. The flowers, borne on a long, stout spike, are creamy-white, veined with violet, with a violet purple lip. A.M., R.H.S., August 4. Messrs. Sander and Sons, St. Albans.

ROSE PAULA.

A tea-scented rose of dwarf habit, and with soft yellow flowers carried on reddish stems. This promises to be an excellent garden rose, and one specially adapted for bedding, by reason of its good habit, freedom, and charming colour. A.M., R.H.S., August 4. Messrs. Paul and Son, Cheshunt.

CARNATION COUNTESS OF PEMBROKE.

A beautiful and fragrant border carnation with finely formed flowers of the palest blush colour. A.M., R.H.S., August 4. Mr. T. Challis, gardener to the Earl of Pembroke, Wilton House, Salisbury.

PRUNUS TOMENTOSA.

A dwarf tree found growing in the mountains of Northern and Western China, from Mandschuria to Szechuen. It is described by Bretschneider as being much cultivated in the neighbourhood of Peking for its edible fruits; but it first became known in Europe from Japan, where also it is cultivated in gardens. The flowers are white, lightly tinged with pink, and these are followed by the ovate fruits, which are about half an inch long, bright red, and edible; it is one of the earliest of the species of prunus to bloom. This, however, is not a point in its favour, for the flowers are quite unable to withstand the effects of the rough weather so frequently experienced in this country during the spring months, and consequently frequently lose their beauty within a short time of their expansion. The shrub at Kew occasionally ripens a few fruits. The species is deserving of a place in large collections, but with so many finer shrubs it cannot be recommended for small gardens. "Bot. Mag.," t. 8,196.

RHEUM INOPINATUM.

A distinct species of moderate growth that should have the attention of cultivators of hardy plants. The leaves are somewhat cordate, five or six inches long, and four or five inches broad, light green above, glaucous green on the under side, and the stems and veins are bright red. The flower spikes are short and compact, the stems and nutlets bright red. This small growing rhubarb was raised at Kew from seeds collected by Captain H. J. Walton, at Gyantse, in Tibet, in the autumn of 1904, and presented by the director of the Botanical Survey of India in 1905. The following year it flowered in the herbaceous border, and has proved quite hardy. "Bot. Mag.," t. 8,199.

PANDANUS HOULLETII.

A handsome screw pine introduced from Singapore in 1866, and flowered for the first time under cultivation in the Jardin des Plantes, Paris, in 1868. According to Mr. Ridley, who has studied the plant in a wild state, it is endemic in the southern part of the Malay Peninsula, where it grows in dense forests. The leaves are long and linear, deep green, tinged with bronze, and the fruits are said to be eatable, and to resemble the pineapple in flavour. "Bot. Mag.," t. 8,197.

THE GARDENERS' MAGAZINE.

NOTES OF THE WEEK.

Leaves and Fronds.

Both the leaves of flowering plants and the fronds of ferns and their allies perform the same office in one respect, viz., they are structures adapted to expose the active cells of which they mainly consist to the light and air to the best advantage according to the environment. From the air both absorb the carbonic acid gas which is one of the chief essentials for growth, and by the light, the cells of both are stimulated, and enabled to work up this, and the material obtained through the roots, into the various forms, structural and chemical, peculiar to the plant concerned. In these two respects their functions are alike, and in the course of evolution we consequently find a certain degree of parallelism in the shape, size, and sub-division of the frond and the leaf, some being simple and undivided, like the Hartstongue and Bird's-nest Fern, and the leaves of the Iris or Funkia, others once divided, like the common Polypody and the Acacia, and so on until we reach the finely-cut foliage of Todea superba, on the one side, and the common Milfoil on the other, all with infinite grades and variations between. Despite this similarity, however, it is curious to note how differently similar types are developed. When the buds of trees burst in the spring, we can immediately see that the incipient leaves have been tightly packed within in a small, but perfect form, and these subsequently grow and expand in all directions until they reach full size. The fern frond, however, begins first as a tiny knob, which becomes lifted upon a stalk, and then, by a process of coiling inward and apical growth, i.e., at the point, a rolled-up ball is produced within which the growing points multiply and together, until, in due course, the coiled-up mass loosens and flattens out, expanding as it does so until the full size is attained. Meanwhile, however, the frond will probably have displayed a faculty entirely foreign to the leaf. Without entering here into detail of varied forms of spore bearing, we may say that, as a rule, there will be found on the backs of the frond dots or rows of small excrescences, green at first, but subsequently developing into groups of brown capsules, so small that a heap of several scores would be no larger than a pin's head. These are popularly known as fern seed, but, in point of fact, minute as these tiny capsules are, they each contain some fifty spores or so, and as large fronds may be literally encrusted with such spore heaps the crop is simply all but incalculable. In this faculty of spore bearing the frond is fundamentally distinct from the leaf. The leaf proper performs no direct reproductive function, it merely collects and prepares material to be worked up in that direction elsewhere in the shape of flowers and seed. The frond makes a short cut, as it were, and devotes such prepared material on the spot to the production of reproductive bodies, i.e., the spores. With very rare exceptions, which we may ignore in this connection, the frond, however, can only go part of the way, and cannot produce a fertilised seed. This has to be done by a quite different form of vegetation, which the growth from the spore assumes, a tiny green scale-like growth, which, small as it is, is capable of bearing what are practically pollen grains and embryo seeds, by whose conjunction a fresh fern is engendered. So much for the frond, now let us return to the leaf. The leaf proper, as we have said, has no direct seed-producing powers, these are delegated to the flowers, but, as all flowers are really modified leaves, this simply means that some leaves have been specialised in a most wonderful manner, and in the process have lost all resemblance to their unmodified associates in colour, make, size, and everything else, including vital function. This fact, however, indicating as it does that despite all appearance it is still the leaf which does the reproductive work, dimly indicates that link in the far distant past when the spore bearer in some cases graded into the seed bearer, and thus by bringing in insect agency for fertilisation, gave birth to all our floral wealth of to-day, wild and cultivated. The fern frond, in fact, is a fossilised conservative type of vegetation, which differs in no essential nowadays from its ancestors of the dim and distant Coal Age, it bore its spores then as it bears its spores now, and it is only to its unknown radical members who found a way out of the rut, and led the way to the future domain of Flora, that we are indebted for our fruits, our blossoms, our cereals, and our vegetables.

MR. H. W. ADNITT.
Co-Honorary Secretary of the Shropshire Horticultural Society.

Mr. H. W. Adnitt, as one of the two honorary secretaries of the Shropshire Horticultural Society, occupies a commanding position in the world of horticulture, and his example is one which secretaries of the leading horticultural societies in the provinces may well desire to emulate. For thirty-three years Mr. Adnitt has, in conjunction with Mr. W. W. Naunton, been responsible for the secretarial work of the Shropshire Horticultural Society, and the splendid success that has been achieved is the best possible proof that it has been carried out with remarkable energy and ability. It is not necessary we should give the history of the society, for that is now well known, and the "Shrewsbury Show" has become a household word wherever an interest is taken in the practical aspects of horticulture. This exhibition is the largest of its kind held in the provinces, it attracts horticulturists from all parts of the country, and the general public pour into the Quarry Grounds in their tens of thousands, over 25,000 having passed the turnstiles on the second day in one year when it rained heavily without break from early in the morning until the gates were closed. As a matter of course the society has a strong committee, but the responsibility for carrying out the multifarious details rests upon the honorary secretaries, and in the conduct of their work Mr. Adnitt, in conjunction with Mr. Naunton, has rendered services in the cause of horticulture that it would be difficult to overestimate.

The Rose Arbour, of which we give an illustration on page 643, is of special interest as an object-lesson in the designing of structures intended to serve the double purpose of displaying the beauty of climbing roses and affording welcome shade in hot weather. Erected at the junction of two walks, it gives an opportunity for relieving the formality of the pergola, of which it forms a part, and thereby contributes materially to the attraction of the rose garden. The lightness and elegance of the arbour is well shown in the illustration, and it can readily be seen that ample space has been provided for passing through the four arches without being inconvenienced by the growths of the roses. This latter is to our mind an important point, for it is not pleasant when visiting gardens, on the occasion of social functions or otherwise, to have one's hat ruffled by the branches of the roses, and it must be still more annoying to ladies to have their hats disarranged, or, it may be, considerably damaged by the rose growths, owing to an insufficiency of head-room. In the arbour a height of seven feet six inches has been provided, and this, as proved by results, has been found sufficient to enable visitors to pass under the arches without having to duck their heads to avoid damage to their headgear.

Cannas at Wisley.—A trial of cannas is this season being held by the Royal Horticultural Society for the purpose of determining the relative merit of varieties for the embellishment of the flower garden during the summer, and the trial plot is now one of the most attractive of the several features. The growth is somewhat less luxuriant than would have been the case had the rainfall more closely approached the normal, but they are blooming freely, and the brilliantly coloured flowers produce a fine effect. The collection was examined by the Floral Committee on the 14th inst., and the following varieties received the distinction of three marks XXX. Fürst Wied, a distinct variety, with handsome leaves and large spikes of scarlet flowers; Metore, the spike and flowers finely developed, and the colour rich orange scarlet; L. E. Bailey, very distinct and effective, the spike and flowers large, the latter rich yellow freely spotted with bright red; Elizabeth Hoss, one of the very best of the yellow red-spotted cannas, spikes and flowers are of large size and the colours clear and rich; Dr. Marcus, a handsome variety with bronze-tinted leaves, and bearing large spikes of finely-formed flowers; and William Saunders, a beautiful variety, the flowers large in size and of good form, the colour rich scarlet. The two large span-roof houses devoted to the cultivation of cannas in pots are especially attractive just now, for the finely-grown plants are blooming with great freedom.

Rambling Roses at Stoke Bruern Park.—The gardens of Stoke Bruern Park, the fine seat of B. W. Vernon, Esq., near Northampton, is rich in features of interest to horticulturists and, indeed, to all who appreciate good gardening; but the feature which this year attracted the largest share of attention is that formed by the rambling roses. These elegant and beautiful roses abound on all sides, and pillars, arches, and other suitable supports have been utilised for the display of their charms. Under the skilful management of Mr. W. Batchelor, they are in the most robust state of health, and have grown vigorously and bloomed profusely, and produced a display of colour of great beauty. The fame of these charming gardens for their rambling roses has extended far beyond the immediate district, and, taking advantage of the generous kindness of the owner, over two thousand persons visited the gardens during the three weeks in which the roses were in full bloom.

Gooseberry Mildew in Essex and Kent.—The Board of Agriculture desire to make it known to growers of gooseberries in Essex that the presence of American gooseberry mildew on gooseberry bushes in a plantation in that county has been confirmed. An Order of the Board requires all occupiers of premises on which the mildew exists to report the presence of disease under a penalty of £10. Gooseberry growers are advised to apply to the Board for a leaflet describing the appearance of the disease and giving the precautions that should be taken. Mr. Alderman G. Marsham, the chairman of the Kent County Council, has reported that an area of 700 acres of fruit plantation in the county has been found to be affected with American gooseberry mildew. The committee had applied to the Board of Agriculture for, and had received, an Order authorising the council to require the destruction of bushes in cases where there was an isolated outbreak in a limited area remote from infected premises, and where such destruction might fairly be expected to result in a check of the disease in that district. The Board had also authorised the payment of compensation out of the County Fund in such cases. The Order of the Board gave unlimited powers to order destruction, but the compensation to be given was limited to half of the value of those bushes which were affected, and to three parts where the bushes were merely in the vicinity of others which were affected. He proposed that the Council should accept the Order, it being understood that it was the intention of the committee to act only in exceptional cases. After considerable discussion, the proposition was agreed to.

Herbaceous Phloxes.—These attractive and highly fragrant flowers have had so many noteworthy additions made to them within recent years that the trial now being held at Wisley is of quite exceptional interest. The dwarf varieties have been largely augmented of late, as the result of the activity of the raisers, and the many fine varieties now in commerce enable cultivators to employ phloxes in positions where the taller varieties would be out of place. When the collection was examined by the Floral Committee a few days since, the following received three marks XXX: Andre Michaux, a dwarf variety, with large spikes and finely-formed flowers, the latter soft-pink, with crimson centre; Jules Cambon, purple, with white centre, very effective; Siebold, orange-scarlet, the flowers large and of fine form; Sesostris, rich purple, the flowers large and of good shape; Lady Tweeddale, a beautiful dwarf pure white variety, the flowers produced in large spikes and of superb form; and General Giovanelli, dwarf, the large rich rose coloured flowers finely formed, and the spikes well developed.

A City Rector's Fern Find.—A paragraph is going the round of the Press to the effect that in 1905, when Senior Dean of Sion College, the Rev. P. Clementi-Smith, rector of St. Andrew-by-the-Wardrobe, discovered a little fern growing in the joint of a leaking pipe against the south wall of the building. The fern was removed to his greenhouse, where it thrived marvellously; it was submitted to the Royal Horticultural Society, and "Mr. Clementi-Smith has been notified that the plant is of the bracken family." As the fern has not died down in the winter "it is believed to be a New Zealand variety." We are sorry to dispel the illusion that the fern is a distinct form from New Zealand; but we have had an opportunity of examining the plant, and have no doubt whatever as to it being the common bracken. The retention of the fronds in a green state during the winter is simply due to the growth having been maintained during that season by artificial conditions.

Gentiana asclepiadea is by no means an unknown plant, yet, notwithstanding its distinctness and beauty, it is not plentiful in gardens. Unlike some of the gentians, there are no great difficulties associated with its cultivation, and consequently, those who plant it under fairly favourable conditions have no occasion to fear any apprehension as to the result. As evidence of the vigorous growth made by this gentian, even when associated with strong-growing vegetation, we have only to visit the Royal Horticultural Society's garden at Wisley, where it is producing a series of extremely beautiful effects. In the rock garden, and in the woodland there are many hundreds of plants, the groups in some cases being eight or nine feet across, and these large masses of rich blue flowers are singularly effective. Gentiana asclepiadea grows to a height of about two feet, the shoots are light and graceful, and bear the large campanulate flowers for about one-half their length. It thrives both in the rock garden and the hardy flower border, but when grown in the former it should be planted at the foot of the rocks or on the lower slopes. Sandy loam, to which a liberal addition of leaf-mould has been made, and peaty soils are the best suited to the production of a strong growth.

Co-operative Flower Show at the Crystal Palace.—The Co-operative Flower Show, to be held at the Crystal Palace on Saturday, August 22, in connection with the Coming-of-Age Co-operative Festival, promises to be very successful. Entries are being received from as far north as Northumberland, and there is every prospect of a very good show at the Crystal Palace. In addition to the flower show the programme includes concerts, choir contests, big co-operative exhibitions, dramatic literature performances, athletic sports, and many other attractions.

GRAND SHREWSBURY FLORAL FETE.

Once more we have to record a wonderful display at Shrewsbury, where, in the Quarry Grounds, on Wednesday and Thursday last (August 19 and 20), there were gathered together some of the finest examples of British-grown fruits, flowers, plants, and vegetables ever seen. Very high quality is shown all through the great show, and anyone bringing poor produce is certain to be left out of the prize list. Fruit was once again magnificent, notably the collections; and the big groups of flowering and foliage plants were another great attraction. The sweet peas were a feature, and the non-competitive displays were magnificent. Then there were the vegetables—an exhibition of themselves, and a grand one at that. Grapes were not so good as we have seen them on some occasions. The cut flowers were very fine, and the vegetables we have never seen so fine anywhere, especially in such quantity.

Messrs. Adnitt and Naunton, with a big committee, continue to do the chief work of the show, and they do it well.

GROUPS.

The groups are grand at Shrewsbury Fête, and in the chief class for a group of miscellaneous plants, arranged on a space of 250 square feet, Messrs. J. Cypher and Sons, Cheltenham, won the premier position for about the twentieth time, with a splendid design, in which there was a charming background of palms, bright crotons, and Lilium speciosum. There were the usual corner mounds, and these were of crotons, cattleyas, and golden showers of Oncidium varicosum; this latter, and O. Marshallianum, were interspersed throughout the group, with Vanda cærulea, Lælia majalis, and Miltonia vexillaria. Lilium speciosum served to lighten the display, and the pretty Fuchsia triphylla was effectively used along the front margin. Mr. W. A. Holmes, Chesterfield, secured the second place, and he had some very fine crotons, but fell short in his flowering plants; Mr. Macdonald, gardener to G. A. Kenrick, Esq., Whetstone, Edgbaston, Birmingham, was a close third, with a pretty arrangement, in which crotons and Fuchsia triphylla and Ixora macrothyrsa figured well.

A severe test of skill is the formation of a big group without the use of flowering plants, but at Shrewsbury the 250 square feet groups of foliage plants are not a bit less attractive than the groups wherein flowers are used. First prize was won by Messrs. Cypher and Sons, Cheltenham, with a bright and noble exhibit, consisting largely of single-stemmed crotons, Dracæna Sanderiana, bamboos, Strobilanthes Dyerianus, alocasias, and caladiums lightly arranged over a groundwork of deep green moss; Mr. J. McDonald was a good second with a very beautiful arrangement, in which brilliantly coloured crotons and acalyphas, the selaginellas, dracænas, and Nandina domestica (very bright), were skilfully used; Mr. W. Holmes, Chesterfield, was third.

SPECIMEN PLANTS.

In the big class for fifteen stove and greenhouse plants, Messrs. Cypher and Sons, Cheltenham, was an easy first, with one of the finest sets they have ever put up; they had grand specimens of Erica Eweriana, Statice intermedia, Ixora macrothyrsa, Rondeletia speciosa, Chironia ixifera, Clerodendron Thompsoniæ, Allamanda nobilis, crotons, and palms, and every plant was perfectly developed; Mr. W. Vause, Leamington, came second, and Mr. Manning, Dudley, third. Messrs. Cypher and Sons led for six stove and greenhouse plants, and here again they had grand specimens, their Statice profusa and Rondeletia speciosa major being superb; Mr. Vause was again second.

Chief honours for thirty stove and greenhouse plants, in ten-inch pots, was well won by Messrs. Cypher and Sons, Cheltenham, with a beautiful set of finely-grown examples, their chief subjects being Ixora coccinea, I. macrothyrsa, I. Pilgrimi, I. Williamsi, Chironia ixifera, Clerodendron fallax, Acalypha hispida, and Statice intermedia; Mr. B. Cromwell, gardener to T. Sutton-Timmis, Esq., Allerton, Liverpool, was a good second, and he showed Stephanotis floribunda, Lapageria rosea superba, Clerodendron fallax, Ixora macrothyrsa, and good crotons, all finely grown.

Mr. W. Vause, Leamington, led for six fine foliage plants, and he showed some splendid crotons, but these were all unnamed; Mr. B. Cromwell was a close second, and he also showed some splendid crotons. The best twelve stove and greenhouse plants, in ten-inch pots, came from Mr. T. Lambert, Brogyntyn Gardens, who had a fine set that included Dipladenia amabilis, Allamanda Williamsi, Clerodendron fallax, Rondeletia speciosa, Pancratium amœna, Chironia ixifera, etc. Mr. W. R. Manning, Dudley, was third.

CHAMPION DECORATED FRUIT CLASS.

In the fruit section a considerable alteration was made this year. The decorated dessert table class, and the big grape class, as such, were omitted, and the chief interest centered round the class for thirty dishes of ripe fruit, in not less than ten distinct kinds, to occupy a space not exceeding 12ft. by 4ft. 6in. The varieties and quantities per dish were left to the discretion of the exhibitors, but not more than four varieties of one kind, or two dishes of one variety, were permitted, and only one variety on a dish. Magnificent prizes were offered, the first being a silver cup, valued at twenty-five guineas, with £20 in cash, and a gold medal; second prize, £17 10s., and small gold medal; third prize, £15, and silver-gilt medal; fourth prize, £10; fifth prize, £8; and sixth prize, £5. We should add that the displays had to be decorated with flowers, foliage, or small plants.

There were five competitors, and the coveter premier award fell to Mr. N. F. Barnes, gardener to the Duke of Westminster, Eaton Hall, Chester, who had a magnificent and imposing exhibit of grandly-grown fruits, splendidly set up—a real champion exhibit. He showed four bunches of Muscat of Alexandria grapes, four bunches of Madresfield Court, four bunches of Appley Towers, the latter very fine; Hero of Lockinge, Earl's Favourite, and seedling melons; superb Emperor Alexander, Washington, Cox's Orange Pippin, and James Grieve applies; grand Souv. du Congrès, Doyenne du Comice, Triomphe de Vienne, and Marguerite Marillat pears; beautiful Barrington (two dishes), Princess of Wales, and Royal George peaches; Pineapple (two dishes), Humboldt, and Elruge nectarines; Brown Turkey and Brunswick figs, Jefferson's plums, and Moor Park apricots. Second prize was won by Mr. J. H. Goodacre, Elvaston Castle Gardens, who was a good second, and his was an imposing exhibit, that was the more effective because unusually large dishes were shown; the Emperor Alexander apples, Triomphe de Vienne pears, and Pineapple nectarines were particularly good in this set. Mr. G. Mullins, gardener to G. Farquhar, Esq., Eastnor Castle, Ledbury, third; Mr. James Gibson, gardener to the Duke of Portland, Welbeck Abbey, Notts, fourth; and Mr. R. Dawes, gardener to the Hon. E. F. Wood, Temple Newsam, Leeds, fifth.

COLLECTIONS OF FRUIT.

In the county class for a decorated collection of nine dishes of fruit, nine distinct varieties, not less than five kinds, there were six competitors, and the premier award was secured by Mr. H. Stowe, gardener to C. F. K. Mainwaring, Esq., Ellesmere, with Muscat of Alexandria and Madresfield Court grapes, Dryden nectarines, finely coloured; Dymond peaches, Moor Park apricots, Beauty of Bath apples, a seedling melon, Brunswick figs, and Transparent Gage plums; Mr. Stowe also secured first prize for his decoration of Gloriosa superba, montbretias, and Francoa ramosa. Second prize fell to an unknown (because unnamed) competitor, who had fine Alexandra Noblesse peaches, Lady Sudeley apples, and Williams' Bon Chretien pears; he was third for decorations. Third prize was awarded to Mr. W. Dawes, gardener to Lord Trevor, Brynkenalt, Chirk; and fourth to Mr. J. Mills, gardener to Captain Heywood Lonsdale, Sharington Hall, who was second for decorations.

In the class for the collection of twelve dishes of ripe fruit, florally decorated, the chief award, £10, was won by Mr. W. H. Cooke, gardener to Lord Belper, Derby, with a good set that consisted of Madresfield Court, Muscat of Alexandria, and Alicante grapes, Emperor Alexander apples, Hero of Lockinge melon, Peasgood's Nonsuch apples, Sea Eagle and Barrington peaches, Magnum Bonum plums, Brown Turkey figs, Duchess d'Angoulême pears, and Pineapple nectarines—a very good, well-balanced set; second for decorations. Mr. G. Hall, gardener to Lady Ashburton, Melchet Court, Hants, was second, his best dishes being of Sea Eagle peaches, Pineapple nectarines, and Lady Sudeley apples; third for decorations; the third prize collection came from Mr. J. Jones, gardener to Miss F. Need, Malvern, and he was a good first for floral decorations, and had a fine dish of Duchess d'Angoulême pears.

GRAPES.

In the leading grape class, for twelve bunches, Mr. J. H. Goodacre, gardener to the Earl of Harrington, was first prize winner, winning the new silver cup and £20 with a fine set of clusters, which were pointed as follows: Black Hamburgh (10),8; Muscat Hamburgh (10), 9; Muscat of Alexandria (11), 9; Madresfield Court (10), 9; Muscat of Alexandria (11), 9½; Madresfield Court (10), 8; Madresfield Court (10), 8½; Muscat of Alexandria (very fine) (11), 10; Muscat Hamburgh (10), 8; Muscat Hamburgh (10), 9; Madresfield Court (10), 9; Muscat of Alexandria (11), 10. The figures in brackets denote the possible points obtainable. Mr. Goodacre secured 107 out of a possible 124, and was third for his floral decorations. Second prize was awarded to Mr. G. Mullins, Eastnor Castle Gardens, Ledbury, who secured 97½ points out of a possible 123, and he was first for floral decorations; his Madresfield Court grapes were fine. Mr. T. Wilkinson, gardener to G. A. Gibbs, Esq., M.P., Tyntesfield, Flax Bourton, Bristol, was third, with 96½ points out of a possible 105, and with very heavy bunches. Mr. W. H. Cooke, gardener to Lord Belper, Kingston Hall, Derby, fourth, with 93 points out of a possible 122. It will thus be seen that Mr. Wilkinson's set was of relatively higher value than any of the others, comparing the points obtained with the possible attainment. Mr. Cooke was second for decorations.

The best four bunches of grapes were good regular clusters of Madresfield Court and Muscat of Alexandria, shown by Mr. T. Lambert, Brogyntyn Gardens, Oswestry; Mr. H. Weaver, gardener to C. G. A. Smith, Esq., Raynor Park, Bangor, second, with Black Hamburgh and finely coloured Muscat of Alexandria; Mr. G. Richardson, gardener to H. St. Maur, Esq., Newton Abbott, third. For two bunches of Black Hamburgh grapes Mr. H. Wilson, gardener to J. Brinton, Esq., Moor Hall, Stourport, scored with finely-coloured examples; Mr. G. Richardson, gardener to H. St. Maur, Esq., Newton Abbott, second; and Mr. A. Ruddock, third; twelve entries. Mr. G. Richardson scored for one bunch of Black Hamburgh with a very big cluster; Mr. T. Wilkinson, gardener to G. A. Gibbs, Esq., M.P., Tyntesfield, Bourton. Salop, second; eighteen entries. For two bunches of black grapes Mr. S. J. Baker, gardener to Sir D. D. King, Bart., Exeter, scored with pretty bunches of Mrs. Pince's Black Muscat; Mr. H. Butcher, gardener to Sir W. Cooke, Bart., Ledbury, second with Madresfield Court. For Madresfield Court, two bunches, Mr. G. H. Hall, gardener to Colonel F. Hayhurst, Middlewich, scored, and Mr. T. Wilkinson, Tyntesfield Gardens, Bourton, second. First prize for Alicante grapes was won by Mr. J. Jones, gardener to Mrs. F. Need, Malvern; and Mr. A. H. Hall came second. In the open class for two bunches of any other black grapes Mr. G. Mullins, Ledbury, scored with Gros Maroc, and Mr. A. H. Hall was second with Black Duke, a big, round-berried variety.

Mr. J. H. Goodacre, gardener to the Earl of Harrington, Elvaston Castle, Derby, led for two bunches of Muscat of Alexandria, but there were no first-class bunches in the whole competition; Mr. A. H. Hall second, and Mr. G. Richardson third. For one bunch of White Muscats Mr. T. Wilkinson led with the best Muscat bunch in the white class; Mr. J. H. Goodacre second, and Mr. J. T. Curtis, gardener to Sir W. H. Davies, M.P., Stoke Bishop, Bristol, third. In the any other white class Mr. A. Child, gardener to H. A. Attenborough, Esq., Daventry, was first, with splendidly berried Duke of Buccleuch; Mr. A. H. Hall second with Chasselas Napoleon.

In the county classes the best two bunches of Madresfield Court grapes came from Mr. J. Mills, gardener to Captain H. Lonsdale, Shavington Hall, who had rather small, but finely-coloured clusters; Mr. J. Lambert, Brogyntyn, Oswestry, second. For a pair of bunches of black grapes Mr. J. Langley, gardener to the Rev. T. M. Bulkeley Owen, West Felton, led with Gros Maroc, and Mr. H. Stone, gardener to F. K. Mainwaring, Esq., Ellesmere, came second with the same variety.

Mr. W. Dawes, gardener to Lord Trevor, Brykinalt, Chirk, scored for White Muscats with heavy, clean bunches, and was followed by Mr. T. Lambert, gardener to Lord Harlech, Brogyntyn, Oswestry. For a brace of bunches of any other white grape Mr. J. Mills led with small clusters of Duke of Buccleuch, and Mr. G. Davis, gardener to Mrs. F. Alderson, Frankton, came second with Buckland Sweetwater. In the amateurs' classes for grapes Mr. H. Turner, Wellington, led for a black variety, and Mr. E. C. Peele, Cyngfelde, Shrewsbury, led for a white variety.

OTHER FRUITS.

In the various single dish classes for fruits the first prizes were awarded as follows: Mr. G. Mullins, gardener to G. Farquahar, Esq., Eastnor Castle, Ledbury, for cherries, Bigarreau Napoleon; Mr. T. Cooke, gardener to J. Drakes, Esq., Market Rasen, for red plums; Mr. A. Searle, gardener to the Marquis of Northampton, Castle Ashby, Northampton, for Gage plums, with Oullin's Golden Gage; Mr. Langley for yellow plums; Mr. Cook for a white-fleshed melon, with Sutton's Royal Favourite; Mr. Durnell, gardener to R. G. Kenyon, Esq., Pradoe, for a scarlet-fleshed melon, unnamed; Mr. J. Durnell for a green-fleshed melon, with Early Favourite—there were forty-four melons in competition: Mr. H. G. Pritchard, gardener to Major Lloyd, Leaton Knolls, for apricots; Mr. G. Hall, gardener to Lady Ashburton, Romsey, Hants, for nectarines, with deeply-coloured examples of Pineapple; Mr. Pritchard for peaches, with Bellegarde in good condition, but there was nothing extraordinary in the peach class.

FLORAL DECORATIONS.

The bouquet classes are always a splendid feature at Shrewsbury, and this year the old high quality was well sustained. For a bride's bouquet and two bridesmaids' bouquets, Messrs. Felton and Son, Hanover Square, London, W., won the chief award with a bouquet of white phalænopsis, odontoglossums, and pure white Cattleya intermedia, beautifully associated, and bridesmaids' bouquets of blush carnations; second prize fell to Mr. J. E. Knight, Wolverhampton, who used odontoglossums and Enchantress carnations; third prize was won by Messrs. Bottomley and Burton, Elland, Yorks. The best bride's bouquet was adjudged to be a moderate design in orchids, from Mr. H. G. Garner, Altrincham, Messrs. Bottomley and Burton coming second. Mr. Garner led for a hand bouquet with a very bright arrangement of cattleyas, odontoglossums, Oncidium macranthum, etc.; Mr. A. Adstead, Gatley, second; and Messrs. Bottomley and Burton third. For an orchid-excluded bouquet, Mr. Garner was awarded a second prize, but Messrs. Felton and Son were easily first with Marmion and Enchantress carnations. For a dahlia bouquet, Mr. W. Treseder, Cardiff, was, as usual, the premier prize-winner, with a charming design; Mr. Garner second, and Messrs. Pope and Sons, King's Norton, third.

Messrs. Gunn and Sons, Olton, Birmingham, led for a floral harp with a design having a foundation of white asters, with Cattleya Loddigesi, odontoglossums, and cypripediums grouped at the base and top; Mr. W. G. Garner second, and Messrs. Felton and Son third, the latter using Vanda cœrulea effectively, but a little too freely over the white ground. The floral crosses were not a success; Messrs. Gunn and Sons, Olton, were first, Mr. W. G. Garner second, and Messrs. Pope and Sons third. For a featherweight bouquet, Mr. H. Blankway, gardener to Sir A. Muntz, Bart., M.P., Dunsmore, was first, with a design in Cattleya Loddigesi and Oncidium flexuosum; Messrs. Felton and Son second. Messrs. Felton and Son led easily for a floral wreath, with a splendid design in white asters, Cattleya Mossiæ, and Lælio-cattleyas.

The best basket of flowers was a bold one of various orchids, set up by Messrs. W. G. Garner; Mr. O. Robinson, Alderley Edge, second, also with orchids. In the orchid-excluded class, Messrs. Felton and Son led with a long basket of Abel Chatenay roses of perfect colour; Mr. O. Robinson second with anthuriums and francoa spikes. In the epergne or stand class, Mr. O. Robinson was placed first for honeysuckle and Gloriosa superba flowers; Mrs. E. Bird, Newport House, second, with a poor design of pink and red carnations.

There were sixteen table arrangements of sweet peas, Mr. J. Nixon, Alderley Edge, winning with pink flowers, and Mr. A. T. Herbert, Acocks Green, coming second with a similar design, and Mrs. W. Marple, Penkridge, third. In a class for other flowers, Mrs. J. Nixon was again first, this time with gloriosa flowers and francoa sprays; Messrs. Deakin, Hay Mills, second, with sweet peas and francoa sprays.

SWEET PEAS.

Sweet peas filled a whole tent with beauty and fragrance. Mr. J. Haycocks, Wrexham, led in one class for six vases, with fine examples of Henry Eckford, John Ingman, Frank Dolby, etc.; Mr. F. Eaze, Bicton, second. In the trade-excluded class for twelve varieties, Mr. T. Jones, Bryn-penylan, Ruabon, was a good first with Helen Lewis, Evelyn Hemus, Menie Christie, Mrs. C. Foster, Miss Millie Maslin, White Spencer, Nancy Perkins, Mr. Henry Bell, John Ingman, Constance Oliver, Prince of Asturias, and Elsie Herbert; Mr. G. Wilkins, Endit Park, second; there was a grand competition here. In the class for eighteen varieties, provided by Mr. H. Eckford, there was also a close competition, and here Mr. Thos. Jones was again first, winning the cup with splendid flowers of Henry Eckford, St. George, The Marquis, Countess Spencer, Queen Alexandra, Jas. Grieve, Prince Olaf, etc.; Mr. G. Wilkins second, and Mr. E. Jones, gardener to G. H. Robertson, Esq., Gresford, third. For twelve varieties, Messrs. Bakers' class, Mr. T. Jones was once more to the fore, closely followed by Mr. G. H. Banks and Miss T. Arbuthnot, Newtown.

Mr. T. Jones had the best bunch of Sutton's Queen, Mr. Banks coming second, and Mrs. Arbuthnot third.

In Mr. R. Sydenham's class for twenty-four bunches of sweet peas, the competition was again very keen, and here Mr. Thos. Jones added one more to his many premier wins.

VEGETABLES.

Vegetables were grandly staged, and when we state that Mr. E. Beckett won three firsts and the championship prize, it may be taken that the vegetables were good.

Mr. Edward Beckett, V.M.H., gardener to the Hon. Vicary Gibbs, Aldenham House, Elstree, Herts, won the chief award in the society's class for nine kinds of vegetables, with superb specimens of Early Autumn Giant cauliflowers, Quite Content peas, Ailsa Craig Onions, Duke of York tomatoes, Goldfinder potatoes, Superb Pink celery, Perfection carrots, Exhibition runner beans, and Holborn Model leeks; Mr. J. Gibson, gardener to the Duke of Portland, Welbeck Abbey, Notts, second; and Mr. J. Hudson, Leicester, third.

The leading prize-winners in the classes provided by Mr. Sydenham were Mr. S. Baker, gardener to Sir D. Duckworth King, Exeter; Mr. W. H. Jones, Newtown, Montgomery; Mr. E. Deakon, Birmingham; Mr. H. Taylor, gardener to Lord Hatherton, Penkridge, Staffs; Mr. Durnell, gardener to R. Ll. Kenyon, Esq., Oswestry; and Mr. Walker, gardener to Sir W. Honeyman, Whitchurch. In the county class, Mr. J. Cook, gardener to W. J. Levett, Esq., Orleton Hall, was first, and Mr. J. Mills, Shavington Hall Gardens, second.

In Messrs. Webb and Sons' class for nine kinds of vegetables, Mr. Beckett was a splendid first, his onions, leeks, and cauliflowers being extraordinarily fine; Mr. J. Dymock, gardener to G. D. Faber, Esq., C.B., M.P., Wallingford, Berks, second; and Mr. A. Searle, Castle Ashby Gardens, third. Mr. T. Sanderson, Whittington, led in the class for six kinds, provided by Mr. Edwin Murrell, and Mr. J. H. Pugh, Newtown, was second.

Messrs. Sutton and Sons' prizes were keenly competed for, and here Mr. Beckett was to the front with grand produce, his onions, Perfection tomatoes, Best of All runner beans, and Solid White celery being superb; Mr. J. Dymock second, and Mr. Jas. Gibson, Welbeck Gardens, third. For Messrs. Richard Smith and Co.'s prizes, Mr. W. Gaiger, gardener to H. T. Tatham, Esq., Elstree, was the leading prize-winner, staging fine produce.

Messrs. J. Carter and Co.'s prizes were also keenly competed for, and here Mr. J. Dymock scored with a splendid lot of produce, showing the Holborn specialities; Mr. B. Ashton, gardener to the Earl of Lathom, Ormskirk, second; and Mr. A. Searle, Castle Ashby Gardens, Northampton, third.

MEDALS AND AWARDS TO NON-COMPETITIVE EXHIBITS.

Large Gold.—Mr. Amos Perry, Messrs. W. Cutbush and Son, Messrs. A. Dickson and Sons, Lim., Messrs. Clibrans, Messrs. Sutton and Sons, the King's Acre Nurseries, Lim., Messrs. E. Webb and Sons, Messrs. Bakers, Wolverhampton.

Small Gold.—Messrs. T. Rivers and Son, Messrs. W. Artindale and Son, Messrs. Hobbies, Lim., Messrs. Dobbie and Co., Messrs. H. Jones and Sons, Lim., Mr. E. Murrell, Messrs. Geo. Bunyard and Co., Messrs. Gunn and Sons.

Silver-Gilt.—Messrs. R. Wallace and Co., Messrs. Hewitt and Co., Mr. John Forbes, Mr. Robert Bolton, Mr. Henry Eckford, Messrs. Dicksons, Chester, Mr. A. Myers, Mr. Isaac House, Messrs. Kelway and Son, Messrs. Jarman and Co., Messrs. Hugh Low and Co., Mr. Thos. W. Darlington.

Silver.—Mr. Frank Lilley, Mr. V[illegible] Slade, Messrs. Webb and Brand, Mr. John Smellie, Messrs. W. and J. Brown, Mr. [illegible] Thorpe, Messrs. Dickson and Ro[illegible], Messrs. Robt. Sydenham, Lim., Miss [illegible] Thompson, Mr. Wm. Angus, Mr. Geo. [illegible] Messrs. Tom B. Dobbs and Co.

Bronze.—Mr. H. N. Ellison, Messrs. [illegible]chard and Sons, Mr. W. L. Pattison, [illegible] Sankey, Esq., Messrs. G. Stark and Son[illegible]

Award of Merit.—Thos. Taylor, [illegible]dale, Martin, Blackpool. For a [illegible] antirrhinum, to Mr. C. H. Herbert, A[illegible] Green; for perpetual-flowering pink Pro[illegible] to Mr. P. Blair, Trentham Gardens, Sto[illegible] Trent; for white carnation, Mrs. Tom C[illegible]waite; to Messrs. Kelway and Son, [illegible]olus, Golden Measure; and to Messrs [illegible] and Co., for cactus dahlia Sentinel.

*** We are compelled to leave o[illegible] sections of the report devoted to cut [illegible] general plant classes, and non-com[illegible] exhibits until our next issue.

NOTES FROM KEW.

Campanula pyramidalis.

The Chimney campanula, which, according to the books, was introduced into this country as long ago as 1596, furnishes a very attractive feature, both in the greenhouse No. 4, and also in the Temperate House. In both places large masses of the ordinary blue-flowered form and its white variety are employed, and not only do they make a goodly show, but a distinct and lasting one.

Campanula Vidali.

This member of the Canterbury bell family is totally distinct from the preceding, indeed, it is, as far as I know, widely removed from any other of the campanulas. It is of a quite shrubby habit of growth, forming, as it does, a stout, erect stem a foot or thereabouts in height. From the upper part of this stem are pushed out numerous wide-spreading branches, which ultimately reach a height of 2 to 3ft. The upper portion of each branch is elongated into a flower spike, which is furnished with very distinct and striking blossoms. Individually, they are of an elongated bell shape, drooping, and of an ivory-white colour, with a yellow marking at the base of the interior. The flowers are unusually thick and waxlike in texture, and remain fresh for a considerable time. For the embellishment of the greenhouse during July and August it is particularly valuable, and for such a purpose it has long been employed at Kew, but is rarely seen elsewhere. Seeds are readily produced, and from these young plants can be raised in quantity. Cuttings do not strike root very readily, and, even when rooted, they often fail to grow in a satisfactory manner, but seedlings give very little trouble. Campanula Vidali is a native of the Azores, and has been in cultivation for over 50 years, but it is very seldom met with, certainly not so often as its merits entitle it to be.

Lilium sulphureum.

This lily from Upper Burmah has proved to be more amenable to cultivation in this country than some other species from the same quarter of the globe. In some districts it has proved to be hardy, but at Kew it is seen at its best when given the protection of a greenhouse. Planted out in a bed there it has pushed up many stems to a height of 10ft. or thereabouts, and they are just now terminated by several long trumpet-shaped blossoms, of a beautiful pale yellow tint and agreeably scented. Though the above is the correct name, this lily is sometimes met with as Lilium Wallichianum superbum.

Stigmaphyllon ciliatum.

This, the Golden Vine of our cousins across the Atlantic, is flowering very freely in the intermediate portion of the T range, and as a climber for such a structure it would be hard to beat. It is a native of Brazil, from whence it was introduced in 1796. For all this, it is by no means common, though its name is generally to be met with in nurserymen's catalogues. It is a quick-growing climber, whose slender shoots are clothed with oppositely-arranged leaves, cordate at the base, and furnished with numerous hairs on the edges. The flowers, produced in umbels of three to six from the axils of the leaves, are bright yellow in colour, from 2in. to 3in. across, and at a first glance, suggest the blooms of one of the larger-growing oncidiums. This stigmaphyllon is a plant of easy propagation and culture, the main thing being to keep the leaves free from red spider.

Ixora macrothyrsa.

In the same structure as the preceding this ixora is bearing several huge heads of its bright crimson flowers. Exception is often taken to some of the varieties of ixora on the ground that they resemble each other too closely, but this cannot be urged against I. macrothyrsa, as there is no other which can be for one moment confounded with it. A synonym still used at times is Ixora Duffi.

Begonia Kewensis.

This very pretty begonia, raised at Kew, was given an award of merit by the Royal Horticultural Society on July 21 last. It is of a slender, drooping habit, with a profusion of white flowers, and in the Temperate House, treated as a basket plant, is very effective.

Dendromecon rigidum.

This shrubby member of the poppywort family is flowering freely on the wall of the herbaceous ground, the plant itself being apparently very happy in its surroundings, though complaints as to non-success in its culture are often heard. A well-drained soil and a warm, sunny spot suits it best. It forms a freely-branched bush from 3ft. to 4ft. high, but more where protected. The leaves are broadly lance-shaped, and of a distinct glaucous green hue, while the flowers, a couple of inches or a little more in diameter, are of a lovely clear yellow tint, with orange-coloured anthers. A succession of flowers is kept up for a long time.

K.

A LIGHT AND TASTEFUL ROSE ARBOUR, AT THE COTTAGE, BRENTWOOD.

DAFFODIL CULTURE IN FIBRE.

Daffodils are so highly appreciated by the majority of flower lovers for beautifying indoor apartments early in the year, that in referring to their cultivation for this purpose there is not much occasion for dwelling upon their charms with a view to promote an extension of their culture. There are, of course, many homes in which pot or vase-grown specimens are wanting at the period when the season of winter with its dulness and discomfort is passing into that of spring, and it is therefore necessary to suggest the desirability of increased attention being given to growing them in the dwelling-house. The beauty of the daffodils is acknowledged, and the soft shades of yellow of their flowers and the glaucous green of their foliage seldom fail to harmonise with the decorations of the room, and there is no odour to render their presence objectionable in rooms of small size, even to the most sensitive of persons. These are strong recommendations, and to a considerable section of the flower-loving community it will be of interest to know that the bulbs of a considerable number of varieties possessing much beauty are inexpensive, and that their culture in pots and vases is of the simplest. If fibre, to which moderate proportions of broken shell and charcoal have been added, is used instead of the ordinary compost, their cultivation will be cleanly as well as simple, and wholly free from the risk of carpets and furniture being injured by water.

The chief point in commencing the growth of daffodils in fibre is to select varieties that thrive with a restricted root run, bloom comparatively early, possess beauty of a high order, and are withal cheap. Fortunately, the varieties that comply with these conditions are so numerous as to afford a wide range for selection. A few of the varieties suitable for growth in fibre will, however, suffice, experience having shown the importance of limiting the selection to a few of the very best and to grow a considerable number of bulbs of each. This practice not only facilitates attention to the few cultural details, but is a great aid in the production of tasteful effects.

NARCISSUS BARRI CONSPICUUS.
Grown in Fibre and Shell.

The trumpet varieties include several of great value, and from these should be selected Emperor, a bold and handsome variety, with rich yellow flowers; Golden Spur, also with large and effective flowers of a bright golden hue. Excelsior is similar to Golden Spur, but deeper in tone, but is about twenty-five per cent. dearer; Henry Irving, a handsome bright yellow flower, that, like the preceding, is early in flower production. The best of the bicolors are Empress, Horsfieldi, and Victoria, all of which are early, succeed in fibre, and are handsome in appearance. They bloom in the inverse order to that in which the names are arranged, and potted at the same time and grown under the same conditions, they will form an admirable succession. Princess Ida is, perhaps, the best of the inexpensive white trumpets, and a few vases filled with it will give a welcome change. Narcissus Johnstoni Queen of Spain is an exquisitely beautiful trumpet variety, the flowers of medium size, with an elegant trumpet and recurving perianth segments, the colour soft clear yellow. One of the best for fibre culture, Telamonius plenus, can also be recommended; it blooms early, and the large double golden flowers are effective in colour, but they are less as compared with those of the single varieties.

The Incomparabilis section includes several varieties well suited for the method of cultivation under consideration, but Sir Watkin stands out so prominently as to merit the strongest recommendation. From the Barri section should be selected Barri conspicuus, a strong-growing and attractive variety that has the additional merit of being exceptionally low in price, and of special value among the forms of the Poet's narciss is Ornatus, which has large pure white flowers, with scarlet-margined cup. The bunch-flowered or polyanthus narcissi can be grown with much success in fibre, but the flowers are strongly scented, and in rooms their odour may be objectionable to some. Much preferable for indoor decorations are the Poetaz varieties, which originated from crosses effected between Narcissus poeticus and the polyanthus narcissi. The flowers are large, finely formed, have a pleasing fragrance, and are borne in clusters of three or four. Elvira, white, with yellow cup, and Jaune à Merveille, primrose, with yellow cup, are two of the best.

Having made a selection and dispatched the order for the bulbs, the next points for the cultivator to consider are the receptacles in which they are to be grown and the preparation of the fibre. The earthenware vases—so generally used for placing pots in when plants are used for indoor decorations—are admirably adapted for the method of culture under consideration, as there is to be no drainage or holes in the bottom to allow the water to escape. There is room for the exercise of taste in the selection of the vases, but it may be useful to suggest that a plain design is preferable to one of a highly ornate character, and that strong colours should be avoided. Daffodils appear to the greatest advantage when the vases are dull brown or dull brownish-green, as in these hues there is nothing to clash with flowers or leafage. The vases may range from six to eight inches in diameter, and the number of bulbs put in each must be determined by the diameter of the vase and the size of the bulbs. For the smaller size three or four large, and five or six small bulbs will be suitable, while for the larger size six or seven large bulbs, and from eight to twelve small bulbs will be good numbers.

Either cocoanut-fibre refuse or prepared moss fibre may be used, as the daffodils flourish in both. Care must be taken to well separate the fibre, so that it will form a smooth, even mass, and then to well moisten it without making it excessively wet. When this detail has been carried out crushed shell should be well mixed with the fibre in the proportions of one to five. In filling the vases put a layer of medium-sized pieces of charcoal in the bottom, and then fill them to about one-half or two-thirds of their depth with the fibre. Upon this arrange the bulbs at equal distances apart, and then fill in the spaces between them with more of the fibre. This should be pressed moderately firm, and when all is complete the points of the necks of the bulbs should be just visible above the surface. Until the new growth commences the material must be maintained in a moderately moist state, and subsequently the water supply must be increased, but at no time should the supply be so liberal as to cause water to stand in the bottom of the vase. If this should be found to be the case lay the vases on their sides for a time, and in such manner as to ensure it draining away. A large cupboard or a cellar will afford suitable quarters until growth shows signs of activity, when they should be removed to the windows or other light position, and there remain until the flowers are developed. Where a cool glass structure is available it should be utilised, and the vases be placed near the glass, and be protected from frost. A small greenhouse will greatly facilitate the preparation of a stock of fibre-grown daffodils, but very satisfactory results can be obtained when they have to be wholly grown in the dwelling-house. The illustrations given herewith of vases of Emperor and Sir Watkin are evidence of this. L. A.

ANEMONE ALPINA AND ITS ALLIES.

The anemones of the alpine group share with most white-flowered Ranunculaceæ the distinction of being refined and attractive, and albeit some are a little difficult of management, their great charm strengthens one's resolve to overcome cultural disabilities and find for them conditions they need. Here, as in so many cases where repeated failures are recorded, a greater measure of success is secured if quite young plants form the colony. Collected plants, shorn of roots, and shipped to this country, do not thrive unless a year's nursing in a frame follows importation, and even then a strong seedling will outstrip them in the race, and as certainly outlive them.

Where one or two specimens only are grown it is less troublesome to secure established plants in pots any time during spring and early summer, but where wanted in quantity for furnishing broad areas of rockery in their own inimitable way, raising from seeds will prove quite successful and easy if fresh seeds are obtainable. The seeds of most alpine anemones are quite ripe by midsummer, and we can recommend sowing in boxes directly they are secured or gathered, using screened road grit and turfy loam as a compost, placing the seed boxes on the shady side of a fence for the winter without protection of any kind. Germination follows the first heavy snowfall, and as soon as the seedlings begin to show the boxes should be placed in a warm frame to encourage more seeds to germinate, and the growing plants to strengthen. Water only on sunny days, or many seedlings will "damp." They must grow on in the seedling boxes for a year, transplanting in the following April to a cool and shady border, giving a root run of road grit and loam as before. They may remain here till judged strong enough to take care of themselves in the rock garden. A careless, but still efficient, way of sowing is to scrape away the soil from a boulder's base and sow there "on natural lines"; the fittest that survive the seedling stages often repay this slight trouble by growing stronger than transplanted specimens ever do.

Anemone alpina is in many respects the best plant of its group. Established specimens often exceed two feet in height, and yield sheaves of white flowers two inches across, the centres occupied by striking anther clusters, and the reverse of the petals is tinted with blue. Although a common alpine, widely distributed throughout Southern Europe, it is rare one meets with thriving colonies in English gardens, and several square poles covered with this plant in full flower was one of the surprises of a Scottish tour in 1906. Its elegant ferny foliage, silky in appearance, and to the touch, is a study always when grouped in association with the grey of boulders. High alpine forms—densely hairy and of low growth—do not reach the stature under cultivation the plants from the lowland pastures reach; they are more attractive, however, and more typically alpine.

A. decapetala, from North America, very closely resembles a refined sulphur-yellow buttercup in its flowers. Its leafage is vigorous and particularly handsome, but the flower petals are too short, and are half hidden by the large anther cluster. It grows readily at a boulder's base, and on the shady side, and has been effectively used to furnish the ground under thin flowering trees and shrubs usually planted in rock gardens.

A. narcissiflora is a very characteristic plant, and abundantly distinct from others of its group. The flowers are clustered, as in polyanthus narcissi, and erectly held. They are white, with yellow anther clusters, and when produced in quantity from old-established clumps are exceedingly attractive. It likes a firm soil of a gritty description, insomuch that the margins of a gravel walk are preferred to rich vegetable soil. It is a lovely alpine of rare beauty, the European forms being less tall, but more refined, than forms from the Pacific coast ranges. Occasional groups of A. narcissiflora are to be found at the London shows in May and June.

A. polyanthes, from the Himalayas, is a rare plant in gardens, but not at all difficult to manage. The foliage is very robust, and of silky sheen, recalling some of the geraniums. The flowers are pure white, aggregated into umbels, simple and compound, and sometimes in tiers of three. It exceeds two feet in height and diameter, and when fully in blossom is a very fine plant indeed. A cool root run and a gritty but strong soil, summarises its needs. It is a native of one of the wettest spots on earth—Sikkim to Kashmir—and if planted in the rock garden should have cool and moist positions approaching the bog or marsh. Finally, and in many respects the most fascinating of all alpine anemones, comes the European.

A. sulphurea, by many cited as a form of A. alpina, and although not markedly distinct from that species, save in the colour of its flowers, it is not so easily grown, and the root conditions are different. A. alpina is a limestone plant, varying considerably in stature. A. sulphurea is more uniformly tall, and it does not grow on the limestone formation. Culturally also, A. alpina survives drought that destroys A. sulphurea. It has stouter roots; those of A. sulphurea are easily ruptured, and young plants are formed in quantity if the central crown is cut out. The flowers of A. sulphurea are markedly beautiful—a clear sulphur yellow, with the burnished petal of the buttercup internally, and the silky down of the pasque flower externally. G. B. Mallett.

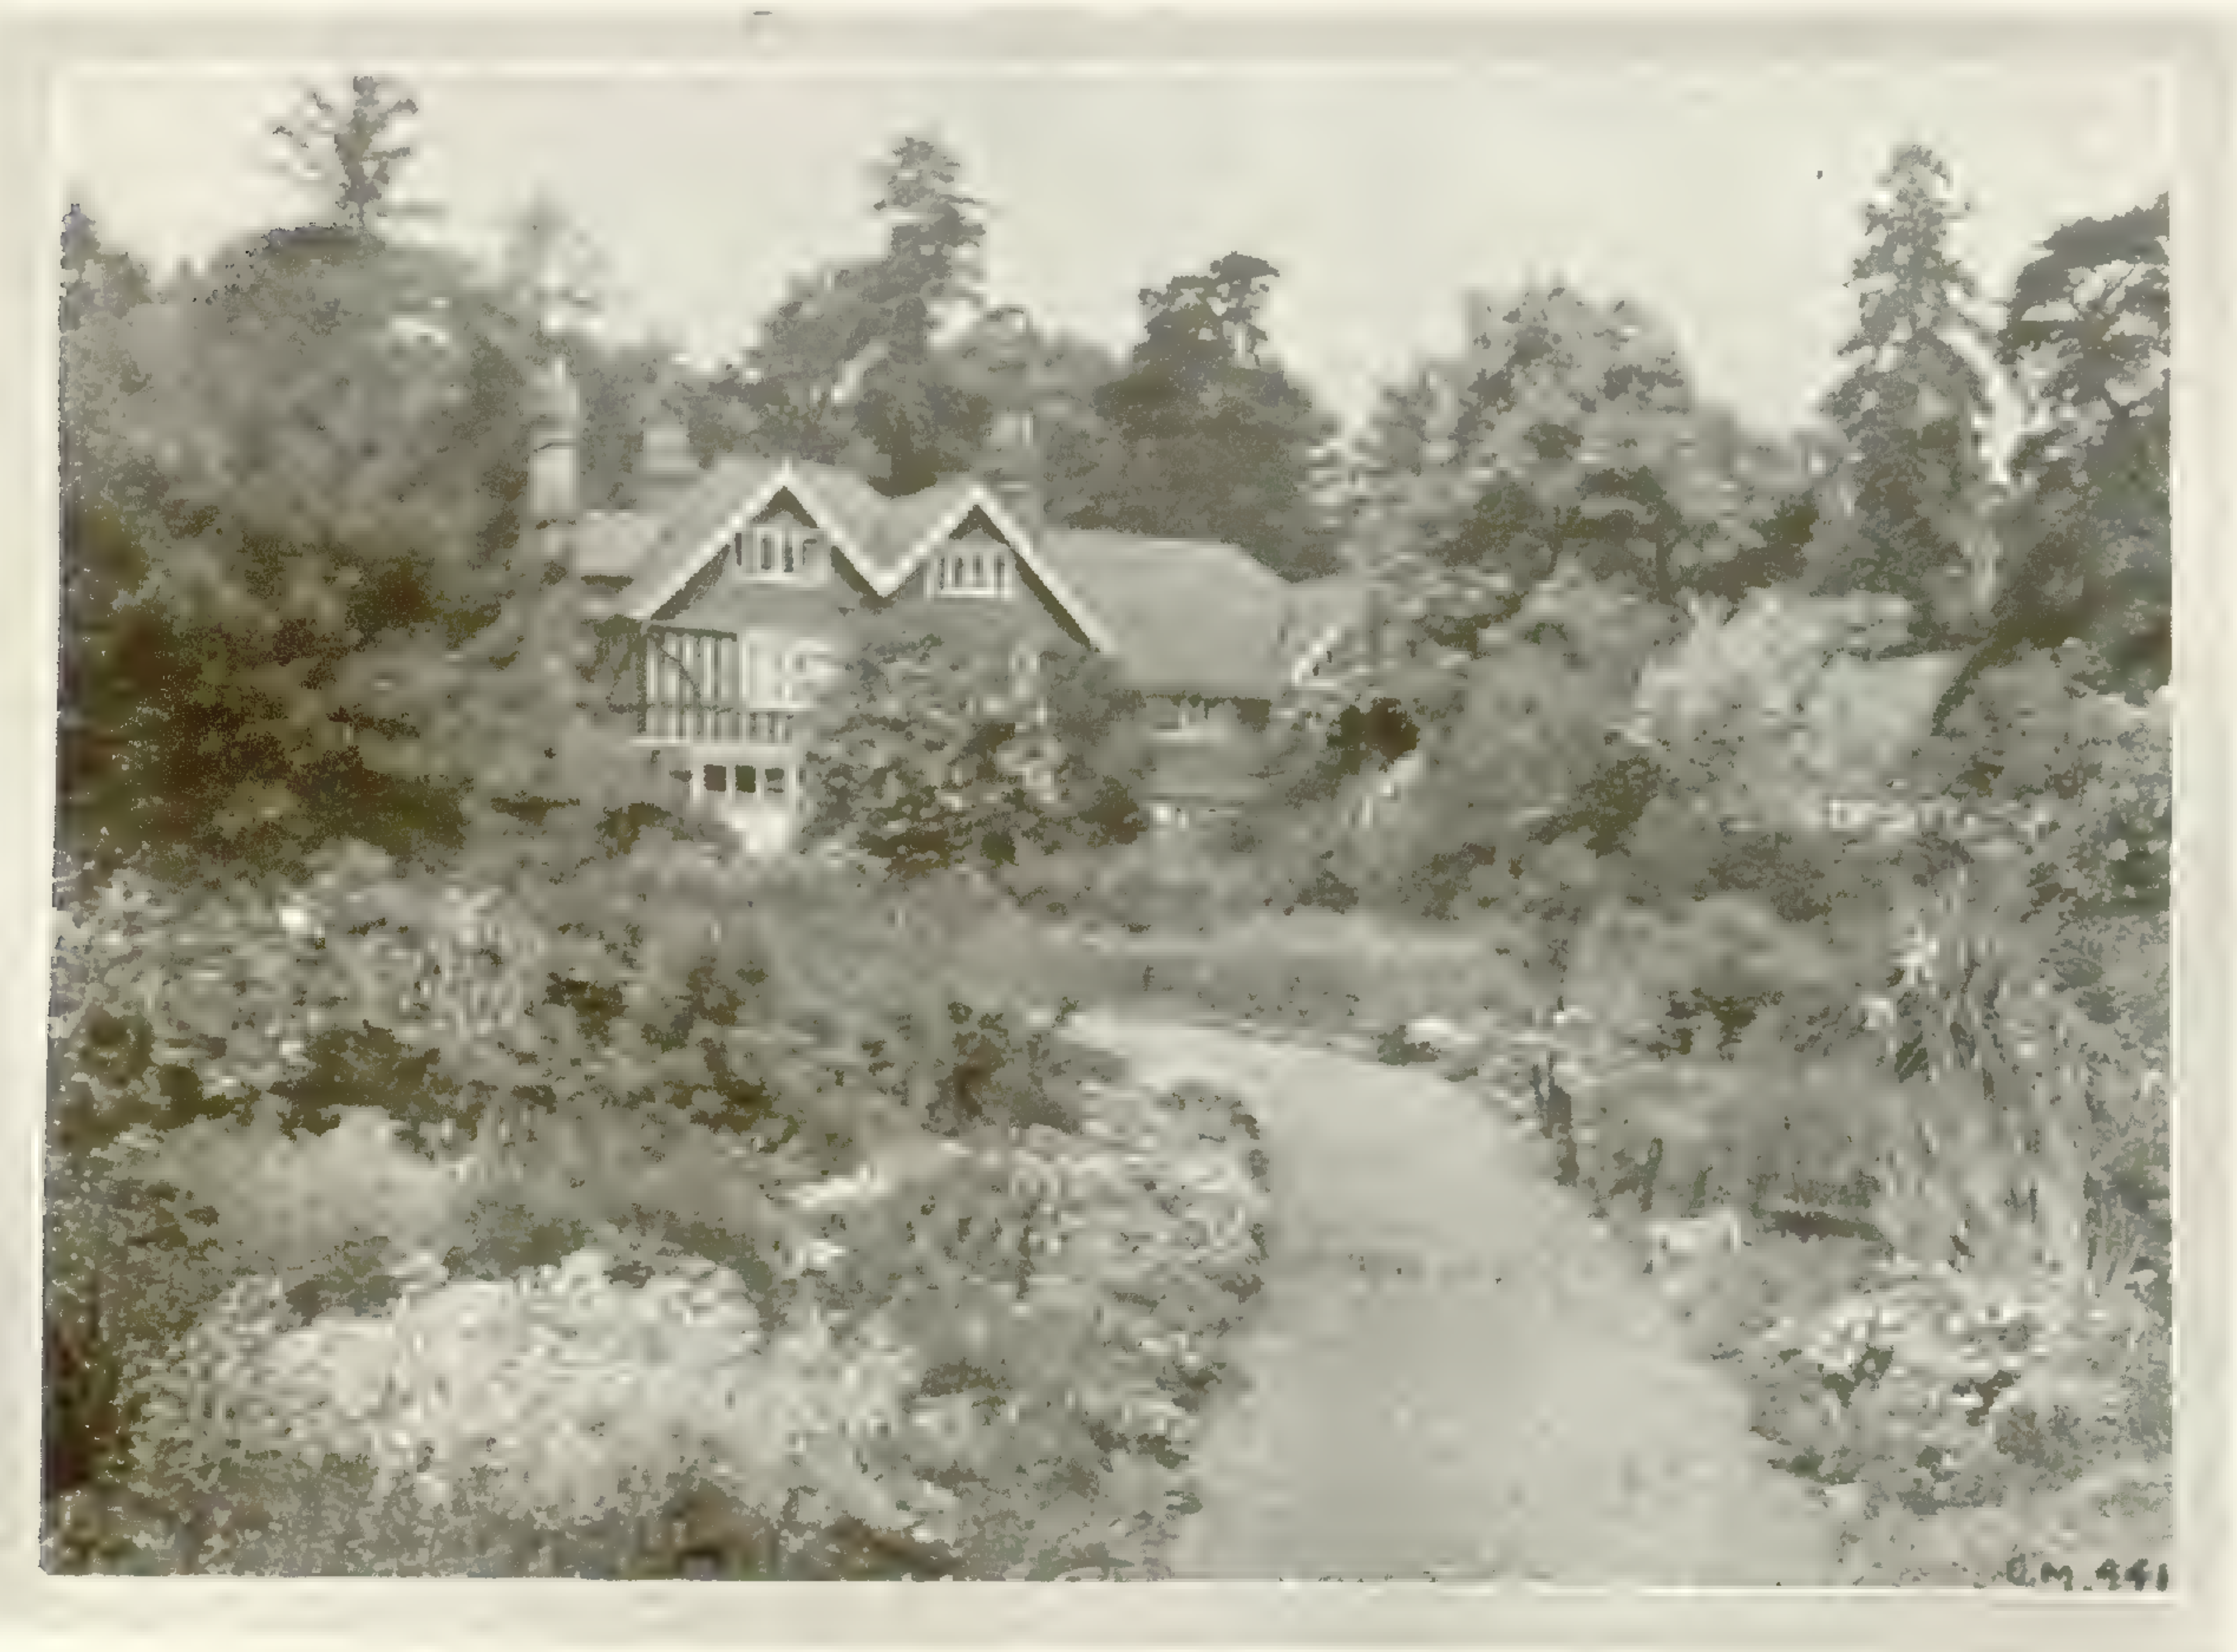
NARCISSUS SIR WATKIN.
Grown in Fibre and Shell.

A BEAUTIFUL AND INTERESTING GARDEN.

Gardens are of many kinds, and he would be a bold, if not an unwise man who would impose upon himself the task of determining which of the several types is the best. There are large and small gardens, formal and natural gardens, and there are gardens in which effects of the spectacular order are aimed at, and gardens wherein an endeavour is made to provide a home for as large a number as possible of plants remarkable for their beauty and interest. Each has some feature capable of arresting attention, and giving pleasure, provided care has been taken in designing and planting to satisfy the principles of good taste. Moreover, the views of the owners are important factors in determining the relative merits of gardens having different characteristics. One can without much difficulty and without the risk of giving rise to a controversy on the planning of gardens, state which of the many kinds is preferred. If there is no objection to engaging in a controversy one may endeavour to induce other garden-lovers to accept his views and follow in their work on the same lines as himself. I have no intention of expressing an opinion as to which is the best. I should not, of course, hesitate to say which would be the best style to adopt under a certain set of conditions, but that it need hardly be said would be a very different matter to dealing with the question in the abstract.



THE HOLT, THE RESIDENCE OF A. KINGSMILL, ESQ.

While able to enjoy to the full the attractions of the formal garden and the charms of the garden in which an endeavour has been made to imitate Nature, the gardens which give me the greatest pleasure are those containing a judicious selection of plants that have been so arranged as to display their distinctive charms to the best advantage. Hence a recent visit to the gardens of The Holt, Harrow Weald, the residence of A. Kingsmill, Esq., gave me an immense amount of pleasure, for therein are large numbers of hardy plants remarkable for their rarity and beauty, and also for the judgment evinced in their arrangement. The garden in no sense resembles part of a botanical establishment, but in a leisurely examination of rock garden and herbaceous border and of the arborescent features, one meets with subjects well-nigh innumerable that are not frequently met with in private gardens. This is largely explained by the fact that Mr. Kingsmill has a strong affection for hardy subjects suitable for garden adornment, and is thoroughly acquainted, not only with those well known, but with many that have not obtained the attention of the general body of cultivators. Not less interesting is the fact that he is personally acquainted with every one of the occupants in his extensive garden, and can at once locate any particular kind, and give its history, or such part of it as may be necessary at the moment. Some are the gifts of friends, many have been collected by Mr. Kingsmill in the course of his travels in various parts of the world, and there is hardly a fact connected with them that he cannot at once give; but should his mind require refreshing, he can at once refresh it by reference to his admirable card index.

Harrow Weald is, perhaps, one of the most delightful spots within twenty miles or so of the Metropolis, and is by reason of its charms a veritable surprise to those who visit the district for the first time. It has a considerable elevation above the sea-level, and from the higher parts the eye ranges in all directions over country in which rolling meadow and richly-furnished woodland combine to form pictures of the most delightful description. The Holt is situate in one of the most beautiful parts of the Weald, and in passing through the grounds on the way to the mansion one is struck by the rare taste and judgment evinced by Mr. Kingsmill in taking advantage of the natural features of the demesne. Especially noteworthy is the manner in which the carriage-way has been carried through the fine tract of woodland, and the way in which prominence has been given to the more finely developed trees that have a place alongside. Broad gravel walks and grassy glades have also been formed within the wood, and alongside these we find the finest trees brought into prominence, and many highly successful examples of plant naturalisation. An illustration is given of one in which the Welsh poppy (Papaver cambricum) is associated with the lily-of-the-valley and the forget-me-not, and produces in the course of the season a bright display of its golden flowers. Elsewhere are similar breadths of other subjects that flourish among trees and shrubs, and in addition to flowering plants, ferns are freely utilised. Among the last-named is a splendidly developed specimen of the Polystichum munitum, one of the most elegant of hardy ferns that Mr. Kingsmill collected in North America some years since.

As the foregoing reference to the woodland will have suggested, The Holt garden is remarkable for its distinctness of treatment, and as evidence of this it may be mentioned that of the many gardens I have had the pleasure of visiting, not one can be called to mind that has other than a remote resemblance to it. As the home of rare and beautiful hardy plants well-nigh innumerable, it abounds in interest, and the taste which has been shown in the grouping of border and rock plants and trees and shrubs adds immeasurably to its charms. Highly attractive is the mansion, handsome in elevation, and of red brick, in its glorious setting of greenery, in which picturesque Scots firs, tapering spruce, stately beeches, wide-spreading chestnuts and ancient yews are conspicuous. Not less attractive is the foreground, of which some portion is shown in the illustration in which the mansion has a place. In the broad borders that skirt the walk leading to the mansion are great masses of hardy plants that would form a lengthy list were their names to be given. Along this walk are finely developed specimens of Cyanoglossum nervosum, one of the most brilliant of blue flowers and not often seen in gardens, and large masses of the Great Spear Wort (Ranunculus Lingua), a handsome species, bearing a profusion of rich golden flowers on stout stems. To the right in the immediate foreground is a small bog, of which one end can be seen, in which a goodly number of semi-aquatics are growing with quite exceptional vigour.

On the far side of the belt of shrubs that forms, as it were, a background to the perennials occupying the border to the right, is a wide expanse of velvety lawn, which extends from the house to the boundaries of the meadows and the orchard beyond. This fine breadth of turf has a great charm in itself, and affords abundant space for lawn games and also for the display of many a choice tree or shrub of moderate stature. Looking across it from the terrace there is an extremely beautiful view in the direction of London, in which the breezy slopes of Hampstead Heath are conspicuous when the atmospheric conditions are favourable, and materially enhance the prospect. The few specimens that have a place on the lawn are kept well to the left-hand margin, looking from the house, so as not to break up the turf or otherwise interfere with the fine effect produced by its great breadth, and these include several choice golden hollies and Japanese maples with crimson and bronze leafage. In the broad border on the other side of the lawn are fine specimens of these maples, one with green leafage being especially remarkable for its splendid development. All the maples of Japanese origin thrive under the conditions that obtain, and form a pleasing feature. Near the last-named are huge masses of bamboo, which also are evidently at home.

The border that skirts the lawn on its left side looking from the mansion is remarkable for its grouping of choice shrubs and the successful example of the cultivation of alpine plants. The illustration of a section of this will be more useful than a lengthy description, and it will suffice to say that the shrubs in the picture include Choisya ternata and Olearia mucrodonta. The alpines are mostly cerastiums, saxifrages, and helianthemums, the last-named, as will be seen, planted for forming an informal margin. A little higher up towards the house is a broad, irregular rock garden that especially deserves mention for the facility it gives for the cultivation of alpines without incurring the expense incidental to the formation of rock gardens of the usual type. The surface is undulating with rock in various sizes partly embedded in the soil, but probably the highest part does not exceed three feet. Here are masses of snowy saxifrages, purple aubrietias, and golden alyssum, six feet or so in diameter, and hosts of rare subjects spreading over a proportionately large area, the alpine pinks being especially conspicuous. The slopes of the terrace are formed with large flag stones laid irregularly, and growing between them are violas, alpine pinks, and other subjects that thrive under such conditions. The "flagging" in the immediate foreground has been carried for a distance of twenty or thirty feet along the front of the border containing the Japanese maples and bamboos already referred to, and the plants with which it is furnished are making rapid growth. This addition has not been made for the purpose of suggesting an old walk overrun with weeds, but for the purpose of cultivating plants thriving under such conditions, and giving visitors an opportunity of inspecting them closely.

A FLOWERY TERRACE SLOPE.

Daffodils have been planted so liberally in the grass beyond the boundary of the lawn as to produce displays of colour in spring, and rambling roses have been planted so freely as to produce a series of charming effects during the summer. Over rustic supports Aglaia, Euphrosyne, and Thalia fling their long flexile growths with great freedom, and produce a profusion of flowers in the season of roses. Rosa Brunonis grows with great vigour, and may be seen running rampant over holly bush and ancient yew, and bearing cascades of snow-white flowers in June. The pergola forms an attractive feature, for thereon rambling roses, ornamental vines, and other suitable subjects display to the full their charms. This feature is of much interest from the fact that it is formed with gas-piping masked with rustic wood, and by this combination Mr. Kingsmill has provided a structure that has the appearance of having been formed with wood, while possessing the durability of iron. This method of erecting pergolas has much to recommend it, and should have the attention of those who may contemplate adding them to their gardens.

George Gordon.

TASTEFUL GROUPING OF CHOICE SHRUBS AND ALPINE PLANTS.

FRUIT TREES GROWN IN POTS.

Of late years much attention has been turned towards the cultivation of fruit trees of various kinds in pots, particularly of pears, apples, plums, cherries, and figs. There is, of course, nothing new in this present-day fashion, because advocates of such practices have been found among the contributors and readers of the Gardeners' Magazine for very many years past. No doubt the fine exhibits by the Messrs. Rivers, of Sawbridgeworth; Messrs. Bunyard, of Maidstone; and Messrs. J. Veitch and Sons, of Chelsea, at the R.H.S. shows, inspire fruit growers and fruit lovers with the natural feeling that they would value a similar production of their own. Remarkably fine pot-grown trees have been contributed by Mr. Hudson and others, representing private enterprise in this direction, and we have also recollections of equally meritorious successes in gardens which have not been represented at exhibitions, Royal or otherwise. There is, therefore, no novelty found in the pot-grown fig, peach, or nectarine trees, because they have been familiarised with the remote past. Apples and pears, however, were not so frequently met with, nor were plums or cherries common, but all are now recognised as possessing sufficient merit to justify their inclusion in the glass-grown stock, where fruit houses are sufficient to admit of this being done.

In competitions at the principal British exhibitions these pot-grown fruits figure rather strongly, and much to the detriment of those who, imbued with competitive aspirations, are compelled, through stress of circumstance, to depend on the everyday provisions in fruit growing and forcing. It is true plums and cherries may be had from outdoor walls in some gardens quite as good as any pot tree can produce, and perhaps, in some cases, even better, but there must be highly favourable climatic influences which can give the bright and clear-skinned apples and pears which the unprivileged have to review in the summer and autumn contests at many shows. Those fine varieties, Ribston Pippin, Peasgood's Nonsuch, Washington, and Cox's Orange Pippin apples lend themselves perfectly to the limited area of the twelve-inch pot, accommodated in the orchard house. The wax-like texture of the skin, and the greatly enhanced colouring of these fruits, place them far before their fellows grown and gathered under normal outdoor conditions. Similar remarks apply also to pears, which bear no comparison in summer time with even wall-grown fruits outside. The Royal Horticultural Society recognising these advantages, insist that in their autumn contests fruits grown entirely in the open shall alone be eligible, and a very fair and necessary obligation it is in the gathered fruit section. The collections of choice fruit, however, admit the pot-grown apple and pear, plum, and fig.

In the treatment of any of these fruits there is a difference of opinion as to the practice of plunging the pots in the natural soil bed, or raising them above it, so that no means, other than the soil contained in the pot, supports them. The old-time custom favoured the plunging of the pots in order that the roots may, if so disposed, take advantage of the extensive area surrounding them. By such aid it is commonly admitted that size of individual fruits, and extent of crop, may be proportionately greater, notwithstanding that these self-same migratory roots are cut back each recurring autumn. Under these cultural conditions we have found that fine crops of peaches and nectarines can be secured, and that, too, with even greater certainty than when the non-plunging practice obtains. The modern idea demands that by the aid of a special iron-toothed fork the roots are disentangled, the soil removed to such an extent that ample material can be returned to the pot without having recourse to root migration in the border in which the pots may be plunged. By a judicious course of pruning, too, of the superfluous coarser roots there is more room for soil in the pot, and thus a greater food supply is placed at the command of the roots. Subject to this course of treatment each year, there is less need for large pots, and there is a greater uniformity of growth, without the coarseness which accrues from border migration, or larger pots. All the kinds of fruit trees enumerated are amenable to this root treatment when cultivated in pots.

A NATURALISED COLONY OF THE WELSH POPPY.

Given this annual renewal of soil in the autumn, preferably while there is still a complement of healthy foliage, feeding with stimulating liquids, or artificially compounded manures, will carry them through successfully. It is deemed necessary to complete this potting process during the leafy season because the presence of foliage assures root activity in autumn, which makes partial re-establishment certain before they finally settle down to their dormant period. It is well known that most deciduous trees form autumn roots, they may be extensions of the summer stock, or new ones issuing direct from the main roots. Provided with fresh and sweet compost, there must be considerable gain in the progress made under, it may be again repeated, such healthy surroundings.

The great advantages to be derived from pot culture of fruit trees is that the space occupied by them in the growing season may be conveniently set apart for chrysanthemums or other plants in the autumn and early winter. The trees can with safety be stood outside, once their crops have matured and are gathered; but it is found advantageous to cover the pots with some protective materials, making them safe from frost rupture. To prevent the wind from playing havoc the pots can be partially plunged in an open, but convenient site. Figs should not, however, be trusted in the open when the weather becomes threatening, because, though they are hardy, the points of the growths, carrying the embryo fruits, easily suffer, and the first crop may be lost. An exposure to the elements certainly is an advantage until such time as severe frost becomes imminent. The late-grown figs seem, under outdoor exposure, to become hard and bronzed, and when brought inside for starting, the fruit buds appear anxious, as it were, to be progressing. It may be well, therefore, to make some special provision for the wintering of figs in pots, if there are not cool glasshouses available.

It is argued by some that the amount of labour involved by pot culture in the orchard house is scarcely justified when comparisons are made between these and permanently planted trees. It is not my purpose to challenge such arguments; individual conveniences and local circumstances are those which must decide these questions, and there is certainly much to be said in favour of pots when two crops, rather than one, may be secured from the same glass-covered area. Object lessons of this kind have been gained from Gunnersbury no doubt by many readers of the GARDENERS' MAGAZINE, who have paid occasional visits. The maturity of an early crop of peaches, nectarines, plums, or apricots may afford space for an autumn crop of tomatoes, which in private gardens, are often of much service, and in a season like that of 1907, when outdoor crops were so precarious, an indoor reserve for winter parties would be invaluable. There is often an aspect of speculation in the use and purpose of glasshouses eligible for these varying crops of spring, summer, and autumn, and much depends on the individual in making the most of these highly desirable conveniences.

Rood Ashton. W. STRUGNELL.

TREE CARNATIONS.

The border carnations having now passed through their flowering season, those who grow the tree varieties planted out will find this section continue to bloom until autumn. While it is not necessary to specially grow trees for outdoor planting there is no doubt that a proper system of culture amply pays. So far we have not grown plants specially for outside, having relied on older examples, or those which have outgrown their pot space, but which have given us excellent returns for the labour bestowed.

That younger plants of tree carnations given even better returns than older ones has been exemplified this season by a batch of seedlings which I had weeded out as not being good enough to retain for pot culture. They were all good, but did not reach my standard of excellence. The plants have given quantities of flower outside, and now are bristling with flower buds, while the growth they have made tempts me to almost relift or propagate them again.

In growing these tree varieties to bloom from August onwards, if they are planted where temporary lights can be placed over them, far better results will be obtained. Such temporary covering should be put over at night to keep off heavy dews, and also when much rain falls. A cheap and useful covering is "The Eureka" waterproof paper. During the day, and whenever dry, the plants are better exposed or uncovered, so that they may obtain all the light possible. To have clean, unblemished flowers, it is necessary to cover at night, or the opening buds and half-expanded blooms may not become dry before the sun shines on them, and therefore the tips of the petals are liable to become scalded.

Poltimore Gardens. T. H. SLADE.

In the Water and Bog Gardens the various plants will soon be passing their best. Note where any failures have occurred, and where others have been a special success, also whether it is desirable to divide or remove any. Where lakes and ponds do not exist much pleasure may be obtained by growing a number of plants in tubs; in this district the fumes from chemical and other works are too poisonous for any but just the strongest varieties, but this season the double white nymphæa has made specially good growth, and flowered profusely. Nuphar lutea always thrives vigorously here. Astilbe Davidi seems at home on the fringe of lakes, and clumps of it produce a pleasing effect. Senecio macrophylla makes a nice contrast, and is equally effective with its noble foliage and golden-yellow flowers.—E. F. H.

VARIETAL FERN HUNTING.

Now that the innumerable beautiful varietal forms of our native hardy ferns are becoming popular, as is evidenced by their increasing displays at our exhibitions of flowers and ornamental foliage plants, a little consideration of how they are obtained may not be out of place. So great are the differences between many of the finest varieties and the common or specific forms which we find in such profusion in our western counties by the roadside, in the hedgerows and stone dykes, in the woods under the shelter of the trees, and in the deep glens and ravines which have been channelled out by mountain streams, that it is often difficult to believe that they can belong to the same species. A popular but quite erroneous idea for which the scientific botanist, who speaks of "garden forms," is not altogether free from blame, is that by dint of close culture, high feeding, warmth, and so on, the common forms assume these finer types. This, however, is by no manner of means the case. We may by such means get larger, robuster plants, but they will be merely enlarged copies, with the ordinary specific characters, it may be, a little emphasised, but this is all.

Collect their spores, sow them, and distribute their offspring, the chances are enormously great against any difference of type appearing among them. They may be smaller or larger, according to the environment, but given the same conditions, each individual will so closely resemble the others as to be unrecognisable by any accidental and peculiar character. Now and again, however, there are exceptions, we know not why, we only know that here and there such exceptions are found in a wild state, in which more or less marked changes of plan of structure have occurred. It is to these exceptions that we are indebted for all the varieties we possess, and their acquisition has been due to long-continued search among the common forms by a number of persons who have, as a consequence, accumulated a great many diverse forms, some far more beautiful than the common ones, and some of interest mainly as curios, but all interesting in their various ways.

It has been found also by experience that when these "sports" are thoroughbreds, i.e., characterised throughout by new features, and not merely partially so, their spores are capable, as a rule, of reproducing the new type, sometimes yielding exact replicas of the parent, but more often yielding variants, some of less marked character and others of more, and it is by means of these latter that the selective cultivator has profited to enhance the beauty or the singularity of the type originally found. A large number of the wild finds, however, are fully equal to those obtained in this way by selection, and, as all the British ferns, with one insignificant exception, are perennial, and with decent care long outlast their owners, most of the best of these original finds have been preserved alive, and handed on to us at the present day. Since also ferns lend themselves, as a rule, freely to propagation by other means than their spores, viz., by offsets, bulbils, etc., even these original types have been largely multiplied, so that in any large collection the owner can indicate what is to all intents and purposes the identical "sport" found, while probably at the same time pointing out its progeny on varied lines, and yet retaining enough of the ancestral character to be recognised as its offspring. Occasionally, however, a wild find, distinct enough from the common to be worth acquiring, but not of an extreme type, has borne spores which at one bound, as it were, transcended all expectations. Thus a thrice-divided Shield fern (Polystichum angulare decompositum Moly) yielded the strain of plumose Shield ferns known as the Jones and Fox type. A prettily divided Lady fern found near Axminster, and known as the Axminster plumosum, gave after a few years an improved variety, plumosum elegans Parsons, and this subsequently, suddenly yielded a batch of youngsters, nearly all tasselled, a feature quite absent in the parent, and one of these through its spores broke into about a score of tasselled and plain forms of such exquisite beauty and diversity as to far and away excel any of their predecessors or competitors on plumose or extra-feathery lines.

Finally, in this particular connection of unexpected leaps, a fine form of the Hard Shield fern (P. aculeatum pulcherrimum) found in a hedge in Dorset by a labourer, after yielding no progeny but offsets for forty years, produced a few spores, from which has arisen a strain of quite unparalleled types, in which the parental subdivisions of ½in. length, are replaced by long, slender silky ones of over 2in., delicately fringed to boot (P. ac. pulcherrimum Druery), and of the same batch, P. ac. divisilobum Green, doing, in another direction, its best to rival the Jones and Fox plumosums aforesaid of the sister species. In such examples as these we see the richest rewards of those who recognise promising features in wild "sports," and devote their attention to selective culture through the spores.

We are also justified by such cases in looking forward to a time when our British ferns will rank in popular taste, as they do already in that of connoisseurs, as rivalling, and even eclipsing the great bulk of exotic ones. So far, indeed, as regards variety of type, our native ferns undoubtedly eclipse all known exotics. Of these there are a good number which display the peculiarity of bearing tassels at their tips, a few are of the plumose or extra foliose character; but among British ferns we have a number of types which so far are quite peculiar to them, and have no discovered counterpart in the innumerable species found elsewhere in the world. In the Lady fern, for instance, there is the Victoriæ or crossed and tasselled type, and the Frizellæ, in which the pinnæ, or side divisions, are bunched into knots. In the Shield ferns we have much-divided mossy-looking forms, which have, it is true, recently been rivalled by the latest developments of Nephrolepis exaltata, but where shall we find any exotic which can even remotely approach our common Hartstongue in versatility?

In this fern, indeed, we appear to possess the very acme of variability, despite its normal simplicity. A mere tapering, undivided strap-shaped frond has sported into literally hundreds of forms, a descriptive list of which involves about a score of sections, frilled, branching, crested, dwarfed, muricate, narrowed, widened, etc., and combinations of all these on varied lines, such as no other fern in the world has even remotely approached. The result of this sportiveness is that in our British ferns we possess a wealth of decorative foliage plants such as all the rest of the world cannot rival in diversity, and it is therefore a matter of congratulation that this fact—for a fact it is— is now becoming popularly recognised.

Chas. T. Druery, V.M.H., F.L.S.

WORK FOR THE WEEK.

◆

THE ORCHID HOUSES.

SEASONABLE NOTES.—The present is a good time for attending to any defects in the heating apparatus. Where boilers are defective they are best removed and replaced with new ones, which can now be done better than at any other season. Each joint should also be carefully examined, and those showing signs of leakage should be made good. The valves and all air taps should be put in order, and with reference to these, I find it a good plan to go round these about once a month throughout the year, keeping them oiled and in working order. With this attention they are ready at all times for any emergency that may occur. The flues and chimneys should also be examined, swept, and made ready for the winter. Stoke holes ought also to be cleaned down, and a coat of whitewash put on the walls will aid cleanliness and help to lighten the surroundings throughout the winter months. In the selection of new boilers perhaps one might be permitted to depart somewhat from the usual lines in the matter of giving some personal experience that might be of assistance. When I came here some years ago the boilers consisted of saddle and tubular types, some three years ago additions and alterations were made. The old boilers were removed, and replaced with independent sectional boilers, which have proved in every way most satisfactory. In fixing, my employer insisted on having fire-bars only about half the length of the boilers, instead of the full length, as shown in the maker's illustrations. This arrangement has given a slower combustion, and we have thus obtained nearly the full advantage of the possible heating power of the fuel. Considerably less fuel has been used than was the case with the boilers that had been removed. These sectional boilers are easily kept clean, and we have had every advantage in working.

PERMANENT SHADING.—Where permanent shading has been used in conjunction with roof blinds, it should now be cleaned off the glass. Growth ought now to be sufficiently advanced to require every assistance that light can afford, and the blinds will be sufficient to protect the leaves from the rays of the sun. In the warmer divisions especially it is advisable not to bring the blinds into use too early in the morning, and they should be taken off again immediately it may be done with safety in the afternoons. It is advisable to assist the plants to harden their growths as they mature, and unless ripened growth is procured during the next few weeks, it is hopeless to expect satisfactory flowering results from the autumn and winter-flowering kinds. Dendrobiums, the Mexican lælias, and other light-loving plants will only now need sufficient protection by shading to prevent the actual burning of the foliage. Where ample light is given the drying conditions will be correspondingly increased. Care must, therefore, be observed to see that ample water and moisture is afforded, so that the plants do not remain for any prolonged period in a dry state at the roots.

INSECT PESTS with the dry state of the outside atmosphere, will have a tendency to increase, and, therefore, a close watch must be kept; these have been, and are still very troublesome. Constant care is necessary to protect the plants from injury. I find there is nothing better than to spray with some safe insecticide at regular intervals.—H. J. Chapman, Oakwood Gardens.

CONSERVATORY AND GREENHOUSE.

HERBACEOUS CALCEOLARIAS.—These extremely showy plants always attract attention, and when covered with their quaint and beautifully marked blossoms, never fail to win the admiration of all who love flowers. They are essentially cool-house plants, requiring the temperature of an ordinary greenhouse only, and succeeding even better during the winter and early spring, with a minimum of forty to forty-five degrees, than in any higher degree. The herbaceous calceolaria is a perennial, and the seed must be sown during the summer of one season to produce flowering plants by the next. To obtain the large specimens frequently seen at shows, the seed should be sown about the middle of May; but good, well-flowered plants may be had from a sowing made in August, and I have obtained useful little plants in 4½-inch pots, with four or five spikes apiece, from seed sown the first week in September, though I should not advise sowing so late as this as a rule. As the seed is very small, it must be sown on a finely-sifted surface of light rich soil, in a well-drained pan or box. The best place for the seed pan is on a good bed of ashes in a cool pit or frame, in a lightly shaded position, or in a shady corner of the greenhouse, covering it with a square of white-washed glass, and keeping the soil regularly but moderately moist.

BULBS FOR EARLY FLOWERING.—For bulbs to flower early, it is important that they should be potted up early. The first to start with are the Roman hyacinths, and, if they are wanted for early flowering, they should be potted as soon as possible, for the earlier this is done the sooner will they flower. Those that are potted up now can easily be had in flower in November, and even if they are required for later flowering than this, they give better spikes and finer flowers, as their growth must not take place until the bulbs have well rooted into the soil. The Paper White and Double Roman narcissi are excellent for early flowering, and are largely grown for both private and market use. The price being low, they come within the means of most lovers of flowers. The bulbs should be procured and potted as soon as possible if blooms are required at Christmas.

ARUMS.—Those who adopted the planting out system will do well to lift and pot up the plants before they have made much growth either at the root or the crown. Leaving them out until October is very bad policy, as the root masses have then to be greatly reduced to get them into reasonable-sized pots. Plants rested in pots, though now backward in growth, will soon overtake those planted out, as regards earliness of flowers, though in most cases the spathes are not so fine, but more useful for cutting.

FRANCOAS.—I have rarely seen Francoa ramosa in better form than it is at the present time in this neighbourhood. It has thrown up very strong stems, bearing huge branched spikes of pure white flowers, which are very attractive. F. conchifolia is worthy of culture, though not so showy as its relative. The spikes are dwarf, unbranched, and the flowers pink, with a dark spot towards the base. F. appendiculata is often confounded with F. ramosa, but it is quite distinct, the flowers being pale red, and also marked with a darker spot on the petals; the racemes of bloom are compact. All three species are very attractive, and useful greenhouse plants.—T. B. FIELD, Ashwellthorpe Gardens.

THE FLOWER GARDEN.

PROPAGATION of the various summer bedding plants should now be proceeded with, efforts being made to insure an ample supply for next season's arrangements, which should have been well thought out and planned. The more tender soft-wooded plants, such as coleuses, iresine, alternanthera, etc., will root best in gentle heat in a close, shaded frame or house, and the other less tender kinds in a cool frame. Zonal pelargoniums give a better effect, and flower more freely, if struck in autumn than in spring, and they may be easily rooted in pots or boxes in the open, though here we find it advantageous to have them in cool frames where lights can easily be placed over them should weather become unfavourable. When taking cuttings do not disfigure beds more than really necessary; secure well-ripened wood, and take cuttings four or five inches long, and only remove the two lowest leaves. The soil should be sharp and porous, but made quite firm in the pots and boxes; use a blunt dibber, and carefully insert the cuttings, making every one rest on the soil at the bottom of the hole. Silver edged, tricolors, bronze, ivyleaved, and scented-leaved varieties should be put into pots rather than boxes, these being more delicate than zonals. Where strong plants of Centaurea candidissima are required for next season, seed should at once be sown, also Humea elegans; both should be placed in gentle (but not strong) heat.

SPRING-FLOWERING PLANTS for autumn bedding out must be carefully attended to and encouraged as much as possible. Should any still be in the seed beds lose no more time in pricking out or transplanting them; rooted cuttings must be gradually exposed and hardened off. The plan of autumn bedding will have already been decided on.

CLIPPING HEDGES.—Should any of this work be not yet completed finish it as soon as possible to enable the wood to receive full sunlight and become well ripened, so as to withstand whatever severe weather may come during winter.

HYDRANGEA HORTENSIS. — Where these are planted out, immediately the flowers are over old trusses should be removed, and any surplus wood cut out to allow proper ripening of the remainder. Cuttings may also be inserted if required; place these singly in small pots, in sharp sandy soil, and stand them in a close frame, shading them from sunshine until well rooted.

DRY BULBS from last season's beds should now be sorted over and graded. If planted in masses or clumps they should be lifted and replanted every three or four years; this applies more especially to narcissi and Spanish and English irises. Snowdrops, autumn-flowering crocus (colchicums), and sternbergias are best planted as early as possible, and no time should be lost in securing these. Snowdrops do best in a light, warm soil. In the wild garden walks may be bordered with them, and large irregular patches planted. As the bulb catalogues continue to arrive select what is required and send to one of the many good trustworthy firms for them, it being best to buy from such, even at a slightly enhanced price, and thus secure best early bulbs.—E. F. HAZELTON, Knowsley Gardens.

HARDY FRUITS.

YOUNG STRAWBERRY PLANTS.—If not already done, young plants which were layered in small pots last month should be planted out, so that the crowns may be strong and well-developed by the end of the season. Although it is very desirable to have a change of land for strawberries, suitable borders are not always available, and the same plot has to be utilised for several years in succession. In all such cases a great deal may be done to improve the soil by adding fresh loam and manure, with soot, wood ashes, etc., at each time of digging. This I have done for several years, and the crop last season (also this) has been excellent. When planting see that the soil is firm, and the roots in the pots well moistened before turning them out. If the pots have become somewhat crammed with roots slightly disentangle them with a pointed stick; take out the holes sufficiently deep to allow the roots to rest on a few handfuls of fresh soil, and ram this rather firmly. If the land is dry follow on with a good soaking of water through a rose water pot to settle all comfortably round each plant. For Royal Sovereign allow a space of sixteen inches between each plant, and a little less for less robust varieties, if only to be fruited one year and then to be thrown away. Do not neglect permanent beds, especially on light land, and if the crops have been heavy a good soaking of manure water will be of great assistance to the plants if the roots are dry; weakened by heavy crops and dryness at the roots means probably a very light supply of flowers the following season.

BLACK CURRANTS.—These may have become crowded, and should therefore be thinned so that air and light can reach the interior of the bushes. In so doing remove a few of the branches entirely, leaving plenty of young fruitful wood. Like some other things, where other work is pressing these are very apt to be neglected, but a little timely thinning, and, on dry soils, a few soakings with water, will greatly help the next season's promise.

FIGS.—Trees bearing heavy crops need a few good soakings of water and liquid manure at a reasonable strength, and if given enough to thoroughly moisten the soil to a good depth this will greatly assist the fruit and growth. Remove any weak shoots, and preserve those of medium growth with sturdy foliage. The roots of figs delight in a firm, sweet, well-drained border, and the growth needs ample head room for extension.

NETS.—All nets, as they are taken from tree and other fruits, should be tied up when perfectly dry, labelled, and put away. If the sizes are taken, and a label duly inscribed is tied on each net, this saves a great deal of trouble when they are next wanted. See that the fruit room is put into good order for the coming crops, cleanliness and sweetness being very important items in a fruit room.—H. MARKHAM, Wrotham Park Gardens.

A NEW TALL LOBELIA.

As is well known to many, Mr. A. Campbell, the gardener to the Right Hon. Lord Ardilaun, at St. Anne's, Clontarf, Dublin, has been a most successful raiser of new tall lobelias, Japanese anemones, and other flowers. Among the lobelias he has succeeded in producing some really good things, and that named in honour of his employer, Lord Ardilaun, will maintain its place in the favour of many, but a later production, named Morning Glow, is destined to take a high place as well as its predecessor.

I came across a good break of it lately in the wonderful garden of the Messrs. Walpole, at Mount Usher, in co. Wicklow, and later I saw it in Lord Ardilaun's magnificent gardens at St. Anne's. Mr. George Walpole, no mean judge, considers Morning Glow the best of all, and one could see that Mr. Campbell has a high opinion of it himself, although he is modest regarding his own productions. Morning Glory has dark-coloured foliage, covered more or less with a delicate grey tint, almost like thin hoar frost, but not in crystals. Above this rise the fine spikes of rosy scarlet flowers, which are at times five and a-half feet high. This season, however, they are shorter than usual, the weather apparently having been unfavourable for tall growth on this and other plants, as we have all experienced with some things this season.

Lobelia Morning Glow requires the same treatment as the other tall herbaceous lobelias, and when more widely distributed will be most acceptable to lovers of these gorgeous autumnal flowers.

S. ARNOTT.

Summer Pruning.—The passing summer has been one which may rejoice the hearts of those advocates of early summer pinching whereby fruit buds are formed in one season. I do not think sufficient account is taken of the weather as an important factor, when such procedure as advocated by some is followed. The past six weeks have not been conducive to secondary growth in fruit trees, and possibly now August is reached, that danger may be passed. At the same time some trees pinched early in the season show no more promise of fruit buds being formed than those now being pruned. Something wrong somewhere!—T. H. SLADE.

HORTICULTURAL SHOW ADVERTISEMENTS are inserted in this column at Ninepence per line, the minimum charge being Five shillings. Offices, 148 and 149, Aldersgate Street, London, E.C.

EXHIBITIONS AND MEETINGS.

◆

Royal Horticultural Society.

The fortnightly meeting was held at Vincent Square, Westminster, on Tuesday, August 18. It was certainly small for the season, but doubtless the large shows being held in the provinces accounted for the paucity of exhibits. The fruit trees in pots from Messrs. W. Paul and Son formed quite a feature, as did the collection of botanical orchids from the President.

FLORAL COMMITTEE.

Messrs. H. Cannell and Sons, Swanley, brought up a fine exhibit of dahlias, which included the cactus, giant-flowered, pæony flowered, and giant single sections. The flowers were very good indeed, for the season, and needless to say, were tastefully arranged with grasses and other foliage. In the cactus section the best were Kathleen Bryant, Mrs. S. T. Wright, Whirlwind, Mrs. Seale, Sunshine, and Australian. The giant flowers were presented by some fine sprays of Yellow Colosse, Jeanne Charmet, Phenomene, Le Grand Maniton, F. Grinstead, and Papa Charmet, while the best of the pæonies were F. W. Jansen, Glory of Baarn, Merveille, and Paul Kruger. The same firm also made a nice exhibit of cannas arranged in vases. Messrs. Carter Page and Co., 52, London Wall, E.C., made a fine display of cactus dahlias, a collection of violas staged in shallow pans, and a fine collection of decorative grasses. These included beautiful bunches of Bromus pendulinus, Poa amabilis, Chrysurus cynosuroides, Panicum glaucum, Eleusine rigida, and E. oligostachya, with some fine examples of maize for a background, quite a novel exhibit. The violas comprised a good collection of both bedding and exhibition varieties. The dahlias were arranged in vases and baskets, which produced a fine effect.

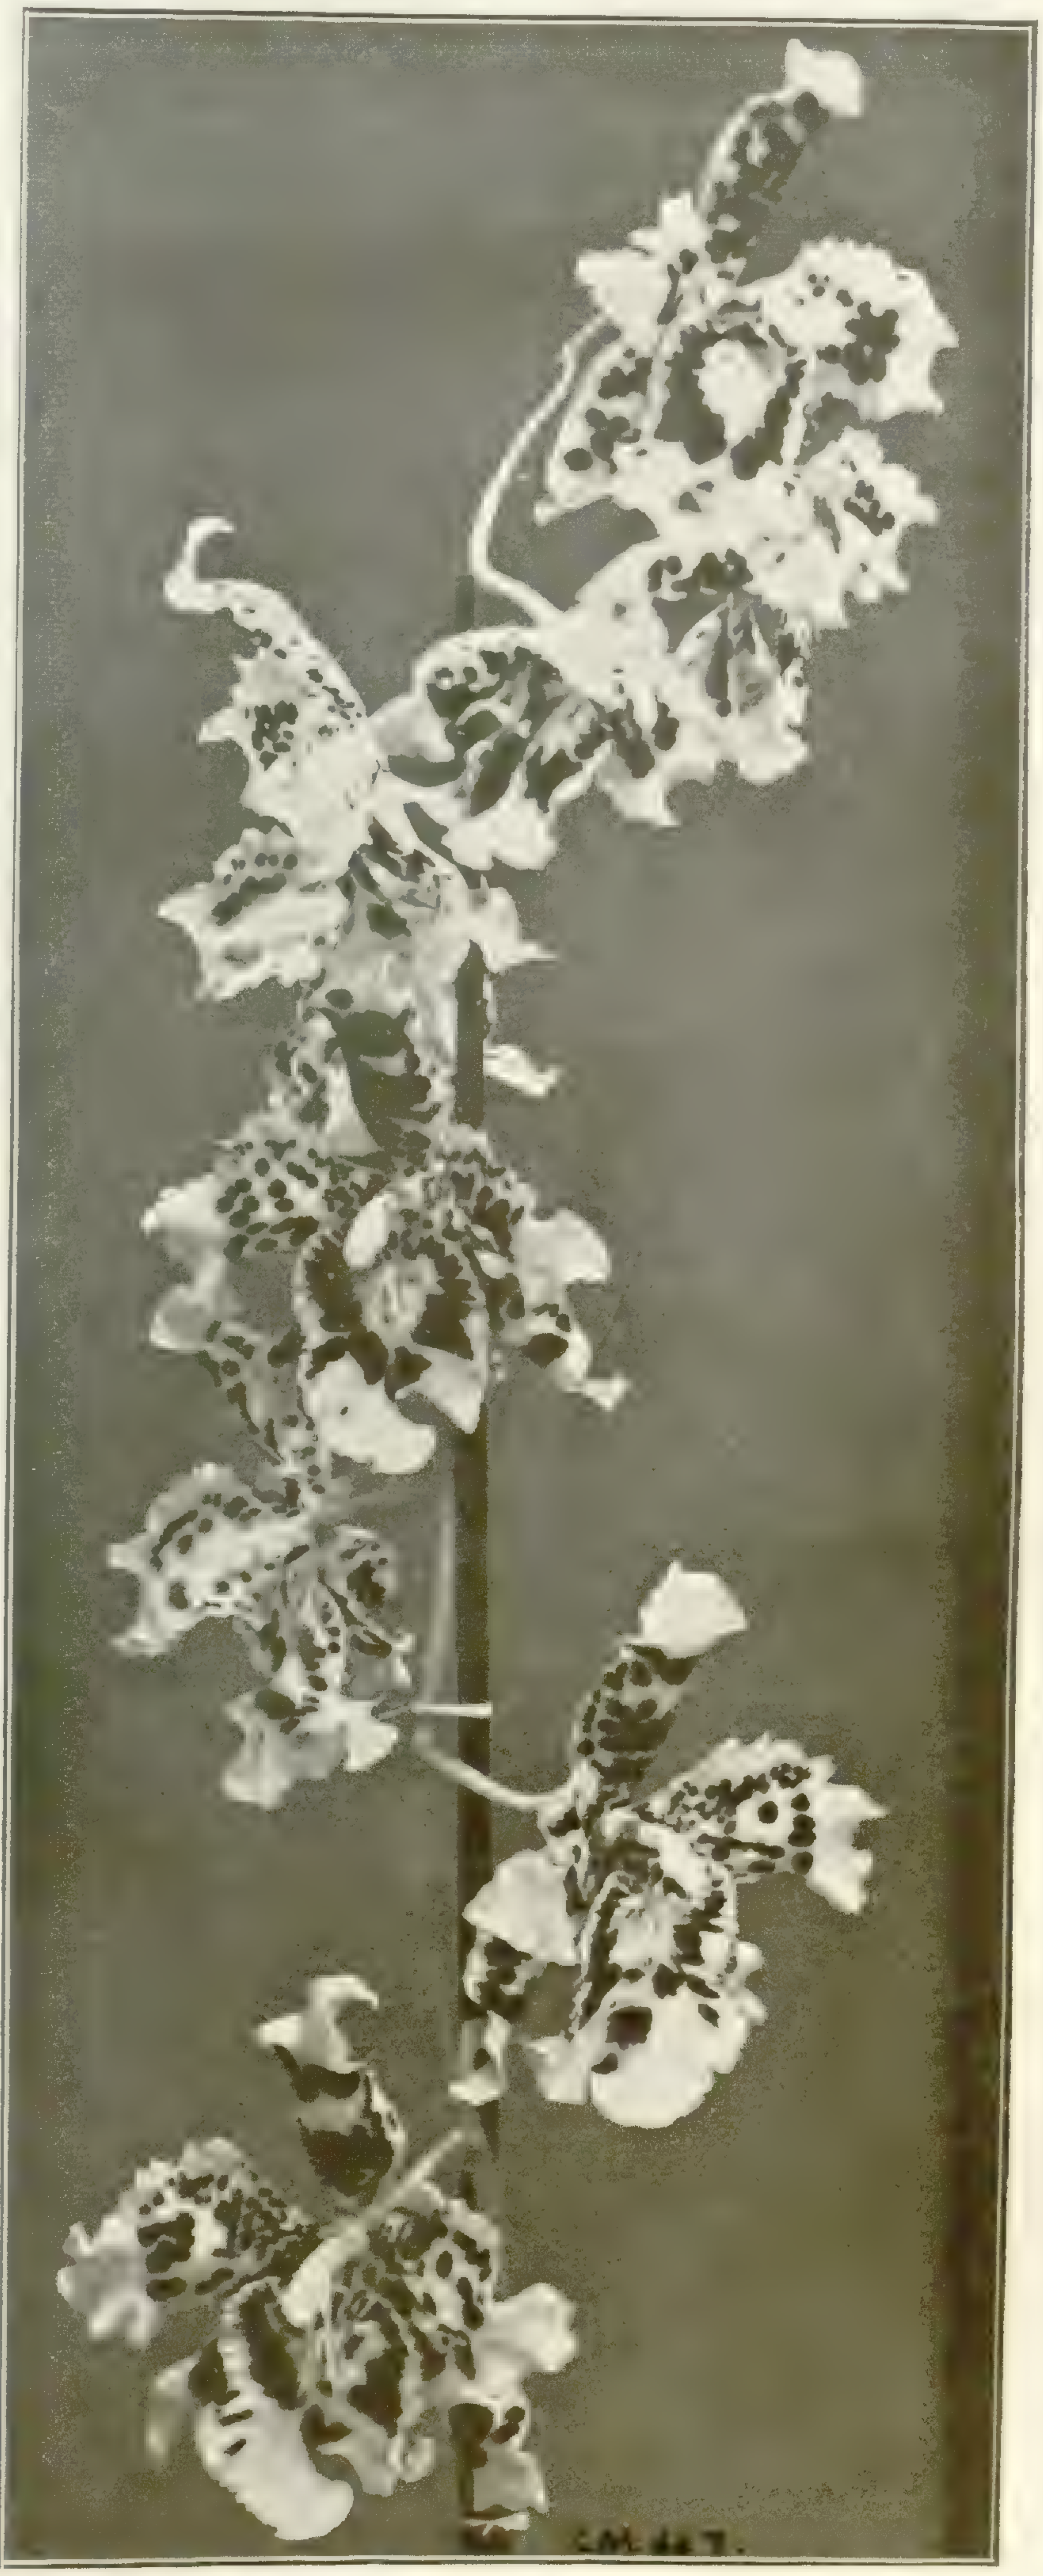
From Messrs. T. S. Ware, Lim., Feltham, came a large table of hardy flowers; also a collection of alpine plants, arranged naturally in boxes. The chief features were the phloxes, Helenium cupreum, Catananche bicolor, Chrysanthemum maximum King Edward VII., Senecio clivorum, and gaillardias in variety. The alpines were very good for the season, campanulas in variety, primulas, aubrietias, and menthas.

Messrs. James Veitch and Sons, Lim., Chelsea, sent a collection of specimen plants. Gigantic plants of Senecio clivorum in grand bloom were to be seen, while S. Wilsonianus and S. Veitchianus were equally attractive. Buddleia variabilis magnifica and B. v. Veitchiana were in splendid condition. Huge panicles of Sambucus canadensis were also much admired. The same firm also staged a representative display of asters, which were well grown and in great variety; also celosias, in three colours, of their dwarf bedding varieties. The plants were about a foot high and of good habit, the colours being yellow, red, and rich salmon.

Messrs. J. Peed and Son, West Norwood, arranged a large group of caladiums, backed with tall kentias, the groundwork being of ferns. The whole was lightly and tastefully arranged. Some of the most conspicuous specimens were La Lorraine, Oriflamme, Golden King, Richard Bastin, Madame Mitjana, Sir Henry Irving, Mary Anderson, Duke of Teck, and Baron Adolphe de Rothschild. The plants were splendidly coloured and well developed.

From Messrs. B. Ladhams, Lim., the Shirley Nurseries, Southampton, came a perpetual-flowering border pink, Princess Christian, a white variety, heavily marked with [illegible], it appears to be very free flowering.

Mr. L. R. Russell, Richmond, arranged a collection of hardy fuchsias, which were in capital condition. A few of the best were Gracilis, Riccartoni, F. coccinea Florian, Madame Corneillson, F. Riccartoni Elysée, R. Drame, a compact semi-double form, and globosa.



ODONTOGLOSSUM WIGANIANUM SUPERBUM.

Exhibited by Sir Trevor Lawrence at the R.H.S. Meeting on the 18th inst., when a F.C.C. was conferred upon it. Flowers large, the sepals and petals rich yellow, spotted with deep crimson, the lip white marked with purple.

A fine collection of phloxes came from Mr. F. Eames, Frome. The flowers were arranged in large masses, and presented a fine appearance. Perhaps the most attractive were Eclaireur, General Von. Heutsz, Selma, Iris, Lord Raleigh, Meteor, Von Hoghberg, and Dr. Charcot. The exhibit was edged with the double gypsophila.

Messrs. Eggett and Son, Thames Ditton, contributed a collection of hardy ferns. These comprised nice plants of Scolopendrium crispum Bowden, S. var. multifidum, Polypodium v. elegantissimum, Polystichum ang. div. scalplum, and a number of small ferns growing in Tufa stone.

A collection of foliage plants came from Messrs. W. Bull and Sons, Chelsea, which comprised some well-coloured crotons, dracænas, aralias in variety, with some nice edging plants; also a small group of Cattleya velutina x Cattleya aurea.

Mr. L. R. Russell, Richmond, also made a large and interesting exhibit of hardy ericas. The plants were arranged in masses, and proved most interesting. The chief forms were Erica vulgaris alba, E. v. cuprea, E. cinerea rubra, E. c. alba major, E. vulgaris flore-plena, E. v. aurea, E. stricta alba, and E. v. Hammondi.

Sir E. Loder (gardener, Mr. W. A. Cook), Leonardslee, Horsham, sent a collection of flowering shrubs and plants that had stood 20 degrees of frost. These included buddleias in variety, hydrangeas, arums, spiræas, Clematis coccinea, Phalesia buxifolia, myrtles, Solanum jasminoides, and Amaryllis belladonna.

From Messrs. Moore, Lim., Rawdon, Leeds, came a grand vase of Lilium nepalense, the colour being very decided, and the flowers well developed.

A full table of gladioli came from Messrs. Kelway and Son, Langport. The spikes were very good, and the colours varied. Some of the most attractive were Marchioness of Granby, Demaris, Lady Warwick, Empress Frederick, Fesca, Miss Zena Dare, Princess Victoria, Viscountess Iveagh, Fireflash, General Buller, and Dovedale.

Messrs. J. Laing and Sons, Forest Hill, arranged a group of caladiums in association with palms and ferns. The plants were well grown and with good colour.

Messrs. H. B. May and Sons, Upper Edmonton, had a large collection of crotons arranged on the floor of the hall. The exhibit was most striking. The colour of the plants and their development merited all praise. The arrangement, too, left nothing to be desired. The plants were chiefly of a decorative size, but arranged in mounds they looked well. Some of the best varieties were Hawkeri, Queen Victoria, Achievement, Princess Matilda, Flambeau, Golden Ring, Warreni, and Reidi. The entire group was relieved with ferns and palms.

FRUIT COMMITTEE.

Messrs. W. Paul and Son, Waltham Cross, brought up a large collection of pears and plums in pots. The whole of the trees were laden with fruit; especially good were Grand Duke, Magnum Bonum, Goliath, Pond's Seedling, and Belle de Septembre in the plums, while the pears, not more than three feet high, were in splendid condition. Brockworth Park, Conference, Duchess d'Angoulême, Louise Bonne de Jersey, and Doyenne Boussoch were in splendid condition; in fact, the whole exhibit bore evidence of the highest culture.

Messrs. S. Spooner and Sons, Hounslow, staged a nice table of fruits, arranged in dishes and baskets. The apples included nice clean specimens of Pott's Seedling, Cardinal, Goodenough's Nonsuch, Lord Suffield, Beauty of Bath, Lady Sudeley, and Stirling Castle. Plums were arranged in shallow boxes, and good examples of The Czar and Early Transparent were noted.

Messrs. H. Low and Co., Bush Hill Park, sent baskets of apples. Early Transparent and Beauty of Bath, both in capital condition.

ORCHID COMMITTEE.

Messrs. H. Low and Co., Bush Hill Park, had a small, but nice display of orchids, in which were noted Oncidium Lanceanum, Cypripedium Watsonianum. A fine specimen of Cypripedium macrochilum giganteum, Cattleya Loddigesi, and Lælio-cattleya Whateleyæ were also in evidence.

From Messrs. Gurney Wilson and Co., Hayward's Heath, came a fine bank of miltonias with a few oncidiums and odontoglossums. The miltonias were in splendid condition, and included some very good forms.

Messrs. Moore, Lim., Rawdon, Leeds, also contributed a group in which were noted Vanda cærulea, a very deep form. Odontoglossums, too, were prominent. A fine plant of Cypripedium Weitzerianum Potter's var., was also in evidence; as was also a good example of Cattleya Germanea, a very fine form.

Another group came from Mr. H. S. Goodson, Fairlawn, West Hill, Putney (gardener, Mr. G. E. Day), which contained some good plants. Odontioda Charlesworthi was magnificent in colour, while other noteworthy forms included Brasso-Cattleya Queen Alexandra, Odontoglossum Harryana, and Cattleya Massangeana, var. Harry Goodson.

Messrs. Stanley and Co., Southgate, were represented by a good collection of cypripediums. The plants were the picture of health, and well flowered. The variety C. A. de Lairesse was especially striking, some of the stems carrying no less than four flowers. A few plants of L. c. elegans var. Turneri were also good.

From Sir Trevor Lawrence came a small collection of choice orchids, which included two well-grown plants of Odontoglossum aspidorhinum, for which a cultural award was given, Catasetum pileatum, while botanical certificates were awarded to four or five of them.

From Messrs. Sander and Son, St. Albans, came a few choice plants, including Odontoglossum Rolfeæ, with extra large flowers, was to be seen. Another fine specimen of Odontoglossum Crispo-Harryanum Bruggense was here noted.

Mr. De B. Crawshay, Sevenoaks, had a small exhibit of odontoglossums, which included some choice hybrids. The most striking were Zenobia, a cross between Halli and Edwardsi; O. Rolfeæ Nerissa, a fine spike; and Wardi. The spikes were good and the foliage excellent.

Messrs. Charlesworth and Co., Bradford, staged some choice plants, such as Sophrocatt.-lælio Marathon, a lovely form; Cypripedium Kubele grandis, Cattleya iris, some grand plants of Odontoglossum Rolfeæ, Pilumna nobilis alba, and O. Lambeauanum.

AWARDS.

First-class Certificates. — Odontoglossum Wiganianum superbum, Sir Trevor Lawrence, Bart.

Awards of Merit.—Trichopilia nobilis alba, Sir Trevor Lawrence, Bart.; Sophro-læliocattleya Medea bicolor, and Cypripedium Rosetti, Lieut.-Colonel Holford; Sophro-cattlælio Marathon, Messrs. Charlesworth and Co.; Odontoglossum Zenobia, Mr. De B. Crawshay; Perpetual Pink Princess Christian, Messrs. B. Ladhams, Lim.; Thalictrum dipterocarpum and apple Feltham Beauty, Messrs. J. Veitch and Sons.

Botanical Certificate.—Catasteum labiatum, C. Claesianum, Listrotachys Kindtiana, Eria longispicata, Polystachya flexuosa, and Epidendrum Lambeauianum, Sir Trevor Lawrence, Bart.

Silver-gilt Flora Medal.—Messrs. H. B. May and Sons.

Silver-gilt Banksian Medal.—Messrs. Kelway and Son, Mr. L. Russell, Messrs. Peed and Sons, and Messrs. Carter Page and Co.

Silver Flora Medal.—Messrs. H. Cannell and Sons, Mr. H. S. Goodson, Messrs. Gurney Wilson and Co., Messrs. Charlesworth and Co., and Sir Trevor Lawrence.

Silver Knightian Medal.—Messrs. William Paul and Son.

Silver Banksian Medal.—Messrs. J. W. Moore, Lim., Messrs. Hugh Low and Co., Mr. De B. Crawshay, Mr. Eames, Messrs. J. Veitch and Sons, Messrs. T. S. Ware, Lim., Messrs. Laing, Sir E. Loder, Bart., Messrs. Spooner and Sons.

Sutton Coldfield and Walsall Gardeners' Associations.

The annual outing of the above associations took place on Monday last to the extensive seed warehouses at Wordsley and seed farms and trial grounds at Kinver, by the kind invitation of Messrs. Webb and Sons, Wordsley, Stourbridge. The party, numbering about 150, included Mr. Joel Cadbury, president of the Amalgamated Associations; Mr. Thompson, Mr. Jeffs, Mr. Grove, etc., and was conveyed by special trams from Dudley to Wordsley, where they were met by Mr. Edward Webb, and the heads of departments, who conducted them over the offices, warehouses, and greenhouses. Adjoining the warehouses is the extensive range of glass, and here all the best types of florists' flowers were to be seen. The size and rich colouring of the gloxinias and begonias excited much interest, and came in for much admiration, as also did the heavy crops of melons, cucumbers, and tomatoes. From Wordsley the visitors passed on to Kinver, where luncheon was provided by the Messrs. Webb, and presided over by Mr. Cadbury. The party then left for an inspection of the trial grounds, where an enjoyable time was spent in looking over the numerous trials of flowers and vegetables. Some idea of the magnitude of these operations may be gathered when it is mentioned that there are hundreds of trials of peas, beans, and other vegetables, 240 rows of sweet peas, and 250 trials of other annuals, but time did not allow of a complete inspection of the seed farms, which extend to 2,000 acres.

At five o'clock tea was served, and, after a hearty vote of thanks, which was proposed by Mr. Cadbury, supported by Mr. Thompson and Mr. Jeff, to Messrs. Webb for their hospitality, the party dispersed to visit the rock houses and Roman encampment at the famous Kinver Edge, a return being made to the Kinver tram terminus, en route for home. It was generally voted that the outing had been one of the most enjoyable ever held by the societies.

Sparkhill Amateur Horticultural Society.

The eighth annual summer show (facetiously designated as the "Shrewsbury" of the Midlands), was held on August 15 in the Sparkhill Recreation Grounds (Birmingham, and proved to be the best and most successful held since 1904. The committee and their energetic hon. secretary, Mr. Wm. W. Staples, are to be congratulated on the splendid results achieved. There was also a series of sports, including equestrian military exercises. The society, in addition to the summer show, has a series of monthly meetings for lectures and horticultural exhibitions, with other social entertainments.

OPEN CLASSES.

For an arrangement of miscellaneous plants to produce the best effect, Mr. George Hancox, West Bromwich, annexed the premier prize with an artistic creation of richly-coloured ornamental foliage and flowering plants; second, Mr. E. Burden, King's Heath, with a creditable display; and third, Mr. S. Rose. The plants in the other various classes were fairly well staged. The cut flowers and dinner table decorations were the most noteworthy features, the latter including fifteen exhibits, with hardly an inferior one; the section was devoted to ladies. A dainty creation was that of the premier prize selected by the judges, and consisted of pale-pink sweet peas, francoa and other appropriate flowers and greenery artistically and lightly disposed as the centrepiece, with elegant spraylets of rosy-red begonias, and white and lavender streptocarpus flowers, etc., supplemented with sprays, the fashionable Selaginella cæsia trailing over the tablecloth. This exhibit was shown by Mrs. Normansell, Edgbaston (gardener, Mr. S. Gibbs); the second honours fell to Mrs. W. Martin for a tasteful arrangement of white and yellow poppies; third, Miss Long with cream and salmon sweet peas, effectively disposed; and fourth, Miss Hirst with pink sweet peas; there were eight awards made. Hand or shower bouquets were very well shown, and Mr. S. Gibbs was the victor with a tasteful exhibit; second, Mr. E. Darby. and third, Mr. A. E. Forty. Sweet peas were extensively staged, and constituted the chief feature in the cut flower section. For a table arrangement of sweet peas, Miss Jessie Hirst, Mr. E. Deakin, and Mr. F. Anderson were the respective winners with elegant combinations. In the class for twelve bunches of peas, Miss M. Guest, Mr. E. Deakin, and Miss J. Hirst were the winners with excellent flowers.

In the class for nine varieties of sweet peas Mr. George Turley led; second, Mr. H. King, gardener to Mr. A. E. Butler, Glindon, Selly Park; and third, Mr. E. Deakin—all with very good exhibits. For the best collection of sweet peas, named sorts, distinct, Mr. C. Perry, gardener to Mrs. Magrath, won with a most creditable lot; second, Mr. E. Perry; and third, Mr. W. Grove.

Excellent, too, were the collections of vegetables in the open classes for eight kinds. Messrs. E. Deakin, E. J. Keeling, E. J. Dalby, and W. F. Anderson were the respective winners. Single dishes were also numerous and well shown.

HONORARY EXHIBITS.

Messrs. W. H. Simpson, Birmingham, were awarded a gold medal for a large and artistic arrangement of sweet peas; Mr. Woolman, of Shirley, gold medal for an extensive and well set-up assortment of chrysanthemums, cactus dahlias, etc.; a silver-gilt medal to Mr. W. T. Mattock, Headington, Oxford, for an arrangement of roses; a silver medal to Messrs. Bostock and Sons, Moseley, for herbaceous and other garden flowers; silver medal to Mr. H. N. Ellison, florist, West Bromwich, for an interesting collection of exotic and hardy ferns; and bronze medal to Mr. A. Dawes for a tasteful arrangement of violas.

Begonia Semperflorens.—The great advantage of the double varieties of this begonia is that they appear to stand better than the single ones, and the colours, which range from pure white to deep carmine, include some peculiarly soft and delicate shades. Under good treatment they make bushy plants, and produce a quantity of blooms, keeping up a succession for a considerable time, though, as the plants advance they become somewhat tall and leggy. It is, however, easy to keep up a succession of young stock by propagating from cuttings periodically, and cuttings put in now will make useful plants for flowering during the winter. It is upon the selection of good cuttings that the results will mainly depend. The short-pointed shoots from the base of the plants are the best, and if these cannot be had the growths may be cut back to below the point where the first flowers were produced, and they will soon give good cuttings.—T. B. Field.

ANSWERS TO CORRESPONDENTS.

APRICOTS ROTTING.—F. B., Chelmsford: Unless we have specimens we cannot possibly help you to discover the cause of the fruits rotting. We can only surmise that the fruits were somewhat damaged, and then fell a prey to birds or insects.

STORAGE BOX FOR POTATOES AND BULBS.—N. J. C., Wellingborough: The box herewith illustrated is so extremely useful for storage purposes in the garden that its general use may be strongly recommended, more particularly in gardens of limited dimensions. The box, as shown in Fig. 1, is equally useful for storing such fruits as apples and pears, various kinds of bulbs and potatoes for planting. The box is handy for lifting about, and, as a considerable number can be piled upon each other, large quantities of fruits, bulbs, and potatoes can be stored in a comparatively small space. The most useful size is 27 inches long, 18 inches wide, and 3½ inches deep. The sides and ends should be formed with deal ⅝-inch in thickness, and the bottom with ¾-inch deal two inches wide, and fixed one inch apart. The uprights and the cross pieces forming the handles should be of deal, one inch square, and the former should be screwed to the sides, and screws should be used to fasten the cross pieces. As shown in Fig. 2, the boxes can be stood one upon the other without excluding the light, or interfering with the free circulation of the air, a point of great importance in the case of potatoes for planting.

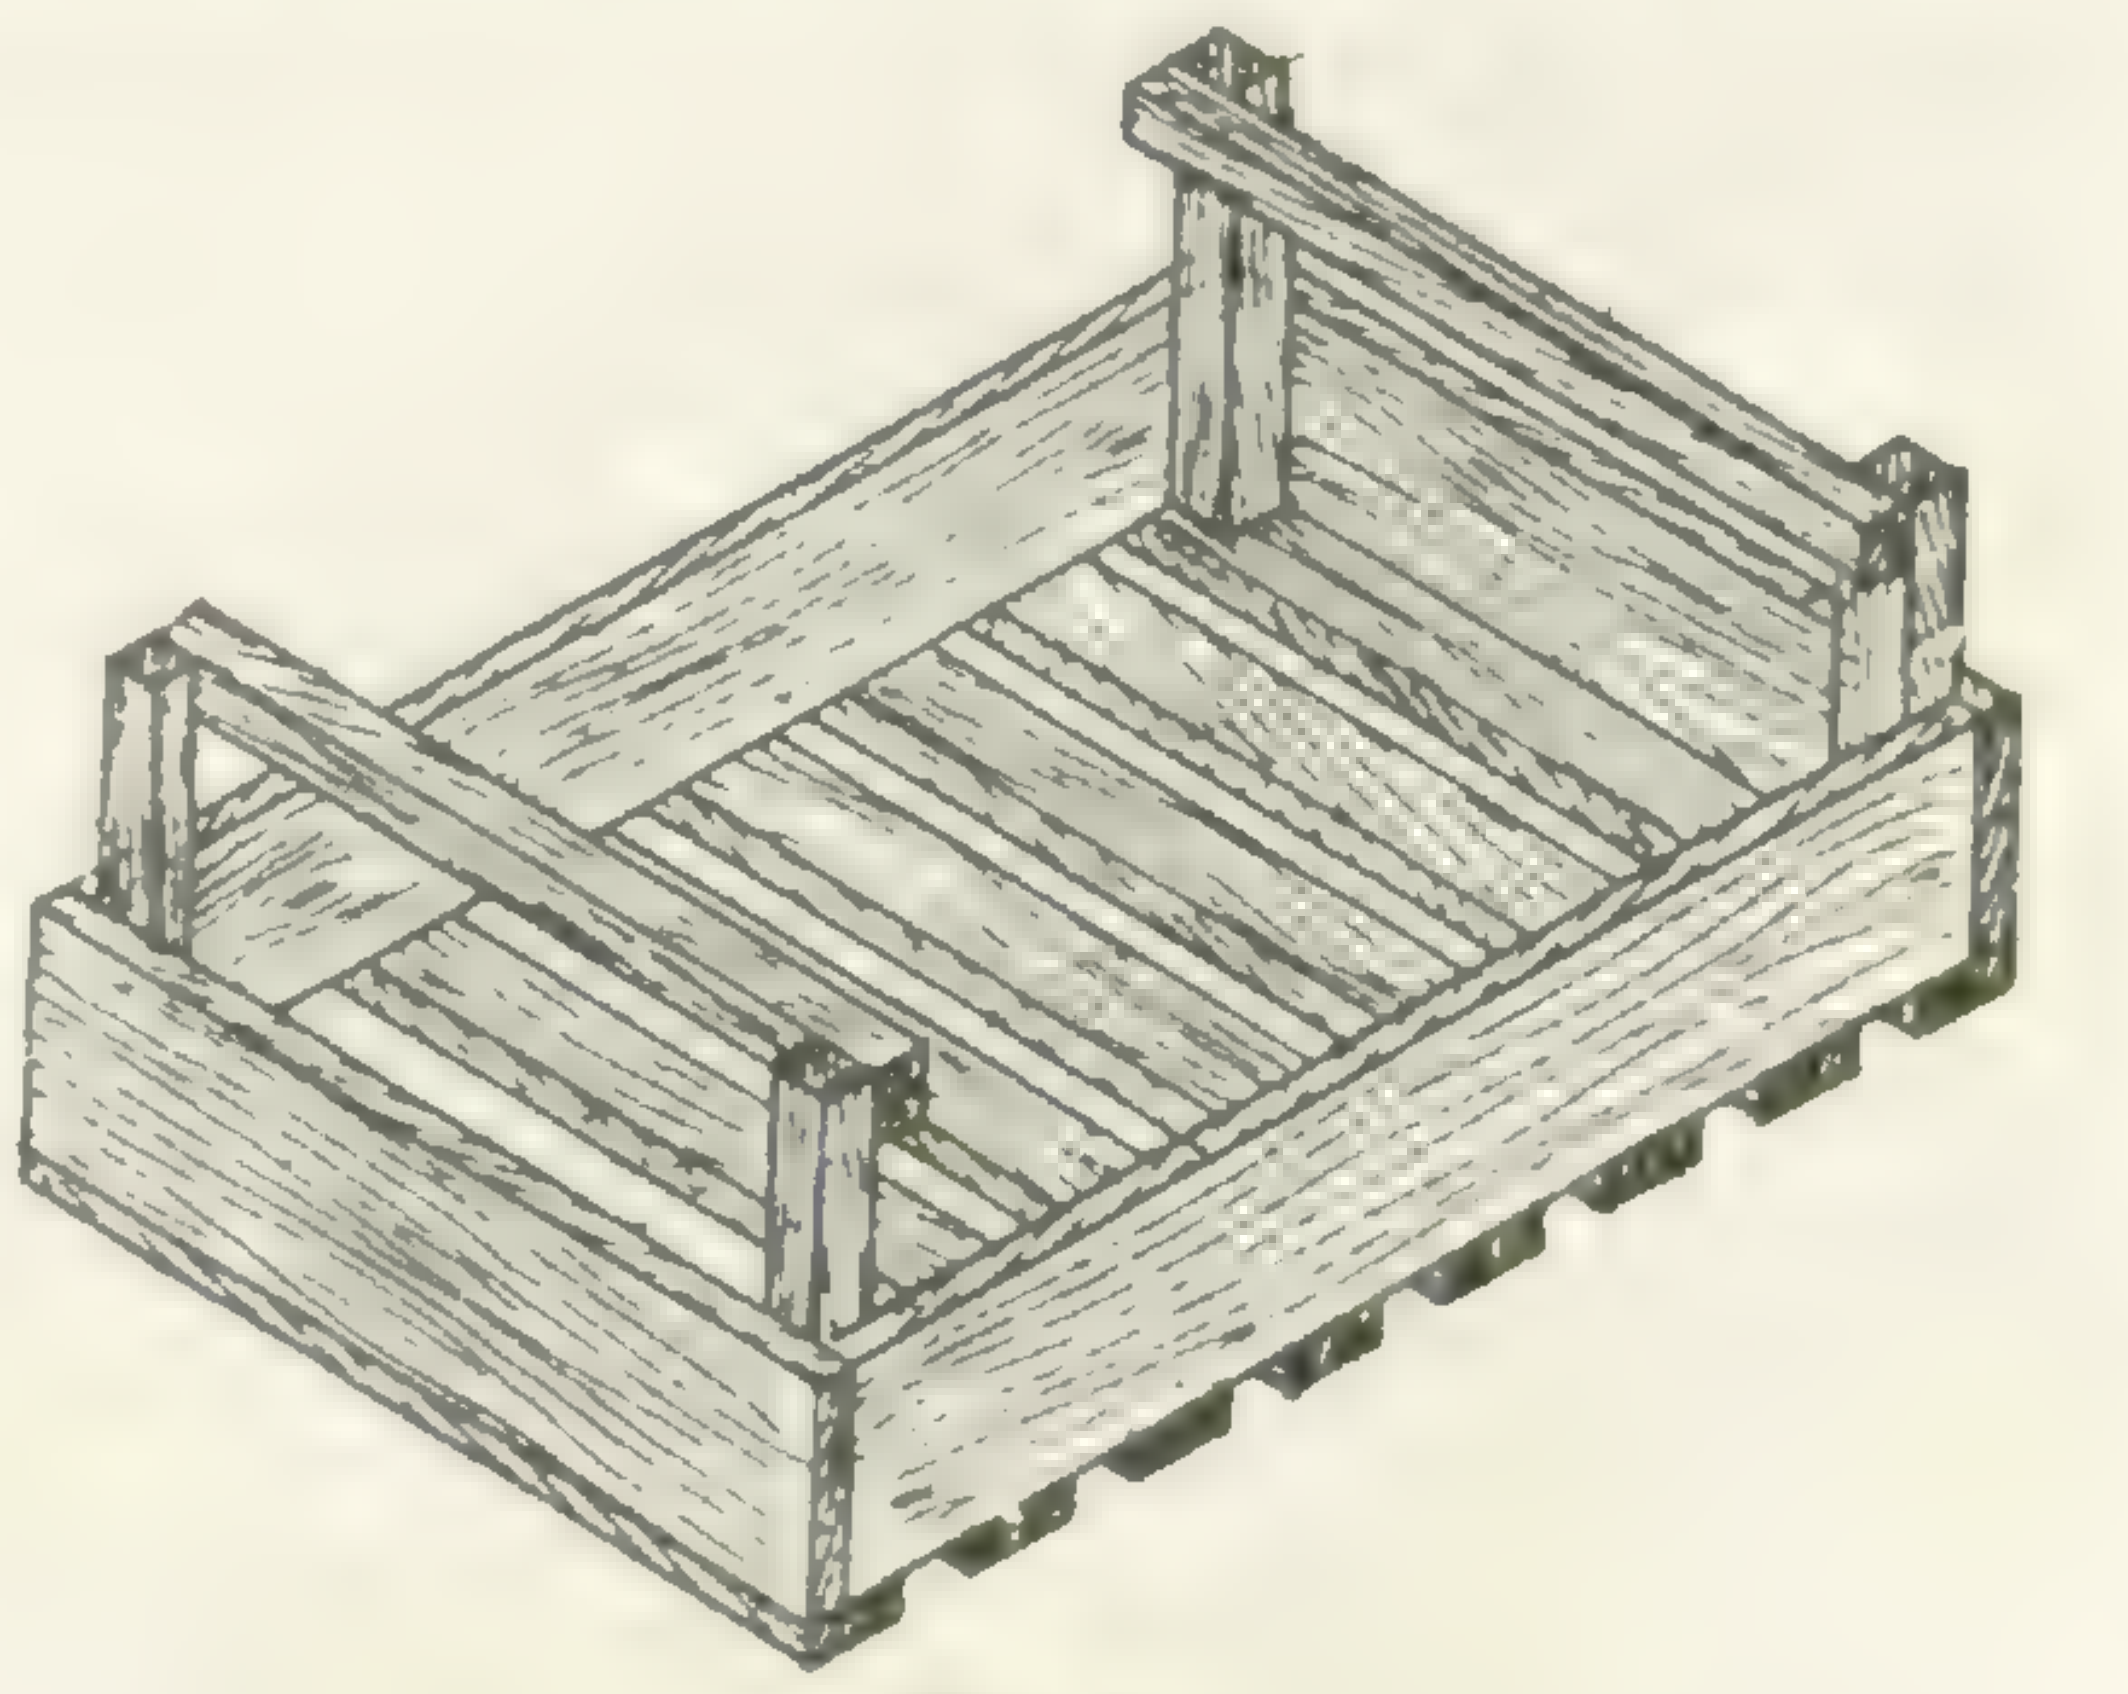

Fig. 1.

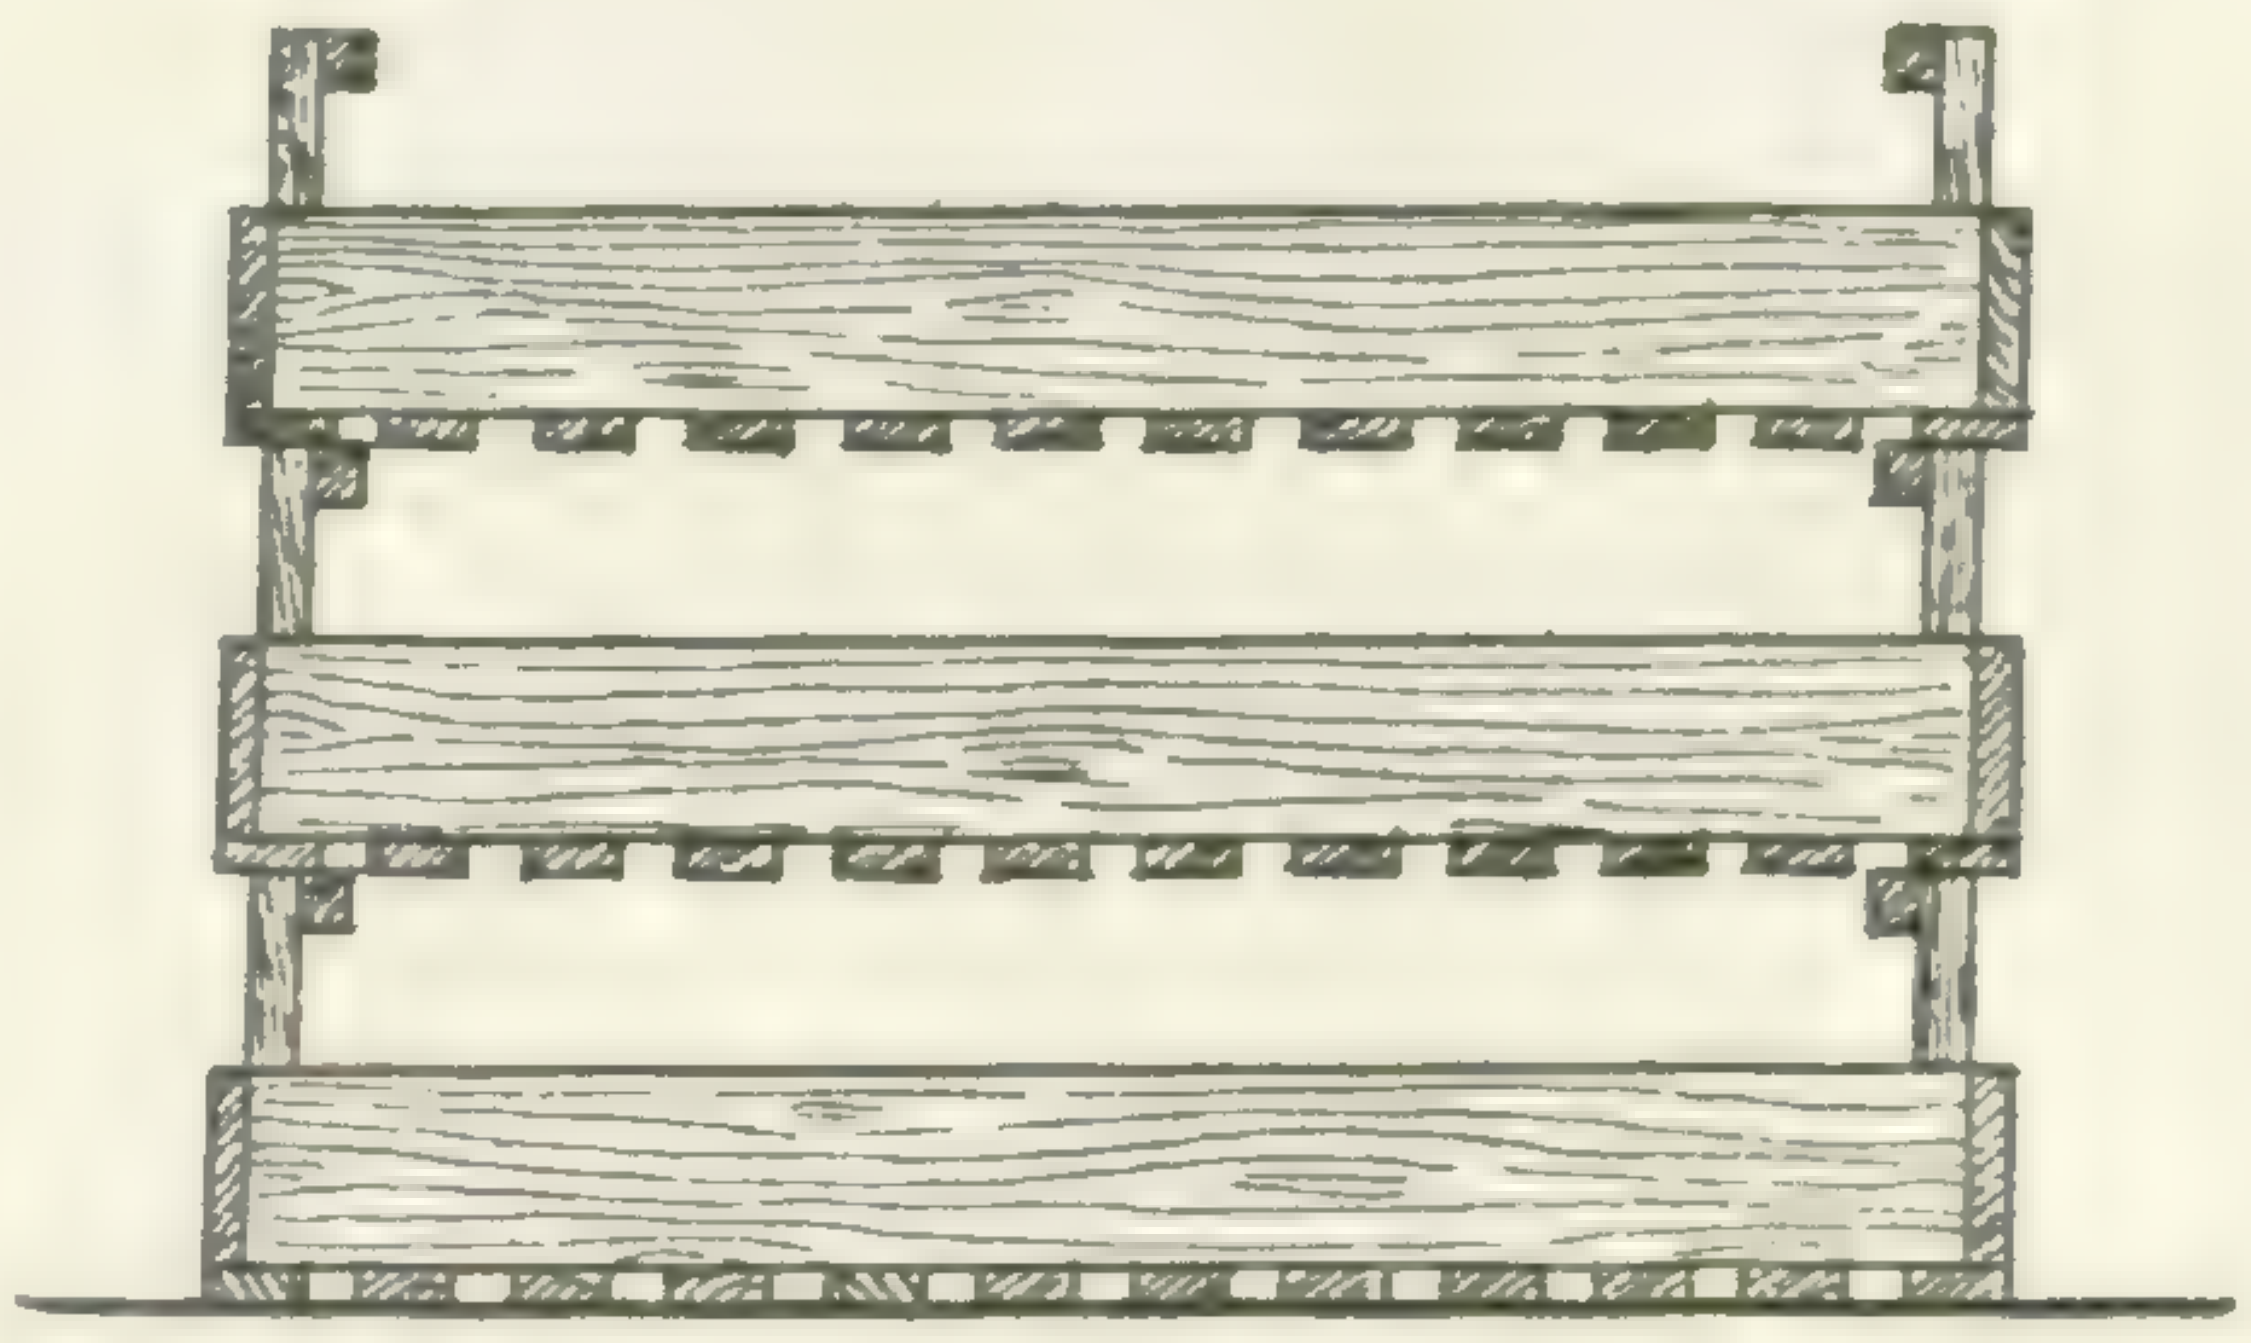

Fig. 2.

STORAGE BOXES OF POTATOES.

REMOVAL OF GARDEN PLANTS.—Rusticus: We are very sorry to have to say that you cannot legally remove anything planted in the garden unless you have the written consent of the landlord to do so, a consent given at the time of planting (which should have been obtained), or now. Pot plants you may remove and also any new variety of a flower that you may have raised yourself, but nothing else. The rockwork you must also leave. Your best plan will be to approach the new owner, and endeavour to obtain his consent to the removal of certain plants. This he may grant freely, or he may permit you to remove them on payment of a certain sum, and it may pay you to pay such a sum. You should, of course, be able to show the new owner that what you propose to remove will not leave the place naked, or cause disfigurement.

TURNIP TOPS.—W. H. D., Warwick: At the end of August or early in September make a liberal sowing of a hardy variety, and eventually thin out the seedlings to about six inches apart. The drills should be one foot apart, and the hoe should be used between the drills whenever opportunity serves. A light dressing of nitrate of soda in February or early March, hoed in, will greatly increase top growth.

GOOSEBERRY LEAVES EATEN.—J. J., Birmingham: The gooseberries are suffering from a severe and late attack of the Gooseberry Sawfly (Nematus ribesi). Dust the bushes with hellebore powder—which is very poisonous—when they are moist with dew or rain, or use soot freely under similar conditions. After the leaves have all fallen, in the autumn, remove two or three inches of the surface soil under and around the trees, and burn it or bury it deeply, putting good garden soil, enriched with old manure in its place. This will encourage new roots, and dispose of the cocoons that lie in the soil for the winter.

WINTER SPINACH.—C. R. C., Dorchester: It is rather late, but not too late to make a sowing of spinach for winter use. Draw drills about one foot apart, selecting a good site, and well enriched soil. The usual date for such a sowing is from August 5 to August 15.

BLACKBERRY CULTURE.—G. P., Melton Mowbray: We strongly recommend you to grow the Parsley-leaved Bramble (Rubus laciniatus), and leave the American varieties alone, as they are not a great success in this country. Substantial supports are necessary for blackberries, and they may be trained to wires fixed to uprights of iron or wood, as may be most convenient, and four or five feet high. But wire trellises, such as are used for cordon pears and gooseberries, are preferable. The trellises should be arranged six or seven feet apart, where several rows are grown, and, as a matter of course, the wires should be stretched quite tight. The plants should be arranged three or four feet apart along the trellises, and have their growths loosely secured to them as they rise in the course of the following season. They may also be successfully grown trained to wood or iron posts, and under that form of culture the blackberries should be planted four feet apart in rows with six feet spaces between them. Each plant should have the support of a post or stout stake, standing five or six feet above the surface. The planting should be done sometime in November, and healthy suckers of medium size should be selected. Plant them to a depth of three or four inches, and, before new growth commences in the spring, cut them down to the ground level to promote the production of strong growths from the base. Not more than three or four canes should be allowed to grow the first year, and the most healthy and vigorous should be selected for furnishing the trellis or post. In subsequent years three or four growths to each plant should be allowed to attain their full development, and all the others be removed as soon as they make their appearance above the surface of the soil. The old canes should be cut out near the base after the fruit has been gathered.

NAMES OF PLANTS.

R. A., Blisworth.—1, Alonsoa Warscewiczi; 2, Liatris spicata.

B. T., Hove.—1, Cosmos bipinnatus; 2, Rosa rugosa; 3, Hoya carnosa.

M. G. A., Cartmel.—1, Veronica Andersoni; 2, Pleroma macrantha; 3, Cobæa scandens variegata.

D. E. W., Roade.—1, Salix viminalis; 2, Cupressus Lawsonianus erecta viridis, 3, Bocconia cordata.

F. C., Hythe. — 1, Buddleia globosa; 2, Veronica teucrium; 3, Arbutus Unedo; 4, Eucalyptus globulus; 5, Acacia lophantha.

N. G. E., Abbot's Langley.—1, Spiræa Douglasi; 2, Andromeda floribunda; 3, Cotoneaster Simonsi; 4, Lonicera sempervirens; 5, Fuchsia triphylla; 6, Gypsophila elegans.

OBITUARY.

MR. HENRY BALDERSON.

With much regret we record the death of Mr. Henry Balderson, which occurred at his residence, Corner Hall, Hemel Hempstead, on the 12th inst., in his seventy-seventh year. Mr. Balderson, who was one of the most genial of men, was best known to the general body of horticulturists by his association with the Fruit Committee of the Royal Horticultural Society, of which he was for many years vice-chairman, a position from which he retired a few years since owing to ill-health. Mr. Balderson was keenly interested in fruits and fruit culture, and notwithstanding the heavy claim that was imposed upon his time by his business, he fully recognised his responsibilities as a citizen. He started the Volunteer movement at Hemel Hempstead in 1869, was a member of the Board of Guardians for thirty years, churchwarden of Boxmoor Church fifty-two years, long an Alderman, and formerly a Mayor of the town.

TRADE NOTES.

Messrs. J. Weeks and Co., who have been established at Chelsea for many years, intend shortly to open an office at 72, Victoria Street, S.W., under new management, as being more accessible for their numerous clients. The excellence of their work, both glasshouses and heating apparatus, is known to most of our readers, and their "Duplex" Upright Tubular Boiler is known all over the world.

Taken in connection with the rapid spread of the American Gooseberry Mildew in Kent, the specimens taken from sprayed and unsprayed bushes that have been sent us by Messrs. H. Cannell and Sons, of Swanley, have much interest. The branches taken from the unsprayed bushes are so badly infected with this highly injurious disease as to have had the development of both wood and leaf seriously checked. The branches on the other hand of the bushes that are described as having been sprayed by a preparation manufactured by the firm are perfectly free from the fungus, and in the healthiest possible condition.

Rose Cuttings may be inserted from now until the end of September, though the earlier they are put in the better. Choose half-ripened wood (not the strong sappy growths), preferably with a heel, though this is not a necessity; they should be from six to nine inches long; remove the lowest leaves and spines, and insert either in a cool frame or in a sheltered border in the open. Shade from the fiercest rays of the sun, and keep nicely moist. The soil should be sharp and porous, and made nicely firm round each cutting. The chief advantage of roses on their own roots is the absence of foreign suckers, but, generally speaking, growth is not as strong as in roses on the briar or manetti stocks.—E. F. HAZELTON.

Notes on Pruning Climbing Roses.—As soon as climbing roses pass out of bloom the plants should be thoroughly overhauled, and loosened from their support, whether wall, pergola, porch, or arch. The old flowering wood may safely be cut out, thereby concentrating the force of the plant into producing vigorous and healthy new wood for another year. When cutting out old wood it is advisable to retain a few buds at the base, as from these adventitious shoots will be produced which, if well exposed to sun and air, will yield quantities of the finest flowers the following season. Roses which are allowed unlimited space for development, or those grown under semi-wild conditions, should only be sparingly pruned. Roses of the Wichuraiana type, and the old Ayrshire roses, succeed well under this treatment, and these rarely require the knife.—THOMAS SMITH, Walmsgate Gardens.

HARDY BORDERS for colour effect, to give a succession of flowers for many successive seasons. Write at once with particulars of space to be filled, and (on order) selections will be prepared and packed ready for planting in September, on Kelway's "Artistic" border system. KELWAY and SON, Langport.

FOR HARVEST DECORATIONS.
GLADIOLUS FLOWERS.
From our Fields of Gladioli through August and September we send these beautiful flowers securely packed at 15s., 22s., or [illegible]s. per 100 spikes. (Cases allowed for if returned.) There is nothing so suitable for Church Decoration at Harvest Festivals; nothing so brilliant nor so lasting. KELWAY and SON, Langport, Somerset.

FOR AUTUMN PLANTING.

PLANTERS of FRUIT TREES should write for our fully descriptive catalogue and supplement.

Well-ripened trees of all kinds, and our large, developed specimens of Vines, Figs, Peaches, and Nectarines, are especially good.

An inspection solicited.

GEORGE BUNYARD and CO., Ltd.,
The Royal Nurseries, MAIDSTONE.

SOW CYCLAMEN SEED NOW, of our fine giganteum strains, and finest of all "Low's Salmon King" of the Begonia Gloire de Lorraine colour, which glows by artificial light. Seed in packets, 1s. 6d. and 2s. 6d.; also Perpetual Flowering Carnation Seed in packets, 2s. 6d.; Schizanthus Wisetonensis, 1s., 1s. 6d., 2s. 6d.
HUGH LOW and CO., Bush Hill Park, Middlesex.

CANNELL'S PANSY, New Orchid-flowered, some of the most delicate and prettiest shades ever seen in Pansies, 1s. per packet, post free. Sow now to obtain good plants. CANNELLS, Loddon, Norwich.

CANNELL'S PANSIES.—Sow now Lord Beaconsfield, Emperor William, Golden Queen, Snow Queen, Wallflower Brown, 3d. pkt.; 5 pkts., 1s., post free. CANNELLS, Loddon, Norwich.

SOW NOW, to FLOWER NEXT YEAR, Cannells Aquilegia, long-spurred hybrids; Antirrhinum, Canterbury Bells, Hollyhocks, Delphiniums, Digitalis (Foxglove), 6 pkts., 1s., post free. CANNELLS, Loddon, Norwich.

TO DAY! AND FOR YEARS AND YEARS PAST the XL ALL Specialities are and have been the best on the market. Where is the Gardener who does not pin his faith to one or the other of these celebrated Insecticides or Fertilisers? XL ALL FERTILISER has pleased all who have used it this season. The Sales of XL ALL FUMIGATOR prove that it is more popular than ever. XL ALL LIQUID NICOTINE INSECTICIDE is always spoken of by gardeners and growers as the most deadly to Mealy Bug, Thrip, etc. XL ALL WINTER WASH for dormant Trees acts like magic, clearing the Trees and Bushes of all Insects' Eggs, Moss, and Fungoid Growths. XL ALL LAWN SAND, a weed eradicator and fertiliser for weedy and poor lawns. XL ALL WEED KILLER used once a year "No weeds can live." Please ask your Nurseryman, Seedsman, or Florist for a copy of my small pink list, giving particulars of these and many other XL ALL Preparations, which can be obtained from the Horticultural Trade throughout the World. G. H. RICHARDS, Manufacturer and Patentee, 234, Borough High Street, London, S.E.

THE GARDENERS' MAGAZINE.

NOTES OF THE WEEK.

Summer Bedders.

Visitors to gardens at this season of the year have an exceptionally good opportunity, not only for enjoying to the full the varied floral displays produced within them, but also for formulating an opinion as to the trend of public taste in its relation to the embellishment of the flower garden during the summer months. We have had many opportunities for visiting gardens in widely separated parts of the country during the past three months, and have taken full advantage of them; and in our visits we have noticed with much satisfaction that there is, on all sides, as strong a love for hardy plants as at any time since the revival of the interest in them. We have noticed also that, speaking in a general way, while there has been no diminution in the interest taken in them, the views with regard to their position in the garden have undergone considerable modification, with, as we believe, advantage to all concerned. Owners of gardens are more fully realising the importance of constant attention and good taste in the management of beds and borders devoted to hardy perennials, and recognise the fact that the association of hardy and tender subjects is a question deserving of the fullest consideration. There are still immense numbers of garden owners who believe hardy flowers are all-sufficient for beautifying the flower garden in summer as at other seasons of the year; but, judging from the observations we have been able to make, the number of those who take extreme views upon this point is gradually diminishing. This is matter for satisfaction, because the greater the breadth of view in garden embellishment the better; but in giving expression to this opinion, we would mention, lest we should be misunderstood, that we feel that, where no effects of the spectacular order are desired, and a personal interest is taken in each individual plant, as in the case of Mr. Kingsmill's garden, of which an illustrated description was given in our last issue, hardy plants are all sufficient. But it must be admitted that where colour effects are desired they can best be obtained by supplementing the hardy plants with tender subjects that can be successfully grown in the open during the warmest season. This fact is now being more generally recognised, as evidenced by the tendency on the part of many owners to give increased attention to the plants popularly known as summer bedders. There is happily no indication of a harking back to the days when the scarlet pelargonium, the yellow calceolaria, and the blue lobelia were in the ascendant, and used almost exclusively in colouring the parterre. The trend is rather in the direction of a freer use of half-hardy plants that are suitable for the production of tasteful effects, and retain their beauty until the season of summer has merged into that of autumn. In the gardens in which we have observed this tendency, there has not been any evidence of a decrease in the interest in hardy plants. They have still spacious borders devoted to them, and they continue to receive the attention essential to their full development, and, as a consequence thereof, the borders are rich in interest and attractions throughout the season. But it is recognised that the hardy plants which produce such a glorious display of colour in the borders, and charm by their diversity of form in leaf and flower, are not the best suited for filling beds near the house where neatness and continuity of flowering are important factors. No longer, as already intimated, do calceolarias, lobelias, and pelargoniums predominate, but they are used as freely as may be considered necessary in working out colour schemes in which yellows, blues, reds, and pinks form a part and no more. With them are associated fibrous and tuberous begonias, which we need hardly say, afford a wide range of colour; ageratums, fuchsias, lantanas, herbaceous lobelias, verbenas, violas, cannas, and various plants remarkable for leaf colouration and elegance of habit. By the judicious utilisation of such materials as these the most tasteful effects may be produced, and the surroundings of the house be made to present a neat yet bright appearance, and especially at the time when the country house is usually filled with guests. We do not hold a brief for summer bedding, nor are we desirous of seeing it greatly extended, because of the work it involves, and the displacement of some part of the hardy plants that would necessarily follow. But we refer to the matter for the purpose of informing our readers as to the tendency of public taste, and pointing out that summer bedders have much to recommend them for the filling of beds contiguous to the house, where continuity of effect is a matter of primary importance. Moreover, they admirably fit into a scheme which includes the free use of crocuses, daffodils, hyacinths, and tulips, in association with such hardy plants as the double arabis, forget-me-nots, polyanthuses, violas, and wallflowers, in beautifying the garden in the spring. The question of flower garden decoration is one that can be considered with advantage at the present time, and we suggest that it be approached with a broad spirit, and that while hardy plants should continue to be grown

MR. GEORGE BUNYARD, V.M.H.,
Chairman of the R.H.S. Fruit Committee.

to the fullest extent, no prejudice should be allowed to prevent summer bedders being utilised in the positions, and in those only, for which they are specially fitted.

Mr. George Bunyard, V.M.H., is so well known to all who take an interest in the practical aspects of horticulture,that in presenting our readers with his portrait there is no occasion we should write at length with reference to the splendid work he has accomplished. Some forty-three years have run their course since Mr. Bunyard commenced business by entering his father's office, having previously laid the foundation of his remarkable knowledge of fruits and fruit culture by assisting in the cultivation, gathering, and storing of the fruit grown for home use and sale. At that time the nurseries had an area of about twelve acres, with a staff of fifteen men, and the trade was of a local character. Now the Maidstone Nurseries have an area of over one hundred acres, a large staff, and a business extending over the whole of the British Isles, and, indeed, considerably beyond their boundaries. From the first Mr. Bunyard devoted close attention to fruit, and soon became well acquainted with varieties, and the details essential to success in the making of trees, and, as the result, he was fully equipped for taking a prominent position in the management of the business when his father's failing health rendered it necessary he should do so. By reason of his business aptitude, and the breaking away from old customs, the demands upon the resources of the establishment increased at a rapid rate soon after Mr. Bunyard assumed the responsibilities of management, and as one of the outcomes the Allington Nurseries were established. By the year 1878 Mr. Bunyard had obtained a high position as a fruit expert, and he was offered a seat on the Fruit Committee of the Royal Horticultural Society, and with this body he has been associated since. For some years past he has occupied the important position of chairman. With the exception of an interval of two or three years Mr. Bunyard has been a member of the R.H.S. Council since 1891, and in 1897 was awarded the Victoria Medal of Honour. In 1890 he was made a member of the Fruiterers' Company, in recognition of the services he rendered in connection with Guildhall Fruit Show, and a few years since he was elected Master of the company, a position, we would add, that had not previously been occupied by a practical pomologist.

Bulbs are now beginning to receive a large share of the attention of the general body of cultivators, and with a view to assisting our readers in making preparations for full displays of bulbous plants, both under glass and in the open, in the spring of 1909, we shall devote our issue of September 12 chiefly to these subjects. The arrangements we have made with contributors specially acquainted with the several classes of spring-flowering bulbs fully justify us in stating that the issue will be equally remarkable for the variety, the interest, and the usefulness of its contents.

The Californian Poison Vine (Rhus toxicodendron) is the subject of an interesting contribution by Sir Ray Lankester to "The Daily Telegraph." After referring to its injurious effects upon persons susceptible to its influence, he observes: "Several cases are on record of the mysterious poisoning produced by this plant in England; but it is strangely unfamiliar to medical practitioners—indeed, practically unknown to them, although an English countess was not long ago a victim for some years to its unsuspected influence. At the University of Harvard, in Cambridge, Massachusetts, they have made quite recently a thorough examination of the poison vine in the laboratory, with the following results: The poison is an oil—a fixed oil, not a volatile one, as we might have imagined from its mysterious action at a distance. The oil exists in all parts of the plant, even in the fine hairs and cuticle of the leaf. It can be extracted by means of ether, and is one of the most virulent irritants known, having a very curious penetrating and persistent action, and producing violent pain and destruction of tissue when placed on the skin in quantity so minute (one-thousandth of a milligram in two drops of olive oil) as to be beyond the terms of everyday language. It seems to be usually brought to the eyes, nose, lips, and skin of the face and body by the fingers which have touched a leaf or fragments of a leaf in powder. The dead leaf in winter still retains the oil, and minute dust-like particles can carry it. The treatment for it is washing with soap, oil, and ether at an early stage of the attack—especial care being taken to free the fingers from any minute traces of the oil adhering to them." Sir Ray Lankester's account of the poisonous effects of Rhus toxicodendron has given rise to some anxiety as to whether it might not in some instances have been planted by mistake for the harmless Ampelopsis Veitchi. It may, therefore, be reassuring to state that the two plants can be readily distinguished by those who have but a slight acquaintance with plants. The rhus does not bear tendrils, while the ampelopsis does. The rhus has trifoliate leaves, and the leaflets have stalks of unequal length, that of the central one being the longest, whereas the leaves of the ampelopsis are entire, with three pointed leaves; occasionally they are trifoliate, but there are always entire leaves on the same plant, and in no case are the stalks of the leaflets of unequal length. Sir Ray Lankester is under a misapprehension in assuming that the medical profession has but little knowledge of the peculiarities of the poison vine.

National Dahlia Society will this year hold its exhibition at the Horticultural Hall on September 3, and the gathering should be of much interest to those who appreciate the value of dahlias for beautifying the garden and supplying an abundance of flowers for indoor decorations late in summer. Dahlias had begun to suffer somewhat on light soils from the drought, but the rains have had a highly beneficial effect upon them, and the blooms are now coming of large size and high quality.

The Jersey Potato Crop has, we learn from the annual report issued by Mr. Philip Barbier, St. Heliers, been on the whole satisfactory. Prior to the end of July when the season closed, 53,100 tons were shipped from the island, and the returns amounted to £356,305, or an average of £6 14s. 2d. per ton. The price obtained for the earlier shipments was remarkably good, the average for the 200 tons dispatched between April 6 and May 2 having been £28 12s. per ton. This produce was obtained from glass-houses and warm slopes. The price for subsequent shipments was well maintained. Upwards of £14 was obtained until the end of the third week in May, and in the last week of that month it did not fall below £11 11s. By the middle of June, when 11,890 tons were exported, the price fell to an average o £6 10s. per ton. Somewhat later the price dropped to £2 9s. 10d. per ton, but quickly recovered to about £3 10s. per t The crop, although satisfactory, was by means excessive in bulk, for during t previous twenty-five years larger quantit were shipped in sixteen years, and the r turns have been greater in twelve year The heaviest crop that has been grown Jersey was lifted in 1907, when 77,800 t were lifted and dispatched to the vario markets, but as the average price was le than £5 per ton the financial results wer not satisfactory to the growers. T largest amount realised was £487,612 1891, and the highest average was rat more than £10 per ton in 1903, in wh year 47,530 tons were dispatched Jersey.

A Commissioner of Fresh Fruits.—A Bill has been introduced int the American Senate which provide the appointment of a fresh fruit comm sioner, whose duty will be to regulat bushel, basket, and box apple measu and ascertain that the contents of packages are of true grade in accorda with the compulsory outside marki With reference to this Bill a corresponden of "The Times" writes: "Might not green fruit commissioner be appointed wi advantage and profit to producers and sumers in England? Market bushel me sures, especially those utilised for app are of such a varying and elastic na that a standard measure should prescribed by law. The apple bu measure cannot be regulated by wei Some varieties of apples are la and light, such as the Early V toria, whilst others are small and he such as Fearn's Pippin. Only a stand measure of capacity can meet the diffic The Bill before the American Senate, w meets with universal approval, compels packer of apples to mark distinctly on package the quality or grade. As most the apples distributed in our markets England are repacked, and often in a that is distinctly to the disadvanta the purchaser, the compulsory marki grade and quality on English apple p ages should be insisted upon in the in of the public. Foreign fruits are often as home-grown, to the injury of the B cultivator and the buyer, and c sorts are often marked and sold as sorts, at enhanced prices. An active fruit commissioner would prove a dis boon, and would make his department of the most interesting branches public service."

Gladioli from Langport. splendidly developed spikes of gladioli Messrs. Kelway and Son have been enough to send us are of much inter a reminder of the great success that been achieved by the firm as raisers cultivators of these stately and attracti coloured flowers. They also sugg remarkable attractions of the la nurseries at the present time. The ties represented by the spikes of sent us are wholly of Messrs. Kelway Sons' raising, and an extremely beau set they are. Among the varieties Prince Henry of York, a distinct ye of high quality, bearing vermilion- flowers; Darkness, rich crimson, lovely purple glow, the flowers and very large: Queen Alexandra, a ha flower of a soft salmon hue, with blotch and white crescent on the segments; Golden Ray, a beautiful yellow flower, with a few crimson ings on the deep golden-yellow low ments; Mrs. F. Field, pure white, pink, and freely marked with brilliant rose, and most attractive; and Mrs. Chatham, a fine variety, the large, pure white flowers being of fine form.

Bulbs for the London County Council Parks.—The bulbs required by the London County Council for planting in their parks and open spaces this autumn will be supplied by Messrs. James Carter and Co., Holborn. The number of bulbs it is estimated will be required are as follows: 20,000 hyacinths, 115,000 tulips, 75,000 crocus, 3,500 lilies, 160,000 snowdrops, scillas, etc. These will be distributed chiefly at Finsbury Park, Victoria Park, Victoria Embankment, Battersea Park, Brockwell Park, Dulwich Park, Ravenscourt Park, Southwark Park, Clissold Park, Kennington Park, Golders Hill, Waterlow Park, etc.

Menthol, which is commonly known by chemists as methylic acid and camphor of peppermint, is described in one of the weeklies as growing in Surrey. The writer, in giving an account of the harvest of fragrant flowers from which essential oils are distilled, writes: "Peppermints and menthol are also grown extensively in Surrey. The plants have only insignificant white and pink flowers, not unlike nettles. They are reaped in much the same way as lavender, and the smell of the distilleries, when their essential oils are being extracted to be used by confectioners and chemists, is almost overpowering." It would be interesting to know what the second of the two plants is to which reference is made, because menthol is not a plant, but a crystalline substance deposited from oil of peppermint when kept a considerable length of time.

The Royal Fern in Lancashire.—At a field meeting of the Liverpool Botanical Society, at Barton, Mr. W. H. Stansfield delivered an address on points of interest in connection with the mossland flora. In the course of his remarks he pointed out that, as a result of draining and cultivation, very little aboriginal moss now remains in Lancashire, and that, as a consequence thereof, the effect on the fauna and flora is becoming very evident. Many plants and animals formerly plentiful on the Lancashire mosses have now become extinct or greatly diminished in number. Osmunda regalis, the well-known Royal Fern, afforded a striking instance. Formerly this handsome fern covered vast areas of moss, and was especially plentiful about St. Helens. Mr. Stansfield remarked that he could remember large quantities being brought from the mosses into Manchester markets. Now, however, partly owing to drainage, and largely as a result of vandalism, this handsome fern is almost lost to the county.

Window Boxes in Winter.—Much has of late years been accomplished in Manchester in encouraging a taste for flowers among the poorer classes by the awarding of prizes to the best-kept window boxes. A correspondent makes the suggestion that the owners of window boxes in that city should be further encouraged by instituting a winter competition.

Brympton Horticultural Society, which was founded early in 1907, has, we are pleased to learn, held a highly successful exhibition. The show was held in Brympton Park, the residence of Sir Spencer Ponsonby-Fane, G.C.B., and there were 831 entries, as compared with 492 entries last year. The weather was not favourable, but we are informed by Mr. W. Hobby, the hon. secretary, that the society has a good balance at the bank.

DESTROYING WASPS' NESTS.

Although one may come across them at any time after the middle of July in an average summer, wasps' nests are not generally much in evidence until the early part of August, and sometimes not before the middle of that month. So soon, however, as the pears, plums, and apples begin to ripen in any quantity wasps are almost certain to make their appearance in considerable numbers, although the plague is often so local in character that one county may be overrun with the pests while the next is almost entirely free from them. Nearly every part of the kingdom has its turn, however, and there are many particularly favourable districts where hardly a summer goes by without great inconvenience and loss being occasioned by myriads of these unwelcome insects. How great may be the damage committed annually by wasps, it would be impossible to determine, but it is very certain that the loss to fruit-growers, fruiterers, and confectioners must total many thousands of pounds per annum, while a not inconsiderable amount of loss is suffered by private individuals. The question of inconvenience and suffering caused by wasp-stings is undoubtedly a small one considering the many millions of these insects that a fine summer must produce, and the consequences are not generally very serious. Fatal cases of wasp-sting do, however, occasionally occur, and many accidents have been caused by horses being stung while passing a wasps' nest by the roadside.

From every point of view, therefore, it is desirable that the number of wasps should be reduced as far as possible, for the small amount of good that they may do in destroying flies is quite disproportionate to the harm that they commit in a variety of directions. The destruction of wasps is a matter in which nearly everyone is interested, and it is therefore somewhat surprising that so little effort is made towards organising a co-operative movement with that object in view. It is true that in some villages the vicar or schoolmaster has instituted a competition among the school children to see who shall bring in the greatest number of dead queen wasps in the spring, and here and there small rewards are offered to encourage this good enterprise; but in most parts of the kingdom no attempt whatever is made to kill the queens, and the most primitive and unsatisfactory methods are adopted for the destruction of the nests. Probably only a very few of the total number of the latter are discovered, those which are found by accident or placed in such conspicuous positions that they cannot be missed being the only ones that anyone attempts to destroy.

Now that a move has at last been made in the matter of rat destruction, and steps are being taken to bring into line such local organisations as already exist for the suppression of such unnecessary creatures as rats and sparrows, it would seem a good opportunity to do something of the same sort in regard to the taking of wasps' nests. Such a campaign ought to be very easily initiated, and one cannot conceive that there would be any opposition on the part of anyone. It might be necessary to offer some inducement in certain cases, but one imagines that the owners of orchards and gardens, as well as local tradesmen who find their wares spoilt and eaten by wasps, would readily support a movement that must be of great advantage to them. Competitions might also be arranged as in the case of rat and sparrow clubs, and a small entrance fee charged to cover any incidental expenses and help to swell the prize-money. But in such a matter as the destruction of wasps' nests, it would be absolutely necessary to have some responsible person to conduct affairs, or otherwise the whole thing might frequently end in dire disaster. In the first place one is dealing with a dangerous and determined enemy which requires careful handling, and in the second the methods adopted are not always free from danger in themselves. Many an accident has happened to a party of foolish boys bent on wasp destroying, and, while it might be all very well for the younger members of the community to search for and mark the nests, the actual work of destroying them ought to be left to those of riper years.

Of all the plans for taking wasps' nests that have been recommended, none can equal the employment of cyanide of potassium for ease of application and absolute efficiency. It is a deadly poison, and as such is only sold to those over age, and must be signed for when purchased. The greatest care must be exercised in using it, and none but a very careful person should be allowed to keep or handle it. The modus operandi is simplicity itself. First of all, the hole must be marked in some way, so that it may easily be found after dark, for wasps go to bed late, and it is no good trying to destroy a nest until all are at home. One person should carry the cyanide and an old teaspoon to administer it with, while another brings a spade and lantern. A sod of turf is cut and brought near the hole, and while the light is placed sufficiently near to enable the operator to push a teaspoonful of the cyanide as far down the hole as it will go, the other man should be waiting ready to clap the sod of turf over the mouth of the hole. A pat or two with the back of the spade will make all secure, and next morning the nest may be dug out, and all the grubs in the comb destroyed. If the cyanide be fresh and the work properly done, not a wasp will survive its deadly effects, and the cost of destroying a score of nests is only a few pence. With such a powerful agent easily procurable, it is mere waste of time and patience to try and take wasps' nests with such unsatisfactory things as tar, boiling water, paraffin, soap-suds, or squibs, not one of which can be relied upon to achieve the desired result at the first time of asking. Finally, let it be urged that in taking wasps' nests early action is of the utmost importance, for the nest that is only two or three hundred strong to-day may contain ten times as many wasps before another week has gone by.

East Sussex.

Veronica filifolia.—There is now in cultivation a very beautiful little speedwell under the name of Veronica filifolia. In foliage it resembles few of the other herbaceous veronicas, this being extremely graceful, and finely divided, as the specific name would suggest. The flowers, also, are charming, with their soft blue colouring, and, as the plant is quite dwarf, it is a splendid thing for the rockery. It is as yet but little seen in British gardens, but is apparently making its way gradually into our gardens. I had V. filiformis some years ago from the famous gardens of M. Philippe de Vilmorin, at Verrieres-le-Buisson, but, through an accident, lost it after a year or two, and have only recently replaced it, much to my own gratification. Only lately I came across it in a few good gardens in Ireland, and I was glad to find that it was appreciated there by good and tasteful lovers of alpine flowers. V. filifolia is quite hardy, and can be cultivated in ordinary soil, although I think it prefers one which is a little moist, though not excessively so.—S. Arnott.

BLACK AND RED CURRANTS.

The various kinds of small fruits form such an important part of the annual crops that one is constrained to ask himself the question if the most is really made of the limited space at his command, or if there are no improved methods to be adopted. There are but very few gardeners with unlimited resources, or who are able to do just as they wish; if there are any such they may consider themselves fortunate. It too frequently happens that the kitchen garden is far too small for the requirements of the establishment, and when a good portion of that already overtaxed small plot has to find accommodation for hardy flower borders, and plants to produce cut flowers, there is not much space left for crops that are really necessary.

Black Currants.

In many places the black currant is in great demand, in others it is the red varieties, or it may be the gooseberry, raspberry, strawberry, loganberry, or the like. Let us take the black currant first, as this fruit is used for a variety of purposes, such as making jelly and preserves, as well as for general cooking. This being so, it is necessary to extend its season of usefulness over as long a period as possible. To do this several varieties should be grown, and they should be planted in different positions, the earliest being given an open sunny place, while the late one should be planted in a shady spot, such as on a north border. Black currants are moisture-loving subjects, and though with attention they may be grown to perfection in dry, gravelly soil, they will grow much more freely with the same treatment in a deep rich loam. To produce the finest samples it is necessary to have young bushes, and were this practice adhered to, we should hear but very little about the black currant bud mite. This is a pest that has not troubled us here, for the simple reason the bushes do not remain sufficiently long in one place.

As every gardener knows, black currants are readily propagated by cuttings, some take off the tips of the shoots about six or eight inches long, and insert these close together in beds in the winter, but we prefer selecting some of the strongest shoots from eighteen inches to two feet in length, and taking these off with a heel of the old wood attached as soon as the young wood has become matured. These cuttings are dibbed in beds that have been previously prepared for that purpose on a north border, where the soil can be kept moist and cool. They are inserted about six inches deep, holes being made with a dibber to admit of them being put in the proper depth. We usually allow a space of a foot between each cutting in the row, and a distance of from fifteen to eighteen inches between the rows. By the following autumn they are nice strong plants, ready for transplanting in their permanent quarters. There is no necessity to put them any great distance apart, four feet each way being ample, and where space is very limited a row of lettuce or some other dwarf crop might be grown between them the first season. It is far better to give the currant bushes a liberal mulching as soon as planted. Some have an idea that if planted any time during the winter equally satisfactory results can be obtained, but if anyone will take the trouble to plant during the first spell of showery weather in October, and lift a plant or two again about the latter part of November, they will find that new roots have been made from two to three inches in length, thus proving the great advantage in early planting.

As previously remarked, black currants are moisture-loving subjects; for this reason they should be liberally supplied during the early summer with sewage or the drainage from the farmyard. Here we allow the bushes to stand from three to four years, then destroy them. Each year a fresh lot is planted, so that there is always a stock of young bushes that can be depended upon to give a crop of fine fruit. There are now several very fine varieties of black currants, such as Early Victoria, Coronation, Boskoop Giant, Carter's Champion, Goliath, Lee's Prolific, etc. Where large quantities of fruit are required it is well to grow several varieties, as the late sorts when planted in a cool, shady place, will give a supply of fruit until the end of August. There is no advantage in having the wood overcrowded in the bushes, and this is not likely to happen if they are only allowed to stand three or four years in one place. It is when the bushes become old that the wood becomes overcrowded, spindly, and unfruitful, the foliage often being a prey to red rust, spider, and the bud mite. Keep them healthy by generous treatment, and they will well repay the cultivator for his trouble. Allow them to become sickly they will soon be a source of trouble and annoyance, being neither of any use or ornament.

Red Currants.

These are used for a variety of purposes, and, though the fruit does not command such a high price in the market, they are even more useful in private establishments than the black varieties, as by careful cultivation the fruit may be had in use until quite late in the season. It is no uncommon occurrence in favourable seasons, and in districts where birds are not too numerous, to see red currants hanging on the trees after the leaves have fallen, as they do not drop off as in the case of the black varieties. Trees that are intended to carry their fruit until late in the season should be planted against a north wall, and have their shoots trained horizontally; by so doing the fruit hangs in a great measure clear of the wood, thus allowing a freer circulation of air amongst it. If the trees are planted four feet apart they will soon cover a wall eight or ten feet high, as two tiers of shoots may be taken up annually. The best varieties for planting against walls are those which produce long, loose bunches, such as Raby Castle and Warner's Grape. La Constance is also a good variety, and hangs well.

The red currant is propagated in the same way as the black, though it is not generally understood that if the cuttings are taken early in the autumn as soon as the wood is ripe, and before the leaves have fallen, that they will take root during the winter, and produce strong, healthy shoots the following year. At the time of taking the cuttings it should be determined what shape the bushes are to assume. The cuttings should be planted in rows with a dibber from a foot to fifteen inches apart in the row, allowing two feet between the rows, where it is intended to train the plants. If intended for bush plants the rows need not be so far apart. There are many varieties of red and white currants, but some of the older kinds have been superseded by those of more recent introduction; they make stronger growth, produce larger fruit, and, as the bunches are longer, the berries hang more loosely, and on that account are not so liable to rot. La Versaillaise, Mammoth, White Versailles, La Hâtive, and Knight's Large Red are all good. The red varieties do not suffer from the currant bud mite, and the only pest that troubles us is the larvæ of the clear wing sphinx; these sometimes eat the pith out of the shoots, causing them to die off.

There can be no doubt but that red currants grow far best in a rich loam, and where an abundance of moisture can be provided at the roots, the fruit is both finer and will hang for a longer time than when the trees suffer from want of moisture at the roots. For general use bushes from five to six years old are preferable to older ones, and if a stock of cuttings are put in each season there will always be a supply of young healthy plants to draw from. H. C. PRINSEP.

Buxted Park Gardens.

RAMBLER ROSES.

Although the growth of these roses has not been so rampant this year as in 1907, the plants have made an average growth, and there is an abundance of young shoots starting from the base of the plants. In this district we have suffered severely from drought, and all outdoor crops have much needed rain. Roses especially wanted rain, and as it has now come there is sufficient time for plants to make up any arrears of growth. The thorough moistening of the ground in its heated condition will speedily produce more growth.

If not already done, the rambler section of roses should have their annual pruning, which will be the cutting out of the shoots that have flowered bodily from the base, so as to make room for, and divert the vigour of the plants into the young growths which are partly grown. To do this efficiently, it is best to loosen all the shoots from the arches or pillars on which the plants are growing. Then carefully lay them out, and afterwards cut out all the growths that are not required for next season. Leave the current season's growth only, unless by so doing the arches or pillars are likely to be somewhat bare, when a few of the older growths may be retained for covering purposes. Keep the shoots secured to their supports as they grow, and this will complete the pruning until next year.

Ramblers have never made a better display with us than this season, while the colours have been intense, especially in the darker shades, notably among them has been Ruby Queen, the colour has been splendid. This variety also has the merit of clean, shining foliage, and is very distinct in character. These two qualities alone should recommend it to planters. All varieties in this section have been good this season, but the one named has been pre-eminently so. T. H. SLADE.

Shasta Daisy.—Can any reader of the GARDENERS' MAGAZINE say anything in favour of this plant? I have tried to grow it during the past two seasons without success, and find it a weedy, poor thing, which withers very quickly in dry weather. The old Chrysanthemum maximum doesn't mind a drought.—J. C.

Godetia, Double Rose.—This double-flowered godetia is one of the best to grow both for display and effect or for cutting purposes. It is a showy plant in a bed, but, like many of the godetias, should not be relied on for a lengthy display. The variety under notice is very effective in a long border and also planted in good-sized clumps in the herbaceous border. While it blooms when there is an abundance of other flowers, yet it provides variety for cutting, the spikes of bloom lasting well in the cut state. Good cultivation and generous soil leave their mark on this annual, and where such can be given the results fully justify the time and attention given them.—T. H. SLADE.

IRIS VERSICOLOR.

As an illustration of the adaptiveness of plants under cultivation one may cite the common Marsh Iris of the United States of America, a plant that possesses all the characters of a waterside plant, but which will grow and thrive in positions that may be described as sun-traps, and in the poorest of soils, so tenacious is it of life. Despite this seeming advantage Iris versicolor has not enjoyed a great measure of popularity. One finds a few clumps in the gardens of the curious and the scientific, and occasionally a happy grouping by waterside, showing some landscape genius had been there, but generally I. versicolor is an unknown plant in English gardens.

In common with most grassy irises of the American beardless group, it is very variable in colour, and the species embraces claret, red, blue, purple, violet, and pale mauve forms, and all vary a little in height and shape of flower. The flower's shape is practically that of Iris reticulata, but the standard petals are half the length of the fall petals; they measure four inches across, and are produced in flexuose sprays just surmounting the leaf cluster, and are effective for a month or five weeks preceding midsummer.

The leaf system is markedly robust, distinctly fan-shaped, and when grown by waterside exceedingly dense and vigorous, the plants being capable of holding up banks (that would otherwise fritter away) by their ramifying root system—an excellent use to which I have many times put them. Their value for broad plantings in semi-wild parts of the water garden and marsh is too great to be overlooked. Although they have not enjoyed a great measure of popularity in the past, there is a rapidly increasing scope for their use in informal gardens and in positions where it is desirable the plants should be able to take care of themselves. I know of several colonies that have thriven apace, and which have spread rapidly by ramifying rhizomes and many hundreds of self-sown seedlings till the patches appeared literally all flowers in the distance. These Iris versicolor can combat all but the strongest grasses, and hold their own with sedges, rushes, and other waterside vegetation if the soil is moist.

Selected or garden colour forms include Kermesiana, whose colour scheme is claret-red. Columnæ, violet-purple; Virginica, pale purple; and pallida, soft lilac. The standards are invariably paler than the fall petals, and these latter are as rich in their particular colourings as any flower I know. All have a white, lined signal patch that serves to heighten the intense colouring of the falls. Those who care for the very easy work of raising I. versicolor from seeds will find endless colour forms among their productions, violets and purples predominating.

To the student of evolution the grassy irises of America are an engrossing study. They are derivatives of apparently one ancient type, and every species is linked up by a series of intermediate forms that render their classification difficult. The lowland and marsh species are among the easiest of plants to grow, but the high and mountain species and species from dry regions call forth all the tenacity of purpose, patience, and the other virtues the man who cultivates alpines, dry region and high level plants must possess—or fail in his efforts to grow them.

G. B. Mallett.

SCHIZANTHUSES.

The various species and varieties of schizanthus are now generally appreciated as subjects for summer bedding, and for this form of garden decoration they are singularly effective, being not only extremely beautiful in foliage, but they embrace a good range of colour and are exceedingly light and graceful. They cover a long season of flowering, and the colours readily harmonise with most other subjects. All the species of schizanthus are annuals, which, to many people, simply means that haphazard growing is good enough, and it is this indifferent culture that so often misses the best things in gardening.

The ground intended for growing these annuals should be of medium richness. I do not advocate direct manuring unless it can be applied the previous autumn, employing thoroughly decayed manure from the farmyard or a spent mushroom bed. Manure of this description by spring becomes incorporated with the soil, and is therefore in a state readily assimilable by the roots.

Seeds can then be sown in the open ground any time after April 1, and the resulting plants thinned out to 12 or 18in. apart. The system I follow is to sow seeds under glass about the middle to the end of April, the seedlings are pricked out into boxes and grown under cool frame treatment, being finally planted out to the open ground at the end of May. Provided the ground has been carefully prepared growth will be vigorous and flowering will follow in due course, the plants remaining in bloom for a period of three months or more. This sowing will be most effective throughout July and August, but where a later display is desired, a date correspondingly later should be chosen for sowing.

Should the weather prove hot and dry after planting, water must be freely applied, and every encouragement given to luxuriant growth. Strong plants come into flower early, and continue growing, but weaklings soon answer to fertilisation, and their further development is stopped by the strain of seed production. The best species of schizanthus is Wisetonensis, which combines beautiful crisped foliage with a splendid range of soft shades of colour. This species yields seeds sparingly, consequently it is somewhat expensive to procure compared with some of the older species. Next in value to Wisetonensis are the hybrid forms, which largely figure in trade exhibits, and are probably the progeny of the last-named and pinnatus. These hybrids ripen seed in abundance, a mixed blessing, as the effort of seed production greatly reduces their period of attractiveness. Retusus and retusus Grahami have both flowers larger than the above, but they are produced more sparingly, the latter is a fine red flower, with a strong yellow lip. Retusus and its forms are not so floriferous as the others, yet when inter-grouped with Wisetonensis and pinnatus, their elegant leaves add to the general effect, and it is often the only greenery discernible among the mass of flowers which these last-named produce. The dwarf hybrid schizanthuses attain a height of 15in. when grown in the open, the others vary in height from 18 to 24in. For pot culture no annual can surpass the schizanthus for usefulness, as by sowing at frequent intervals they may be had in flower through summer and autumn, and an August sowing yields one of the most useful batches for spring flowering, as the subsequent plants come into flower in time for the Easter festivities. The effectiveness of the schizanthus in the garden is well shown in the accompanying illustration.

Thomas Smith.

Walmsgate Gardens, Louth.

A TASTEFUL ARRANGEMENT OF SCHIZANTHUSES AT WALMSGATE.

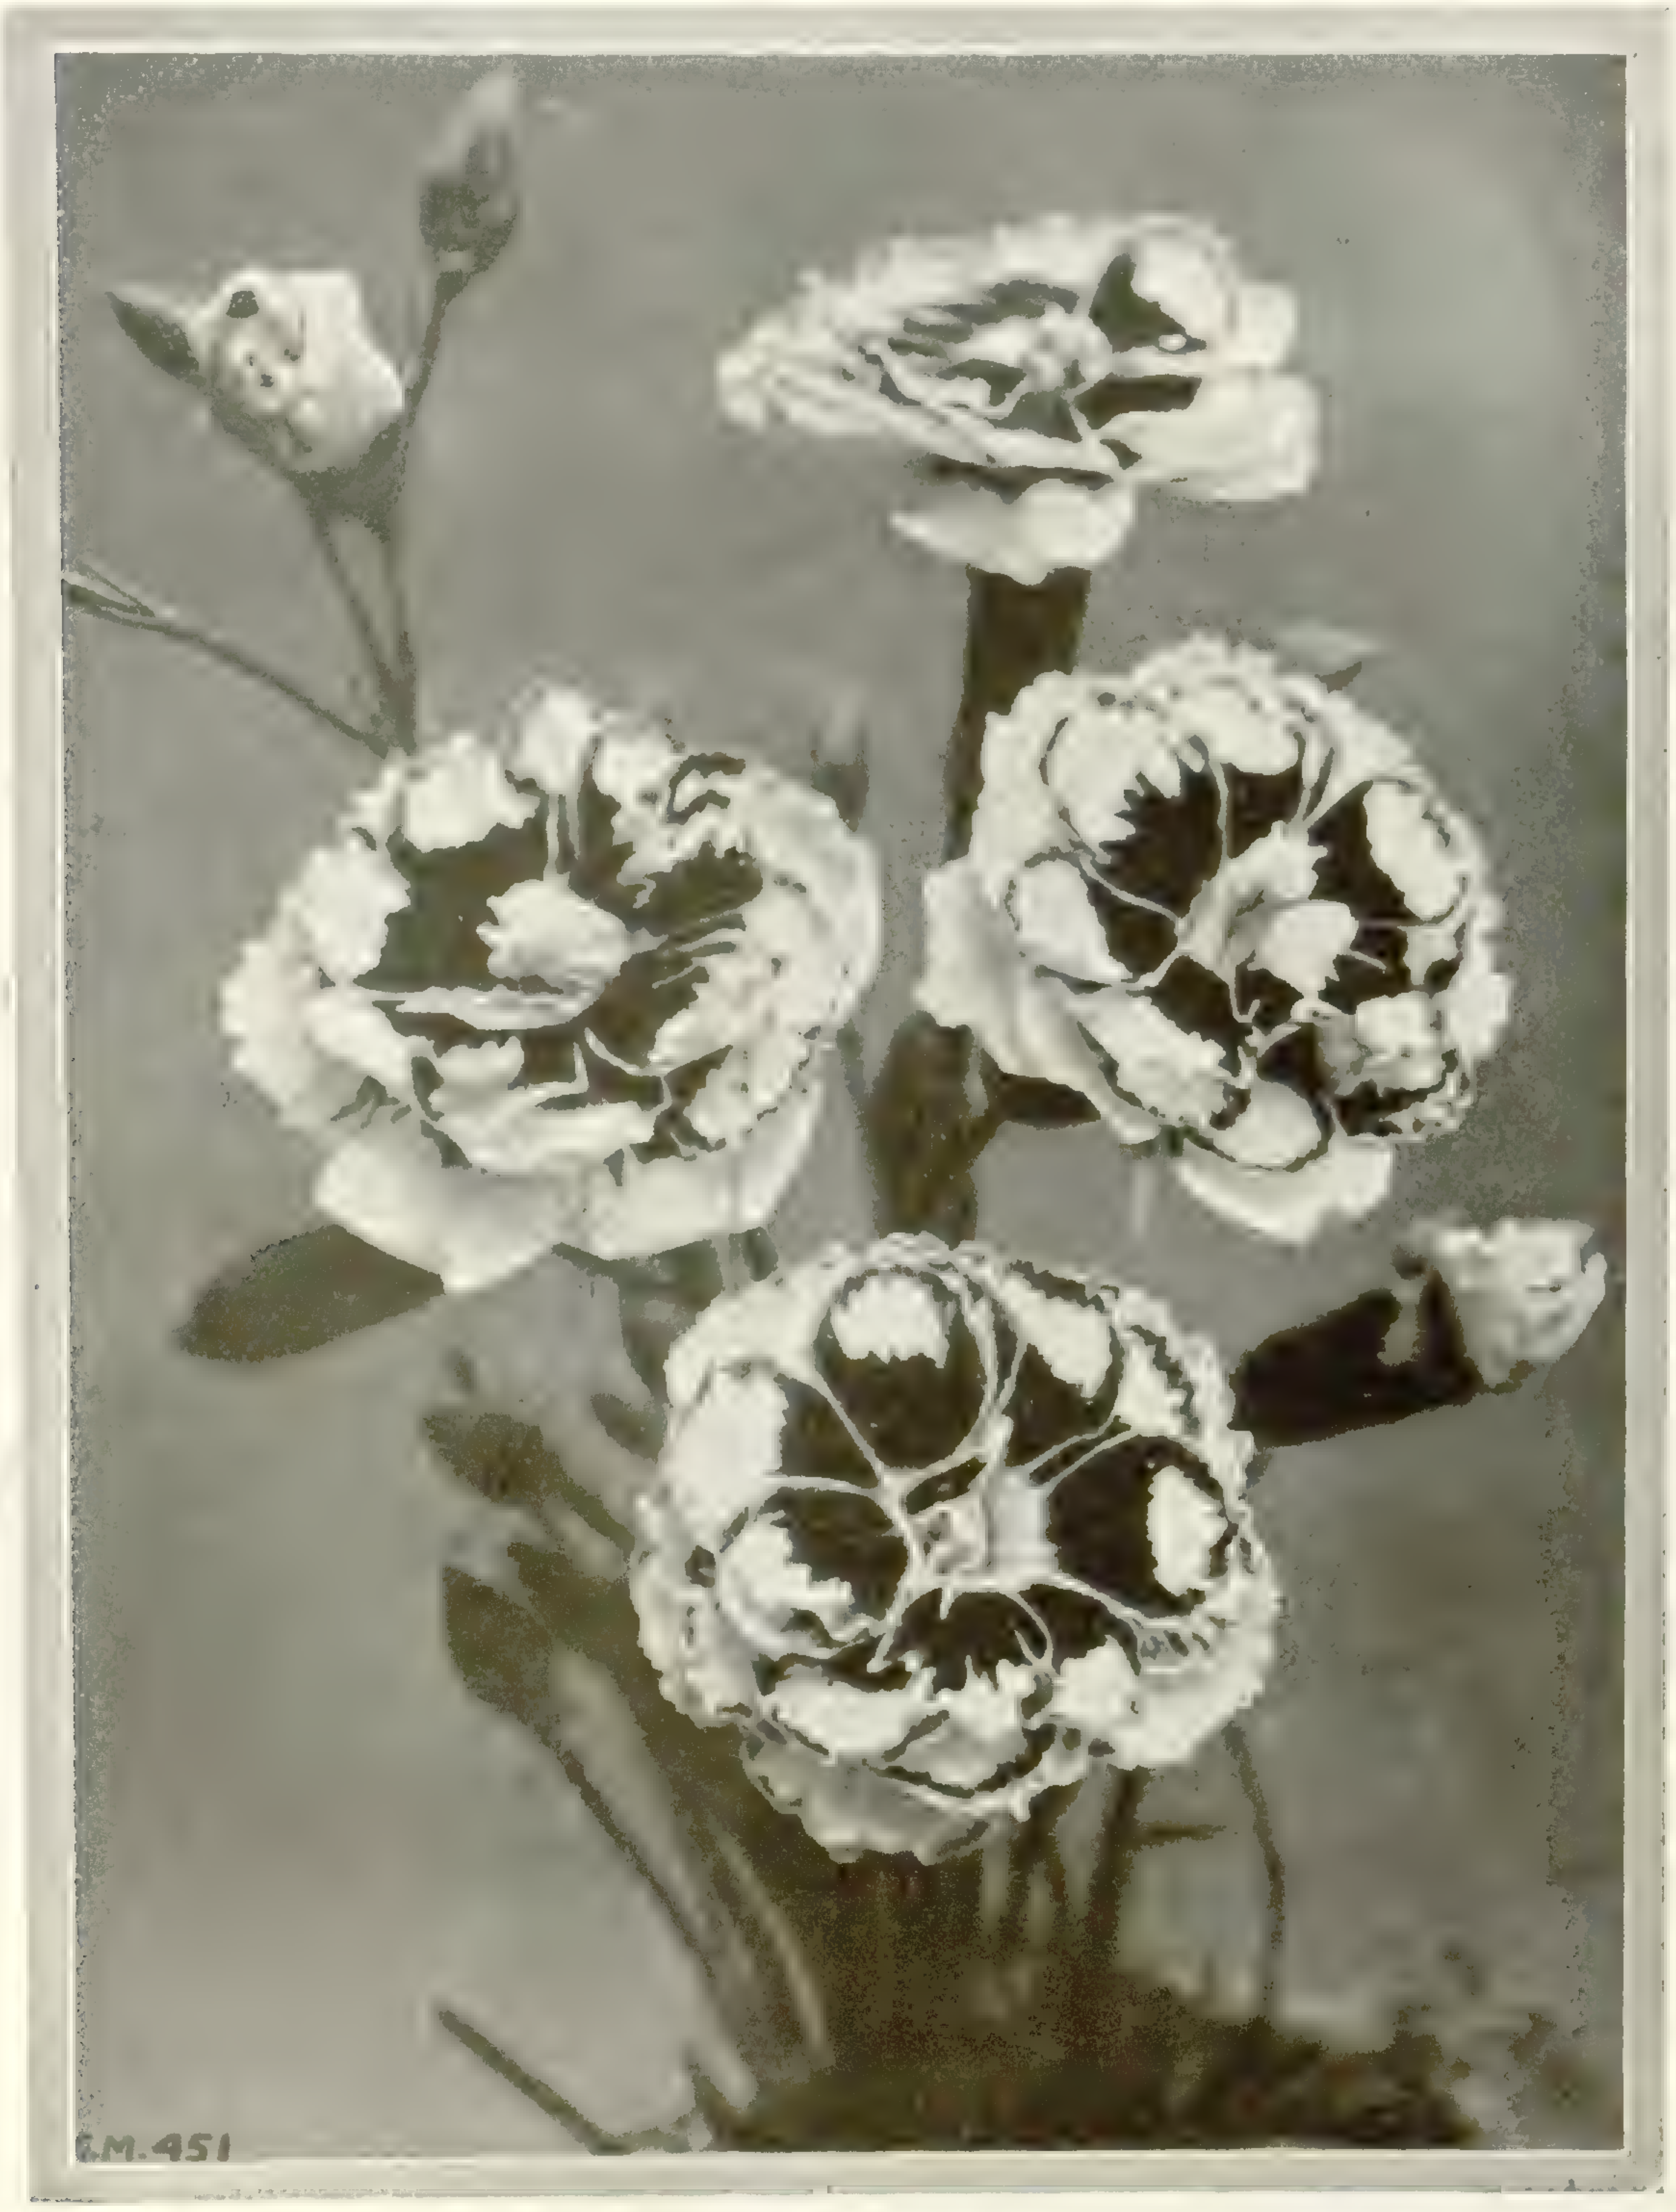
Helenium cupreum. — Helenium cupreum is one of the most conspicuous objects among hardy perennials at the present time. The colour of the flowers is a curious combination of bronzy chocolate and orange, a rare colour among plants, and one which is always popular. The plant attains a height of 2½ft., the growth is very free, and it is one of the best plants for flowering throughout a period of drought. The best results follow from planting in a good deep mass, and as it is easily increased by division, no difficulty need prevent the attainment of this end.—Thomas Smith, Walmsgate Gardens.

NEW PLANTS, ETC.

◆

ODONTOGLOSSUM WIGANIANUM SUPERBUM.

A remarkably handsome variety of the fine hybrid obtained from a cross between O. Wilckeanum and O. Rolfæ, as will have been seen from the characteristic illustration given in our issue of the 22nd inst. The flowers are large and of fine form; the petals and sepals bright yellow, freely marked with dark crimson spots, the lip pale white, marked with bright rose-purple. F.C.C., R.H.S., August 18. Sir Trevor Lawrence, Bart. (orchid grower, Mr. W. H. White), Burford Lodge, Dorking.



PERPETUAL-FLOWERING PINK PRINCESS CHRISTIAN,

Exhibited by Messrs. B. Ladhams, Lim., at R.H.S. Meeting, August 18, when an A.M. was conferred upon it. The flowers are shown rather below natural size, and the petals are laced with purple.

SOPHRO-LÆLIO-CATTLEYA MARATHON.

A distinct hybrid with Sophro-lælia Psyche and Cattleya Empress Frederick William as its parents. The flowers are large, and possess much beauty; the sepals and petals white marked with rose, the lip bright ruby red. A.M., R.H.S., August 18. Messrs. Charlesworth and Co., Heaton, Bradford.

THALICTRUM DIPTEROCARPUM.

A charming hardy border plant found growing in Western China at elevations ranging from 4,000 to 5,000 feet, and introduced to cultivation by Messrs. J. Veitch and Sons. The plants attain a height ranging from 18 to 24 inches, and the soft lilac-coloured flowers, which have pale-yellow stamens, are borne in panicles nine or ten inches in length. A.M., R.H.S., August 18. Messrs. J. Veitch and Sons.

SOPHRO-LÆLIO-CATTLEYA MEDEA VINICOLOR.

A beautiful variety that deserves a much less cumbrous name than has been given it. The hybrid was raised from a cross between Sophro-lælio læta Orpetiana and Cattleya bicolor, and is remarkable for the comparatively large size of its flowers, and this variety differs from it chiefly in having flowers of a rich vinous crimson. A.M., R.H.S., August 18. Lieut.-Colonel Holford (orchid grower, Mr. H. G. Alexander), Westonbirt, Tetbury.

CYPRIPEDIUM ROSETTI.

A beautiful hybrid between C. insigne Sanderæ and C. Maudiæ. The flowers are rather large, the flowers are pale green-yellow, the dorsal sepal veined with bright green, and having a broad white margin to the upper part. A.M., R.H.S., August 18. Lieut.-Colonel G. L. Holford.

TRICHOPILIA NOBILIS ALBA.

A beautiful variety differing from the type in having its flowers wholly pure white. A.M., R.H.S., August 18. Messrs. Charlesworth and Co.

ODONTOGLOSSUM ZENOBIA.

A hybrid remarkable for its distinctness and beauty with O. Halli and O. Edwardi as its parents. The flowers are finely formed, the petals and sepals deep chocolate tipped with white, and the lip brownish red with a few white markings. A.M., R.H.S., August 18. De B. Crawshay, Esq. (gardener, Mr. Stables), Rosefield, Sevenoaks.

APPLE FELTHAM BEAUTY.

A dessert variety possessing quite exceptional merit, and a valuable addition to the eating apples available for the table at this season of the year. The fruits are of medium size, roundish and shapely, the skin green-yellow richly coloured with red, especially on the side next the sun; the flesh yellowish-white, brisk, sweet, and juicy. The parents were Cox's Orange Pippin and Gladstone. A.M., R.H.S., August 18. Messrs. J. Veitch and Sons, Chelsea.

PERPETUAL PINK PRINCESS CHRISTIAN.

A useful addition to the border pinks, being strong in growth and free and continuous in flowering. The flowers are of full average size and good form, the petals slightly serrated at the margins and finely marked with rich purple, as shown in the accompanying illustration. A.M., R.H.S., August 18. Messrs. B. Ladhams, Lim., Shirley, Southampton.

OLEARIA CILIATA.

An elegant species attaining a height of about two feet, and producing a profusion of flowers about an inch in diameter; the ray florets are lilac and the disk yellow. This shrub is a native of Australia, and inhabits deserts and sandy places. Seeds were sent to Kew from Albany, West Australia, by Sergt. Goadby, R.E., in 1899, and plants flowered in the Temperate House in the spring of 1907. It has yet to be proved whether it will thrive in the open in the British Islands. It is difficult to propagate from cuttings, and it has failed to mature seeds at Kew. "Bot. Mag.," t. 8,191.

LIPARIS TABULARIS.

One of the most attractive of the species of Liparis and closely related to the Formosan L. macrantha. It was introduced a few years since from Penang; was flowered in Mr. H. T. Pitt's collection at Stamford Hill in April, 1906, and submitted to public notice at a meeting of the Royal Horticultural Society. The flowers are comparatively large, reddish-purple, and borne on a spike rising to a height of about six inches. "Bot. Mag.," t. 8,195.

PHILADELPHUS PURPUREO-MACULATUS.

A handsome shrub of medium stature described as having been raised from seeds ripened by Philadelphus Lemoinei Fantasie; a hybrid raised by M. Lemoine from a cross between P. mexicanus and another form. This fine form is of medium stature, and bears pure white flowers with purple blotch at the base of each petal; in the figure the blotch is rose-red, and much lighter than the colouring of the flowers of any of the many plants of P. purpureo maculatus that have come under our notice. With reference to the culture of this valuable shrub Mr. W. J. Bean writes: "A mode of cultivation which answers exceedingly well for Philadelphus Lemoinei at Kew may be adopted for this plant also. This is to cut away the shoots that have flowered as soon as the blossoms are over, thus leaving behind nothing but the young growths of the current year. These grow quickly, and make long flowering shoots for the following year, to be cut away in their turn. Propagation is most readily effected by cuttings made of the young shoots whilst they are still in a semi-herbaceous condition. Placed in a brisk bottom-heat they strike root in a few days." "Bot. Mag.," t. 8,193.

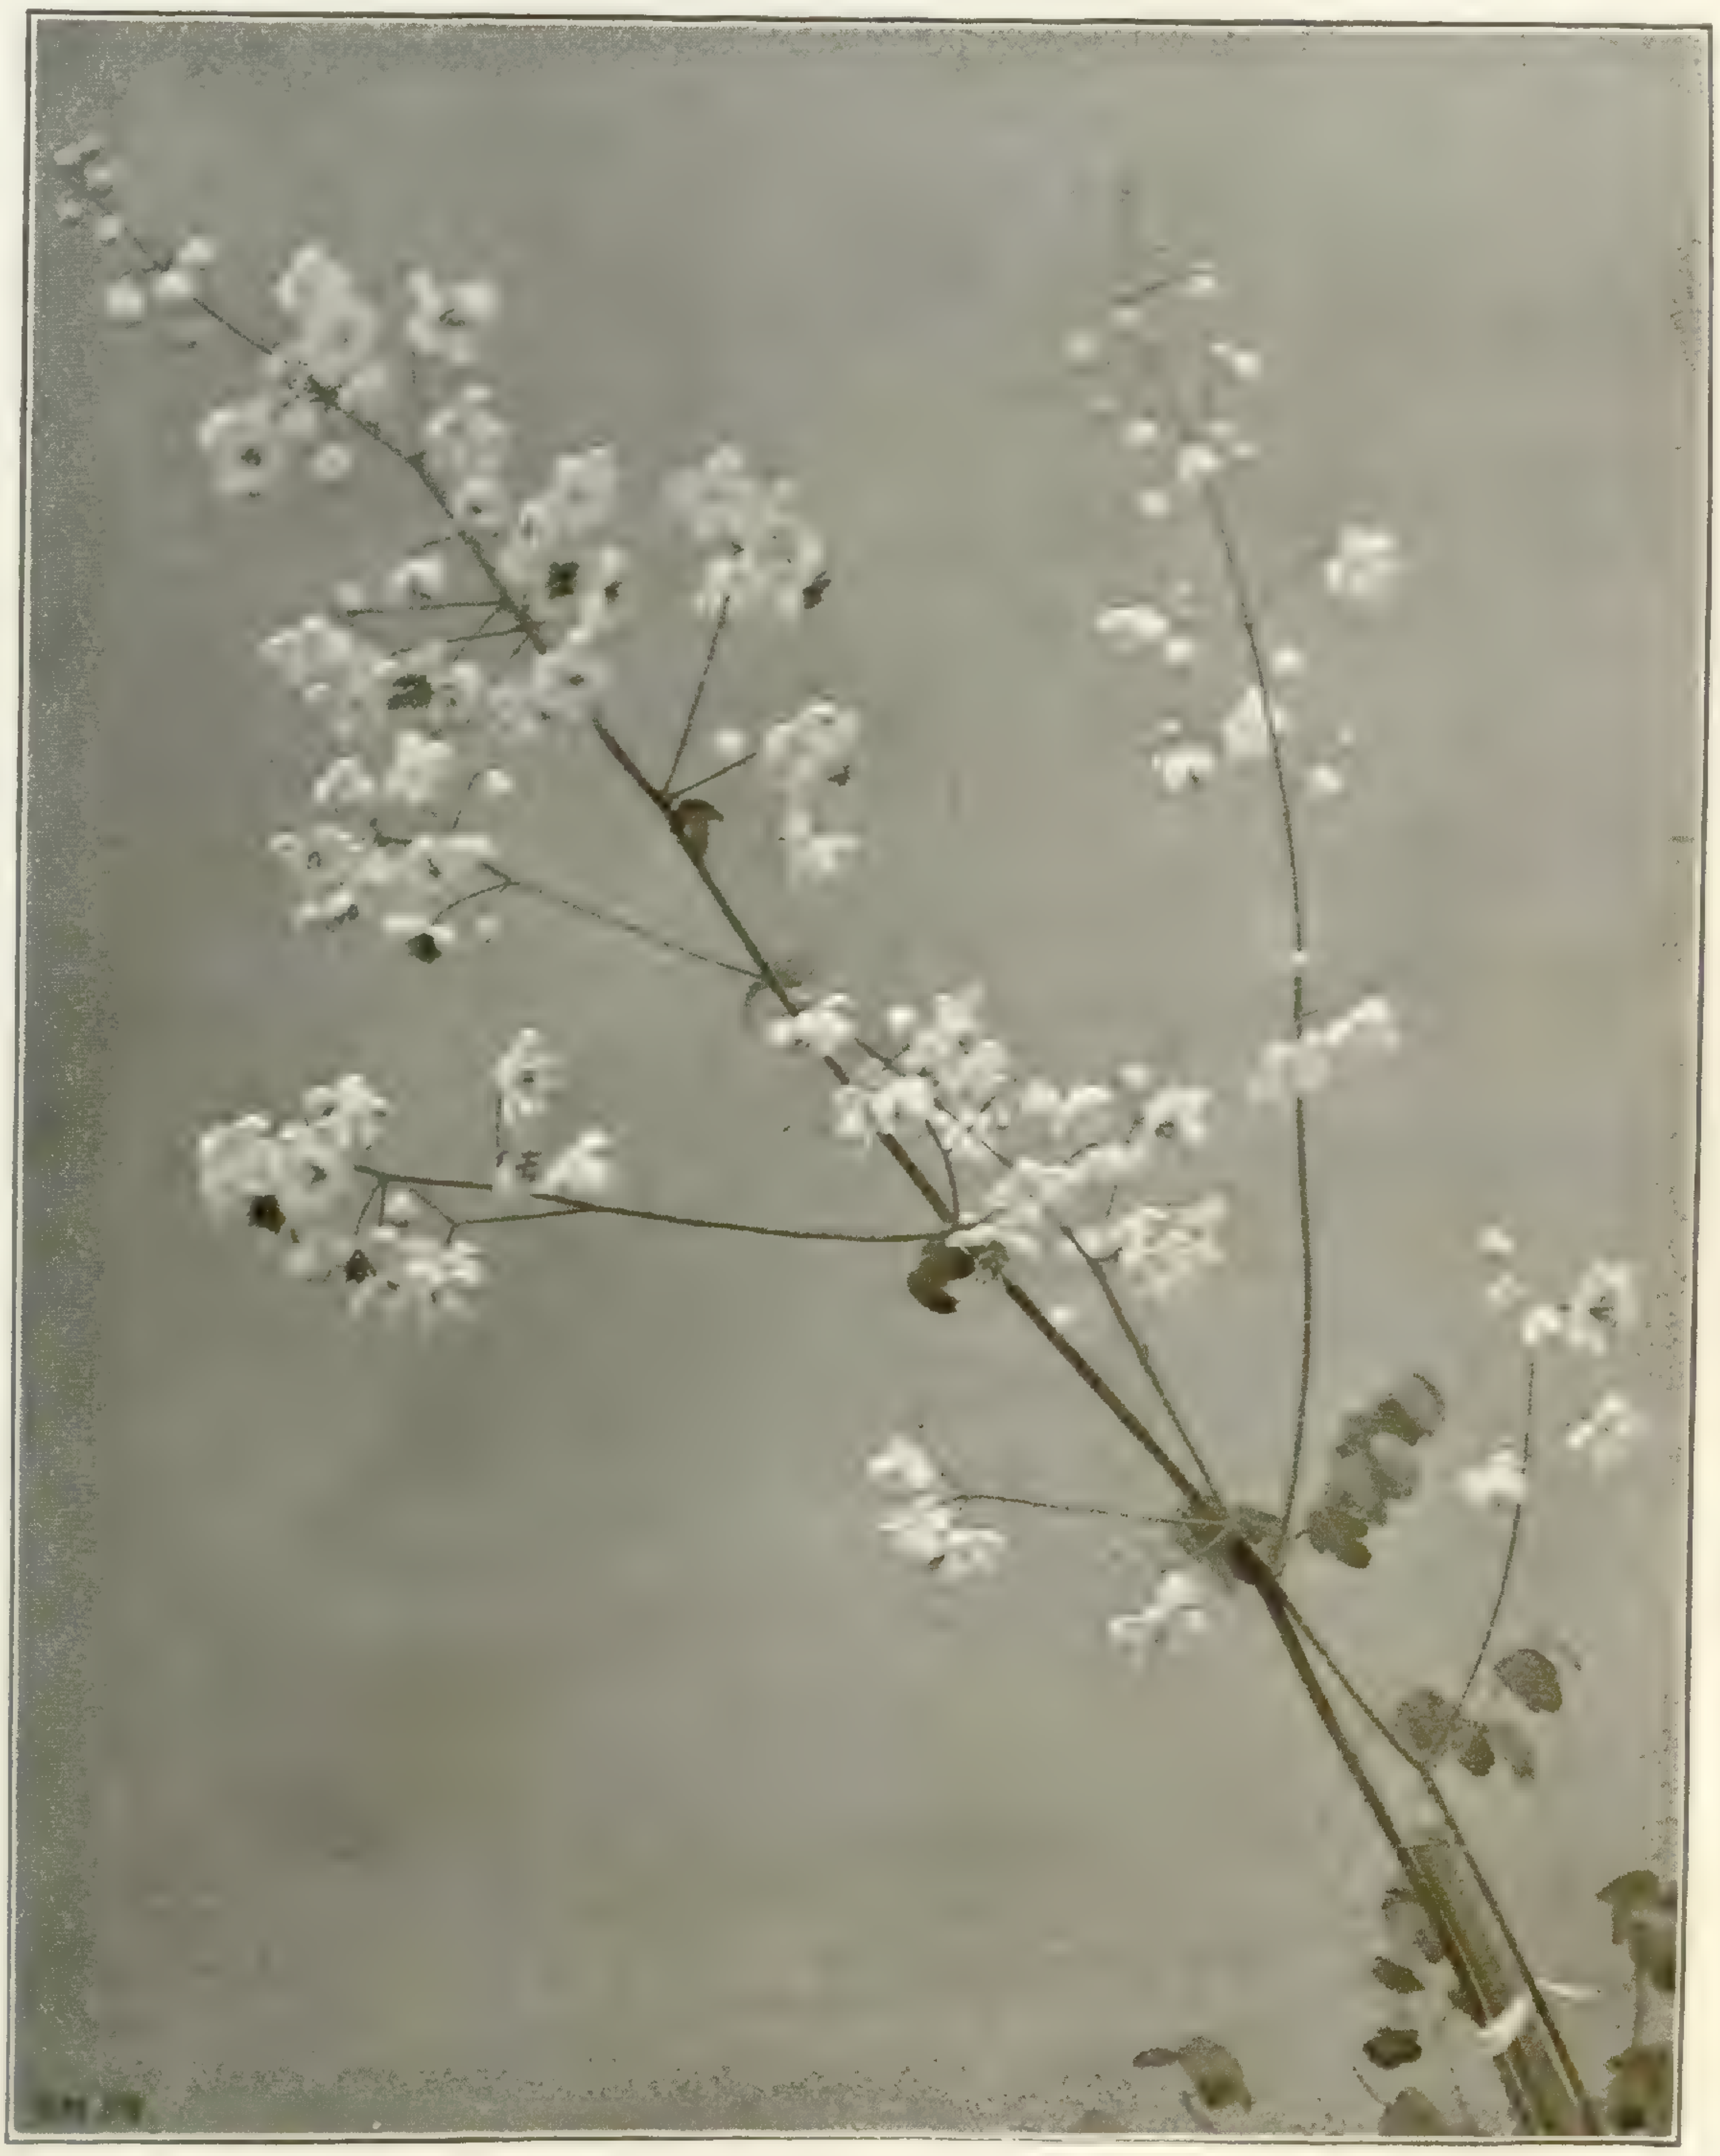
THE LADY FERN AND ITS VARIETIES.

Those who have seen the Lady Fern (Athyrium filix-fœmina) at its best in some of the cool, moist, shady coombes of Devon, or the equally favourable glens of Scotland, will readily admit that it is one of the most delicate and graceful ferns extant. To its delicacy of cutting when developed to the utmost we must ascribe both its botanical and popular names, which are really synonymous; both are, however, misapplied, seeing that, like all other ferns, it propagates itself by spores, which reproduce a succeeding generation by independent fertilisation of an embryo seed. Had, however, the old botanists who christened it foreseen the marvellous varieties which the species has since produced, they would possibly have felt more than justified in so naming it, since no fern in the world, and we speak advisedly, has managed to contrive so many diverse fashions in its foliage as the Lady Fern, and, in this way, asserted its feminine character by its consequent assumption of a truly ladylike capacity.

If we compare some of the most diverse bizarre sports of this species with each other, and with the normal or common form, we shall find, indeed, a fair parallel between them and those extraordinary varieties of feminine costume which have displayed themselves in successive eras, as shown by antique fashion plates. Normally, that is, in what we may term the peasant costume, the Lady Fern adopts a garb of delicate point lace, the tall graceful fronds being cut into small and smaller divisions, each of the smallest being a little miracle of semi-translucent veins, to which the finest lace must yield in delicacy. Lace, however, not sufficing for her ladyship's taste, she has in numerous cases adopted more or less elaborate tassels, some fan-shaped, some bunched, some with long repeated strands on very charming lines, and in a few cases she has gone so far as to put tiny tassels to all the tips of her finest point lace to quite a bewildering extent, far and away eclipsing any human effort at embroidery. In the well-named Victoria Lady Fern she has adopted a criss-cross lattice-work effect, tipped with the best type of slender tasselling on absolutely unique lines. In A. f.-f. Frizelliæ she goes in for the narrow and slender style, and adopts a sort of bead costume, the divisions being bunched up into rows of little round knobs, and, by way of variation on this particular form, crests, or spreading tassels have been added by way of ornate fans. Then we have ambitious dames who, spurning the simplicity of mere lace, have donned delicate plumes, the fronds being cut so finely as to be quite feathery in texture. These form what are termed the plumosums, and by many are esteemed as the most beautiful of all. Ringlets have been assumed on more or less successful lines, A. f.-f. revolvens having the side divisions rolled and twisted into spirals, while the whole frond forms nearly a tube with a spiral end, the minor spirals forming a curly fringe. A. f.-f. fluctuosa is a lady who conceived, but only half perfected, this idea, and has only succeeded in twisting herself into acrobatic contortions. Besides mere fashion in dress, too, there are giant ladies and dwarf ones, the last-named embracing some of the prettiest little ferns existing, the tasselled and crested forms being condensed into miniatures only a few inches high when full-sized. In some instances the lady is absolutely lost to view as a fern proper by hiding her identity under such a dense heap of frills and tassels, that she resembles a ball of fine moss (A. f.-f. uncoglomeratum).

The Lady Fern has, in short, eclipsed all other fern species in versatility of design, and it is noteworthy that every distinct type must be attributed solely to Dame Nature's inventive power, and not to any capacity in that respect of the fern specialist and selective cultivator. We plunge into a ferny glen or woodland nook where the Lady Fern abounds, and among the thousands of fair dames of ordinary type we may suddenly perceive one of quite different appearance, tasselled or plumed, or otherwise costumed, and all we can say of her, as was said of Topsy in "Uncle Tom's Cabin," "I specks she growed." None of her companions present the slightest claim by family resemblance to her parentage, and there she stands alone in her glory until her discoverer transfers her to a place of honour in his collection, and thus, maybe, adds thereto an unique attraction. Some slight idea of the capacity of variation of the Lady Fern may be found when we state that over 300 distinct varieties are described and chronicled, with their finders or raisers, and although even this number is exceeded by the Shield Ferns and the Hartstongues, the fact remains that in the Lady Fern there are several marked types of variations distinct from any which have appeared in any other fern species in the world. Not content, too, with her native sportiveness, when brought under culture her descendants not only inherit her peculiar tastes, but often display and expand them on more and more marked lines, enhancing their beauty immensely. Finally, when we add that the Lady Fern is one of the easiest culture, resenting only drought and rough winds, which spoil its beauty, we think we have said enough to induce our readers to give at least a few good specimens a place in their rockeries and shady conservatories.

Chas. T. Druery, V.M.H., F.L.S.



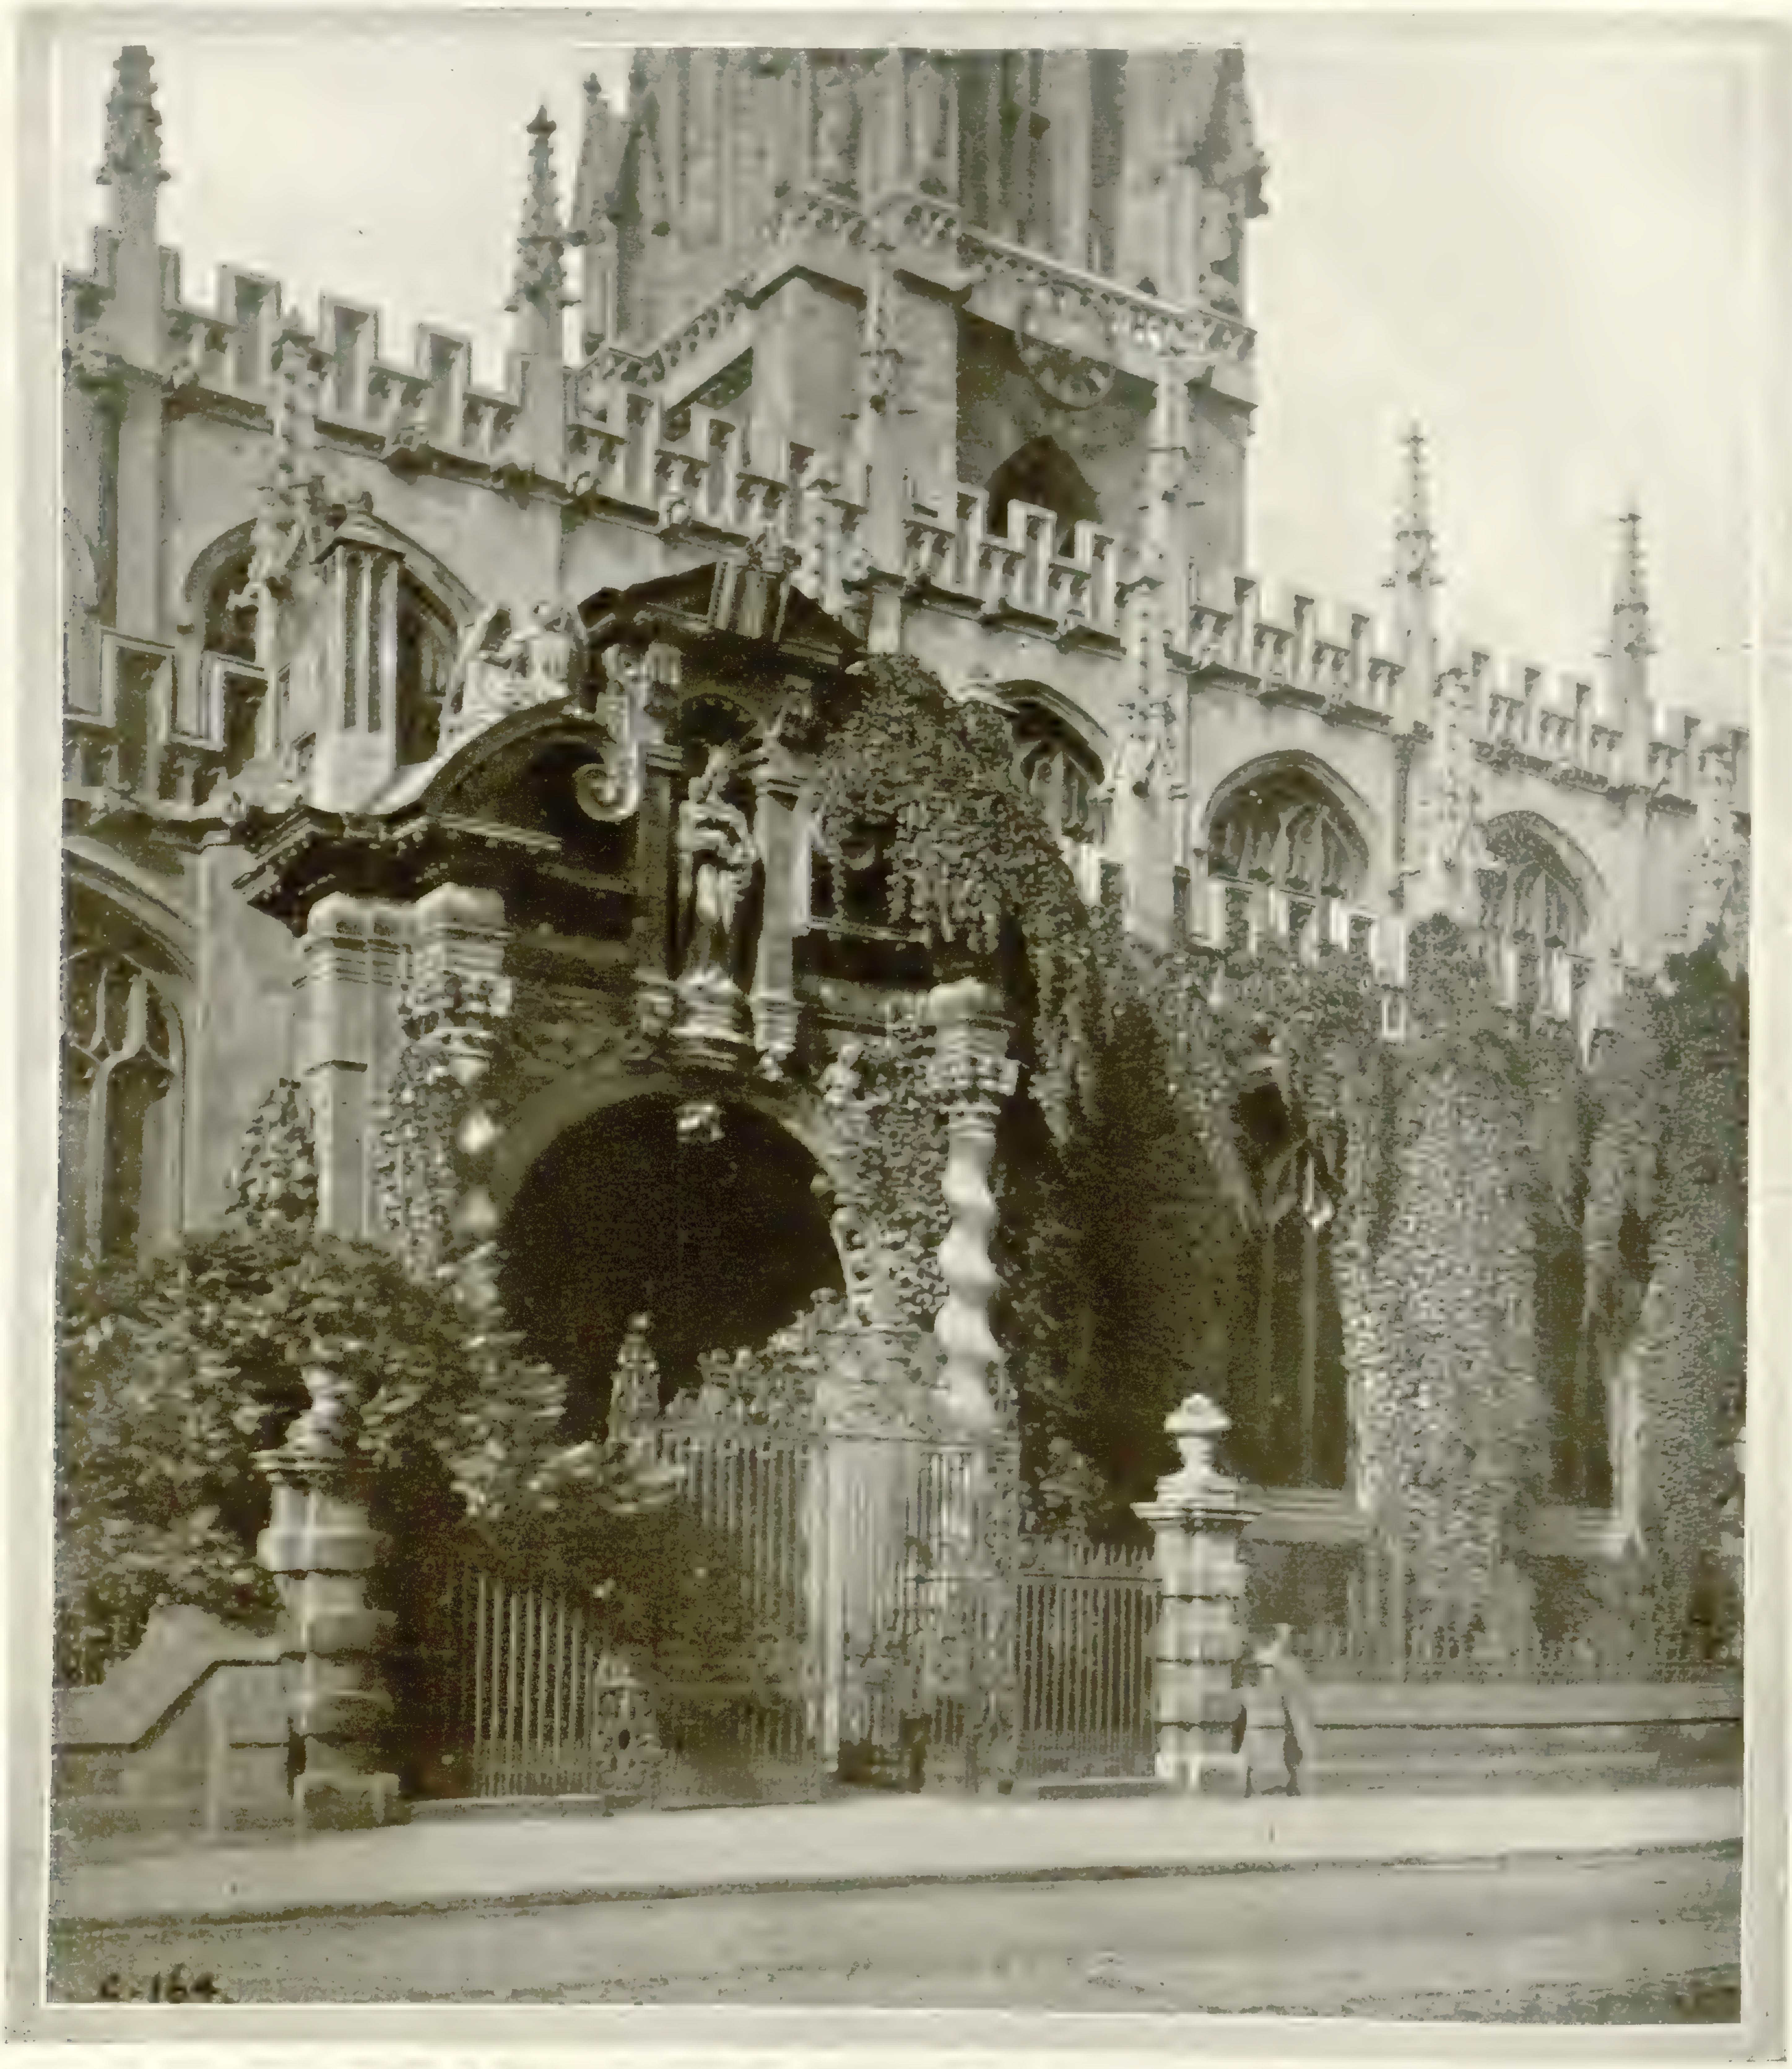
THALICTRUM DIPTEROCARPUM,

A new hardy plant, exhibited by Messrs. J. Veitch and Sons, at R.H.S. meeting on August 18, when an A.M. was conferred upon it. Flowers, lilac colour with yellow stamens.

Viburnum plicatum.—This beautiful shrub was more beautiful than ever this summer. I am sending you a photograph of one growing at the end of my vine border here [shows a fine plant.—Ed.] It was just an avalanche of snow-white flowers from top to bottom, surpassing all its former meritorious efforts. Visitors to my garden would look at nothing else. Just beyond it, in the angle between the greenhouse and the wall, is a young specimen of V. macrocephalum; this also covered itself with glorious trusses of the purest white, and was "highly commended," but, in the matter of attractiveness, it was quite dwarfed and overshadowed by its older and bigger relative.—S. G. Reid, Yalding, Kent.

USE OF CLIMBING PLANTS ON BUILDINGS.

There cannot well be any difference of opinion with regard to the beauty of climbing plants, and their usefulness in the garden; but there is room for a diversity of views on the manner in which they should be used on the walls of public and private buildings. This diversity is greater than might have been expected, and it finds expression in walls bare of greenery, that would be greatly improved by a liberal use of plants of scandent habit; and in the covering up of buildings remarkable for their historic interest or architectural beauty, in such manner as to hide from view their distinctive features.



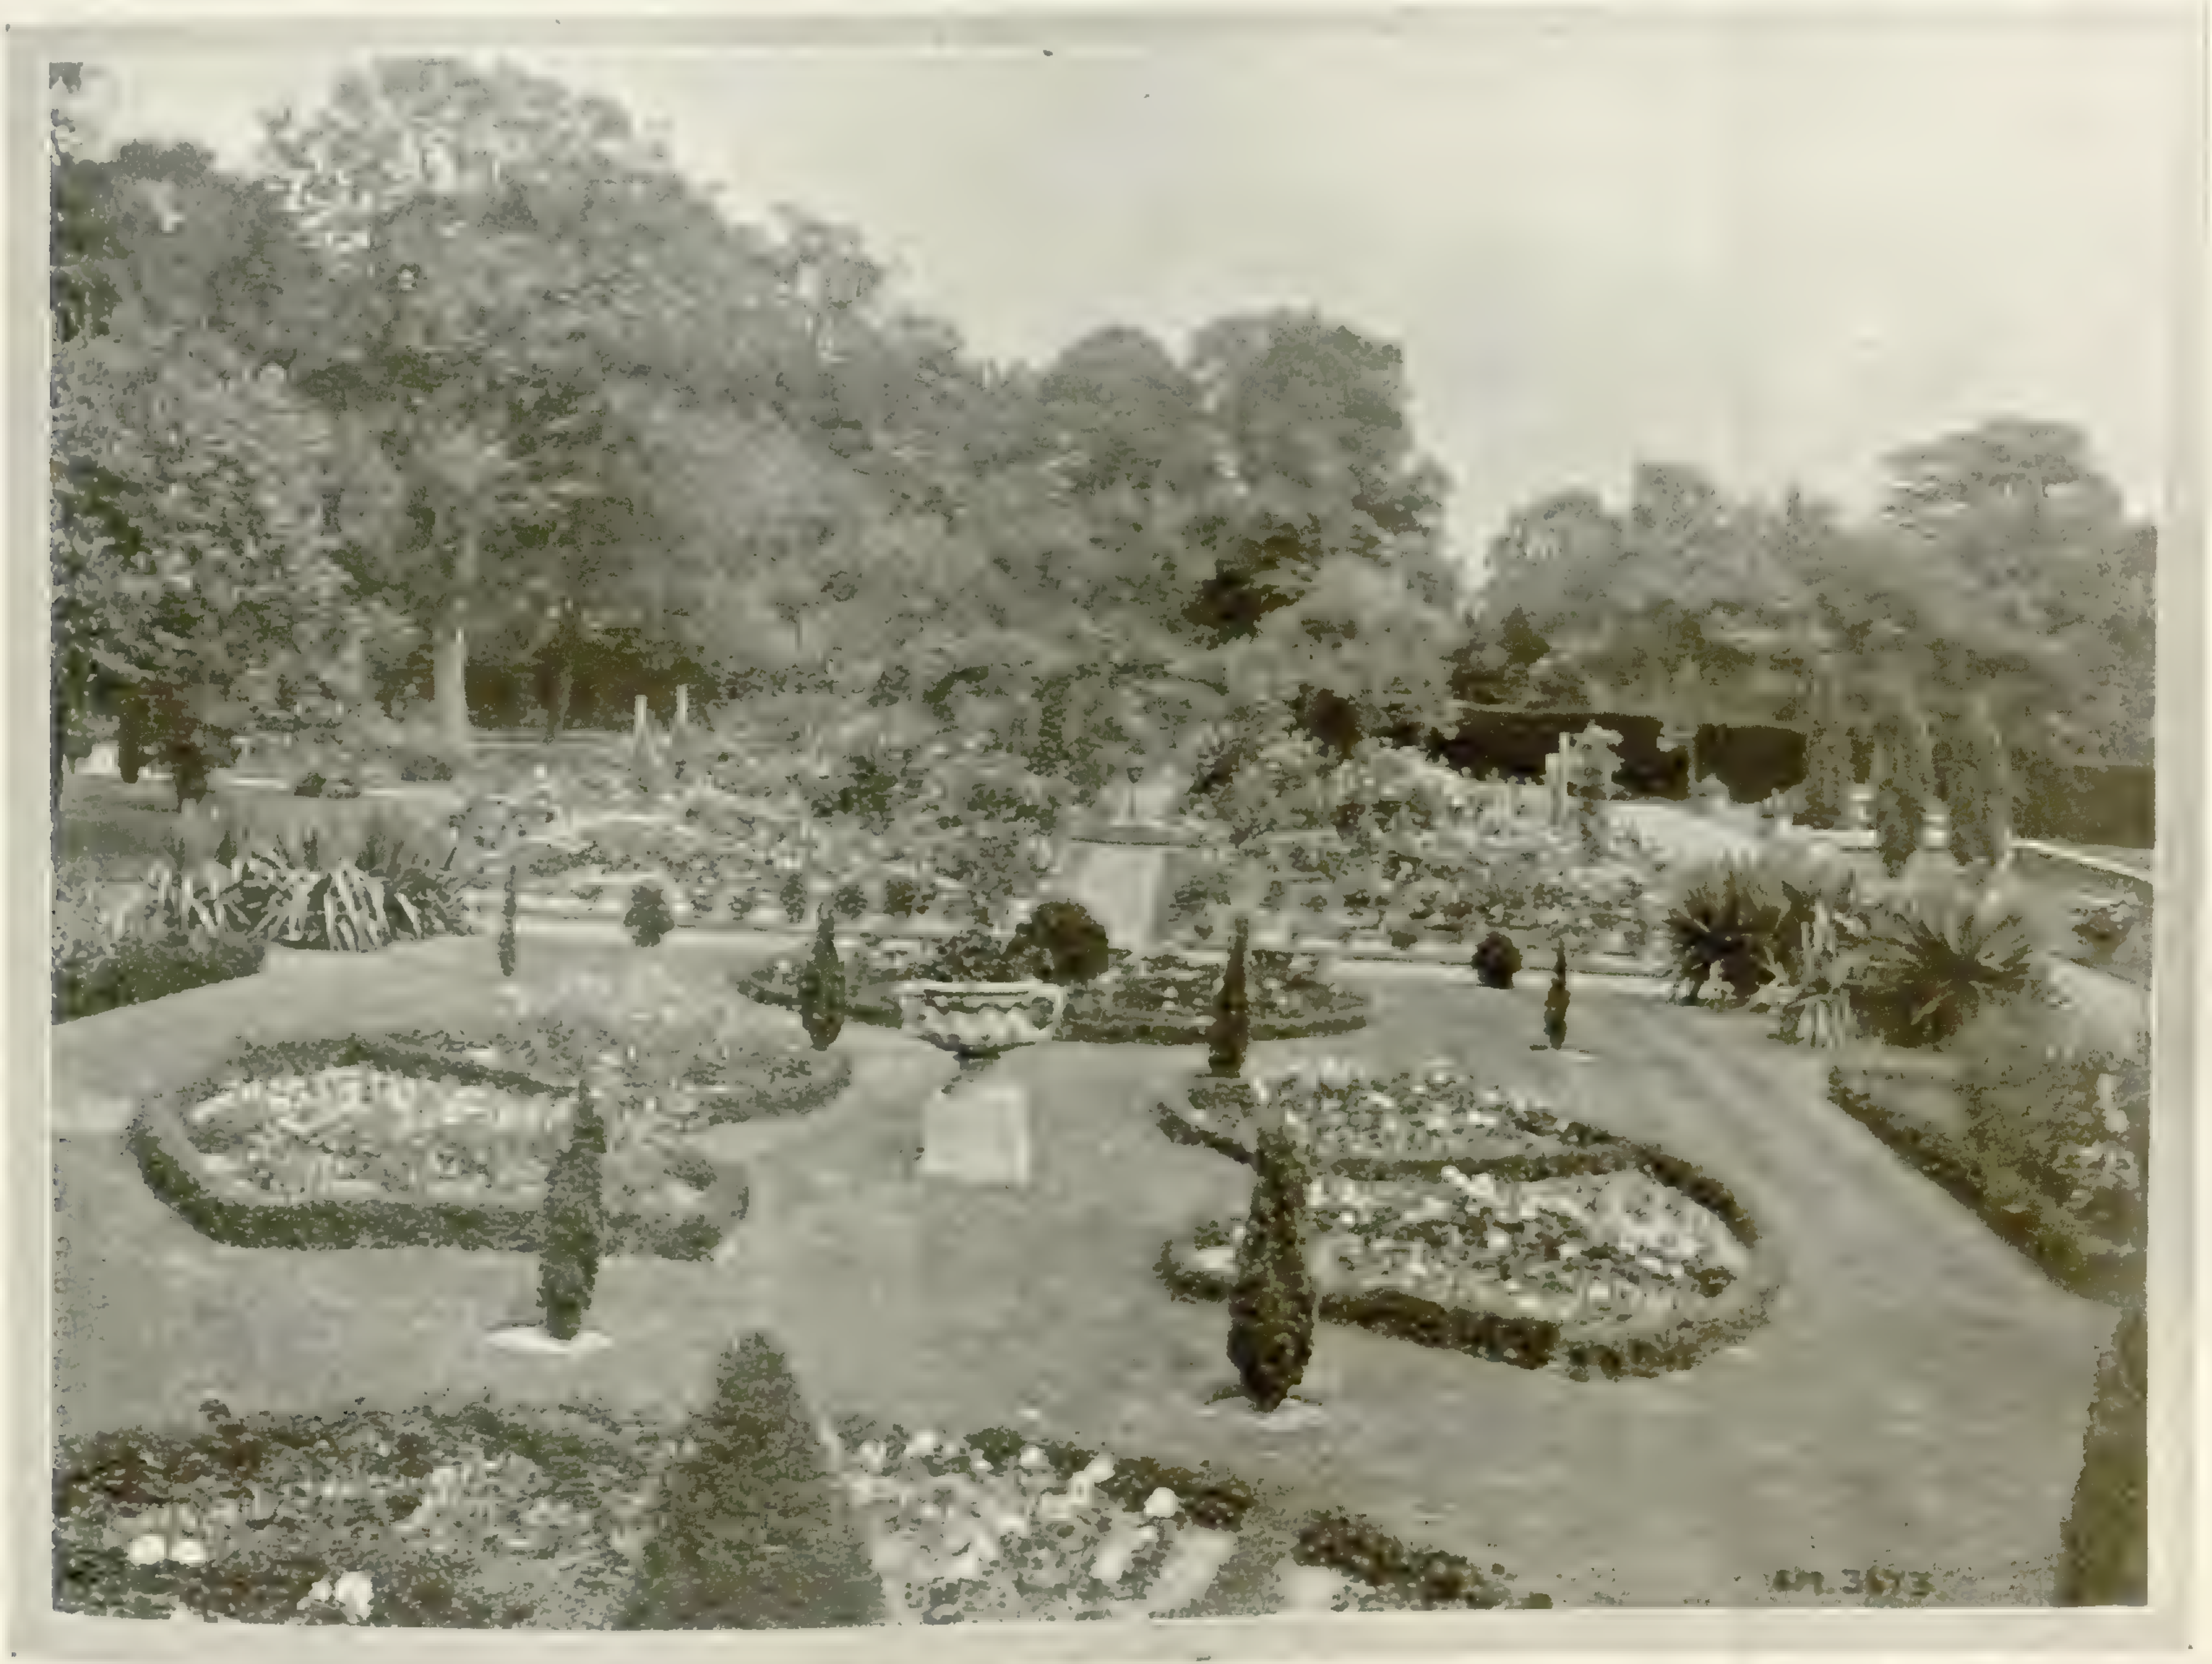
PORCH OF ST. MARY'S CHURCH, OXFORD, DRAPED WITH VIRGINIAN CREEPER.

This difference in opinion as to the manner in which climbing plants should be used on the walls of dwelling houses and public buildings is difficult to understand, and probably a more useful purpose will be served by stating a few of the principal points that should have attention in the planting of climbers against walls than in endeavouring to give an explanation of the diversity of views that are held. It is important to give first consideration to the fact that buildings, whether public or private, are not erected specially for the purpose of displaying the charms of vigorous roses, rampant ampelopsis, or rapidly running ivies. They are designed for other purposes, and the clothing of their walls with climbers has for its object the enhancement of what beauty they may possess, or the softening down of objectionable features. The walls of outhouses are not now being considered, but it may be advisable to mention in passing that those which come into view from the garden or mansion should be wholly covered with plants that grow to a suitable height, and thrive in the aspect they afford.

The planter of climbers must be largely governed by the style of architecture represented by the building whose walls he is desirous of clothing. If it possesses the baldness which found so much favour among builders in the early Victorian days, the whole of the walls might, with advantage, be covered by climbing plants suited to their height and aspect. In these bare, barrack-like structures there is but little of beauty, and well-kept climbers will soften their lines and render them pleasing to the eye. In the case of dwelling-houses of more recent date, of which the designs are more or less tasteful, climbing plants must be used with some discrimination. A judicious selection of climbers will, with careful management, contribute materially to the attractions of such buildings as these, and judicious procedure in this case means using the plants somewhat sparingly. Careful management consists in so regulating the growth that the allotted space is nicely clothed without hiding any portion of the architectural features. A well-designed house is an object of beauty, and climbing plants should be used, not for the purpose of hiding any part of it, but rather to emphause the characteristic features of the design. There is yet another class of buildings awaiting consideration, and it is that which includes those of historic interest or remarkable for beauty of architecture. These are frequently dealt with in much the same manner as one would deal with a commonplace suburban villa, and this is unquestionably a serious mistake. As briefly stated, buildings that possess an element of ugliness should have their walls almost, if not quite, hidden by greenery; and those erected from designs that are good without possessing special merit, should be sufficiently embellished with climbers to bring into prominence whatever of beauty they may possess. Historic buildings, and those distinguished by reason of their handsome elevation, require but little aid from vegetation. In visiting an historic building one does not go to see great sheets of solemn-looking ivy or a big expanse of flaming ampelopsis, but rather is the journey made for becoming more closely acquainted with its associations, and of studying the style of architecture it represents. To the student of architecture it is a serious matter that the object lessons which a fine old building is so well able to afford should be hidden beneath a covering of ivy or Virginian creeper. In like manner fine examples of architecture, whether ancient or modern, should not have their beautiful lines broken or their exquisite workmanship hidden by climbers. It does not necessarily follow that no plants should be allowed to come near the walls of such buildings; in many instances they may be employed to advantage, but they must be used very sparingly, and with great care.

The fine porch of St. Mary's Church, Oxford, is an excellent example of what may be accomplished in beautifying a graceful and highly ornate structure. Here we have a few, comparatively speaking, of the slender growths of the Virginian creeper hanging gracefully over some parts of the masonry, and forming a pleasing contrast to its dark grey tones. There is no interference with the architectural lines of the building, as would be the case were this or other climbers allowed to form dense masses of foliage, as in the case of some other buildings hardly less beautiful that we have in mind.

G. G.



THE CHARMING FLOWER GARDEN AT SHIPLAKE COURT, HENLEY-ON-THAMES.
Embellished with summer bedders and roses.

A BEAUTIFUL FLOWER GARDEN.

Visitors to Shiplake Court, Henley-on-Thames, the residence of R. H. C. Harrison, Esq., are invariably charmed by the beautiful flower garden, which forms so fine a feature of the grounds, and we have much pleasure in presenting our readers with an illustration of it. This so admirably shows the characteristic features of the flower garden as to render a lengthy description wholly unnecessary. In the foreground are flower beds cut in the grass and enclosed by bold box edgings, and interspersed are columnar coniferous trees, with bold masses of Yucca recurva at the corners. Beyond are beds and borders of roses, enclosed with bands of turf and intersected by gravel walks. In the centre is a handsome sun-dial, and around it are roses in great variety, and so robust in growth and profuse in flowering as to testify in no uncertain manner to the skill that is brought to bear upon them by Mr. J. A. Hall in carrying out the details incidental to their cultivation.

CENTAUREAS.

The great improvement effected in these annuals is more inducement to grow them than was formerly the case. The glorious summer weather of the past few weeks has suited them admirably, for they are far more satisfactory when the blooms can open free from moisture, while the plants, individually, are not quite so strong owing to the drought, yet the flowers are all that can be wished for.

Two new, or improved, varieties sent out by the Holborn firm have come far superior to previous introductions. One, named Chameleon, has large sulphur-yellow flowers, with a suffusion of mauve, and a suspicion of other shades approaching a fancy shade in centaureas, a blending of colours which appeal to many flower lovers. The other centaurea is a golden-yellow, which the firm describe as "new yellow," this, in size, is much larger than the ordinary yellow sweet sultan, and therefore of greater value for the supply of cut flowers for use in large vases and bold decorations generally.

Centaureas are not difficult to grow. Slugs are their greatest enemy, and frequently do them much harm when the plants are young. It is therefore advisable to sow in dry weather to get the plants up a few inches, when the danger is over. If showery weather prevails when the blooms are opening some protection to keep off the moisture should be given. The plants resent coddling in any form. Our latest sowing is where we can cover with temporary lights.

T. H. Slade.

Poltimore Park Gardens.

THE VIBURNUMS.

The viburnums are found in Europe, North America, and China, and, although the majority of them produce the small, fertile flowers, that render them ineffective as blossoming shrubs, a few that bear large, sterile flowers are among the most valuable of garden plants. The best known is the Guelder Rose, V. Opulus sterile, which, with its rounded trusses and large, pure white, sterile blossoms, is common in English gardens. In the type the centre of the truss is filled with small, fertile flowers, only a few of the outer blossoms being sterile.

V. tomentosum, generally known as V. plicatum, is without doubt the finest of the family as a flowering shrub. It is a native of Japan, and has been known in this country for more than sixty years. It is quite hardy, and will stand thirty degrees of frost without injury. It is a shrub of neat and graceful habit, and bears on short branches, springing from the previous year's growth, fine trusses of pure white blossoms four inches across, that, in well-flowered specimens, smother the plant in a snowy cloud. The typical seed-bearing type has trusses that are composed of small fertile flowers.

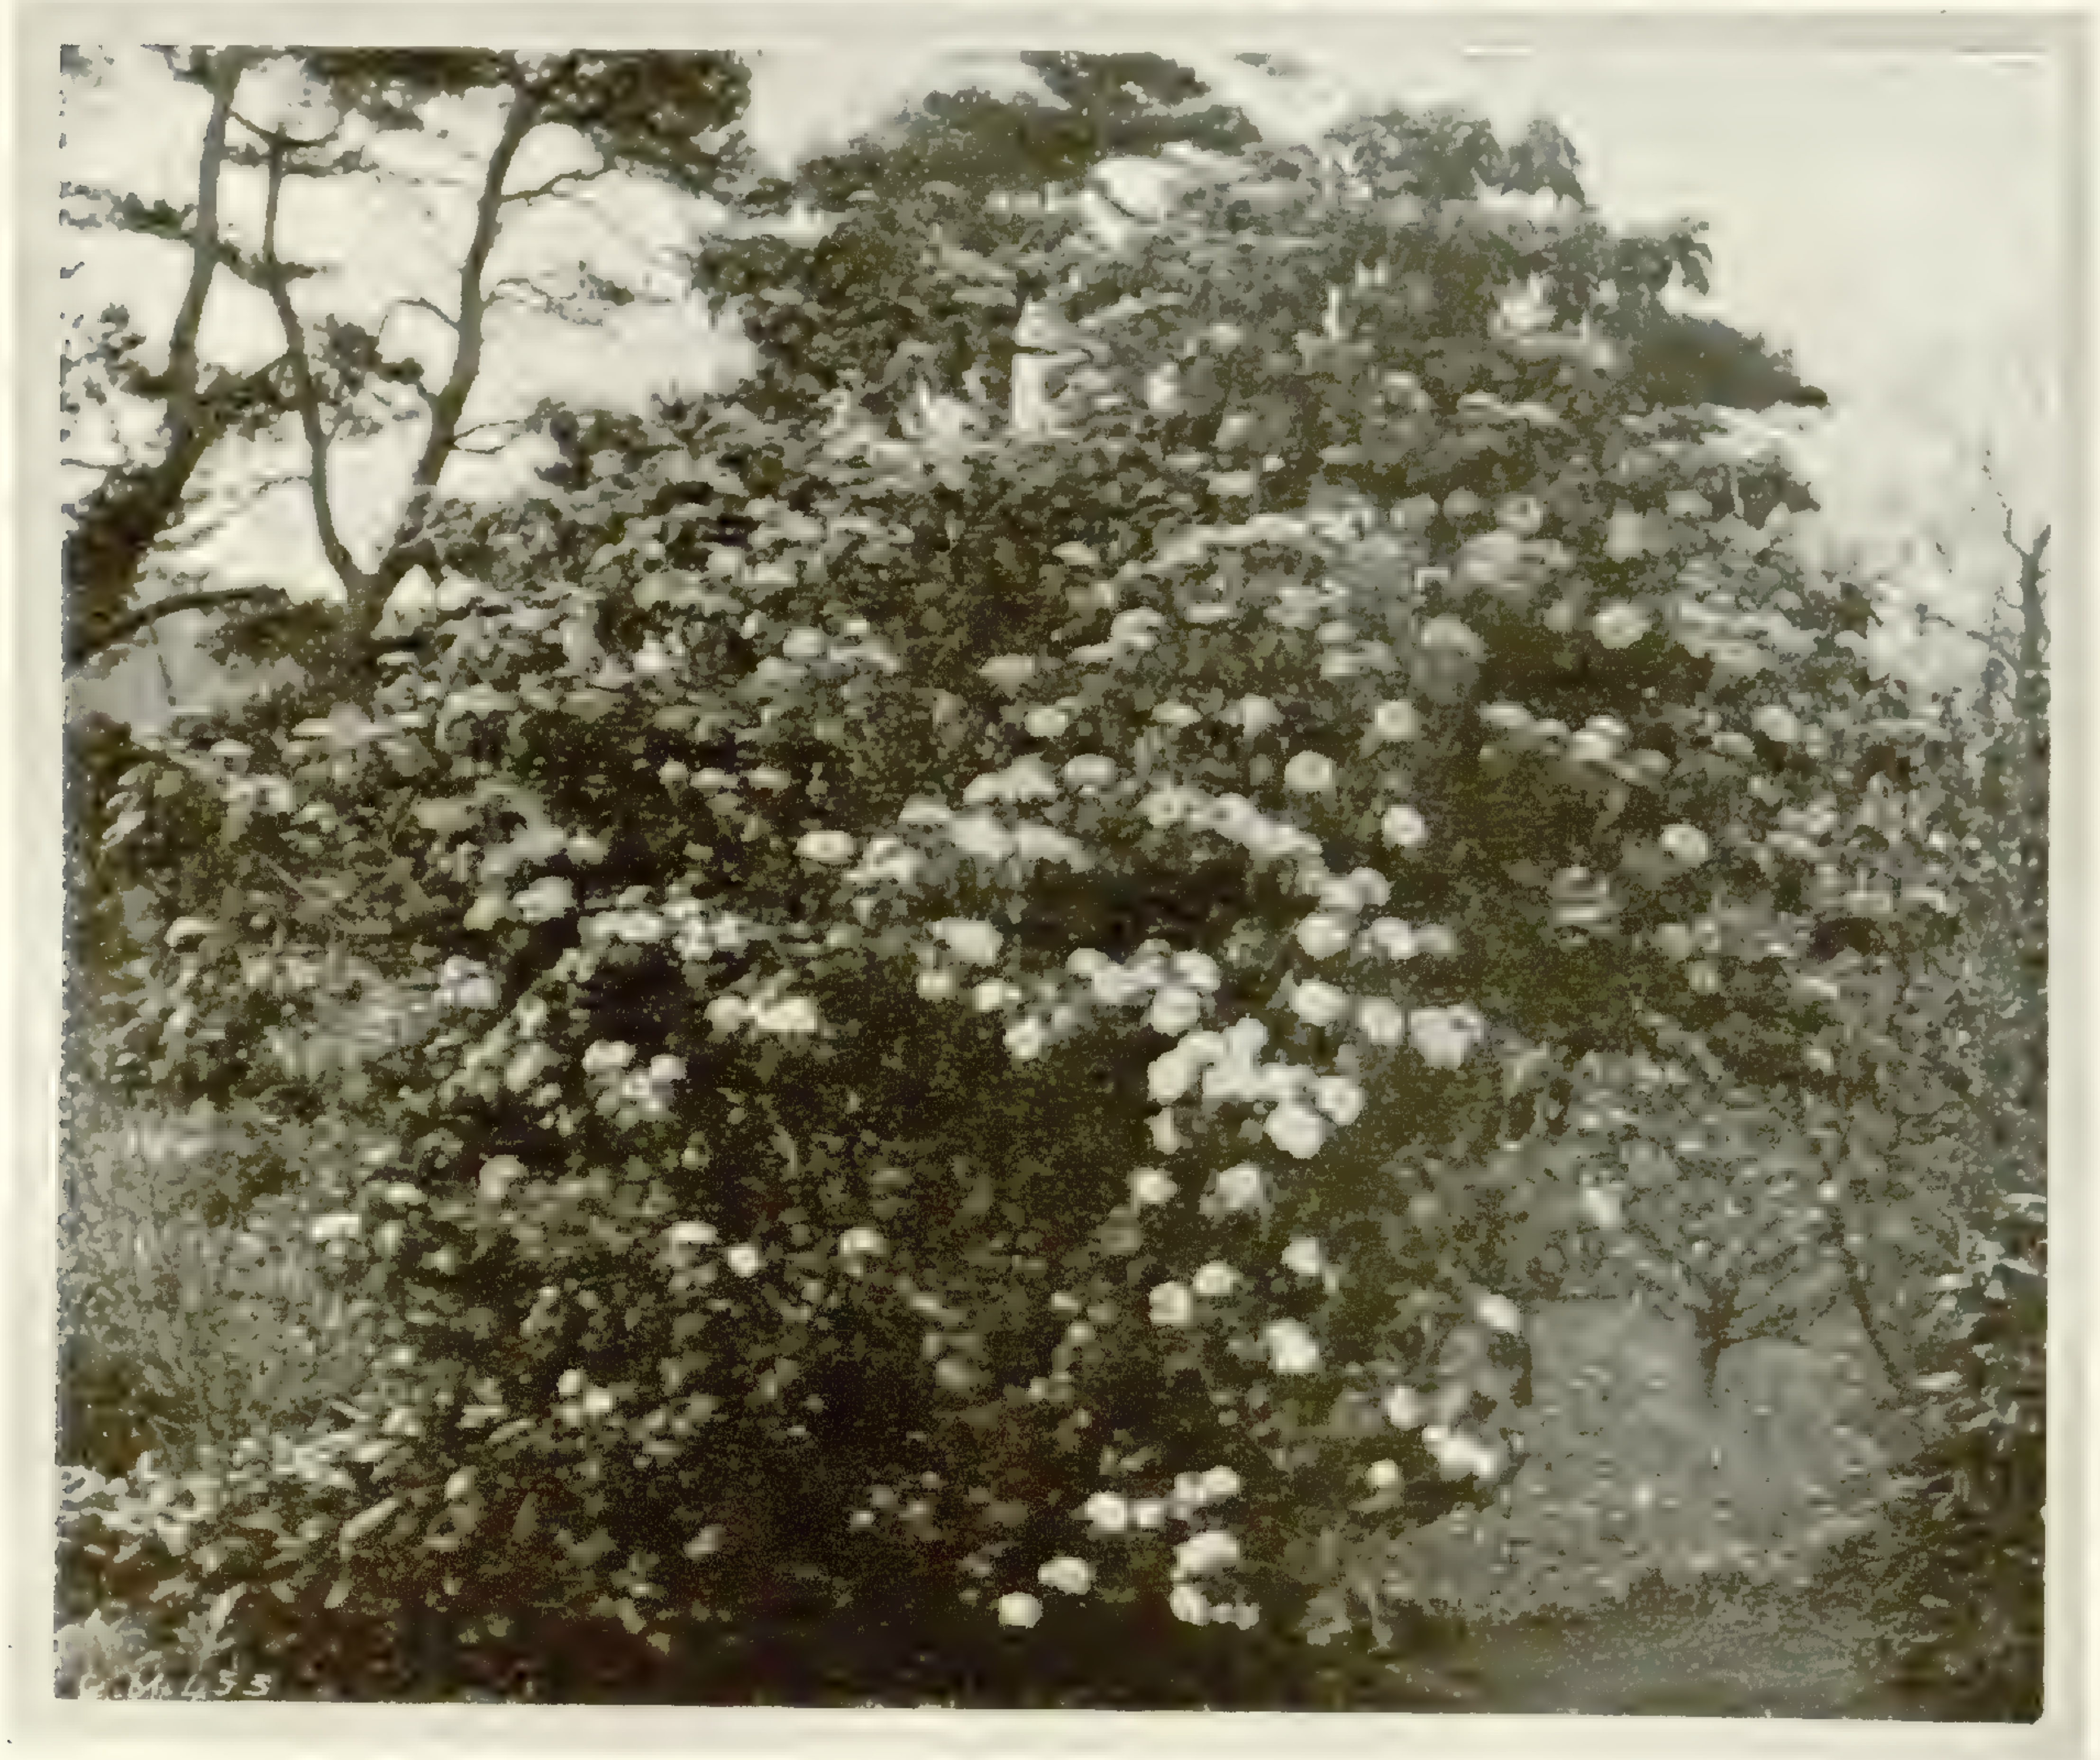
V. macrocephalum is a very showy shrub, bearing the largest trusses of any of the viburnums. The blossoms, all of which are sterile, are pure white, and measure from one inch to one and a-half inches across. The trusses are pyramidal in shape, much resembling those of Hydrangea paniculata. It was introduced from Shanghai in 1844, but is, unfortunately, not very hardy, and is rarely seen in good condition in the open air, except in the warmest gardens. V. macrocephalum is not a wild plant but a garden hybrid. The type is known as V. macrocephalum Keteleeri, and has the centre of the truss filled with small fertile flowers, only the outer ones being large and sterile.

The variety of the Laurustinus, V. Tinus, known as lucidum, is a pretty flowering shrub, which has larger trusses than the type, and blossoms of a greater size and purer white.

V. rugosum, of which an illustration is here given, is a native of the Canary Isles, and is practically unknown in this country, the only two specimens I have met with being the one here shown, which is growing in Mr. T. B. Bolitho's garden at Greenway, on the River Dart, and one in Mr. Howard Fox's garden at Rosehill, Falmouth. The example illustrated is over twenty feet in height and sixteen feet through. Its flattened white flower trusses are five inches across, and are carried in great numbers, and the shrub, when in bloom, has a very decorative effect. It is apparently fairly hardy, as in neither of the gardens in which I know it has it ever suffered from the winter frosts.

S. W. Fitzherbert.

Kingswear.



A FINELY-DEVELOPED SPECIMEN OF VIBURNUM RUGOSUM,
In Mr. T. B. Bolitho's Garden at Greenway. Flowers, white.

Autumn Flowers.—It is always interesting to record any special features which occur in practice, and especially when it applies to colour grouping of plants. A particularly fine autumn effect results from a liberal planting of Lobelia Queen Victoria and a few plants of Aster Hon. Edith Gibbs. The vivid tone of this lobelia is subdued by the feathery growths of the aster, then when the daisy flowers open the intermingling of the high colour with the half-tone of the aster produces an effect which appeals to every taste. On similar lines Gypsophila paniculata or its double form makes an excellent groundwork for a large bed; if Gladiolus Brenchleyensis be planted through it—not too liberally—the result will be a success that will generally bear repetition. —Thomas Smith.

SHAKESPEARE AND ROSES.

Authorities assure us that the famous scene in the Temple Gardens has no historical basis, and the attempt to decide the time of its supposed occurrence by a reference to the death of Edmond Mortimer, which in the play takes place on the same day, is frustrated by the brutal fact that Mortimer was a young man instead of an old one, and died, an officer of state, in Ireland, instead of a prisoner in the Tower. So, observes "The Globe," in default of dates, which it is agreed are soul-less things, we must be content with the knowledge that the "scene" was "in the time of roses," and can, if we choose, identify it with the glow of June or July. The emblematic choice of red rose or white in the Temple Gardens is only one out of over a hundred references to the flower in Shakespeare's plays, but it is the sole instance in which the rose is part of the essential mechanism of the play; elsewhere it is mentioned by way of illustration, metaphor, or apostrophe. But wherever and in what manner it is mentioned, the impression we receive from the allusion is that Shakespeare wrote con amore, certainly as a lover—perhaps as a grower—of roses.

But more noticeable even than his technical knowledge is the intense, almost personal and tender affection that Shakespeare shows for flowers, and notably for roses. There is the apostrophe to Ophelia, where to "dear maid, kind sister," is prefixed "O rose of May"; we have, as comparisons, "my fair rose," that "sweet lovely rose," "sweet rose, fair flower"; in one of the sonnets that breathe the most fervent and abiding and passionate love the lover tells his mistress, "Nothing this wide universe I call, Save thou, my Rose: in it thou art my all."

Far more frequently does Shakespeare mention the rose than any other flower, though in the case of almost all flowers there is a note of tenderness and affection before referred to. Roses were abundant in London in Shakespeare's day. There is no record of his having personally known Gerard, whose "Herball" was published in 1596, but as Gerard was gardener to the great Lord Burghley, whose splendid estates Shakespeare must have been familiar with, and had besides his own garden in Holborn, the acquaintanceship may be not unfairly presumed. At any rate, one may take it that the poet would have subscribed ex animo to the horticulturist's encomium of the rose: "The Rose doth deserve the cheefest and most principall place among all flowers what growe, being not only esteemed for his beautie, vertues, and his fragrant and odoriferous smell, but also because it is the honore and ornament of our English Scepter."

Doubtless, too, there was a like allusion to Gerard's to the Royal Cognisance of the flower in Ophelia's mournful reference to Hamlet as "the expectancy and rose of the fair state," though its literal appropriateness would, of course, be not to Denmark but to England. Occasionally one meets with the idea that in the famous scene in the Temple Gardens the choice of the white and red rose by the respective representatives of York and Lancaster was a sort of happy thought, inspired by the surrounding blossoms bright in their summer beauty. This is very doubtful, the "rose gules" of Lancaster and "rose argent" of York having probably been established heraldic cognisances before the outbreak of the war between the factions. Floriculturists do not identify these two roses with unanimous decision, but the Lancastrian rose is probably the old English cabbage rose, and the York rose, according to one eminent authority, is the double white rose. The variegated red and white rose, which is referred to in the sonnets, is doubtless what is known as the York and Lancaster rose, which, according to tradition, first bloomed when the Lancastrian Tudor married Elizabeth, the "White Rose of York," and joined in peace the warring flowers. The other roses Shakespeare mentions are the musk, the damask, the Provençal roses, the sweet briar, and the canker rose,

"CURIOSITIES AT FLOWER SHOWS."

All will probably agree in theory with your leading article in this week's number under the above heading, but the difficulty, as it appears to me, is to give practical effect to the ideas expressed.

I have hardly known a small show where some variety of asparagus has not been brought in for exhibition as a fern. In these cases a hint from one of the committee has been effectual in getting a fern proper substituted.

Before referring to the remainder of the article, I should like to interpose here a few words on another show point about which you hold strong opinions—the naming of exhibits. It seems to be pretty generally agreed that exhibits should be named, but what is to be the penalty for a wrong name being affixed, and, again, who is to judge whether the name is correct or not? Take the Muscat grapes that were disqualified at last year's fruit show of the Royal Horticultural Society, and suppose that they were exhibited and named in a collection of fruit —what would happen? Take the case of a cottager who buys a packet of seed of something he has heard about, but has not grown before, and who exhibits the "rogues"—what would happen here?

The foregoing, although not in strictness relating to the article in question, should have careful consideration. Returning to the article, we come to the matter of exhibiting vegetables—one variety of each. This again is a very proper provision, but how is it going to be given effect to without causing considerable bitterness. If we take the grape question, for example—suppose a collection of fruit, "six kinds, one variety of each," were asked for, and the exhibitor showed grapes cut from the vines of the disqualified Muscats with Muscats cut from another vine. There would probably be a difficulty here with the same judges.

At a show with which I was connected, the schedule, last year, asked for "six kinds of vegetables." The best exhibit contained ten varieties, and the judge wished to disqualify, but the committee properly ruled that the exhibit was within the words of the schedule, and so the exhibit obtained first prize.

The same society holds an autumn show, and to avoid the difficulty added the words "one variety of each" to the collections asked for. The exhibitors did their best in this direction, but the best exhibit had undoubtedly two varieties of onions, and was disqualified. The exhibitor, a cottager, was naturally sore about this, as the onions were all the produce of the same packet of seed, and he does not buy cheap seed. How would you obviate this undoubted hardship?

If flowers of plants that are not "herbaceous" are allowed to be exhibited as such, it would be as well to drop that title which was used, I presume, to exclude shrubs—by the way, what is a shrub as distinguished from the plants that can be used to cut perennials from?

Some time ago I asked in your columns, "What is a hardy perennial?" I am still awaiting a reply from your readers.

I now ask what is an "annual"? I am strictly in agreement with your definition, but if it were strictly acted upon there would again be hardship. Seedsmen here are largely to blame, including, as they do, in their lists of annuals plants that are naturally of longer duration. If you will turn to the back of the cover of No. 2,839 of the "G.M." you will find an instance of this. Even the "G.M." itself is not without blame in this matter, as reference to the articles "A Garden of Annuals" (Nos. 2,836-7), and "Annuals for the Greenhouse" (No. 2,840) will show. If such authorities can go astray, how can you penalise the poor cottager or allotment holder?

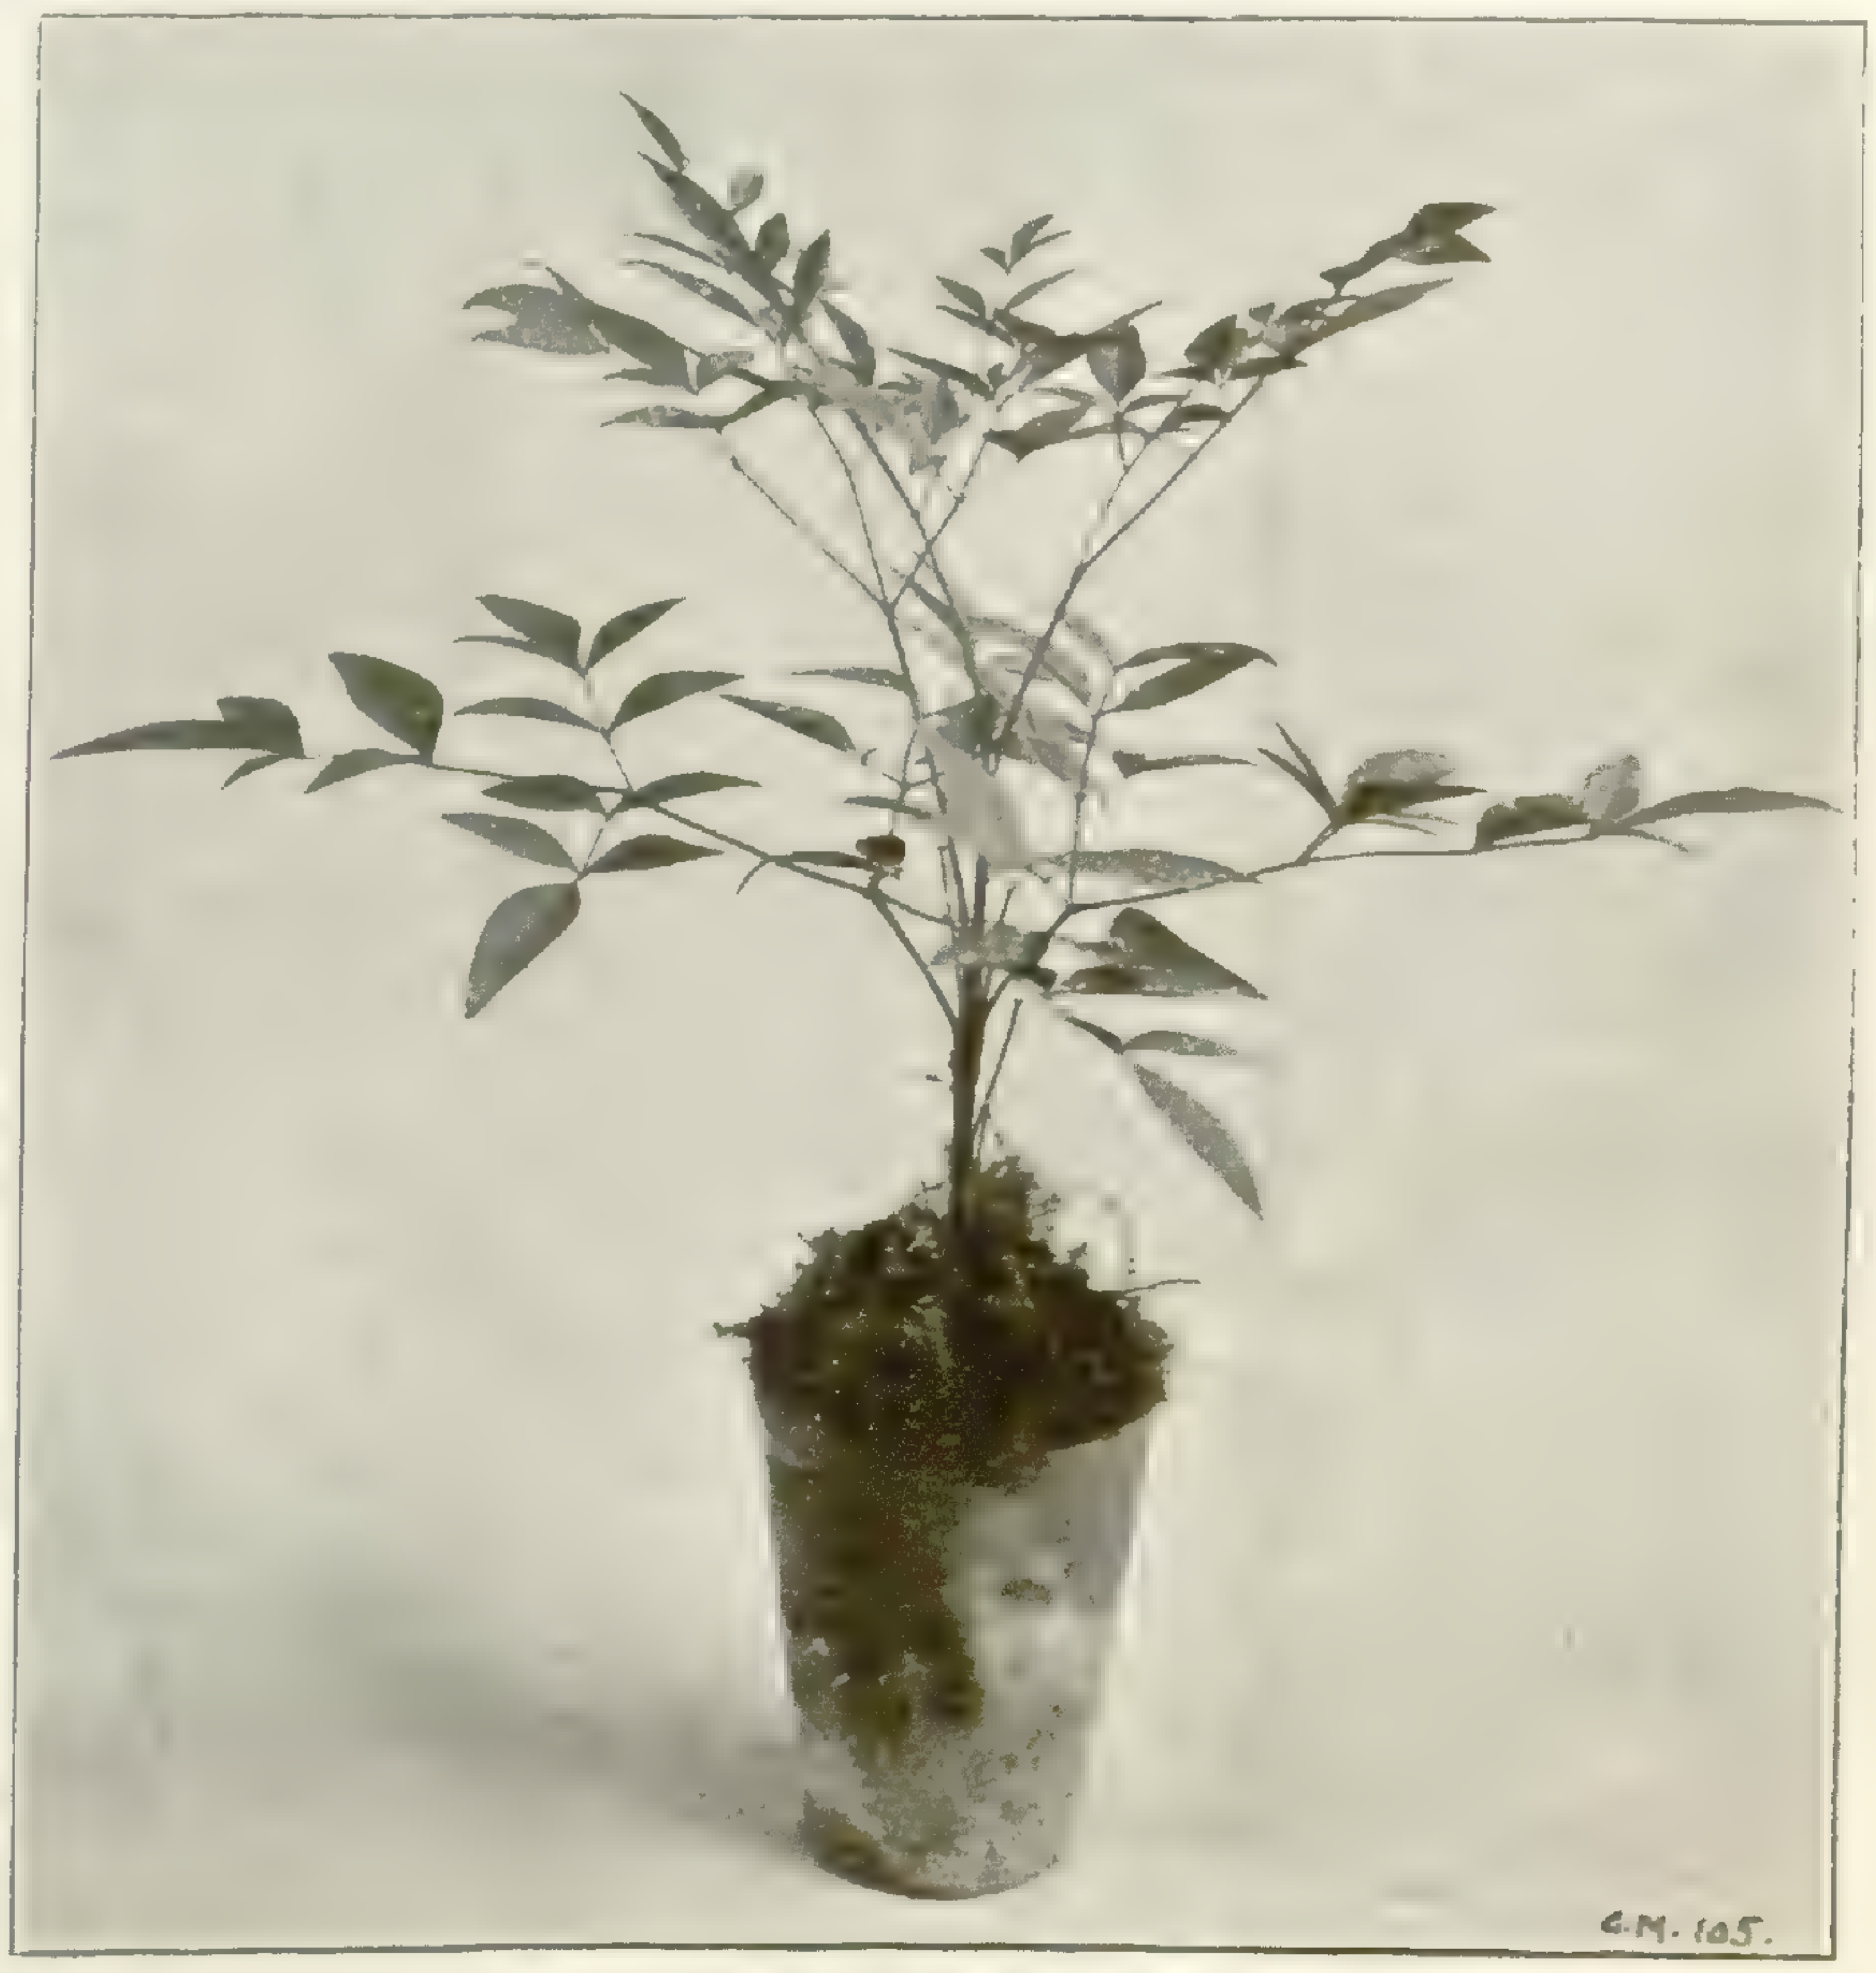
I am afraid I am trespassing too much on your good nature by the length of this letter, but before I finish I should like to ask another show question. What is the value of the word "distinct," as used in schedules? Agreeing that where there is a society for the special cult of any flower the synonyms as classed by them would not be "distinct," what is to be done where there is no such society? Would a nurseryman's catalogue be conclusive? If not, who is to judge?

B. Henderson.

Lansdowne Road, Snaresbrook.

NANDINA DOMESTICA.

Although this plant is of very old introduction, it is by no means common in gardens. This is propably due to the fact that it can only be successfully grown out of doors in a few favoured localities, and also that, except for certain objects, it is not very suitable for indoor culture. It must not, however, be imagined that it is not an ornamental plant, for when seen at its best, either when crowned with handsome, doubly pinnate leaves, with upright panicles of white or pink-tinted flowers, or with red fruits, it is decidedly decorative. Autumn also provides a further period of beauty, for the leaves take on very pretty orange-red shades.



NANDINA DOMESTICA.
As grown for decorative purposes by Messrs. Barr and Sons.

It is found in both China and Japan, and is cultivated largely in many parts. In those countries it is called the sacred bamboo, on account of the reed-like branches, which are clothed with heads of leaves, and largely used for decoration in religious festivals. The branches, terminated with heads of red berries, are also sold for house decoration during winter. It was figured about 1808 in the "Botanical Magazine" (t. 1,109), the plant at that time being in flower in the nursery of Messrs. Lee and Kennedy. Several forms may be obtained, the chief difference between them being in the colour of the flowers and fruit.

W. D.

HARDY FLOWERS are always popular, as they make the garden bright and attractive, and require but little attention. All the information required for their successful culture is given in Easily Grown Hardy Perennials, by G. H. Vos. Price 5s. net, by post in box, 5s. 6d., from W. H. and L. Collingridge, 148 and 149, Aldersgate Street, London.

WORK FOR THE WEEK.

STOVE PLANTS.

MYRSIPHYLLUM ASPARAGOIDES.—A batch of plants of this useful stove trailing subject may now be raised from seeds sown in shallow pans or boxes. If the seeds have been previously thoroughly steeped in water they will germinate in a few weeks time, and the seedlings be ready for potting off singly, using small thumb pots. They ought to be kept steadily growing throughout the winter, and as soon as they show signs of twining they must be placed in their permanent position, where green twine should be fixed to support the growths. Autumn-raised plants are best kept growing in pots throughout the winter months, although, if desired, they may be planted out as soon as the new year arrives. Under this system of cultivation serviceable trails of smilax can be obtained for decorative purposes early in the new year. Aphis and thrips will sometimes attack the tender growths, but these troublesome pests are readily destroyed by fumigation with a nicotine preparation.

POINSETTIA PULCHERRIMA.—As soon as later batches of these plants require further root room, they should be shifted into the pots in which they are to flower. As they become well established, apply weak liquid manure occasionally, and alternate top-dressings of some chemical fertiliser. As the summer advances, gradually cease syringing, and expose the plants to as much light as possible. This will assist in the ripening up of the wood, and in the preservation of the foliage plants throughout the flowering period.

STEPHANOTIS FLORIBUNDA.—Where grown as roof climbers in the stove, the plants will have almost finished their season's flowering. Those growing in the intermediate stove will continue to bloom for some time if attention is regularly given to watering and feeding. They should, however, be trained and thinned out as they require it, and gradually expose the growth to more light and air as the season advances.

CLERODENDRON BALFOURI. — Specimens of this species that have finished flowering must have the water supply gradually reduced to induce them to pass into a state of rest. At no time must the growths be allowed to suffer for want of water. As soon as the wood is well ripened they may be stored in a temperature of 50 to 55 degrees, when they will require very little further attention. They should, however, be examined occasionally throughout their resting period.

CLERODENDRON FALLAX. — Examples that have been grown for autumn and winter decoration may now be exposed more fully to the sun, and the use of the syringe be gradually withheld. They may be kept in a temperature of about 60 to 65 degrees during their flowering season. — John Donoghue, Bardon Hill Gardens, Leeds.

THE ORCHID HOUSES.

THE COOL HOUSE.—The end of the month of August and onwards is a suitable time to examine the plants in the cool house divisions for repotting purposes. In the case of Odontoglossum crispum, plants that are flowering at different times throughout the year, cannot have any hard and fast rules applied to them with regard to treatment for repotting at this particular season of the year. Those in charge must judge for themselves as to whether or not plants are in the right state of growth for being repotted, and should not be carried away from any successful line of cultivation by outside suggestions. There is also the fact of being acquainted fully with the peculiarities of plants we are dealing with. In a collection like ours I have been able to observe that even the special varieties of odontoglossums commence root action in totally different stages of their growth. In many cases they emit their new roots when the new pseudobulb commences to form at the base of the developing growth. In others there is not a new root to be found until the growth has matured, and sometimes even not until the plants have passed out of flower do we find root action commencing. I have always held that the safest season to attend to the repotting of any orchid is when the new roots make their appearance, irrespective of the season of the year. I consider there is the least possible check given at a season when the plants are thus afforded the best opportunity of becoming quickly re-established. Practically all prominent growers have of late years recommended the months of August and September for general repotting, because the bulk of the plants are in the stage of growth when new roots are found at the base of the recently developed or developing growths. The fact also of the hottest weather having been passed is also beneficial, as the plants are not nearly so liable to become shrivelled from the effects of the warm, dry condition of the outside atmosphere. I prefer, if possible, to delay repotting until a reasonably moist outside atmosphere is obtainable.

It is well, then, to have potting material made ready as soon as possible, so that there may be no delay when the favourable opportunity of commencing occurs. The potting compost we use consists of two parts fibrous peat, the remaining portion consisting of chopped sphagnum moss and broken oak or beech leaves, with sufficient broken crock and sand added to render the compost porous; the surface of the potting compost is covered with a layer of chopped sphagnum moss. The pots should be cleaned, and a crock or two placed over the hole at the bottom, and filled to at least one-third with chopped dried bracken roots. I would point out that it is advisable to dip the leaves used in the compost into boiling water. We place them in bags and dip them into a boiling copper for a few minutes; this destroys all insect life and fungoid growth. The leaves are afterwards laid out thinly to dry before they are used.

MASDEVALLIAS, especially those of the robust-growing type of the M. Harryana section, will be found in an active rooting condition during the next few weeks. It is not advisable to disturb large specimens of this section more frequently than is absolutely necessary, and unless they require more pot room, or the compost is in an advanced stage of decay, removing any dead or decaying matter about the base of the plant, and renewing with fresh potting material is all that will be required. Any repotted plants in the cool division must be well shaded from strong light, and the atmosphere kept in a moist state about the plants.—H. J. Chapman, Oakwood Gardens.

FRUITS UNDER GLASS.

CUCUMBERS.—Those in frames should have plenty of nourishment, and old and useless vines thinned, and old leaves infested with red spider removed. Encourage new growth for another month by top-dressing with good loam and lime rubble. Syringe and shut up early in the day. If hot-water pipes are available they will continue productive until the next batch comes into bearing. For winter supplies the Improved Telegraph still holds its own. The plants for winter crops will at this time be making good headway, and may be given a small shift to encourage growth till the house is ready. Clean this structure well down, especially if it abounds in woodlice, which soon make havoc amongst these in the winter. Syringe all walls and crevices with paraffin and water, whitewash the walls, and paint the woodwork if necessary. The compost should be prepared and turned over a few times before bringing it into the house. The mixture should consist of loam free from wireworm, old spent mushroom bed, and plaster rubble.

STRAWBERRIES.—The potting of these being completed syringe them night and morning to keep down red spider. They should have been stood on a good thick bed of ashes to prevent worms entering the pots. Watering should be done carefully, and care taken to well moisten the whole of the soil when water is applied. At the same time they must not be overwatered. Dryness at the roots checks the growth and encourages red spider, and with an excess of moisture the soil becomes sour, and growth is very slow. The plants should be stood far enough apart so that the pots can be sounded by a hazel stick; this, perhaps, is slow work, but it will give a good return.

PINE APPLES.—Those that are swelling their fruit should have assistance with liquid manure prepared from sheeps' droppings, and this may be syringed between the pots that are plunged when the house is closed in the afternoon; this gives off an aroma which these revel in, and makes the foliage a good colour. Soot-water may also be given in the same way occasionally, but no great quantity should be allowed to lodge in the axils of the leaves; a slight overhead syringing with clear water may be given also at closing time. As the fruits colour they should be removed to a somewhat drier house.

SUCCESSIONAL PINES will now be rooting freely, and will require plenty of clear water. Syringe and shut up early; pot on a few successional plants as they are required. They will require a cooler temperature, and a little bottom heat to induce them to root freely.

TOMATOES.—These for winter should be in their fruiting pots; the two best are Winter Beauty and Lye's Early Prolific. The pots, which should be 10 or 12 inches in diameter, should be well drained and have some good turf placed over the crocks. Use good loam, leaf-mould, and charcoal, and leave a few inches space on the surface to allow for top-dressing later on. They should be stood outside for a short time unless wet weather sets in. Those carrying heavy crops should have the assistance of liquid manure. Cut off all bad leaves and side shoots to assist them to finish off their crop.

MELONS.—These swelling in the houses generally attain a good size at this season of the year. Melons, if given plenty of fire-heat, will be valuable, as most of the bush fruits suitable for dessert are over. Midseason melons may be grown on the stage of a house in deal boxes about two feet square. They do not canker so much as those grown in a bed resting on decayed manure.—A. B. Wadds, Paddockhurst.

THE KITCHEN GARDEN.

LIFTING POTATOES.—It is not a good plan to leave the main crop of potatoes long in the ground after the tubers have attained their full size, for, should a thunderstorm come, it would no doubt start the tubers into second growth, which greatly interferes with their keeping properties. It is not at all necessary to wait for the foliage to die off, for if the skins seem hard and firm they are ready for lifting. Store the tubers in a cool, airy place, and cover them well over to exclude the light, for they would soon become green and unfit for culinary purposes. Pick out the seed potatoes at the time of lifting and leave in an exposed position to harden the skins. All the early varieties should be lifted at once and stored.

EARTHING CELERY.—The early batch should now be earthed up for the last time. Choose fine weather for this operation if possible. If there are any slugs lurking about in the rows dust well between the plants with fine powdered lime before earthing. Place the soil equally round each plant with the hand as the work proceeds, then a clean, kind growth will follow.

MUSHROOMS.—It is now a good time to collect horse manure for forming outdoor beds which are to produce mushrooms during the spring months. Turn the manure frequently so that the rank heat may escape. The beds should have a dry foundation, and be made up ridge shape, about four feet wide and three feet high, made firm, and the spawn put in 1½ inches deep when the heat has declined to 80 degrees, and afterwards cased over, to the depth of two inches, with loam or any good garden soil. Then place a good thickness of clean straw on the beds, and put some wire netting over all to keep the straw from blowing about.

MUSHROOMS INDOORS.—If the mushroom house has been cleaned down and limewashed out the first bed may now be started, so that a few early dishes may be had for the shooting parties in October.

CAULIFLOWERS.—To provide cauliflowers for the table in May make several sowings in September; keep the plants strong by giving them cool treatment. Good results may be obtained by sowing extra early varieties under glass early in the year.

PARSLEY.—Another sowing may still be made, which will prove useful for gathering in the early spring months. Any old beds will be much benefited if cut over, so that young leaves may become hardened before the winter sets in. And they will keep up a supply much longer than if left with the old leaves.

LETTUCE.—It is advisable to sow another batch of All the Year Round cabbage, or Hicks's Hardy cos, and keep a look-out for those that are just showing through the ground, as slugs are very fond of the tender leaves. Dust the plants with a little soot early in the morning.

TURNIPS.—Late sowings are growing well, and they should be encouraged by thinning them out whilst they are quite small. Those required for present use should be watered, or they will become stringy, and indifferent in flavour.

GENERAL WORK.—Attend to clipping box and privet hedges, and make the kitchen garden neat and clean, hoeing and pulling all seed weeds as fast as they appear.—T. W. Birkinshaw, Hatley Park Gardens, Sandy.

Freesia Notes. — Unlike tulips and hyacinths, freesias should not be subjected to a burying process after potting. Stand the pots in a cool place under the shade of a low wall, or what is better, stand them close together in any disused frame, such as was in use earlier for forcing vegetables. Plunge the pots to the rims in coal ashes or cocoanut fibre, and when the young growths are an inch through the soil expose the pots to fuller light. Water in the early stages of growth must be sparingly applied, as the least tendency to saturation of soil at this stage invariably ends in failure. — Thomas Smith, Walmsgate Gardens, Louth, Lincs.

HORTICULTURAL SHOW ADVERTISEMENTS are inserted in this column at Ninepence per line, the minimum charge being Five Shillings. Offices, 148 and 149, Aldersgate Street, London, E.C.

EXHIBITIONS AND MEETINGS.

◆

Grand Shrewsbury Floral Fete.

We now give our report of the three sections of the Shrewsbury Flower Show, which we had to leave over from the issue of the 22nd inst.

GENERAL PLANT CLASSES.

Mr. C. Roberts, gardener to Mrs. Swann, Halston Hall, led for the local groups, and Mr. T. Edwards, gardener to Dr. G. Burd, Newport House, came second. Mr. Lambert, Mr. Roberts, and Mr. Cromwell were the prizewinners in the local class for stove and greenhouse plants. Mr. Lambert led for dracænas, Mr. A. Bridge for fuchsias, Mr. F. Hammond, Castle Street, for four begonias; Mrs. Eyke, Belvedere, Shrewsbury, for double pelargoniums, and Mr. H. Cliffe for single pelargoniums, the latter also winning for six specimen singles with beautiful plants, while Mr. Bridge, Green Hyton, Liverpool, scored for six specimen double varieties; Mr. E. Vaughton, Handsworth, had the finest ferns, Mr. Cromwell the best caladiums, and Mr. J. Swain, gardener to Colonel Patchett, Broome Hall, led for coleuses.

Messrs. T. S. Ware, Lim., Feltham, were awarded the first prize for a collection of begonias, arranged on a space 16ft. by 4ft.; theirs was a marvellously fine set of finely-selected and finely-grown plants, the colouring and the arrangement being alike good. Messrs. Blackmore and Langdon, Twerton-on-Avon, second; and Mr. F. Davis, Pershore, third.

FLOWERS.

Messrs. J. Gibson and Sons, Bedale, gained first place for eighteen bunches of hardy flowers, and they had a fine set, but it was put up in an extremely formal manner; Mr. M. Prichard, Christchurch, Hants, second; and Mr. Bamfield, gardener to W. H. Banks, Esq., Kington, third. Mr. J. Smellie, Busby, Glasgow, led for six bunches of summer-flowering chrysanthemums with splendid flowers of Improved Masse, Mrs. W. Sydenham, etc.; Mr. W. Barsley, Leicester, second; and Mr. A. Hoggan, Busby, third. For twelve bunches of cactus dahlias Mr. M. V. Seale, Sevenoaks, led with Harbour Light, Raymond Parks, Daisy Easton, etc.; Mr. W. H. Banks, second; and Mr. E. Deakin, Hay Mills, third.

Reflexed asters, twelve blooms, were best shown by Messrs. H. J. Clarke and Son, Rodley, Leeds, who led in a big competition. There was a splendid competition for two dozen show dahlias, and here Mr. J. Smellie, Busby, led with wonderfully bright, shapely blossoms of popular sorts; Messrs. H. Clarke and Sons second. Mr. T. Jones, Ruabon, led for twelve show or fancy blooms, and Mr. J. Haycocks, Wrexham, was a good second. Messrs. G. Gibson and Co. had the best gaillardias.

In the rose classes Messrs. A. Dickson and Sons, Newtownards, led for eighteen blooms, and Mr. Hugh Dickson, Belfast, came second. Messrs. A. Dickson and Sons also led for two dozen blooms with splendid [illegible], and Mr. H. Dickson was again second. Mr. W. E. Wilson, Cannock, scored for twelve cactus dahlias, splendid flowers arranged on a velvet-covered, heart-shaped stand: Dreadnought, Mrs. E. Mawley, and Thomas Wilson were superbly shown. Mr H. Rutherford, Brechin, second. For eighteen cactus dahlias Mr. W. E. Wilson was [illegible] first, and Mr. J. E. White, Bramley, second. Gladioli were finely shown by Messrs. [illegible] Muir and Son, Prestwich, and Mr. J. Walker, Thame, came second.

Messrs. Bottomley and Burton, Elland, Yorks, secured first place for two dozen cactus dahlias, Mr. W. Tresider, Cardiff, coming second, and Mr. J. Smellie, third; this was a fine class, and all the flowers were of excellent colour and quality. Mr. W. H. Banks led the way for a collection of cut hardy flowers, and he did well with montbretias, helianthuses, etc.; Mr. T. Bouskill, Market Bosworth, second.

The best collection of carnations and picotees was a handsome one set up by Messrs. M. Campbell and Sons, High Blantyre, N.B., who showed Foxhunter, Polly Aitken, Peggy, and May Campbell finely; Mr. C. H. Herbert, Acocks Green, Birmingham, was a good second, the latter also showing Progress, a new freely-flowering perpetual pink. Mr. C. Allcock, Liverpool, led for twelve carnations or picotees, three blooms of each, and Mr. W. H. Parton, Hollywood, Birmingham, was second. First for cut carnations and picotees, another class, was won by Mr. J. Wallace, Bromboro, with a splendid set, rather flatly set up, however; Miss Gladys Bibby, St. Asaph, second. For a group of tree carnations Mr. C. F. Waters, Balcombe, Sussex, gained first place with a splendid set of popular varieties admirably arranged: Mr. A. F. Dutton, Iver, Bucks, second.

For a display of roses Messrs. Gunn and Sons, Olton, were first with a lovely arrangement of tea and hybrid tea varieties, and Mr. George Prince, Oxford, came a very close second. Mr. Lambert scored for cut stove and greenhouse flowers with a gorgeous set of clerodendrons, eucharis, allamandas, etc.

The best collection of hardy perennials was the one from Messrs. Gunn and Sons, Olton, Birmingham, a very bright and worthy display. The collections of cactus and decorative dahlias were splendid and numerous, and the leading prizes were won in order by Messrs. M. Campbell and Sons, High Blantyre, N.B.; Messrs. Keynes, Williams, and Co., Salisbury; and Mr. J. Walker, Thame, Oxford; all these showed fine flowers, and set them up beautifully.

NON-COMPETITIVE.

Messrs. Dobbie and Co., Rothesay, contributed a bold and very effective display of early cactus dahlias, setting these up in pyramids and vases. In front of these were pompon varieties in great variety, and a fine set of the increasingly popular pæony-flowered varieties, these creating a great deal of interest. The front of the group was finished off with boards of cactus and show dahlias, show pansies, and Dobbies' Selected French marigold, and Dobbies' Lemon Queen African marigold.

Mr. Henry Eckford, Wem, Salop, contributed a very extensive and well-arranged bank of sweet peas, the flowers being large and pure in their respective colours, most of the leading varieties were represented, the strikingly distinct Henry Eckford being conspicuous. Others worthy of note were Mina Johnston, and Queen of Spain.

Messrs. Hobbies, Lim., Dereham, had a large semi-circular group of roses, artistically set up in tall stands, hanging baskets, pyramids, etc., and associated with smilax and growing plants of the Wichuraiana varieties. A few more flowers would have improved the display, but we understand that part of the consignment reached Shrewsbury too late for use. Messrs. Sutton and Sons, Reading, had an attractive and imposing exhibit. They had an arched background of asparagus, and varieties of various annuals, such as scabious, asters, etc. The front was filled with the Reading specialities in melons, tomatoes, dwarf and runner beans, potatoes, peas, carrots, cucumbers, etc. Nemesias and Primula obconica were also used in the centre, and at the ends of the group.

Mr. Albert Myers, Sutton Lane Nurseries, Shrewsbury, set up a very bright group of zonal pelargoniums, cut flowers, and growing plants. The disposal of the cut flowers of the best varieties, in arches and pyramids, added materially to the effectiveness of this display.

Messrs. Dicksons, Chester, were represented by a bold bank of roses in bunches, these being chiefly tea and hybrid tea varieties, with these were the finer phloxes, montbretias, gladioli, liliums, and select hardy herbaceous flowers. Messrs. Isaac House and Son, Westbury-on-Trym, set up a splendid lot of phloxes in large bunches, vases of excellent pentstemons, delphiniums, gladioli, etc., but a grand feature of this display was a huge flower of Aristolochia gigas, a strong-growing stove climbing plant.

Messrs. Jones and Sons, Lim., Coton Hill Nursery, Shrewsbury, made a bold and bright display of cactus dahlias, backed up by tall arches decorated with sweet peas, the reverse side of the stage being occupied by sweet peas in bunches. Messrs. Hugh Low and Co., Bush Hill Park, London, N., showed vases of carnations set up on a groundwork of Nephrolepis todeaoides.

Mr. John E. Knight, Tettenhall Nurseries, Wolverhampton, put up a bold and effective group of cactus dahlias, arranged in tall bamboo stands and glass vases. The varieties were of the best, the blooms good, and the arrangement very tasteful. Messrs. Dickson and Robinson, Manchester, showed a fine new tomato named Moneymaker. It is a smooth, medium-sized fruit, borne on large, spreading bunches, averaging 15 to 20 fruits. Dahlias were also shown by this firm. An extensive collection of vegetables was staged by Messrs. Clibran's, Altrincham. In addition to excellent dishes of the popular kinds were several uncommon and at present little-used vegetables, such as silver beet, golden turnips, and kohl rabi.

Messrs. Alex. Dickson and Sons, Newtownards, Ireland, made a very fine display of roses. The so-called garden varieties occupied the background with boxes of the leading exhibition sorts in front, all being excellent in quality. Messrs. Wm. Artindale and Son, Nethergreen, Sheffield, showed herbaceous flowers, carnations, pentstemons, and a few good lilies; also a very extensive collection of violas, dahlias, and early-flowering chrysanthemums.

Mr. Thos. W. Darlington, Wharton, Carnforth, staged sweet peas in a manner that betokens the specialist. Large bunches of best varieties arranged artistically; the whole stand was a feast of beauty. Messrs. G. Stark and Son, Great Ryburgh, showed a few choice sweet peas, including the new variety Silver Wings.

The well-known firm of Webb and Brand, Saffron Walden, showed hollyhocks, both as single blooms and on spikes; Salmon Queen, Walden Primrose, and Black Knight were three good and distinct varieties. Roses were well shown by Messrs. W. and J. Brown, Stamford. The best known hybrid teas and polyanthas were arranged in lightly constructed bouquets, a few tall bamboo stands at intervals breaking the dead level. Several good hardy subjects were staged by Mr. William Angus, Penicuik, N.B.; Chrysanthemum maximum Snowdon is a remarkably large, broad-petalled flower, with a clear centre; Disa grandiflora was well staged, and also some good phloxes. Mr. John Smellie, Pansy Gardens, Busby, N.B., showed early chrysanthemums, a new seedling named Stella being noteworthy. It is a Japanese, with long waved florets of a clear cream, with deeper centre. Another good one, of more compact build, is Caledonia. This is also cream, and of good substance. Zonal pelargoniums were shown in fine style by Mr. Vincent Slade, Staplegrove Nursery, Taunton. Among singles, Ascott, Hopedene, and Mrs. Williams were good, Tresor being a good double salmon.

Messrs. Tom B. Dobbs and Co., Wolverhampton, showed some rustic rose supports of useful design; pillars formed of short pieces of oak so fixed as to form short jutting branches, among which the roses can ramble; rather a good idea. An interesting exhibit of ferns was put up by Mr. H. N. Ellison, Bull Street, West Bromwich. Nephrolepis todeaoides and Whitmanni occupied prominent positions, with smaller things, such as Adiantum hispidatum, Asplenium viviparum, and some good gymnogrammas, etc., in front. Messrs. Cutbush and Son, Highgate, N., brought down from London a fine lot of perpetual-flowering carnations. All the leading varieties were staged in a light and graceful manner. The new dwarf Polyantha rose Mrs. William H. Cutbush was shown, and is certainly very pretty and free flowering. A recess in the big tent was devoted to the roses, gladioli, and clematis staged by Mr. Edwin Murrell, Portland Nurseries, Shrewsbury. Trained specimens of Gruss an Teplitz and Dorothy Perkins surmounted bunches of other good garden roses, Sunrise and Liberty being conspicuous. Messrs. Webb and Sons, Wordsley, Stourbridge, made a most interesting and effective display, which consisted of melons, tomatoes, peas, and other vegetables arranged on tall, elegant stands, and in flat baskets, the whole being interspersed with many choice varieties of sweet peas; a remarkable and instructive exhibit. A large and varied collection of gladioli were staged by Messrs. Kelway and Son, Langport. The varieties exhibited were excellent in colour and form.

Messrs. Bakers, Wolverhampton, made a bold display of excellent hardy flowers, and also cactus dahlias, and the new pæony-flowered dahlias in several good varieties. The exhibit was well staged, and merited the high praise it received. Messrs. Jarman and Co., Chard, Somerset, put up dahlias and roses, also some good onions, but the feature of their stand was the excellent arrangement of their strain of sweet sultans, which were bright in colour and of good size. A bunch of their new sweet pea, Mrs. Townsend, was also shown. Messrs. Robert Sydenham, Lim., Birmingham, showed sweet peas in rustic receptacles, also lilies in fibre. Mr. A. W. Thorpe, Lichfield, had a well-arranged group of early-flowering chrysanthemums, in which the soft colours of the Masse varieties were excellently blended. Tall vases contained Wells' Masse, Hector, Ethel, and other decorative flowers. Gladioli, lilies, Hyacinthus candicans, and montbretias formed a good group staged by Mr. Frank Lilley, Guernsey, the centre feature being an arrangement of auratum and speciosum lilies. Tall pyramids of sweet peas, rising from a groundwork of smaller vases arranged in four terraces to form a bank of colour, enabled Mr. Robert Bolton, of Warton, Carnforth, to arrest the attention of the visitors Several good novelties were shown.

An exhibit which provided a distinct feature among the many floral displays, was the collection of pot-grown fruits staged by King's Acre Nurseries, Lim., Hereford. Healthy, evenly-balanced, and perfectly clean, the well-laden apples, pears, and peaches were good to look upon, and evinced skilful care and culture. Baskets of fruits were also shown, the apple Irish Peach being very well coloured. Phloxes, roses, and other hardy flowers were also staged by the firm. The exhibit of phloxes by Messrs. Gunn and Sons, Olton, Birmingham, can only be described as grand, and totally worthy the firm who show and grow phloxes so extensively and well. A number of remarkably good seedlings were staged by Messrs. Gunn, but these are not at present named. Forbes' phloxes once more helped pentstemons and carnations to add to the laurels of the well-known Hawick Nurseries. Violas and antirrhinums were also staged, and we saw so many things on Mr. Forbes' stall that were good that it is useless to single out any for special mention. Messrs. Pritchard and Sons, Shrewsbury, staged nephrolepis, crotons, and a few flowering exotics; also alpines in pots, which were arranged over a groundwork of virgin cork. We did not particularly admire the idea, but were pleased with the many choice things the exhibit contained.

True to their reputation, Messrs. Rivers and Son, Sawbridgeworth, Herts, caused outbursts of admiration from all who viewed their remarkable fruit trees in pots. Peaches were most in evidence, but plums and black Bigarreau cherries were also well shown.

Liliums were a prominent feature in the exhibit of Messrs. Hewitt and Co., Solihull, Birmingham. Phloxes, carnations, and a variety of perennials made up a good stand. A word of special praise must be accorded Messrs. Wallace and Co., Kilnfield Gardens, Colchester, for their remarkable display of the newer montbretias, for which the firm hold a high reputation. Probably a finer exhibit of these charming subjects has never been seen. Liliums and gladioli were also shown in great variety and excellent condition. As a contrast to the gorgeous colouring of sweet peas and other flowers, a collection of cacti and succulents was quite restful to the eyes. Miss S. S. Thompson, Handsworth, Staffs, had a number of interesting and well-grown specimens. A large semi-circular group of aquatic and bog plants was arranged by Mr. Amos Perry, Hardy Plant Farm, Enfield, N. Nymphæas occupied the surface of an improvised pond, on the margins of which were Scirpus zebrinus, cyperus, Acorus japonicus fol. var., and many other excellent things. At either end of the group were bunches of border perennials. Messrs. Gunn and Sons, Olton, Birmingham, staged garden roses in great arching sprays, together with bunches of such varieties as Frau Karl Druschki, Mdme. Abel Chatenay, Maman Cochet, and other good sorts.

Messrs. G. Bunyard and Co., Lim., Maidstone, staged a large collection of fruit, comprising very fine pears, apples, plums, etc. The fruits were of capital size, and richly coloured. Messrs. Artindale and Son, Sheffield, arranged a group of hardy plants, chiefly of a moisture-loving character. Rough stones were used with a small expanse of water in the centre of the group. Among the many good things represented we noticed the new, brightly-coloured Silene purpusi, a plant which promises to be a very useful thing for the lower parts of the rockery. Mr. G. Prince, Langworth, Oxford, showed roses in his usual good form, the hybrid teas being well represented.

National Carnation and Picotee Society.

NORTHERN SECTION.

The thirty-fourth annual exhibition was held on Saturday at the White City, late Botanical Gardens, Old Trafford, Manchester. A grand lot of flowers was staged in competition, and the exhibition was notable in showing how the trend of opinion is forcing the florists to fall into line with what may be called the prevailing fashion. The white-ground carnations and picotees are being ousted from the leading, and, as many think, their rightful position, in favour of the selfs and yellow-ground sections. The display produced by the various exhibits was very fine, although competitors stated that they would have preferred to exhibit a week earlier, as they would then have had more flowers. The following list of awards was made:

CARNATIONS.

For twelve selfs, not more than two of any one variety, Mr. A. R. Brown, Birmingham, was first with Daffodil, Avalanche, Major Galton, Mrs. H. Skeels, Isinglass, Mrs. Eric Hambro, Chaucer, Alplin, Mrs. Howard Green, W. H. Parton, Ann Hathaway, and Helen; Rev. C. Gottwaltz, Droitwich, second with John Pope, Hadzor, Helen Gottwaltz, Major Galton, Anglia, John Pope, Helen Gottwaltz, Theodore Galton, Mrs. Eric Hambro, John Hughes, Cambria, and Sir Galahad; Mr. J. Edwards, Moston, third with Daffodil, Mrs. James Douglas, W. H. Parton, Benbow, Mrs. Flight, Mrs. Eric Hambro, Leslie Mills, Seedling, Carabus, Sultan, Mrs. Flight, Mrs. E. Hambro; five exhibits. In the class for six selfs, not more than two flowers of any one variety, Mr. C. Allcock, Blundelsands, was first with Daffodil, Agnes Sorrel, Much-the-Miller, H. J. Cutbush, Daffodil, and W. H. Parton; Mr. H. Chadwick, Stoke, second; Mr. G. Lord, Turn, Ramsbottom, third; twelve exhibits.

There was a strong competition in the class for twelve yellow-ground carnations and picotees with not more than two flowers of any one variety, and in the result Mr. A. R. Brown was first with Lord Skeyne, Brodick, Margaret Thurstan, Emperor, Queen Bess, Hornet, Jupiter, Hidalgo, Sir Olaf, Lara, Mrs. Leo Hunter, and Gaiety; Mr. C. F. Thurstan, Wolverhampton, second with Liberte, Elaine, Sam Weller, Lory Steyne, Professor Cooper, Mr. F. Wellesley, Erl King, Elaine, Leading Lady, Liberte, Leading Lady, Hidalgo; Mr. C. F. Budenberg, Marple, third; six exhibitors. For six fancy or yellow-ground carnations and picotees, no more than two flowers of one variety, Mr. C. Allcock was first with Daniel Defoe, Merlin, Lara, Wm. Pemberton, Lara, Argosy, Hesperus; Mr. G. Lord second with George Lord, Cavalier, Lara, Liberte, Daniel Defoe, Roney Buchanan; and Mr. G. D. Ford, Birmingham, third; eleven exhibits. In competition for the prizes for six carnations, white grounds, dissimilar, bizarres, and flakes, Mr. C. F. Budenberg first with Master Fred, George Melville, Robert Houlgrave, Gordon Lewis, Edward Adams, Flamingo; Mr. J. Edwards second with Murillo, Sportsman, Little Dick, George Melville, Gordon Lewis, J. W. Bentley; and Mr. H. Chadwick third; twelve exhibits.

PICOTEES.

For six picotees, dissimilar, white grounds, Mr. A. R. Brown was first with Lady Sybil, Linda, Mrs. Chaundy, W. E. Dickson, Miss E. Cartwright, and Mrs. Hoskins; Mr. J. Edwards second with John Smith, Mrs. Beswick, Favourite, Thos. Williams, Little Phil, and Pride of Leyton; Mr. G. Lord third.

UNDRESSED BLOOMS.

In the class for twelve single blooms, undressed, without cards, Mr. C. F. Budenberg was first with Brodick, Johnny Briggs, Lara, Leading Lady, Aran, Cadmus, Loveliness, George Lord, Richness, Huish, Sir Launcelot, and Strongbow; Mr. A. R. Brown second with Sir Lancelot, Strongbow, Maud Brown, Sir W. Olaf, Highland Lass, Hornet, The Nizam, Liberte, Mrs. Herbert Incledon, Lara, Daffodil, Drogense; J. Edwards third. For six single blooms, undressed, Mr. C. Allcock Mr. G. D. Ford, and Mr. D. Thompson, Marple Bridge, were the winners in the order of their names; six exhibits.

SINGLE BLOOMS.

Premier white-ground carnation was George Melville. The premier white-ground picotee was Mrs. C. H. Herbert, and the premier yellow-ground carnation was Lara.

Best bizarre carnation, white ground, Mr. G. Lord first with Master Fred; Mr. Budenberg second with the same variety; Mr. J. Edwards third; and Mr. A. R. Brown fourth and fifth. Best flake carnation, white ground, Mr. J. Edwards first and second with Gordon Lewis; Mr. A. R. Brown third with Guardsman; Mr. Thurston fourth; and Mr. Brown fifth. Best heavy-edge picotee: Mr. Brown first with Maud Brown; Mr. Kenyon second with Mrs. Holden, and third with Mrs. Openshaw; Mr. Budenberg fourth; and Mr. Thompson fifth. Best light-edge: Mr. Brown first with Lucy; Mr. Edwards second with Thomas Williams; Mr. Thurstan third with Fair Maiden; Rev. Gottwaltz fourth; and Mr. G. Lord fifth with Lucy.

A first-class certificate was granted to Mr. G. D. Ford for Mrs. C. H. Herbert, light purple picotee.

GARDENING ENGAGEMENT.

Mr. J. Newton, who for the past three and a-half years has occupied the position of foreman in the gardens of Garscube, Mary Hill, Glasgow, the residence of Sir A. Campbell, Bart., has been appointed head gardener to D. W. Graham, Esq., Kilston Park, Monmouth.

Beet.—The roots are swelling fast, and should any of them be likely to become coarse lift them, taking precautions not to bruise them in any way. Lay them in behind a north wall, and cover them over with soil, when they will keep in good condition for a long time.—T. W. Birkinshaw.

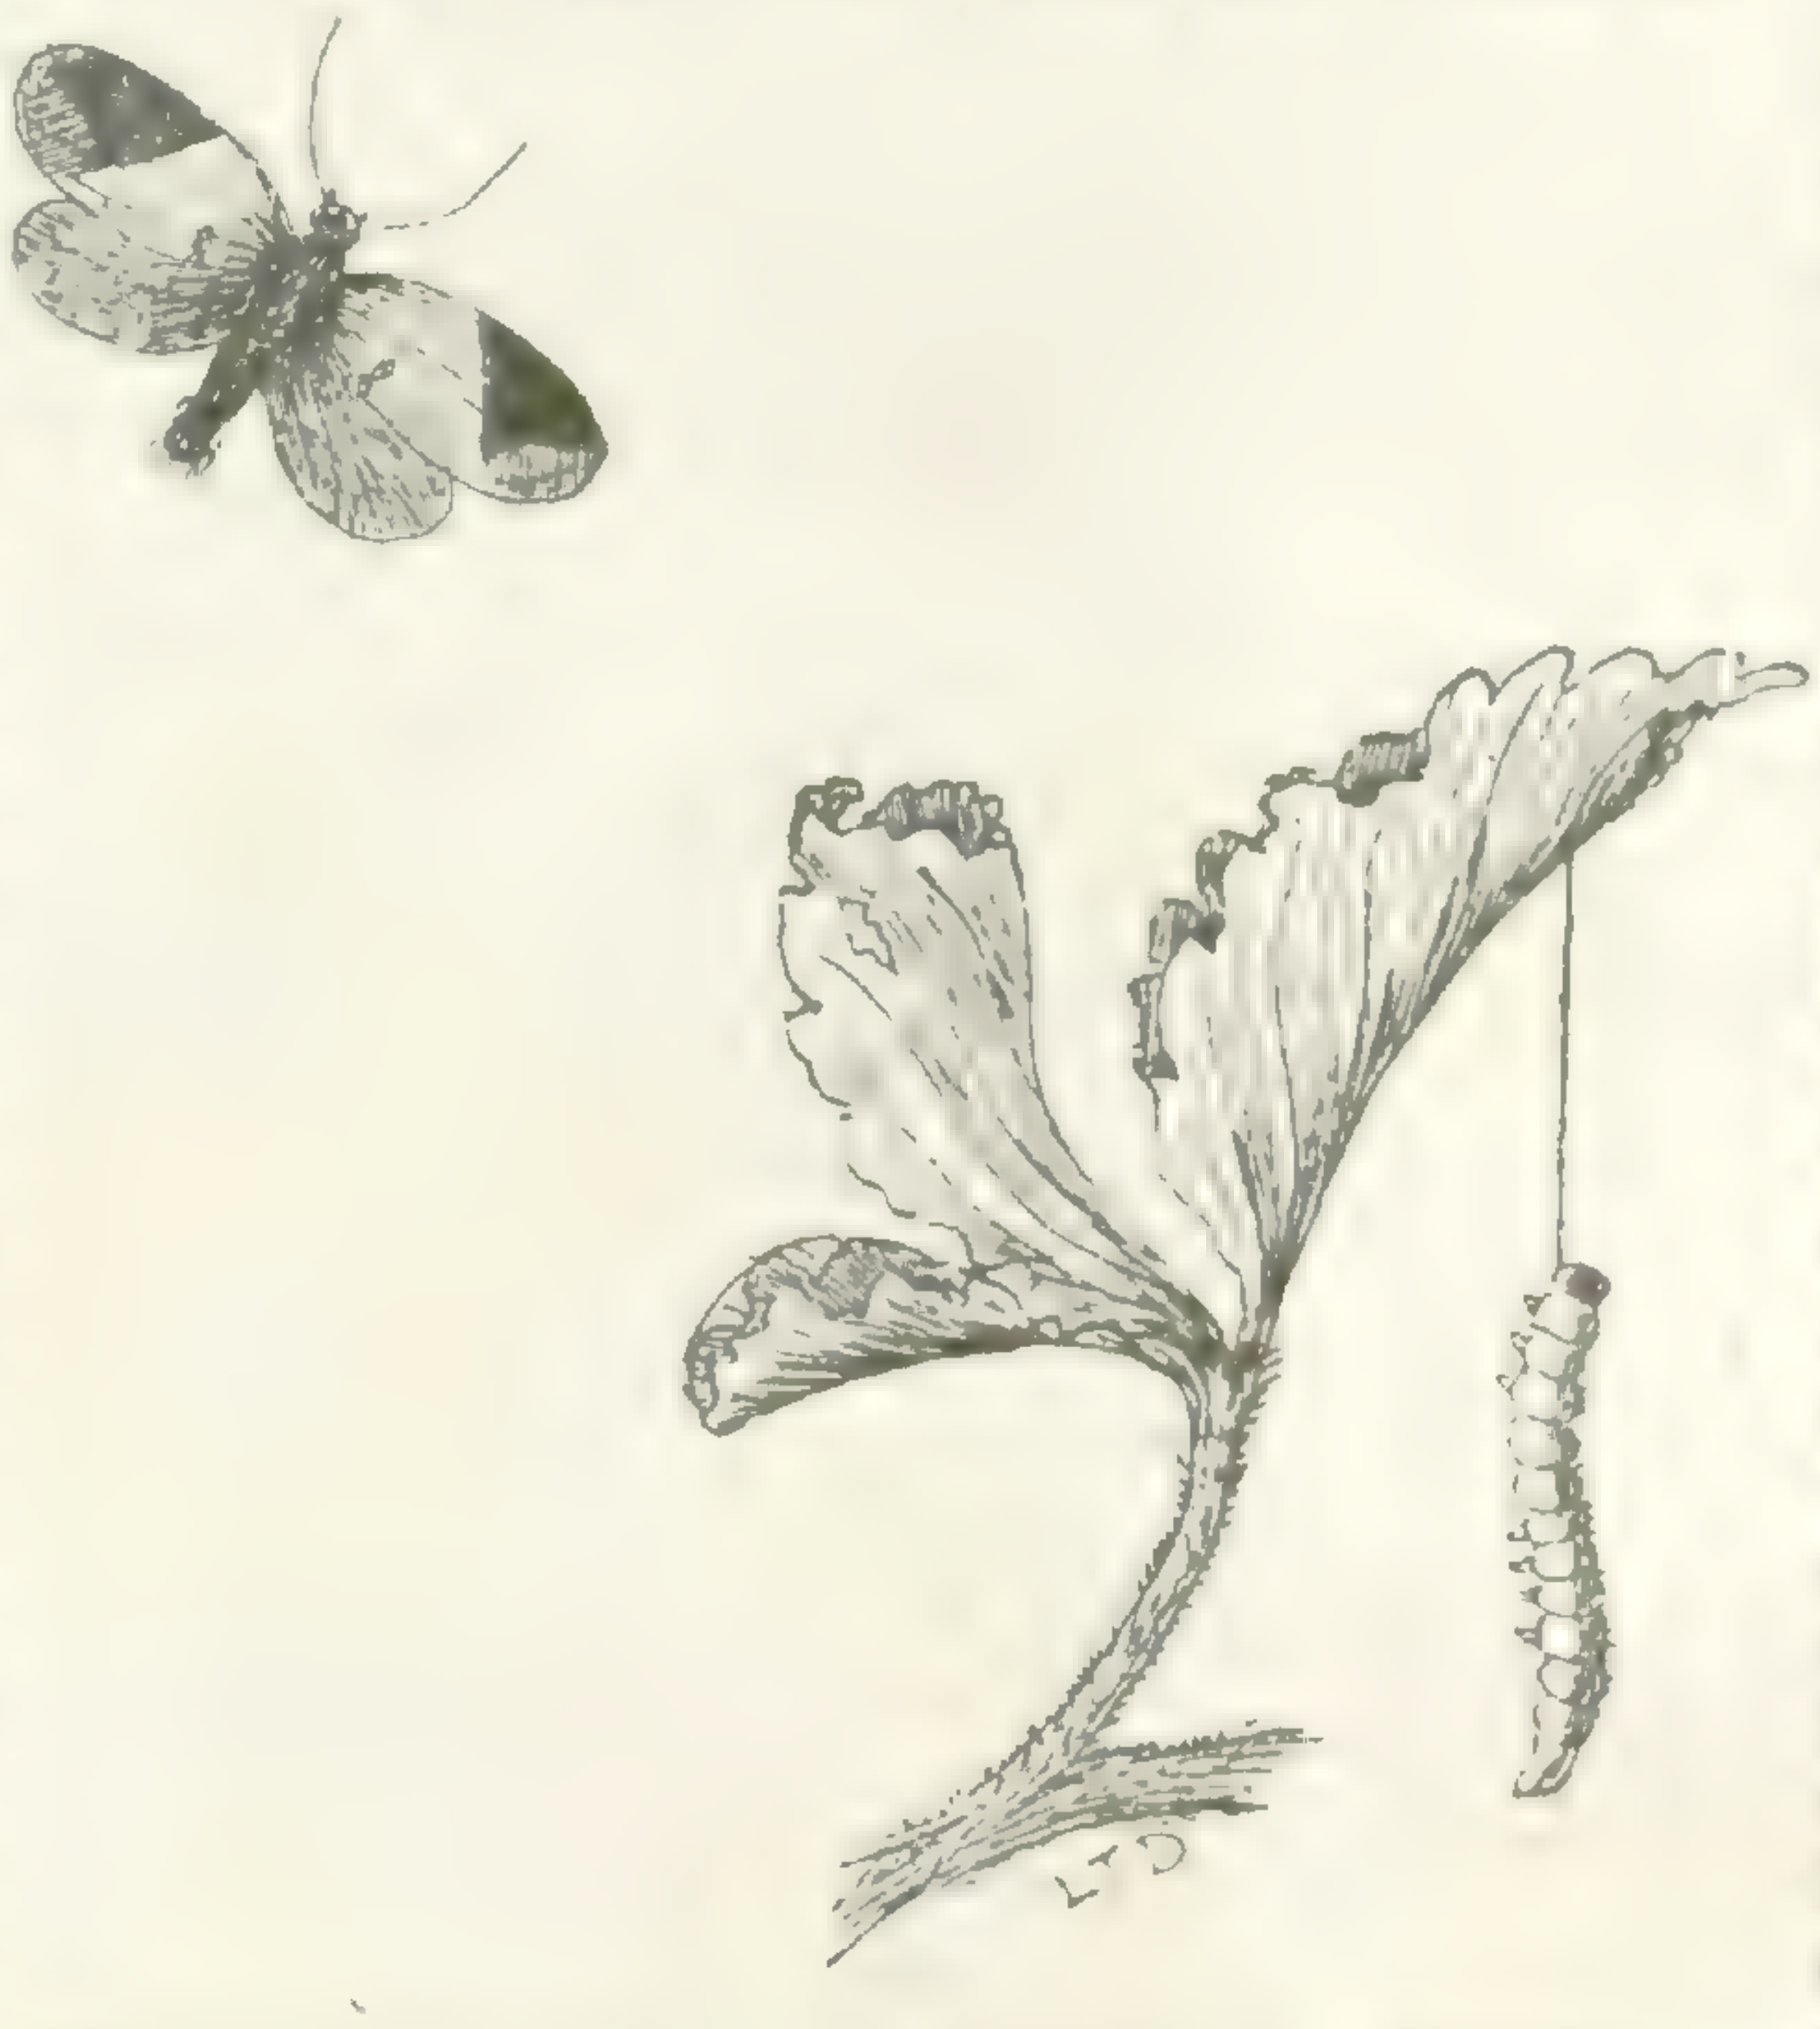
ANSWERS TO CORRESPONDENTS.

ASTERS.—W. B., Bristol: Your question reached us too late to admit of answering it in our issue of the 22nd inst. In view of the development which the annual asters have undergone within recent years, "French Aster" is a vague term, and it would be well were compilers of schedules to use terms which would express exactly the type or types they wish exhibitors to stage. Originally, the term "French" was applied to the flat-petalled varieties to differentiate them from the quilled or German type. According to the schedule you have sent us you could, without any risk of disqualification, stage blooms of the Victoria type, and your opponents would be equally justified in staging blooms of the Comet type. It would be better to use the term flat-petalled in connection with the so-called French asters, and the term "quilled" to the so-called German asters, which have quilled petals, and then exhibitors would have no doubt in their mind with regard to the flowers they should stage.

DESTROYING WASP NESTS. — K. F., Gloucester: The article from the pen of "East Sussex," which we publish in this issue, will give you the information you require. There are strong objections to the use of gunpowder and prepared squibs, for the former is dangerous, and the latter one not sufficiently effectual. The material advised by our correspondent is most destructive to wasps when used in accordance with the advice given, but, as he points out, it is a dangerous poison and requires the greatest care, both in its use and storage. For the information of those who are afraid to handle so poisonous an agent, we would mention that we have destroyed many wasps' nests with spirits of turpentine. In using turpentine for destroying wasps nests, a medium-sized piece of rag is fixed to a pliable stick between two and three feet in length, and then the rag is placed in a cup or basin, containing the spirit, where it remains until saturated. It is then plunged into the passage to the nest, and a piece of turf put firmly over the opening. It is essential to success that the turpentine be of full strength. There is no occasion to dig the nests out.

CHINESE PRIMULA.—F. C. C., Hants: We are sorry we are not able to assist you to the extent you wish, for the materials available for a comprehensive history of the Chinese primula are so widely scattered over the gardening journals published during the past fifty years that the work of obtaining the necessary data, and arranging and summarising them would involve the expenditure of much time. We can, however, assist you by stating that the primula was introduced from China in the year 1820, and is a native of mountainous regions. The plant that first flowered in this country had comparatively small flowers, and a corolla so variously jagged as to lead to a doubt in the mind of Dr. Sims, who edited the "Botanical Magazine" in 1825, when the primula was figured in that publication, whether it really belonged to the genus primula. Judging from the illustration in the "Botanical Magazine," the primula during the earlier years of its cultivation in this country had a strong resemblance to a good type of the star primulas of the present day. There was then some diversity in the height of the plants, and Dr. Sims states that scapes once or twice proliferous, making the flowers verticillate, were not natural, but the result of luxuriance. Thus from plants bearing flowers of much the same size and form as those of an ordinary star type of the present day have been evolved the magnificent strains that cultivators now have at their command. These results have been obtained by intercrossing and selective culture, for as yet it has not been found possible to obtain hybrids between the Chinese primula and other primula species. Primula sinensis was first cultivated with success in this country by Mr. Thomas C. Palmer, of Bromley, Kent.

STRAWBERRY-LEAF BUTTON MOTH. —S. B. E., Bargoed: The trouble is due to the Strawberry-leaf Button Moth (Peronea comariana), which, in the larval stage feeds upon leaves and flowers alike, and draws the leaves together with a silky web. The earliest larvæ appear during May, and when once there has been an attack, the beds should be carefully inspected at that time, as hand-picking is the best remedy, though dusting with soot before the flowers open is useful, inasmuch as it renders the strawberry foliage distasteful to the larvæ. As soon as possible after the runners have been secured, clear away all top-dressings, rough leaves, and useless runners, and burn all promptly; then skim off the surface soil and burn or deeply bury it, returning, in its place, sufficient rich substantial soil made firm.



STRAWBERRY-LEAF BUTTON MOTH AND CATERPILLAR.

SEAKALE FOR FORCING. — M. S. B., Rutland: The want of vigour in the seakale plants is, so far as we can determine from the information contained in your letter, due to your having been too sparing in the use of manure in the preparation of the quarter last winter. Very little can be done now to assist the plants. A liberal watering with liquid manure would be beneficial, and a top-dressing of sulphate of ammonia at the rate of two ounces to the square yard would stimulate. The fertiliser must be carefully distributed between the rows without touching the foliage and be lightly hoed in.

ROMAN HYACINTHS.—W. H. B., Leicester: Roman hyacinths required for indoor decoration may be grown without drainage in a mixture of fibre and shell, in much the same manner as advised by our contributor in describing the culture of daffodils in fibre in our last issue. In our issue for September 12, the writer of the article will deal with other of the bulbs that thrive without drainage, and will, of course, include Roman hyacinths. We need not, therefore, do more in replying to your question than state that these bulbs are amenable to this course of culture, and suggest that you purchase first size bulbs.

SHADY GARDEN. — B. S., Sussex: As your small garden is over-shadowed on all sides by trees in the gardens of your neighbours, it will be extremely difficult for you to grow hardy perennials with any degree of success. Michaelmas daisies, and the helianthuses of moderate stature will grow moderately well under such conditions, and be useful for their greenery in summer. They will bloom fairly well towards the close of the season. If you are unable to have many flowers during the summer and autumn you may have an extremely beautiful display in the spring months by utilising some of the less expensive bulbs. By the judicious use of crocuses, daffodils, and early and May-flowering tulips you can have an attractive display of flowers during March and the two following months. It now being possible to obtain many beautiful daffodils and tulips at a low price, the cost will not be heavy, as both daffodils and tulips will bloom satisfactorily two seasons. We advise you to refer to a bulb list, and select such daffodils as Barri conspicuus, Emperor, Empress, Golden Spur, Grandee, Sir Watkin, Stella, and Poeticus ornatus. From the early-flowering tulips you might select Artus, Chrysolora, Cottage Maid, Duchesse de Parma, Keizerskroon, and Rose Gris de Lin. The May-flowering tulips specially adapted to your requirements comprise Bouton d'Or, Gesneriana major, Isabella, Picotee, Parisian White, Parisian Yellow, and Rosalind.

NAMES OF PLANTS.

G. H., Herts.—1. Polygonum baldschuanicum; 2, Solanum jasminoides.

H. H., Godstone.—We hope to be able to give you the names in our next issue.

R. H., Yorkshire.—1, Buddleia globosa; 2, B. Lindleyana; 3, Spanish Broom.

B., Kent.—We cannot undertake to name florist's flowers. Your begonias are probably unnamed seedlings.

W. F.—We do not recognise either of the Michaelmas daisies you have sent us. They are both inferior to many other varieties in cultivation, and we suggest you weed them out and replant with finer varieties.

In 1906 America bought in other countries, Nursery Stock to the value of $1,542,011; Seeds to the value of $5,411,815.

TRADE NOTE.

Quite Content pea, as sent out by Messrs. James Carter and Co., is a maincrop variety; height, 6ft.; foliage and pod, deep green; pod, 7 to 7½in. long, hanging mostly in pairs, and is quite distinct from all other peas. We are requested to make this statement, as we are given to understand that a pea which has not all the claims of Carters' Quite Content, has been distributed this season by others, either by accident or design.

FORTHCOMING ENGAGEMENTS.

TUESDAY, September 1.—Royal Horticultural Society: Committees meet at 12 o'clock; Lecture at 3 p.m.; Scientific Committee at 4 o'clock.

Bicester Horticultural Society.

BENGER'S Food assists nature.

It is used mixed with fresh new milk and forms a delicate and nutritive cream which can be enjoyed and assimilated when other foods disagree. It is entirely free from the rough and indigestible particles which produce irritation in delicate stomachs.

Mothers and interested persons are requested to write for Booklet, "Benger's Food and How to Use it." This contains a "Concise Guide to the Rearing of Infants," and practical information on the care of Invalids, Convalescents, and the Aged. Post free on application to Benger's Food Ltd., Otter Works, Manchester.

WEST'S PATENT GARDEN SUNDRIES have been invented during 25 years of practical experience. By improved cultivation and pleasure by which gardens are kept in order their expense is doubly repaid. Samples and Illustrated Catalogue free. C. E. WEST, Higham Hill, London, N.E.

KELWAY GARDENS.

Greenock.
26th August, 1908.

Messrs. Kelway and Son,
Langport, Somerset.

Dear Sirs,—You will be pleased to hear that the £10 or so which I have sent you in the last few years have made my garden (½ acre) one beautiful mass of colour all the year round.

This year especially the place has been a perfect picture—quite as fine as any of the pictures in Walter Wright's "Perfect Garden."

I am.
Yours faithfully,

FOR AUTUMN PLANTING.

PLANTERS of FRUIT TREES should write for our fully descriptive catalogue and supplement, 6d., post free; and gratis to customers.

Well-ripened trees of all kinds, and our large, developed specimens of Vines, Figs, Peaches, and Nectarines, are especially good.

An inspection solicited.

THOMSON'S CELEBRATED MANURES.
For full advertisement see page iii.

TO-DAY: AND FOR YEARS AND YEARS PAST the XL ALL Specialities are and have been the best on the market. Where is the Gardener who does not pin his faith to one or the other of these celebrated Insecticides or Fertilisers? XL ALL FERTILISER has pleased all who have used it this season. The Sales of XL ALL FUMIGATOR prove that it is more popular than ever. XL ALL LIQUID NICOTINE INSECTICIDE is always spoken of by gardeners and growers as the most deadly to Mealy Bug, Thrip, etc. XL ALL WINTER WASH for dormant Trees acts like magic, clearing the Trees and Bushes of all Insects' Eggs, Moss, and Fungoid Growths. XL ALL LAWN SAND, a weed eradicator and fertiliser for weedy and poor lawns. XL ALL WEED KILLER used once a year "No weeds can live." Please ask your Nurseryman, Seedsman, or Florist for a copy of my small pink list, giving particulars of these and many other XL ALL Preparations, which can be obtained from the Horticultural Trade throughout the World. G. H. RICHARDS, Manufacturer and Patentee, [illegible] Borough High Street, London, S.E.

Holland in IRELAND.

Custom and tradition alike suggest your buying Bulbs in Holland. Why continue to do so? "Holland in Ireland" has amply proved the superiority of Irish grown Bulbs.

Tulips, Narcissi, Iris, Anemones, etc., from the Bulb Farms of Messrs. HOGG and ROBERTSON, equal and even surpass, the Dutch Bulbs in their exquisite form and beauty of colouring.

The Booklet "Holland in Ireland" fully illustrates and describes them; it is free on request.

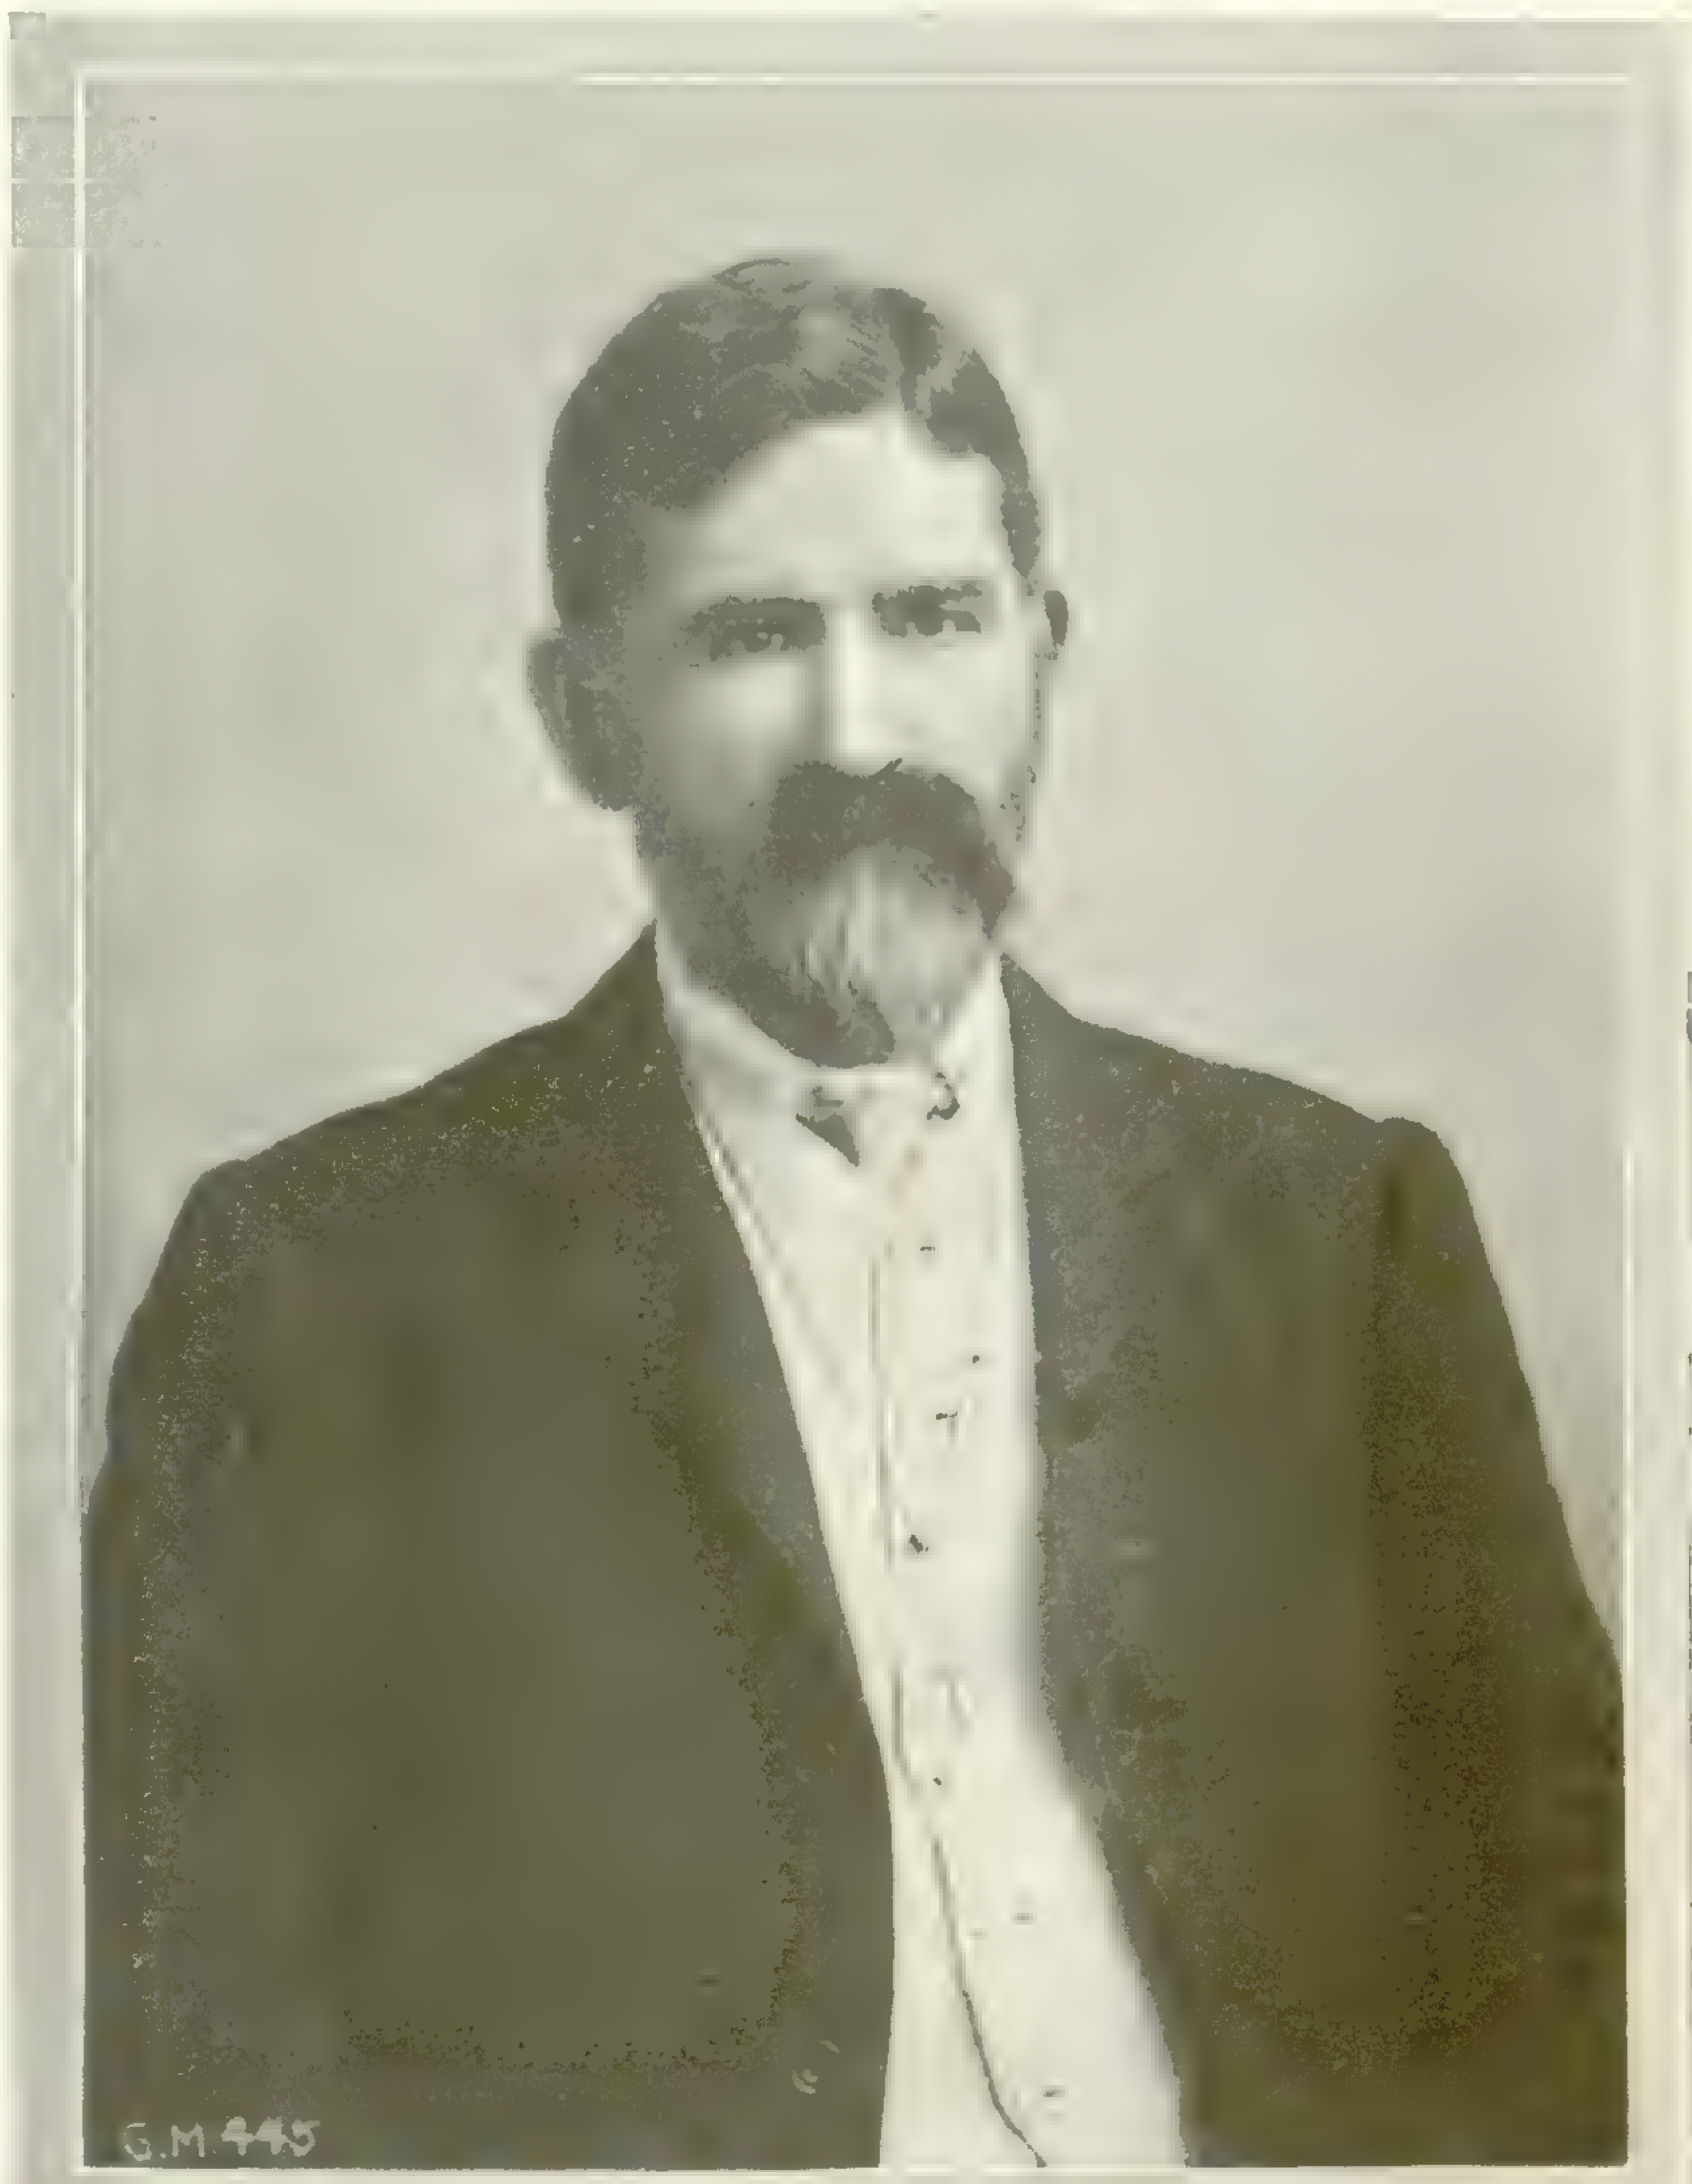
THE GARDENERS' MAGAZINE.

NOTES OF THE WEEK.

Water Circulation.

It is a very curious thing to consider that in our ordinary water heating apparatus for hothouses and conservatories, we have really a working model of the water circulation of the great world itself, the sunheat at the tropics raising the water and sending it north and south to cooler regions, whence it returns as ice-cold water creeping along the ocean bottom to be warmed and returned again and again. The surface current of the Gulf Stream represents a portion of this circulation, but it is only the deep sea explorer who can tell us that the water at the bottom of the profound tropical oceans is always, despite the great heat at the surface, at or near the freezing point. This circulation of water as a liquid is, however, only a part of the great system of to and fro distribution which is always going on. In addition to this there is the great aerial transference, to which we owe our rain, hail, and snowfalls. Here again, of course, the sun is the great motive power, constantly lifting millions of tons of water from the surface of the ocean by evaporation into invisibility, conveying it thousands of miles by gentle zephyr, breeze, gale, or hurricane, to far-distant and cooler areas, where, by virtue of the lower temperature, it assumes the visible form of cloud and the tangible form of rain, hail, or snow, as the locality or electrical conditions may determine. In the form of rain it sooner or later finds its way back to mother ocean by way of spring, brook, rivulet, or river, shaping the land as it flows along from one to another; and in the form of snow it does the same, though consuming generally far longer periods of transit. The snow that falls on a heaven-soaring mountain peak, or is perhaps deposited on the great ice cap of the Poles, is probably long ages on its way to the sea after being incorporated as solid ice with that on which it falls as cap or glacier. At the Pole especially, centuries must elapse before the slowly creeping central ice mass gives birth to the mighty bergs, huge fragments of coastal ice cliffs, which, as they float away and slowly melt, contribute their quota to the creeping cold current beneath which will carry the materials of the original snowflake back to the tropic seas in preparation for a new journey. Nature's operations are slow, but sure, and in this particular connection they must be slow indeed. It does not, however, by any means follow that there are no short cuts for the water; even at the Pole evaporation goes on, and the snowflake may escape imprisonment thereby, and sail away as vapour on the wings of the arctic breeze to find its way direct to the ocean as rain or snow again. Great lakes and inland seas must also involve a circulation of their own, contributing to the local rainfall by their own evaporation; but even here the great oceans must be large contributors, and the mighty falls of the Zambesi or Niagara must, for the major part, consist of water thence derived and carried in the upper air to the sources of the great rivers concerned, and their innumerable tributaries. In this connection we usually regard the visible clouds as representing the aerial water supply in transit, but in point of fact they only do so in comparatively small measure, since a perfectly clear sky may be really as richly laden with water as a densely clouded one. It is purely a matter of temperature which determines visibility and deposition, or invisibility and evaporation. The breeze which sweeps across the Atlantic towards our shores, for instance, may do so in unclouded sunshine, but let it strike the cool summits of our western hills, or meet a check by a chilly blast from the north, and at once its watery nature is demonstrated by the formation of dense cloud, and possibly the descent of a deluge. It is, indeed, often interesting to watch the clouds in changeable weather, and note how they appear and disappear. A tiny wisp, like an ethereal feather, appears in a spotless sky, and as we watch it it may spread and become denser, and in a very short time a very appreciable cloud is sailing along on the wings of the breeze, and possibly with many companions, born in a like mysterious fashion from apparently nothing. Or, on the other hand, we may see the fringe of clouds become thin and vanish, and clear sky assume their place in the converse case of warmer conditions prevailing. Dull or clear, the water is always there, making its way from one part of the globe to another, and fulfilling its part in the great circulating system we have described.



MR. DAVID HOUSTON.

Mr. David Houston, whose portrait we have the pleasure of giving in this issue, may not be so well known to the general body of horticulturists as are some of the botanists and horticulturists whose portraits we have presented to our readers, but his name and work are familiar to those who take an active interest in the scientific aspects of horticulture. For a considerable period Mr. Houston occupied a prominent position on the teaching staff of the Birkbeck Institution, and the splendid success he achieved in connection with his classes for agriculture, biology, and botany, contributed in no small degree to bringing the fame which the institution so well deserves. On the establishing of the laboratories and school of gardening and agriculture at Chelmsford, by the Essex County Council, Mr. Houston was appointed to a leading position on the staff, and here he did such excellent work as to greatly enhance his already high reputation, and after a stay of a few years he was appointed to an important position in the Royal College of Science at Dublin. The work achieved by Mr. Houston has undoubtedly been largely due to his having a thorough acquaintance with the practical details as well as of the scientific side of horticulture and agriculture, which has enabled him to take a greater breadth of view in his teaching, and the faculty he has of imparting to his pupils the enthusiasm he takes in whatever matter he may have in hand.

"Gardeners' Magazine" Bulb Number.—As briefly intimated last week, our issue for the 12th inst. will be chiefly devoted to bulbous plants, and the several articles and the numerous illustrations have been arranged with special reference to the requirements of the general body of cultivators during the season of planting. The subjects that will be dealt with include, "Daffodils in the Grass," "Some Newer Daffodils," "May-flowering Tulips," "Dog's Tooth Violets," "Good Bedding Hyacinths," "Spring-flowering Crocuses," "Naturalising Bulbs among Shrubs," and "Bulbs Suitable for Fibre Culture." The number will be freely illustrated, and it will be of special interest, and the large amount of information contained in it will be found of much value to amateurs, and, indeed, to all who are concerned with bulbs and bulb culture.

R.H.S. Journal.—The first part of the thirty-fourth volume of the Royal Horticultural Society's "Journal" has been issued, and although less bulky than some of the parts issued of late years, contains much that is of interest to horticulturists. The principal contents include the lectures on "Brassica Crosses," by Mr. A. W. Sutton, V.M.H. "History of the Cabbage Tribe," by Rev. George Henslow, V.M.H. "Beautiful Flowering Trees and Shrubs," by George Gordon, V.M.H. "The Profession of Landscape Gardening," by Mr. Edward White. "Hardy Cacti and other Succulents," by Mr. E. A. Bowles, F.L.S. "Gardening in the Western Highlands," by Mr. Osgood Mackenzie, and "Photography in Natural Colours," by Mr. T. E. Waltham.

Nature Study.—The Caxton Publishing Company announce a work of considerable importance, to be entitled "The Book of Nature Study," of which Professor J. B. Farmer, F.R.S., is the editor. Nature study is now recognised as possessing great value from an educational point of view, and within recent years it has made good progress in elementary, secondary, and other schools. The chief difficulty connected with conducting classes in nature study lies not so much with the pupils on the subject matter, as with the teachers. While there are many capable and enthusiastic teachers who make the work a real thing to the children, many feel at a loss as to how to set about the work properly, and also as to the objects to be aimed at in the course itself. The aim of the work is to give detailed and systematic guidance to teachers and parents in introducing children to the study and love of nature. The common plants and animals are dealt with by acknowledged experts, who also are experienced in teaching.

Conference on the Spraying of Fruit Trees.—With the hearty concurrence of the National Fruit Growers' Federation, the Royal Horticultural Society is organising a conference on spraying on the second day of their annual exhibition of British-grown fruit, October 13, at their Hall in Vincent Square, Westminster. The following is the programme proposed:—Morning meeting, 11 a.m. to 1 p.m., Colonel Ward, M.P., in the chair, papers by Mr. Geo. Massee, V.M.H., and Mr. H. F. Getting, F.R.H.S. Afternoon meeting, 2.30 p.m. to 4.30 p.m., Colonel Long, M.P., in the chair, papers by Prof. F. V. Theobald, M.A., and Mr. G. Hammond, F.R.H.S. Discussion invited at each meeting, and seats will be reserved for any making application before October 9.

The Hampton Court Vine, which is equally remarkable for its great age and dimensions, is this year bearing an excellent crop of grapes. There are upwards of 250 bunches, ranging from 1lb. to 2½lb. in weight, and they will soon be cut and disposed of in accordance with the King's commands. We have seen heavier crops on this ancient vine, but we cannot call to mind any year in which the fruit has been of higher quality, the bright warm weather having been favourable to the perfect development of the fruit. The vine is said to be between 130 and 140 years old, and in some years it has borne as many as 1,700 bunches, but they were small and not well finished.

Gardeners' Royal Benevolent Institution.—A few days since Messrs. Fisher, Son, and Sibray, with a view to assisting this valuable charity, threw open their nurseries at Handsworth to the public, and made a small charge for admission. Favoured by fine weather there was a gratifying attendance, and Mr. G. J. Ingram, who was present, did not fail to take advantage of the opportunity he had for explaining the objects of the institution to the visitors, and urging the strong claims it has upon all who are interested in gardening.

North Middlesex Dahlia Society will hold its annual exhibition at the Alexandra Palace on the 10th and 11th inst. We mention the dates of the society's show thus prominently for the purpose of expressing our regret that sufficient care should not have been taken to avoid the clashing of the dates of the exhibitions of the North Middlesex Dahlia Society and the Dahlia Union. Dahlia growers for exhibition are not so numerous as to be able to provide two really first-class exhibitions within a comparatively short distance of each other on the same dates. Shows, unless they approach a comparatively high standard, do but little for the advancement of dahlias or other flowers in public favour.

Bulb Culture in Moss Fibre.—As so well-known to our readers Mr. Robert Sydenham has for some years made strenuous efforts to popularise the cultivation of various spring-flowering bulbs in moss fibre, without drainage, and by his advocacy of the method, and the examples he has presented at the public exhibitions he has achieved much success. To still further increase this method of culture which has so much to recommend it, and especially to those who grow their bulbs indoors, Mr. Sydenham generously offers for competition at the R.H.S. meeting, March 9, 1909, prizes for six vases of hyacinths, six vases of tulips, and six vases of narcissi grown in moss fibre, or similar material (not soil), and without drainage. The hyacinths are to be grown in separate vases, not exceeding six inches in diameter, and to be selected from the following varieties: Balfour, General Vetter, Grand Lilas, Grand Maitre, Innocence, Isabella, Jaques, Johan, Koh-i-noor, King of the Blues, La Grandesse, and Roi des Belges. The vases of tulips are not to exceed seven inches in diameter, but there is no restriction as to the number of bulbs in a vase. The varieties must be selected from Duchesse de Parma, Dusart, Fabiola, Joost van Vondel, Keizers Kroon, Mon Tresor, Prince of Austria, Rose Gris de Lin, Thomas Moore, Van der Neer, Vermilion Brilliant, and White Pottebakker. The vases for narcissi are not to exceed seven inches in diameter, but there is no restriction as to the number of bulbs in a vase. The varieties must be selected from Barri Conspicuus, Campernelle, Rugulosus, C. J. Backhouse, Emperor, Frank Miles, Lulworth, Leonie, Mad. de Graaff, Phyllis, Sir Watkin, Victoria, and Waterwitch. The prizes are liberal, and there are five for each set of vases. The varieties named are considered the best for this method of culture.

Japanese Postcards.—We acknowledge with much pleasure a budget of postcards that Messrs. John Stevens and Son, of Coventry, have kindly sent us, as evidence of the circulation of the Gardeners' Magazine in Japan. Messrs. Stevens are large growers of primulas for distribution to cultivators in a small state, and regularly advertise their plants in our pages, and the cards have been received by them in response to their advertisements. It is of much interest to have this further evidence of the large, rapidly increasing circulation of the Gardeners' Magazine in distant lands, and it is not less interesting to know that flower lovers in Japan fully recognise the beauty of the various primulas grown under glass in this country, and appreciate the facilities that Messrs. Stevens afford them in obtaining stocks of high quality.

Flora of the Southport Sand Dunes.—The recent excursion of the Southport Field Club, to the sand dunes around Seaside, for the purpose of studying their flora proved of much interest. The most characteristic and most useful of the plants that have found a home on these dunes is the marram grass, which is planted artificially in many places. Its value consists in its creeping underground stem and long, fine root fibres, which tend to bind the loose sand together. Its manner of growth was well seen in places where a bank had slipped away, or perhaps the sand had been removed by some violent gale and left the underground portion uncovered, showing thread-like roots of great length. On the dunes also occur a few plants of the yellow ragwort, spurges, and hound's-tongue. On the moister flats among the sandhills, and sheltered by them, occur a more varied and attractive flora. Some of these are marshy, and afford characteristic plants, such as the marsh helleborine, a handsome wild orchid now in the fruiting stage; gipsy wort, bog pimpernel, water-mint, marsh pennywort, etc. On these flats also were found the lesser bugloss, sea-rocket, yellow-wort, red centaury, eyebright, stork's bill, prickly saltwort, and Monotropa hypopitys, whose parasitic character is proclaimed by the absence of leaves. The Grass of Parnassus was in great abundance and perfection, its white cup-shaped flowers producing a charming effect.

Checkmating the Turnip Fly.—The Irish Department of Agriculture has recently issued a leaflet on the turnip fly, and in perusing it we cannot repress a feeling of regret that it was not issued at a time when the useful advice it contains would have received more attention than is likely to be now the case. Thorough tillage, liberal manuring, rolling the immediately after the sowing has made, and the selection of seeds of good germinating power are recommended as aids in combating the pest. Dusting the young plants with soot and lime is also advised. There is nothing new in this advice, but it is so good as to well deserve repeating in the interest of cultivators.

GROUPING AUTUMN-FLOWERING SHRUBS.

For beauty and variety spring unquestionably yields the richest array of flowering shrubs. Nevertheless those which adorn the garden in autumn with their flowers form collectively a group which well sustains the interest to those who study and appreciate arborescent vegetation. Whether as isolated specimens, or massed in quantity, they are very beautiful, and there is every reason to suppose that greater appreciation will be extended to flowering shrubs in future than in the past, for the storehouse upon which we draw is exhaustless; form and variety are all that one could well desire, and the selection is so comprehensive as to embrace subjects for every possible style or size of garden.

A singularly pleasing study consists in grouping the various flowering shrubs useful for garden decoration that flower at the same season, by this means the individuality is brought out to the fullest; at other times a carefully planted mass of a single species or variety contains within itself every element of strength and beauty.

One of the finest shrubs which flower during August is Buddleia variabilis Veitchii, a group of dwarf plants, through which some low standards of Colutea arborescens are planted, allowing these to overtop the buddleias, and the ground between the shrubs carpeted with Erica vagans alba, results in a combination of striking beauty, effective for the best part of the month. Another effective grouping consists of tall plants of Colutea Pococki intermixed with Ceanothus Indigo as the intermediate level, and the foreground massed with the bright lemon-flowered Potentilla Friedrichseni, the latter a shrub of great beauty for many months. Ceanothus Indigo and Olearia Haasti group well together, resulting in a half-misty effect which is very pleasing. One seldom finds Indigofera Gerardiana grown in standard form, but if a strong shoot is allowed to run up five or six feet, and topped, and then pruned to form a mop head, cutting the shoots back to a couple of buds in late spring, they form by this system perfectly balanced heads of light shoots, and display the elegant foliage and bright purple flowers to the best advantage. Hypericum Kalmiana forms a good setting for indigofera, and, being slow in growth, requires no pruning. Hypericum patulum and uralum are equally serviceable, but require hard pruning in spring to secure the necessary dwarf habit.

Hydrangea paniculata grandiflora is a well-known autumn-flowering shrub, which succeeds best upon rich soils, and produces the heaviest panicles of flowers when rigidly pruned to a couple of buds in spring. It makes a fine group alone, but is also a charming feature when planted in company with the pale lavender blue Hibiscus Celeste.

Few gardens can dispense with the sweet-scented Spartium junceum, for in those gardens where its value has been practically tested we are sure to meet it in quantity, and whether regarded as a permanent occupant of the ordinary shrubbery, or planted on dry, hungry banks under unkindly conditions, it yearly rewards us with enormous quantities of its glowing yellow flowers, and one of the most enduring charms that memory retains of this fine shrub is to inhale the soft fragrance of the blossoms, as it is borne upon the air in the summer twilight. In the same family as the foregoing is Cytisus nigricans, with soft yellow flowers upon loose-built, erect spikes; it makes a charming group about three feet high, and forms an effective feature when planted with Fuchsia Riccartoni; the latter must be cut hard back each spring.

Some of the privets are excellent for autumn flowering, producing branching spikes of showy white flowers. Ligustrum japonicum has stout, glossy leaves, borne upon slender pendulous branches, and when in flower it forms a conspicuous object in the shrubbery. Ligustrum sinense grandiflora has small foliage, but is exceedingly free in producing flowers. Caryopteris mastacanthus, when grown into a large bush, produces a peculiar misty effect in autumn, with its pale blue flowers; it succeeds best on deep, rich soil, proving almost a failure on light stony ground. It frequently appears under the fanciful name of blue spiræa.

Of the true spiræas which flower in early autumn the varieties of Callosa rubra and Anthony Waterer regale us with crimson flowers; like most members of this family they prefer a cool and moist root run, and their floral display is prolonged when planted in half shade.

Tamarix gallica planted in a good dry mass, and pollarded to the ground each spring, results in a thicket of soft amber-coloured stems clothed with grey-green leafage; the terminal points of the canes produce the soft rose flowers, which are later followed by a white, woolly substance in the seed cases. Tamarixes are splendid seaside shrubs, which grow freely in any well-drained sandy soil.

An aged specimen of Clerodendron trichotomum rarely fails to evoke admiration and praise; the curious flowers, with their rich chocolate bracts, proclaim it a shrub of great decorative value, and a distinct gain to the garden in autumn.

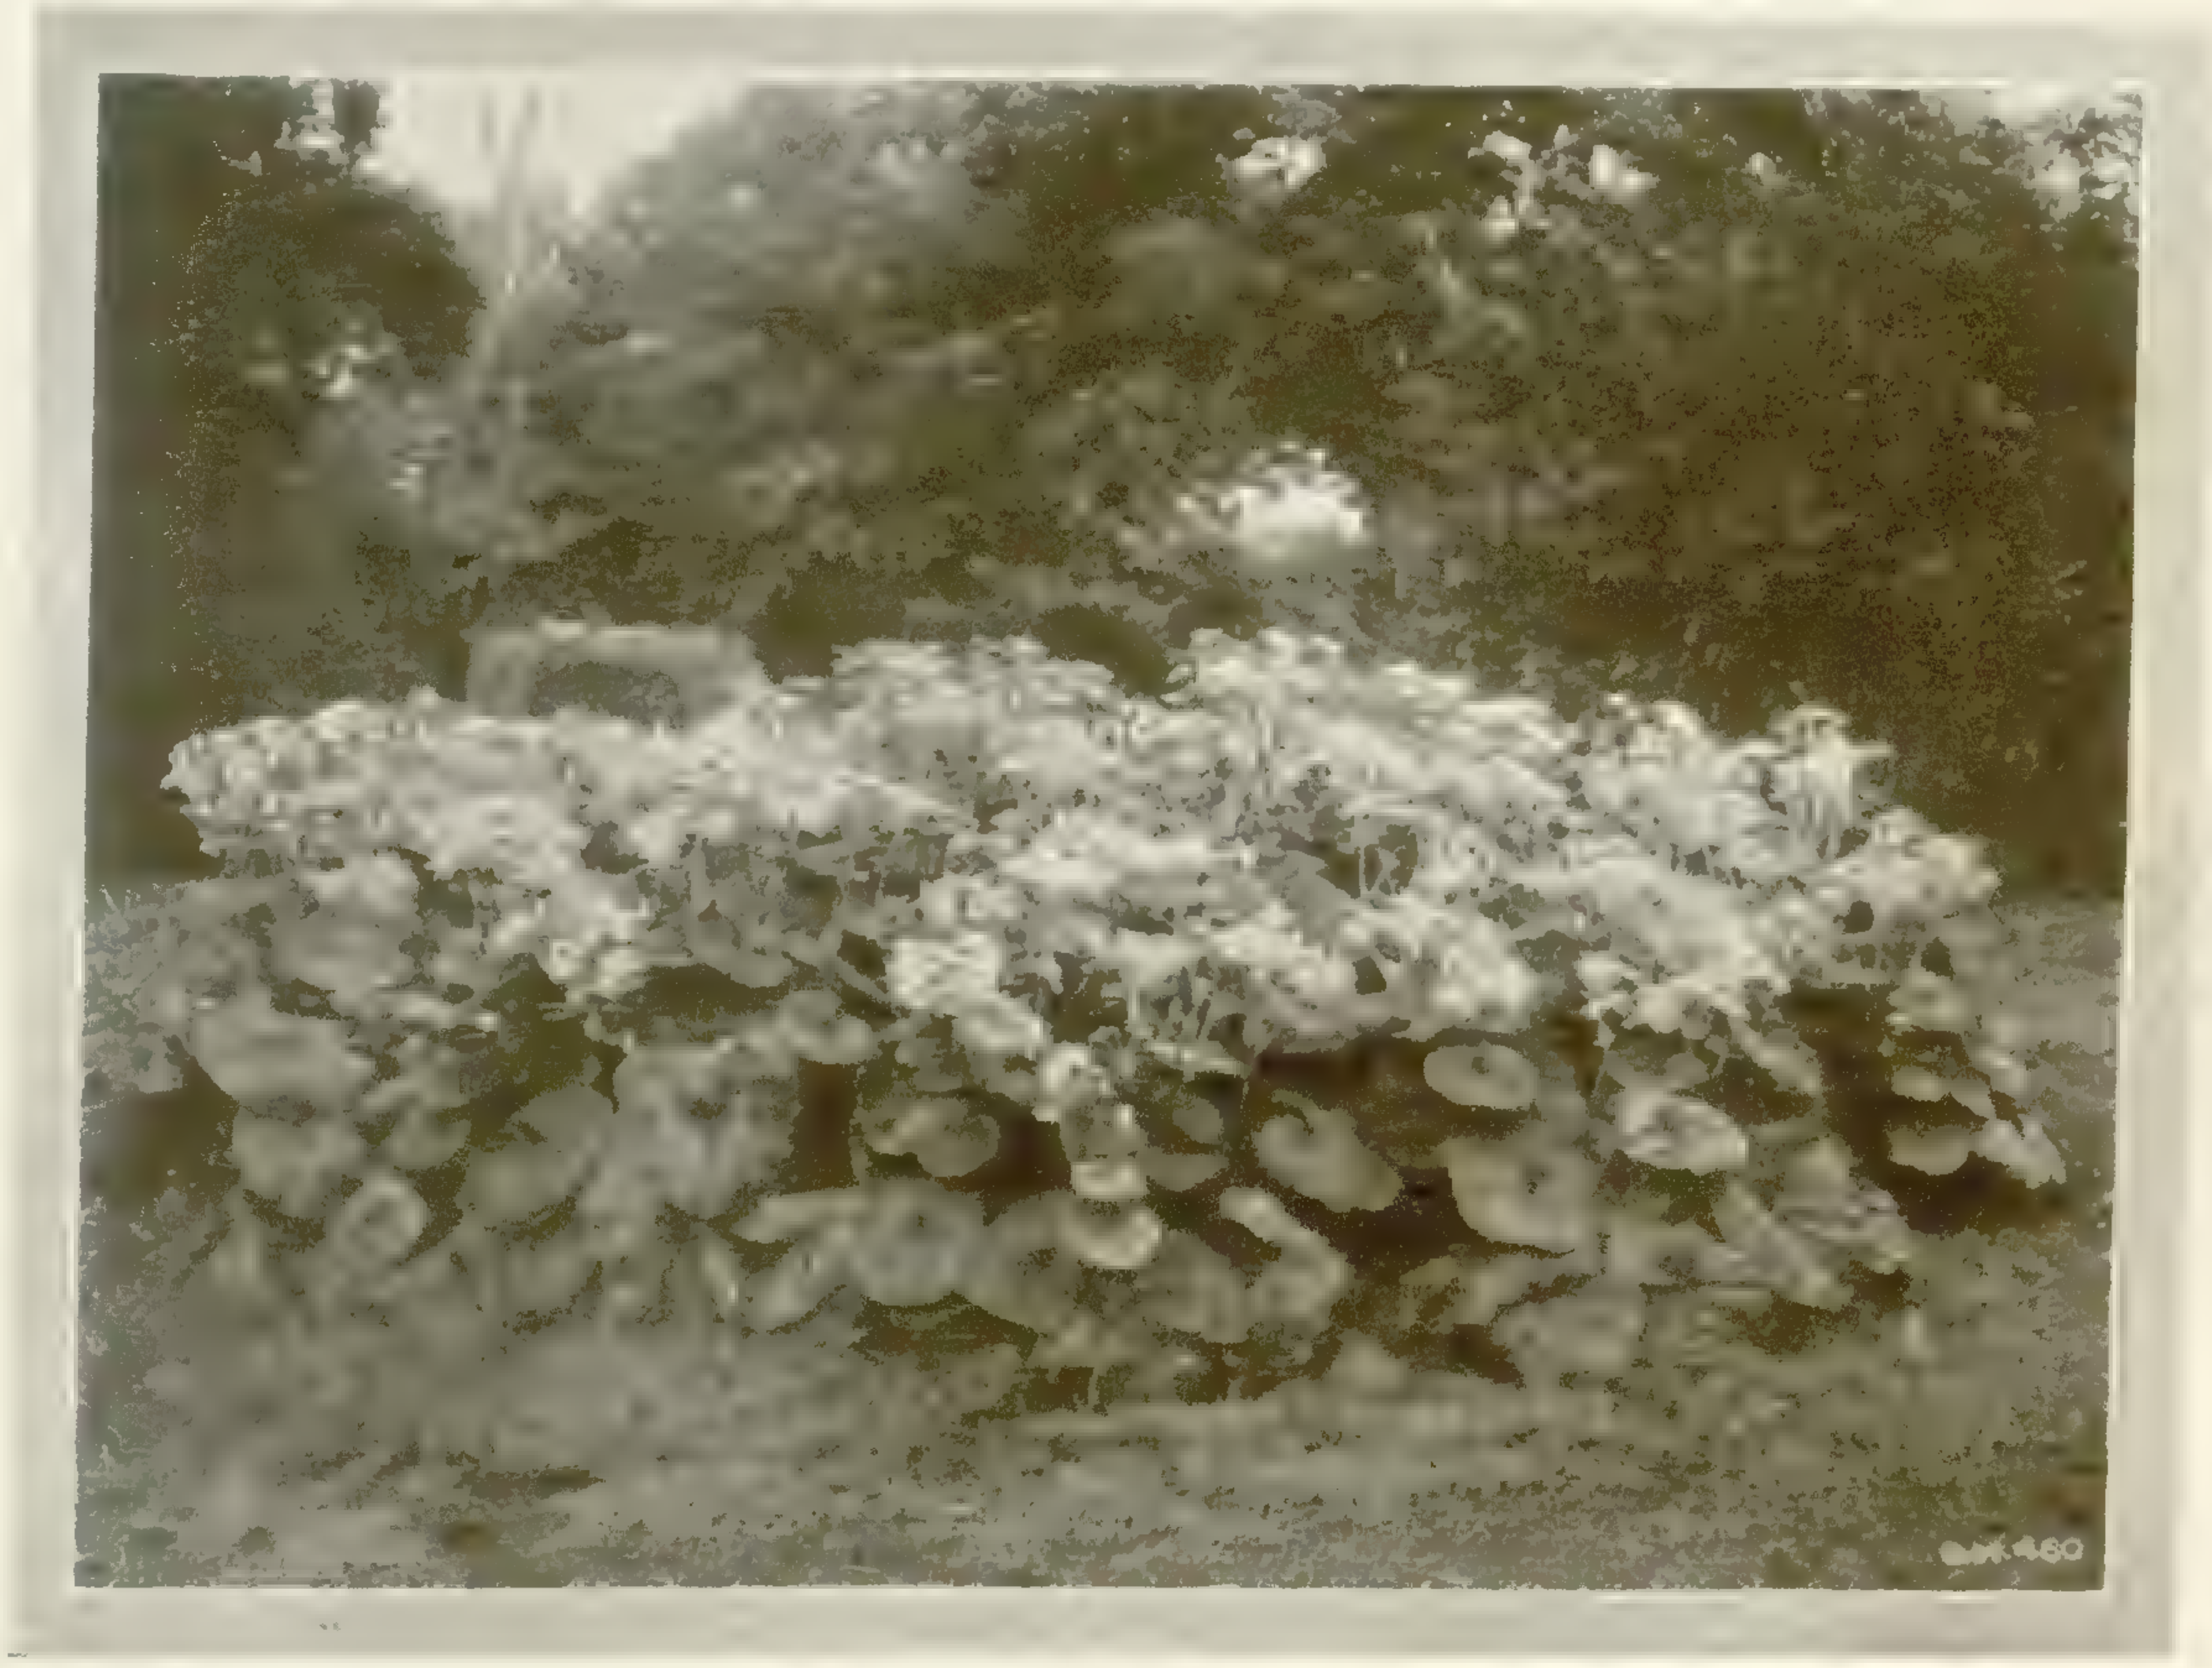
THOMAS SMITH.

Walmsgate Gardens, Louth.

There is no better guide to the kitchen garden than VEGETABLES AND THEIR CULTIVATION, by T. W. Sanders. It is a complete treatise on the general management of the garden, and the successful culture of vegetables, saladings, and herbs for home use. Price 5s. net, by post, in box, 5s. 6d., from W. H. and L. Collingridge, 148 and 149, Aldersgate Street, London.

SENECIO CLIVORUM.

The Giant Groundsel, of which an illustration is given herewith, may well be described as one of the finest of the many good hardy plants that have been introduced from Western China within recent years. There are, perhaps, some other Chinese plants of recent introduction that possess certain attributes of beauty in a higher degree, but none perhaps that are more effective when grown under suitable conditions than is Senecio clivorum. There is, however, no necessity for instituting comparisons between the various plants that we have of late received from China, with a view to determine their relative merits. For our present purpose it is sufficient to know that this robust groundsel is quite distinct from other hardy plants in cultivation, and that it is of immense value for planting in positions where bold vegetation is appropriate. We have only to glance at the accompanying illustration to see that the plant has large and handsome foliage, that the flowers are freely produced on stout stems and in much branched heads, and that it is specially suitable for the formation of lawn groups of a striking character. The reader will be in a better position to appreciate the effectiveness of this senecio when it is stated that the flowers are rich orange-yellow with dark centre, or to state the colouring more scientifically, the ray florets are rich orange-yellow and the disk florets very dark brown. While highly effective when grown in bold groups, such as the one illustrated, this groundsel is not less attractive when grown singly or in small groups in the wild garden, and on the margin of streams, ponds, or lakes. The growth is most luxuriant when the roots have access to liberal supplies of plant food and an abundance of moisture, and the bold masses of leafage, and large, brightly-coloured flowers are especially attractive when reflected in the water of pool or stream. The plant is not wanting in attractiveness when grown in borders devoted to hardy perennials, but it does not



SENECIO CLIVORUM GROWN AS A LAWN GROUP AT KEW.

A giant groundsel from Western China, quite hardy in this country, and bearing large orange-yellow flowers.

appear to so great an advantage as when grown in the positions suggested. In all cases the stations when being prepared for Senecio clivorum should have a liberal application of partly-rotted manure from the stable or farmyard, and the soil be broken up to a depth of two feet or so, and the manure and soil be well mixed. It should be remembered in planting that when the growth is made under favourable conditions strong plants will soon form specimens three or four feet in diameter, and attain to a height of four or five feet. The season of flowering extends from the end of July to the beginning of September, and the group illustrated occupies a position near the Pagoda in the Arboretum at Kew, where, it may be added, the soil is thin and naturally poor. G. G.

THE ABELIAS.

The abelias form a very pretty class of flowering shrubs, but some of them unless in particularly favoured parts of the country, cannot be regarded as perfectly hardy.

By far the showiest and, at the same time, the most tender, is Abelia floribunda, a native of Mexico, whereas all the others in general cultivation are natives of the eastern portion of the Old World. As widely removed from the others in general appearance as it is in geographical distribution, Abelia floribunda forms a freely-branched, loose-growing shrub, clothed with small neat leaves, while the flowers are tubular, about three inches long, and borne in clusters at the points of the shoots. Their colour is a kind of bright magenta-red, and they are at their best in early summer. When in full bloom this abelia is really delightful, but even in the London district it will not thrive unless given the protection of a warm wall, such as that of a hothouse facing south. Throughout the greater part of the country it must be regarded as a greenhouse rather than an outdoor shrub.

Another tender species is Abelia triflora from the Himalayas, where it sometimes attains the dimensions of a small tree. In this country it forms a freely-branched bush, whose flowers are borne during the summer months. They are small, pink, and borne in compact clusters at the points of the shoots. A casual glance suggests that the specific name of triflora is a decided misnomer, but close inspection of a flower cluster reveals the fact that the flowers are in threes. This abelia needs the protection of a wall in most districts, but I have met with it as an open bush in the South-west of England.

Abelia chinensis is more generally met with as A. rupestris, while it is also known as A. uniflora. In passing, it may be noted that the nomenclature of the abelias is in a very confused state, and authorities are by no means of one accord in the matter. With regard to A. chinensis, it forms a neat-growing, freely-branched bush, flowering profusely when from two to five feet in height. The leaves are small, ovate, and of a bright shining green, while the flowers, borne in loose clusters, are pale pink. Each flower has a large calyx, which becomes red after expansion, and is then very attractive. It is at its best during the latter half of the summer and in early autumn. This is one of the hardiest, as it will flourish as an open bush in the London district. So situated, the slender branches dispose themselves in a partially drooping and exceedingly graceful manner. This species is a native of Japan, and for its introduction we are, I believe, indebted to the late Robert Fortune. W. T.

MATURITY OF VEGETABLE CROPS.

Speaking generally, 1908 will without doubt be remembered as far above the average season from a horticultural standpoint, and in most cases a corresponding amount of satisfaction will be enjoyed by having bountiful crops. The excellent and beautifully matured specimens seen from the large and pretentious exhibition down to the small village show, point to this. On every hand one finds exceptional maturity and good quality, especially amongst the different vegetables, such as potatoes, onions, carrots, etc., which can only be brought about by a bright and sunny season. In some parts of the country the rainfall has been too light, which has necessitated assistance to be given with the hose or watering-pot, but this has not been serious over the greater part of the country.

All crops will now be sufficiently advanced for an opinion to be formed of the amount of success that has been achieved with each one, and a review of them may be profitable now in noting the causes that may have been instrumental in bringing this about. In this district there has been considerably more clubbing of the brassica family than usual. The early cauliflowers did very well, but mid-season plants in many cases collapsed, and a real scarcity of good heads has been the result, more especially in cottage gardens, where they have to occupy the same ground so often, has it been most noticeable.

On land that has been in a fertile state peas have given splendid returns, and where moisture to the roots has been sufficient, they have kept exceptionally free from the much-dreaded mildew. In some cases I fear the high temperature has brought mid-season crops into pod earlier than we anticipated, and thus put them out of line of succession for picking, which to the private gardener is troublesome. Onions have stood the tropical weather very well where the soil has been favourable to their roots pushing down for food and moisture, and some remarkable crops are to be found. But on light, weak soils and with late-sown crops I have seen many failures, the whole of the plants having died off. French and runner beans under good conditions have set their pods with wonderful regularity throughout the last month and this, which, by the reports from the markets in the country has caused a glut and unprofitable prices. The plants will require stimulating with liquid manure regularly to enable them to continue to bear freely where daily supplies are needed.

Potatoes have not, as far as my experience goes, ever lifted better, both in bulk and quality. The old variety, Snowdrop, which is, perhaps, not so notable for its productiveness as for its cooking qualities, is this year giving splendid returns. Equally good reports are given of other varieties. Unfortunately attacks of disease, although slight up to now, are showing themselves pretty generally throughout many parts, and will rapidly spread if the weather changes to much wet. Main crop carrots are very satisfactory, the roots very clean and of first-rate growth. Wireworm has been more prevalent among them than usual. The roots are more matured at this time than is often the case. This will render them particularly liable to crack when wet weather sets in. It may therefore be found necessary to lift them as soon as they have finished their growth to avoid loss. They are practically worthless when they are much split.

Turnips have not been so satisfactory in many gardens where the position has been high and the soil of a light character. The turnip fly has been troublesome, the bulbs became strong and stringy, and unfit for use in a week or two, consequently, frequent sowings in the lowest and coolest position were necessary to obtain usable and tender fleshed roots. The latest sowings for winter appear, so far, to be making satisfactory growth. Summer spinach, with the high temperature, has been rather difficult to obtain with really good fleshy leaves. Frequent sowings in good soil and in semi-shaded cool borders have been necessary.

Celery, in all cases where it has been attended to properly, appears to have grown vigorously during the hot summer, and is now looking robust. Some plants have successfully resisted the attacks of the celery-fly that were made when they were small, which, to some extent, shows that a vigorous plant is much more able to resist pests of this kind than those weakly in growth.

Although we can very materially assist Nature, we are absolutely dependent upon the sunshine and rain in proper proportions to enable us to produce and mature crops in their best form; this year we have little cause for complaint.

C. Flack.

Cholmondeley Castle Gardens.

FLOWER GARDENING AT THE FRANCO-BRITISH EXHIBITION.

In accordance with the opinion expressed in our first notice of the horticultural features of the Franco-British Exhibition at Shepherd's Bush, the several flower gardens in both the English and French sections have proved a decided success, and notwithstanding the heavy rains of late they present a remarkably bright and attractive appearance. They afford now, as they have done throughout the season, a remarkably good proof of the great value of the several classes of plants commonly known as summer bedders for the production of colour effects in positions where continuity of flowering and neatness are essential.

The first of the gardens through which the visitor passes on his entrance to the exhibition from Wood Lane, is that occupying a central position in the section devoted to the fine arts. This garden consists, briefly stated, of large lozenge-shaped breadths of turf, on which are numerous borders and beds of flowering plants and numerous specimen palms and other plants remarkable for elegance of habit. The illustration given herewith conveys an excellent idea of the design and the style of planting, and on close examination, it is not difficult to imagine that the effect must be bright and tasteful. This garden has been planted by Messrs. J. Carter and Co., who may be heartily congratulated on the success they have achieved. On the outside sections of turf are serpentine bands of zonal pelargoniums, mostly scarlets, and chief among them are King Edward VII. and West Brighton Gem. On either side of the pelargoniums are narrow bands of Golden Feather, one of the oldest and still one of the best of the golden-leaved plants for use in working out colour designs in the flower garden. It is certainly one of the most easily raised of all the summer bedders, and because of this it has suffered from being used too lavishly both in public and private gardens. In this case the use of the plant has been judicious, and in consequence it contributes its proper share to the general effect. In the bays outside the border are circular beds in which purple and blue violas, seedling verbenas, petunias, dwarf and herbaceous lobelias, and dwarf begonias are growing freely and blooming profusely. Each bed, it should be stated, contains one colour only, and has a neatly grown standard fuchsia in the [illegible] tre. On the middle portions of the turf are crescent-shaped beds, with circles within the crescent, and in these dwarf fuchsias, petunias, and some other plants have been used with good effect. Round the bed, enclosing the circular mound in the centre, are good blocks of tuberous begonias, and some other subjects, the kochias being especially noteworthy. Plunged in the turf between the beds are fine examples of Cordyline australis and well-developed palms.

Upon Messrs. J. Carter and Co. has devolved the task of planting and keeping the grounds of the Royal Pavilion, and admirably have they performed it. Of much interest are the two miniature trial grounds that have been formed by this firm in the Colonial Gardens, which occupy a site in the more northern parts of the grounds. These are skilfully planted, and in the spacious beds and borders are trial plots of annuals in great variety, and of the various grasses and clovers used in the making-up of preparations for laying down land for meadows and for lawns, bowling greens, and putting greens.

The spacious flower garden in front of the Palace of Fine Arts has been embellished by Messrs. Sutton and Sons, and in beautifying this extensive area they have achieved a high degree of success. The treatment is bold, the colouring, what, to use a popular term, may be described as quiet, and the general effect is in the best possible taste. Two of the more important of the big beds are filled with white marguerites, which have grown vigorously and bloomed splendidly, and these are enclosed with a band of Madame Crousse pelargoniums, one of the best of the pink ivy-leaf varieties, and the broad belt of pink blossom produces a charming contrast to the pure white flowers of the marguerites. Fibrous-rooted and tuberous-rooted begonias are splendidly represented in this garden, both as regards the quality of the varieties or strains, and the development of the plants. Especially noteworthy also are the beds of dwarf antirrhinums, which are now, as early in the season, a mass of bloom. The colours include white, yellow, and crimson. There are several other examples of Messrs. Sutton and Sons' work in this section, and these, as in the case of the flower garden, represent taste of a high order.

In the northern part of the grounds Messrs. Kelway and Son have a big bed devoted to gladioli, and as the flowers produced by the large number of plants are supplemented by some hundreds of cut spikes, visitors are afforded an excellent opportunity for becoming well acquainted with the finest types of these handsome summer flowers.

Much that is of interest may be found in the gardens devoted to the products contributed by French nurserymen and seed houses. These gardens are situate between and beyond the machinery halls, on the western side of the grounds. In these roses predominate, and they also contain a goodly number of trained fruit trees. These trees are of interest as representing the skill shown by French cultivators in the training of such trees, but, as proved by the results, the style of training favoured by growers across the Channel is much less productive of fruit than the tree style generally adopted in this country, and necessarily entails much labour. In the beds and borders devoted to roses the teas and hybrid teas are blooming rather freely, and where planted in masses of one variety they produce a pleasing effect. Especially noteworthy for freedom of flowering are Kaiserin A. Victoria, Madame A. Chatenay, Prince de Bulgarie, La France, [illegible], and several of the polyantha type represented by Maman Lavasseur. Highly effective and of considerable interest are the small stock gardens that have been decorated by Messrs. Vilmorin, Andrieux, and Co., with dwarf, fibrous-rooted begonias. The two begonias used are B. gracilis, which has deep rose-pink flowers, and B. gracilis rubra, of which the flowers are rich ruby-red. These grow to a height of about six inches, bloom with great profusion, and arranged in scrolls about two feet wide are singularly effective.

HARDY SPIDERWORTS OR TRADESCANTIAS.

Among the true "old-fashioned" flowers which have again become so popular are the spiderworts or tradescantias, first cousins of the greenhouse and stove species, but totally distinct in their characters, although the same features in general run through all the species. All have the same air of character which has given them the popular name of spiderworts, the appearance of the foliage presenting the "sprawling" appearance we associate with the spider, but, happily, without that weird look which makes that creature so obnoxious to many.

The hardy spiderworts, best represented in gardens by Tradescantia virginica and its varieties, have this characteristic in a marked degree, and no one looking at them can fail to discern some warrant for the popular name they bear. Yet they are in no sense repulsive, but, on the contrary, are decidedly beautiful, and their general form renders them all the more distinct, and thus all the more valuable for the garden. They are handsome plants, generally reaching a height of a foot and a-half, but sometimes a little more or less, according to the nature of the soil.

FLOWER GARDEN AT THE FRANCO-BRITISH EXHIBITION.
Planted and maintained by Messrs. J. Carter and Co.

Tradescantia virginica.

Of the hardy species, of which some eleven or so are found in the United States, the best for the garden is Tradescantia virginica and its varieties, some of these occupants of British gardens for many long years, and among the hardiest of all our exotic flowers, standing our most severe winters with perfect equanimity, and thriving under an amount of neglect few flowers will bear when under reasonable circumstances.

The typical plant, T. virginica, sometimes called T. virginiana, is a well-known one, with its long, pointed leaves, and its clusters of short-lived flowers, which compensate us for their fugaciousness—which has given the plant the alternative name of "Flower of a Day"—by producing them in long succession from the same cluster. The colour is purplish, but this is by no means the prettiest hue given by the quaint spiderwort.

Varieties of T. virginica.

There is a very beautiful white variety called alba, and this, again, is surpassed by a larger white one, alba grandiflora. In the variety called sometimes azurea and occasionally caerulea, we have one with rich blue flowers; while those of violacea are of a beautiful violet. Nor do these exhaust the range of colouring, as the variety rubra gives us blooms of a fine rich carmine. This, again, has another variety, one with double flowers of more lasting character than the singles, but with hardly the same features which make these spiderworts so attractive in their way. There is also a pleasing lilac variety called lilacina.

Tradescantia pilosa.

Of the other species found in the United States the only one which appears to be in commerce in Great Britain is T. pilosa, which has lilac-blue flowers, and is rather pubescent, or rather pilose. This blooms rather later than T. virginica.

Soil and Cultivation.

One great merit of the tradescantias in the garden lies in their accommodating nature, as one has seen them doing fairly well in soils varying from those which were light, sandy, and poor to those of rather stiff clay, while they thrive well in either sun or shade. The height is greatly affected by the soil and position, and while it averages that already indicated, it sometimes reaches as much as three feet in its native country. In rich soil and under trees it may attain that stature here also. This accommodating nature of the tradescantia renders it peculiarly suitable for many purposes, and, as it is occasionally found in woods at home it can be successfully utilised for planting under trees or in the shade. One can well imagine the beauty of a large colony of the spiderwort established in some woodland glade and holding its own among the dwarfer vegetation through which it might be grown. This old-fashioned flower, which will ever keep green the memory of John Tradescant, is deserving the consideration of all who are about to plant a new garden, or who are desirous of adding to an old one some flower of proved worth and long known in our land.

S. Arnott.

THE TORCH LILIES.

The kniphofias, or torch lilies, which over a long period were known as tritomas, rank amongst the most valuable of autumn-flowering hardy plants. Coming into flower at a somewhat late date, they illuminate the garden at a time when Ichabod is written upon the majority of garden plants, and seem to stand sentinel over their decaying brethren.

To see the kniphofias at their best, large, bold, and irregular groups should be formed, consisting of from three to nine plants, arranged two feet apart. They lend themselves admirably to the formation of effective backgrounds in the herbaceous border, while they may be successfully employed in the shrubberies, semi-wild garden, and also in close proximity to the water garden.

They are natives of South Africa, or, at least, the majority of them, and cannot be described as being perfectly hardy. At the same time, if planted where they will be exposed to the full sunshine, and protected with coal ashes or cocoanut-fibre refuse in winter, they will come through unscathed. A capital plan is to place a mound of tree leaves over them, and cover with an inch or two of fibre refuse. A point to remember in planting upon retentive and heavy loams is to have the sites slightly raised above the surrounding level. These mounds should rest upon a few inches of drainage, such as broken crocks, the drainage being put two and a-half feet below the surface.

It is idle to expect good results from impoverished soil, and being deep rooting and hungry subjects abundance of manure should be incorporated with the staple. They should also receive mulchings of the same material. As regards the best time to plant, I would advise that it be deferred until early in the spring, when they will at once commence to grow and make rapid progress if liberally watered in periods of drought. Once a colony has become established let it alone, and do not shift it in the rearrangement of borders, etc. They are impatient of root disturbance, and provided a dressing of manure is given each winter they will steadily increase in dimensions, and produce a magnificent display.

It may be explained that in dealing with light, porous soil, steps should be taken to give "body" to the soil, and this may be done either by the addition of loam, clay, or cow manure. If clay is used a portion should be placed about two and a-half feet deep, and the remainder allowed to remain on the surface to be pulverised by the action of the atmosphere and frost.

The type plant, Kniphofia aloides, better known under its familiar name, Tritoma uvaria, or Red Hot Poker plant, is a very old inhabitant of our gardens, and is less fastidious as to soil and situation than many of the newer forms, and, further, I have never known it injured by frost or severe weather, and this without any protection. In the northern counties and very bleak districts it is, I believe, the custom to cover the basal part with bracken or other protective material in winter. T. caulescens is also hardy, and evergreen, but the inflorescence is inferior to many others. K. nobilis is a superb species, the spikes towering up to seven or eight feet in height, while a very beautiful dwarf kind is seen in K. Macowani, which produces its orange-scarlet flowers in the latter part of July. K. Leichtlini hails from Abyssinia, and is of medium growth, and, further, seems totally unable to withstand our climate, unless favourably placed and well protected. K. Nelsoni, K. Tucki, and K. rufa extend the list. Amateurs who do not possess these exceedingly useful and brilliant plants should prepare sites during the winter in readiness for their reception in early spring, just prior to renewed activity.

WALTER H. AGGETT.

A FINELY FLOWERED SPECIMEN OF BENTHAMIA FRAGIFERA IN A CORNISH GARDEN.

BENTHAMIA FRAGIFERA.

Although this shrub is frequently met with under the above name, it is really a species of cornus, and is correctly known as Cornus capitata. Other species of cornus have at one time or another been referred to benthamia, but, although they constitute a distinct group of the genus, scientists do not now keep them separate. Lindley was responsible for the name benthamia, and he adopted it for those species of cornus which have the flower heads attended by an involucre of showy, petal-like bracts. These bracts are infinitely more beautiful than the flowers, and are usually white, so that a large bush in full bloom is a very conspicuous object. Unfortunately, most of the sorts are somewhat tender, and are better fitted for gardens in the south-west counties than for those situated in colder places.

The species under notice is a native of N. India and China, and when growing under favourable conditions it forms a large bush twelve to twenty feet in height. During late spring the flowers, accompanied by their white bracts, are borne, and, as may be seen from the accompanying illustration, a specimen in full flower is a very conspicuous object. Unlike the majority of cornuses, this one retains its leaves during winter, whilst its fruits are infinitely more beautiful than those of other sorts. At first sight the fruits suggest those of Arbutus unedo, being scarlet in colour and very similar in shape; in fact, the tree has been called the "Strawberry-bearing Benthamia."

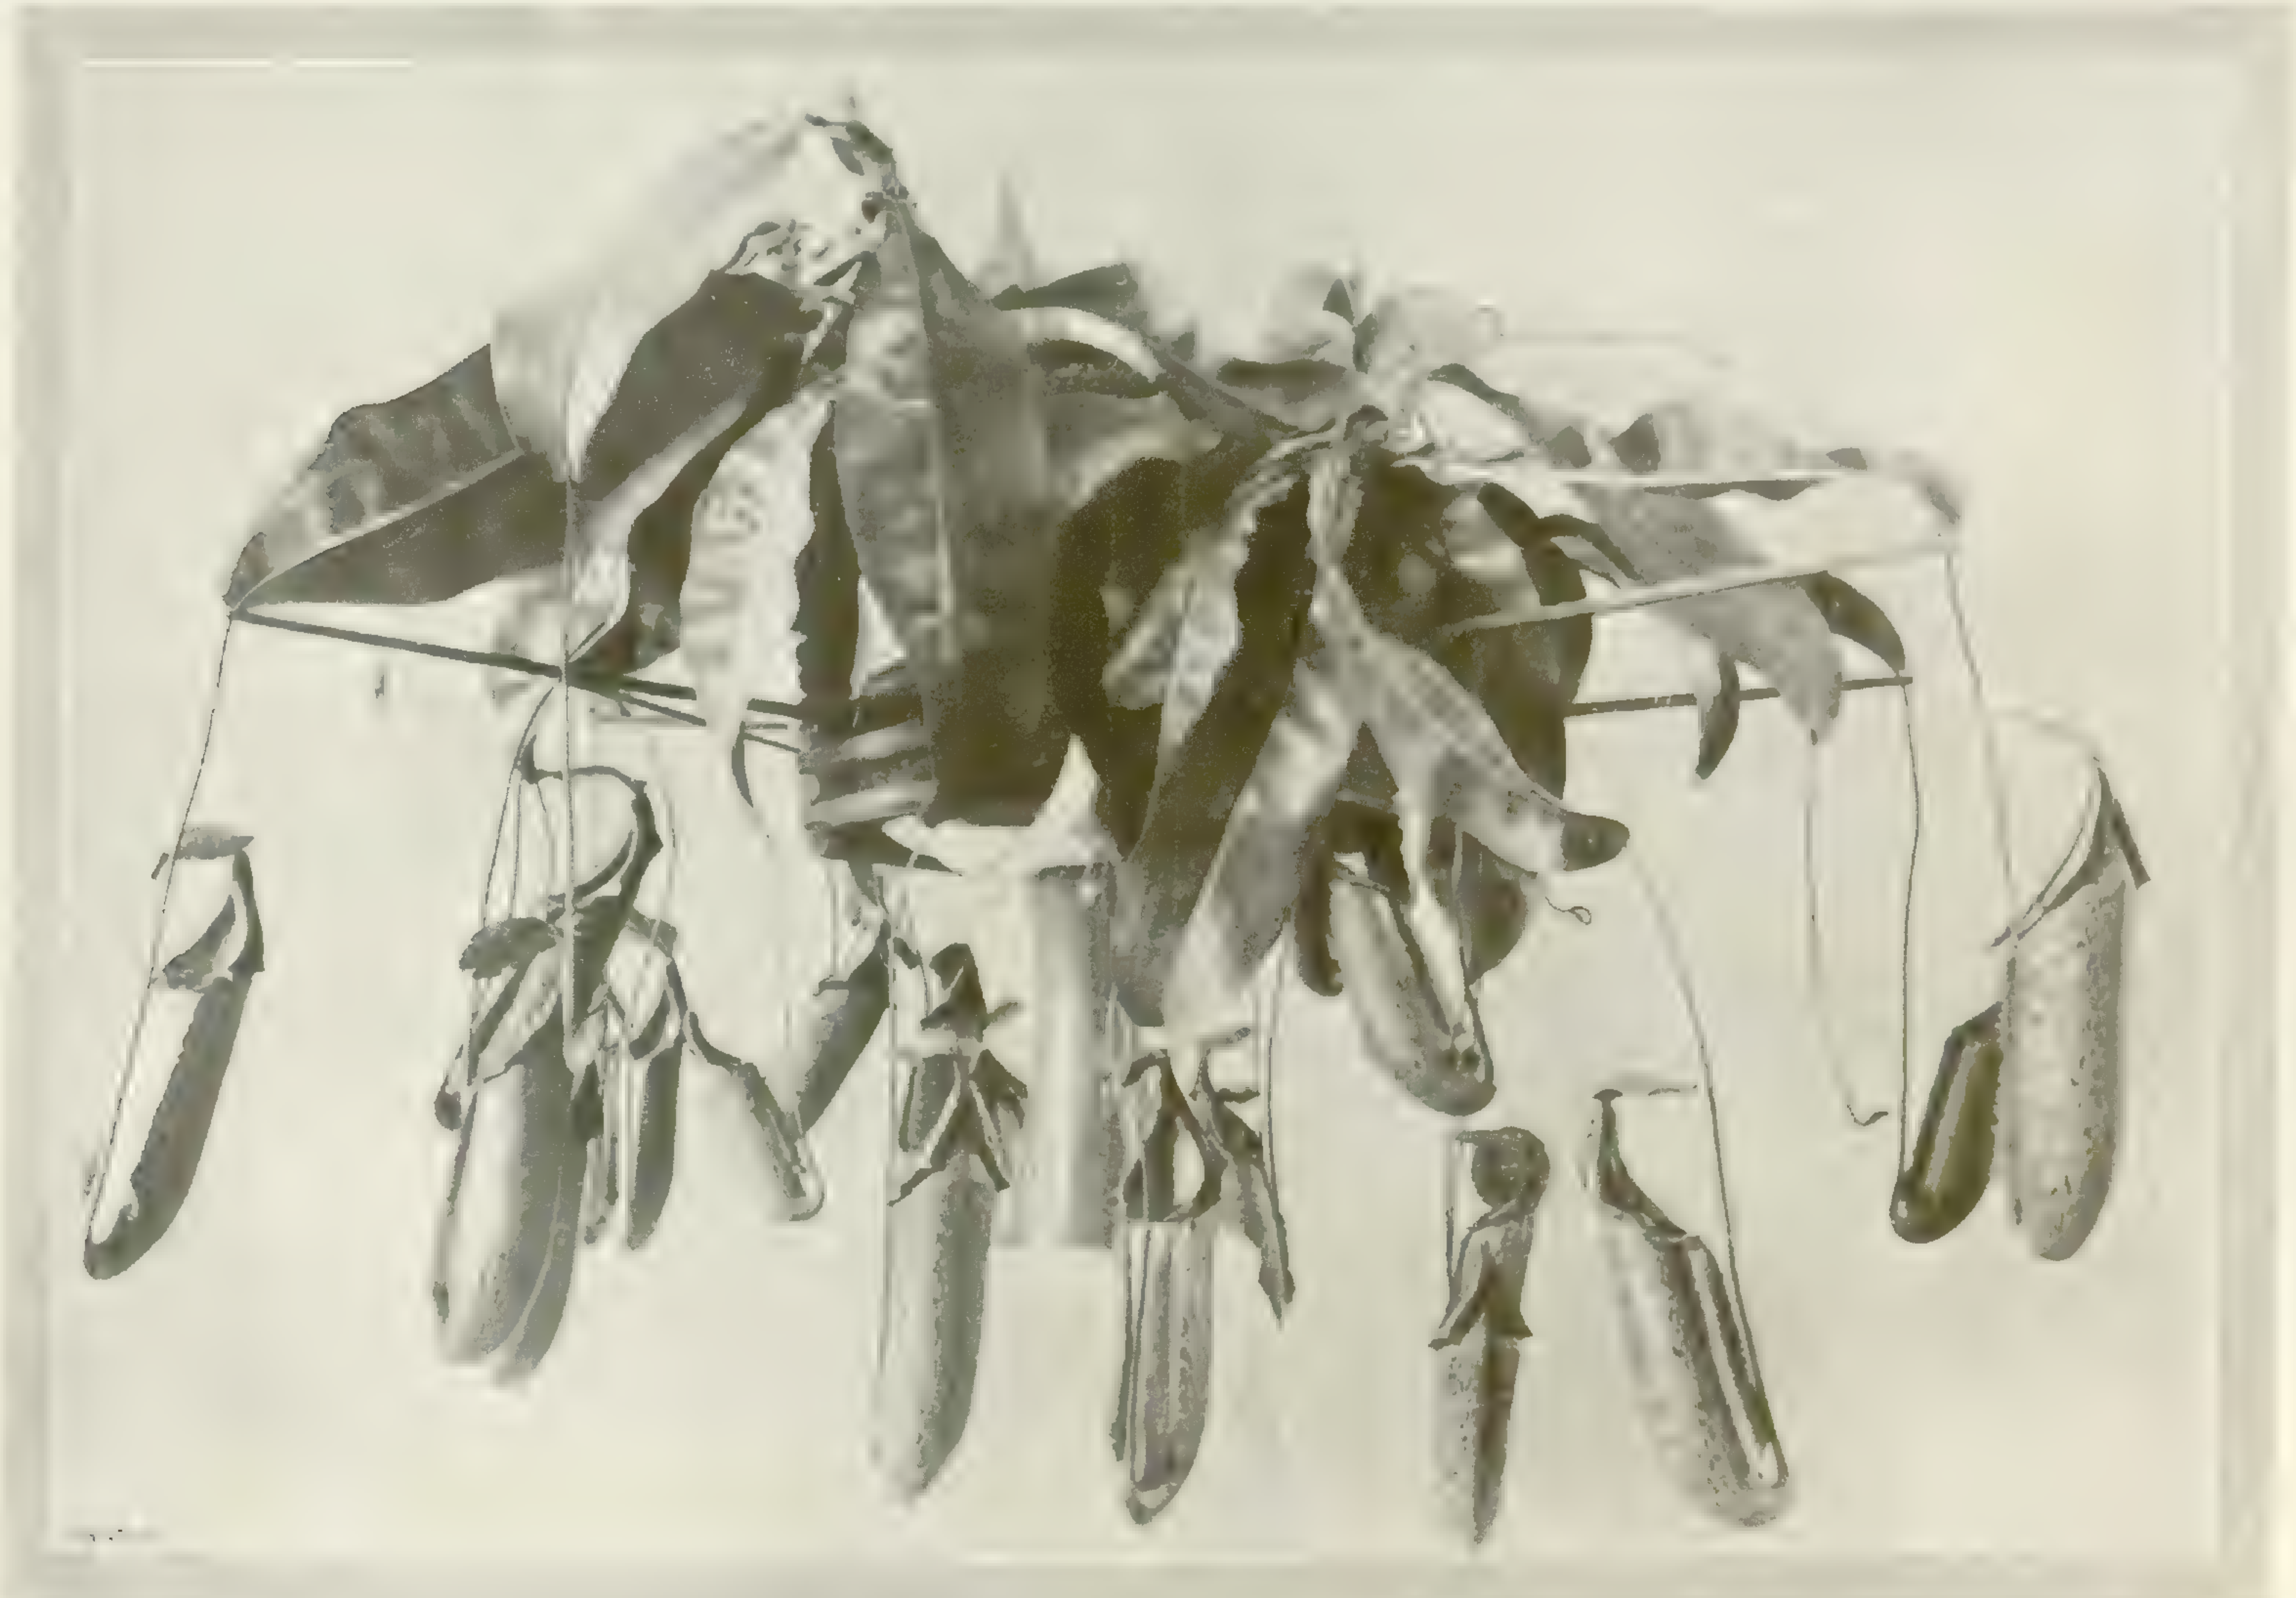
It thrives excellently in Devonshire, Cornwall, and other counties of England in the vicinity of the sea, whilst on the West coast of Scotland and most parts of Ireland it grows well. It cannot, however, be recommended for the midland and northern parts of the country, and even about London it is not a success in the open ground. Other species closely allied to this are: C. florida, from E. N. America; C. Kousa, from Japan; and C. Nuttalli, from W. N. America.

W. D.

Shrubberies.—It is early yet for the removal of many shrubs, but if positions can be decided on for those to be removed the ground may now be prepared with advantage, and while the foliage is on the trees and shrubs the amount of light and shade in each place will be readily seen. Attend to climbing and trailing plants either on trees or rambling over mounds and banks. In many cases the old flowering wood may with advantage be removed. As autumn tints of foliage will now soon be appearing, note the different effects, and where the distinctive colourings are most effective; in many cases a judicious grouping of shrubs with highly-coloured foliage in autumn may be made. In this locality most trees fail to assume their full autumn colouring.—E. F. HAZELTON, Knowsley Gardens.

NEPENTHES.

This family of carnivorous plants is most wonderful and curiously constructed, but very seldom do we find nepenthes growing with anything like real vigour in private establishments. The general impression is that a specially constructed house is required in which to cultivate them successfully, but this is a mistaken idea, as the plants will thrive well in an ordinary stove or East India orchid house, and if suspended from the roof, where the pitchers can be seen hanging down, they will give to the house a very ornamental appearance. As most of the species come from the parts of the Tropics where there is a continually moist atmosphere, it must be understood that the nepenthes should be grown in a high temperature, and have an abundance of atmospheric moisture.



A SPLENDIDLY DEVELOPED SPECIMEN OF NEPENTHES MIXTA SANGUINEA.

Grown by the raisers, Messrs. J. Veitch and Sons. Pitchers very large and richly marked with crimson on a green ground.

Shading should not be of a fixed kind, but under control, so that the plants may receive sufficient light to bring out the beautiful colouring and markings of the pitchers, which would not be developed if too much shade were applied. At no time must the material in which the plants are growing be allowed to become dry, as the roots would soon perish, and when once a pitcher plant's roots are in an unsatisfactory state, it is very rarely the plant regains a healthy appearance again. Baskets have the preference for cultivating the nepenthes in, and the material should consist of good fibrous peat, with the finer particles shaken out, and a proportion of fresh growing sphagnum moss and small lumps of charcoal should be mixed together. The surface of the baskets should be covered with the growing points of the sphagnum. We are indebted to Messrs. James Veitch and Sons for the introduction of many fine species, and the raising of many fine hybrids, and the firm cultivates these wonderful plants with a skill that is greatly admired. The accompanying illustration represents an improved form of Nepenthes mixta, and is known as N. m. sanguinea. T. Cromwell.

Allerton.

PLUMS: SOME VAGARIES OF THE SEASON.

With the passage of years there occur incidents in relation to crops and trees which may be regarded somewhat of contrary disposition, and sometimes past the comprehension of the average gardener. The season now hurrying onward may claim to have given us a series of contrasting incidents, and especially in weather matters, and as the work, and result of work, in horticultural problems depend so much on the weather, the least reflective of minds must expect that issues diverse in degree must follow. In the spring months trees of all kinds gave of their first bounty—blossom—freely, and while Nature was in such pleasant mood the elements essayed unjustifiably to frown and to frolic, even to the extent of giving snowfalls knee deep, and even of greater depth than the proverbial two-feet rule, in some localities. This, too, while plum trees blossomed! Now we have reached the season of plums we are made to wonder why it is we have any to remind us it is summer, for we are taught from our early days that snow and frost are fatal companions of tree flower of any kind, and we inquire of ourselves whether these old-time theories are really reliable.

But while we are wrestling with these peculiarities of the weather, we are reminded that garden walls are built at great cost in order to protect trees which are grown and trained thereto from passing inclemencies of weather, and when good crops respond to the general incident of season, we congratulate ourselves that our forefathers were wise in devising such useful aids, and generous in the outlay which such schemes incur.

Remembering that the open-air tree, be it bush or standard, has to shudder under the cold wind-blast, rain, and snow, while the wall-trained tree has so much less exposure to climatic changes, the natural thought will arise that in such a season as 1908 wall trees should at least afford the greater bounty, because the weather influences have been rather inclining in their favour, but it is not invariably so. Beside wall-grown trees in varied kind and aspect, we have bush and standard specimens, and while so many of the apparently favoured trees have light—some, indeed, very light—crops, the standards are, and have been, on the point of breaking down, some of them, under the load of maturing fruit, and yet these same trees were wreathed with snow and felt to the full the pinch of frost which accompanied it. The puzzling question one must ask themselves is, why is it? Of course, some will answer readily that the snow so protected the vital organs of the individual flower that frost had no chance to injure, but it was remarked by some that the snow had been reduced to icicle on the tree bough. To many beside the writer the matter remains a mystery, and must be left for those of greater wisdom to investigate. It must not be forgotten that all are not alike fruitful, even standard and bush trees in the open. Some of these have crops which are not recognised hardly by the birds. Pond's Seedling, Victoria, Monarch, Wyedale, and Early Rivers, besides Bradley's King and Cluster of Farleigh damsons are the heaviest croppers. The gages, Sultan, Belle de Louvain, Czar, Kirkes', are, in standard and bush forms, shy of fruit, as is the prune damson, although the varieties here named are growing under exactly the same conditions as regard shelter and position.

ABIES PUNGENS GLAUCA.
One of the finest of the silvery-leaved firs, as grown by Messrs. J. Backhouse and Son.

The summer has been, in the matter of drought and temperature, almost tropical, and heat usually is an effective agent in hurrying crops forward, even to premature maturity. It is not so in 1908, at any rate, the experience of growers hereabouts does not coincide with this familiar theory in plum matters. A plum that used to be depended on from aged trees to furnish a dish of ripe fruit the first week in August does not promise a gathering until quite three weeks later this year. Similarly Oullin's Golden Gage, an even more dependable plum, fails this year, not only in season, but crops also, though occupying south and west aspects in well-matured trees. What is there in this season of sunshine to explain the lethargic aspect in plum crops? There must be antagonism between the elements and tree life to justify such peculiarity.

The common law again affecting adverse seasons brings visions and recollections in turn of hordes of insect enemies of one sort or another. The season of 1908 has been remarkable for its immunity; indeed, we cannot easily recall another when so little of pest worries have been imposed in the case of plums. It appears to us a significant breach of old-time theory, for there has been ample ground for the intrusion of the enemy legion, judged by the variable weather moods. Possibly the dripping nature of last summer made its impression on hybernating creatures. Some no doubt will accredit birds with the anomalies in question; it would be pleasant experience if such assurances could be substantiated.

It will have occurred to many how often such finely-developed fruits come from aged trees, and a corresponding undersized fruit from young and vigorous specimens. A natural inference would lead even the untrained mind to expect the contrary to happen. That there are occasions when such cases are cited need no remark, but it is at the same time well worthy of passing notice that trees much past the prime of life give finer individual fruits than do the young and thrifty specimens. We have often heard resolutions of the winter, when the nude state of the old and perhaps decrepid tree comes under review, changed as the summer advances, and there is large and luscious plums to gather altogether more numerous and satisfying than from its younger neighbour, whose object, like that of much of our civil life, is bent on superfluity and extravagance. Thus the vagaries of youth bear poor comparison with a more settled state even in tree life.

W. Strugnell.

Road Ashton Gardens.

PROFITABLE FRUIT GROWING for Cottagers and small Holders of Land. By John Wright, V.M.H. A Gold Medal Essay, written for the Worshipful Company of Fruiterers. Fully illustrated. Price 1s., by post 1s 3d., from W. H and L. Collingridge, 148 and 149, Aldersgate Street, London.

THE YORK NURSERIES.

Established quite early in the eighteenth century, the York Nurseries have, by reason of the business ability and the practical skill and scientific knowledge that have been brought to bear upon their management, occupied from the first a high position among the establishments devoted to commercial horticulture within the United Kingdom. The position occupied was never higher than at the present time, and it is of interest to mention in connection with this fact that the principles which governed the management of the nurseries in their earlier days, and gave such splendid results, are those on which Messrs. J. Backhouse and Son conduct their business at the present time. Hence it is that the establishment continues to rank high among the foremost of the nurseries in Great Britain. To mention this is necessary, lest it might be thought that we do not fully appreciate the importance of the firm having occupied a prominent position in the world of horticulture for about two hundred years; but there is no occasion we should dwell upon this fact, because the nurseries are so well known to those interested in horticulture that but few gardeners who go to York do not make a strenuous effort to visit "Backhouse's."

In making this brief reference to the firm, it is of interest to recall the fact that the business was established within the City walls, and carried on there until some sixty years or so ago, when the great extension of business rendered more room absolutely necessary. The firm then removed its office and nurseries to Holgate about a mile from the railway station, and in the nurseries, which have an area of one hundred and fifteen acres, the visitor finds stocks of both useful and ornamental plants, remarkable alike for their comprehensiveness and the rude health of the several kinds. In addition to the nurseries at Holgate, the firm has established a branch nursery at Cattal, a small town on the railway that connects York with Harrogate, and this is chiefly devoted to fruit trees, for which the soil and site are specially adapted.

It is a good education for any one who is imbued with a keen interest in those forms of plant life specially adapted for the embellishment of conservatory and hothouse, and of indoor apartments, to walk through the fine ranges of glass houses at Holgate. Their furnishing is complete, and of the best, and the several collections afford an excellent opportunity for becoming acquainted with the most useful kinds, and their value for various purposes, when grown to a high state of development, as is the case here. Some of the structures are of proportions quite exceptional in nursery establishments; consequently, many of the specimens are of large size, and scope is afforded for the display of their individual charms to the best advantage. Of special interest is the extensive collection of filmy ferns, of which so many fine kinds have been introduced by the firm, and the cleverly-constructed underground fernery wherein they are so successfully grown has long been regarded as one of the leading attractions of the nurseries. It would be pleasant to mention some of the many objects of interest that arrest attention in walking through the numerous structures, but it must suffice to mention that the collections are so complete as to include all the finest kinds in the several classes.

The rock garden has contributed in no small degree to the fame which the York Nurseries have so long enjoyed, and there can be no question as to it having greatly influenced the extension of the cultivation of alpine plants, and afforded valuable object lessons on the conditions under which the various kinds can be the most successfully cultivated. The rock garden extends over several acres, and is remarkable for boldness of treatment and abaptability for the [illegible] beautiful plants that have found a home on its slopes. Alpine plants of exquisite beauty from the Pyrenees, Switzerland, the Tyrol, and other parts of Europe, the Himalayas, the New Zealand Alps, and the Rocky Mountains, are grouped on the higher parts in a natural and effective manner, and produce a series of delightful effects. On the lower parts bog and water plants in great variety, and dwarf shrubs suited to their rocky surroundings, contribute their full share to the beauty of this charming garden. The great success that has been achieved by the Messrs. Backhouse in the formation and management of the rock garden in their nurseries and in many rock gardens they have formed in private gardens, is, there can be no doubt, largely due to their intimate acquaintance with alpine plants in their own homes. From time to time the principal localities, both at home and abroad, have been visited, and the conditions under which alpine plants are found in the most thriving state closely investigated. Not only have these visits been of value in affording opportunities for becoming well acquainted with rock formations and the conditions under which the various alpines flourish, but they have resulted in the introduction by the firm of many beautiful plants. The illustration herewith gives an excellent idea of one of the "features" in the rock garden, but there are many other features, and some that, by reason of their boldness, appeal strongly to those who can enjoy to the full rugged scenery.

VIEW IN THE ROCK GARDEN AT THE YORK NURSERIES.

Hardy herbaceous plants have throughout formed a strong feature of the York Nurseries, and continue to do so. In the days when [illegible] were so largely grown as [illegible] to occupy nearly the whole of the space available for ornamental plants, they were cultivated extensively by the firm, and the spacious borders devoted to them were a welcome relief to the brilliant displays of colour in private gardens in Yorkshire, as in other parts of England. As with hardy perennials, so also with ornamental trees and shrubs, the choicest of these were grown in considerable numbers when comparatively little attention was given to them by planters, and consequently when the trend of the public taste gave rise to a brisk demand, the firm was in a splendid position for meeting requirements of planters, and, indeed, of augmenting their stock with sufficient rapidity to keep pace with the increasing demand. Of the ornamental trees and shrubs one may write at length, so rich are the collections, both in plants of the usual stock sizes and of finely-developed specimens, the latter being of special interest as showing the characteristics of the several kinds when fully developed. Trees grown for the beauty of their flowers, for the rich colouring or elegance of their leaves, and for their graceful habit or nobility of aspect, afford abundant interest in their respective seasons. Especially noteworthy are the many fine trees and shrubs with golden, silvery, or variegated foliage, for the splendid development of leaf colouration, which is perhaps the best indication one could have of a robust state of health. The golden and glaucous conifers are particularly remarkable for their bright leaf tints, and the illustration of the extremely beautiful Picea pungens glauca indicates very clearly the success with which the choice conifers are grown, for a glance is sufficient for the reader to see that the growth is free, and the silvery colouring fully developed.

This, it should be understood, is not intended as a description of the York Nurseries, but as pleasant "memories" of a short visit made during the present summer.

WORK FOR THE WEEK.

THE ORCHID HOUSES.

SEEDLING ODONTOGLOSSUMS. — The raising of odontoglossums and allied genera from seed has become so general during the past few years that one is at last able to consider the subject as suitable for a weekly calendar. That which was until quite recently considered a difficult accomplishment now proves, with us at least, to be a comparatively easy task. There are no orchids that germinate so readily as do the odontoglossums. The rain of the past few days will assist greatly in providing the conditions desirable to attend to the pricking off of young seedlings, and for the potting on of larger plants that require more rooting space. It is by no means easy to induce young seedlings (that is those which are just forming their first leaf), to make much growth, if they are pricked out of the seed bed during a hot, dry season, such as that we have experienced this year. If the plants even survive the lengthened season of drought, they will remain in a practically dormant state until more favourable outside conditions are provided. It is best, if possible, to delay transplanting until favourable facilities are offered. Now that the hottest part of the year is past, and with moister conditions outside, the small plants may be pricked off, and as they now become established quickly, they make such rapid progress during the autumn and winter months that a growth of two or three leaves is obtained by the spring of the year.

PRICKING OUT THE SEEDLINGS.—This may either be done singly, or they may be pricked off several together in small pots. Where there are comparatively speaking, only a few to be dealt with, I would prefer to prick them out singly, but this is impossible where they have to be treated in large numbers, as room then becomes a consideration. We use the same potting compost as that mentioned in a previous note for odontoglossums. The pots used are filled to about half their depth with drainage material, the compost being made moderately firm, covering the surface with a thin layer of finely chopped sphagnum moss. After watering the compost sufficiently to moisten it, the pots should stand for a time to allow the excessive moisture to drain away. They will then be ready to receive the seedlings. I find a large pin, or finely pointed hard stick the most suitable to transfer the seedlings from the seed beds to the pots. Care must be taken to see that the surface of the moss does not become unduly dry, and the atmosphere should be maintained in a moist state about the plants until satisfied that the latter are pushing away in the new compost. The size of the seedlings when they are best transplanted is when the first leaf is made and the young root makes its appearance from the base of the plant.

SEEDLINGS in a more advanced stage that require more root space should also be attended to now. The aim of the grower is naturally to induce as much strength as possible in the advancing growth, so that a larger and more robust pseudo-bulb may be the result. It is rarely, indeed, that we obtain a matured pseudo-bulb from the seedling growth under two years. It is quite possible, if we have the first bulb strong enough, to procure flowers from them. So that it is advisable to afford every facility that will procure the most desirable results. We fill our pots about half full of drainage material, using a compost in a coarser state as the plants advance in strength. Liberal atmospheric moisture, and a free circulation of air, is desirable at all seasons of the year. —H. J. CHAPMAN, Oakwood Gardens.

CONSERVATORY AND GREENHOUSE.

PELARGONIUMS.—Plants cut back some time ago will now be ready for potting. Much of the old soil should be shaken away previous to cutting back the roots, thus reducing the balls to small proportions, so that they may be put comfortably into pots several sizes smaller than those in which the plants flowered. The pots used should be thoroughly clean and dry, so that when the plants are turned out for repotting the roots will not stick to the sides. The soil most suitable is a fibrous loam broken up into a convenient size for working round the roots, with plenty of sand and a little old mushroom bed manure. Pot firmly, return the plants to the frame, and give but little water for the present.

STREPTOCARPUS. — Seedling plants should now be shifted into the pots in which they are to winter. Very little additional room is needed, as they will not be very active at the roots until the spring. The soil should be fairly rich, using well-decayed cow manure rubbed up fine, and if the loam is fibrous, and not heavy, nothing but the manure and some sand need be mixed with it. On the other hand, if the loam is heavy some good leaf-mould will be a useful addition. A minimum temperature of 55 degrees will keep them growing for the present; later on this should be lowered, and a fall of 10 degrees will do no harm.

HYACINTHS FOR EARLY FLOWERING.—The foundation of a successful flowering of these should be made in autumn, by potting at the proper time, so that a plentiful supply of roots may form before any kind of forcing is started. September is a good time for potting hyacinths, and those required for forcing should be so treated early, following with later batches. A good compost is loam two parts, not sifted, good dry rotten manure one part, which should be passed through a sieve, and a half-part of grit. I use road scrapings in preference to sand, because they are coarser, and tend to keep the soil open. The compost should be thoroughly mixed, and, if very dry, watered to make it in a medium state of moisture, that it may be properly handled. Five-inch pots are used for one bulb, and three bulbs are also put into pots of eight-inch diameter. These latter make showy specimens for the conservatory. In this instance, too, be careful to select each of the three bulbs about even in size, so that there shall not be an odd look in the spikes of bloom.

COLEUS.—Cuttings of these should now be inserted for raising a stock for next season. They root freely at this time in almost any soil, loam or leaf-mould, or a mixture of both, with sand in any case, will do. Cuttings taken with three joints, and the lowest pair of leaves on each cut off, inserted in pots or pans filled with the compost, may be placed in a house or frame which does not require much air, and has a moist atmosphere. Pot off before the roots become entangled into four-inch pots, and when they have recovered the slight check of potting, place them in a sunny position near the glass in a more airy house. As they attain to a height of six inches or so pinch out the points, and when the weather gets colder (in October) shift them to a heated house. The coleus cannot bear cold, though in summer it likes plenty of air day and night from June to September.—T. B. FIELD, Ashwellthorpe, Norwich.

THE FLOWER GARDEN.

WALKS should continue to have close attention, rolling them when their condition renders it desirable. Keep the verges well cut, and if the walks have been allowed to become at all green or weedy no time should be lost in applying a dressing of weed killer. This application should not be left until leaves are falling, for there is then a danger of the leaves becoming contaminated, and injurious results follow in unlooked-for ways. Possibly a heap of the poisoned leaves may be included with those collected for leaf-soil, to the injury of the plants for which it is used.

LAWNS must still be mown as required, as growth will continue for a short time longer. Though not very vigorous, it will produce an untidy appearance if not attended to. Long grass in the wild garden and other parts of grounds should now have its second mowing for the year. If the mowing is done before the leaves fall the walk will be more satisfactory. The work of planting additional bulbs in the grass can be more readily done when the grass has been cut. The appearance will also be much better, for even in the wild garden neglect should not be apparent.

HERBACEOUS BORDERS.—Continue to remove all old flowers and seed pods, give all necessary support to everything that requires it, lest a storm or gale come and speedily disfigure the border. Stakes and supports that have accomplished their purpose for the season should be removed, and if not required again this season, put away in the store for next year. Should the weather be hot and dry, a large number of the autumn-flowering plants will be greatly benefited by a copious supply of water or liquid manure, it being useless to expect fully and perfectly developed lasting flowers if moisture at roots is lacking. As we cannot tell how soon early frosts may come, it is well to be prepared for them. Should they appear likely to occur protection should be given to Anemone japonica and other tender-flowering subjects; this protection on perhaps one or two occasions may prevent disfigurement of borders for several weeks. Large clumps of pinks may now be pulled to pieces and replanted; few will fail to grow. Continue to remove all seed pods from sweet peas.

FLOWER GARDEN.—The propagation of any of the tender summer bedders still in arrears should be completed. Pentstemons, antirrhinums, and calceolarias may be successfully propagated at the end of month. Here also see that nothing lacks moisture; remove dead flowers and foliage, and preserve a bright display as long as possible. A careful selection of the proved best varieties should have been made according to the results obtained this season.

DAHLIAS must still be attended to, as in the absence of frost they will continue bright a few weeks longer. Remove surplus or crowded growths, and tie up all remaining ones.—E. F. HAZELTON, Knowsley Gardens, Prescot.

HARDY FRUITS.

A THOROUGH INSPECTION should be made of all kinds of fruit trees, and a note taken of those requiring renewal. It is practically a waste of valuable space to allow old, worn-out trees to remain; walls are most valuable for the production of good clean fruit. If the trees are healthy, and growing in a sweet, suitable border, the varieties of pears, peaches, etc., should be carefully selected with a view to yield a lengthy supply of fruit, of the very best quality.

OUR PEACHES AND NECTARINES, on a south wall, are very good, heavily cropped, and needed much thinning. The first of the peaches to ripen was Waterloo, and of this we have only one large tree, which fruits very regularly each year, and ripens about July 21. The individual fruits may not be equal to those of the early September varieties, but are, notwithstanding, very valuable. They are of fairly god size, and of excellent quality when gathered a few days before becoming fully ripe and placed in the fruit-room to finish. Hale's Early and Early York follow this, and they are very desirable varieties to grow. Then come Stirling Castle, Early Grosse Mignonne, Goshawk, Royal George, Dymond, Bellegarde, Crimson Galande, Violet Hâtive Marquis of Downshire, Sea Eagle, and Princess of Wales. The last-named should be given a good position as it ripens late, and unless it has that advantage the flavour is not particularly good. Barrington, Walburton Admirable, and Gladstone are all very good varieties. Of the nectarines Lord Napier, Elruge, Pineapple, Dryden, and Humboldt are our main varieties. There are several other good sorts, but we have not room for more.

PEARS.—As several of these will now be approaching maturity, it will be desirable for prolonging their season to gather a few of the most forward at intervals. These should be placed in shallow boxes and stood on the stages under glass. We use shallow peach boxes, with lids. This will hasten maturity and lengthen the supply considerably. When gathering the fruit be careful not to bruise them. William's Bon Chretien is one of our best pears to ripen at this season when gathered at the right stage; but like other early fruits does not remain in good condition for any length of time. When packing these for a long journey they should be a little underripe, rolled carefully in soft tissue paper, and then packed in shallow boxes, with wood or cotton wool. A single layer is enough for travelling. Clapp's Favourite with me bears very moderately, but Madame Treyve, Louise Bonne of Jersey, Beurre d'Amanlis, and Marguerite Marillat bear freely. These are followed by Conference, Pitmaston Duchess, Doyenne du Comice, Durondeau, and others.

THE EARLIEST APPLES will likewise need special care and attention, and in some gardens must be netted to protect the fruits from birds which, in these gardens, are fairly plentiful. Quarrenden, Irish Peach, Beauty of Bath, Kerry Pippin, and Worcester Pearmain are amongst our earliest to ripen. Of these we usually gather at intervals to maintain a supply for as long a period as possible, in fact until Cox's Orange Pippin and other of the finer apples are fit for use.—H. MARKHAM, Wrotham Park Gardens, Barnet.

BEST PLANTS FOR GREENHOUSE.—Nearly 300 pages are devoted to the description, propagation, and culture of the best flowers and plants for the greenhouse in THE AMATEUR'S GREENHOUSE, by T. W. Sanders, price 5s. net, or by post 5s. 6d., from W. H. and L. Collingridge, 148, Aldersgate Street, London

AMONG THE WILD FLOWERS.

Every gardener, whether he pursues his avocation for pleasure or profit, will find it greatly to his advantage to cultivate an acquaintance with the trees, flowers, and grasses that adorn the lanes, fields, and stream banks of the countryside. Much may be learned from Nature's garden that will aid him in his work amongst cultivated plants. Happily, many gardeners are so situated that a ramble among the flowers of the field is possible whenever a half-hour can be spared.

Dwellers in large towns are scarcely so fortunate, but, thanks to the present-day enterprise of our great railway companies, the country is becoming more readily accessible, and even the London gardener may now, at a trifling cost, obtain a peep into some of the green and shady dells, or scramble up the side of some flower-decked hill, and return to town by an evening train. The Great Central Railway, for instance, runs through some of the most delightful country that lies within an hour's journey from London, and the company issues what are known as pedestrian tickets. By means of these one may for a very small sum take train to a specified station and return from another a few miles distant. Nothing could better meet the needs of the student of botany or natural history. A few notes made in the course of one of these pedestrian excursions, which we had on a recent Saturday afternoon, will, we trust, interest the readers of the Gardeners' Magazine, and induce some of them, perhaps, to take a similar trip. Starting from Marylebone, our outward journey was to Chorley Wood, situate on the borders of Buckinghamshire, amid surroundings of exceptional beauty and interest. One of the points of interest in travelling by "G.C.R." is that one soon gets beyond bricks and mortar, and reaches very quickly pure air and picturesque surroundings. By the time Harrow is reached one forgets that London is so near, and it is good to look out upon undulating meadows, plantations of trees, and the many gay gardens that are to be seen from the carriage windows. The railway banks also become interesting, and as we speed onward we catch glimpses of scarlet poppies, broad masses of Ox-eye daisies, and golden headed senecios, with waving grasses adding grace and elegance that might be imitated in some of our herbaceous borders—choosing, of course, grasses most suitable for the purpose. Here and there large colonies of full-blown thistles appear, and in spite of a gardener's inborn hatred of these noxious weeds, we have to admit that here, amid their wild surroundings they are by no means devoid of beauty. Arrived at Chorley Wood, we quit the train, and, leaving the station by the road to the left, turn under the railway arch, and then again to the right, over a stile into a meadow, where we immediately commenced our search for botanical treasures.

On the hedge banks we soon found the nodding harebell and the rosy-pink flowers of the crane's-bill. Onopordon acaulis, with its stemless purple flowers nestling in the centre of the rosette of spiny foliage, grew beside vigorous plantains, some of which, in full bloom, were really beautiful. Passing a small plantation, where, under the taller trees, grew fine bushes of Cytisus scoparius, [illegible], and symphoricarpus, we entered a narrow lane which leads out to the high road, just by the turning to that pretty little village of Chenies. The lane had yielded no rarities, although the commoner wild flowers grew in profusion.

The inhabitants of Chenies are fortunate. They live in a charming village, surrounded by beautiful scenery, and the tenants are under the Duke of Bedford, than whom a better landlord could not be found. The cottages are roomy and well cared for, and each has a large garden, which the tenants are encouraged to cultivate in the best possible manner. Needless to say, not many empty cottages are here to be seen, but when one does fall empty it is thoroughly cleaned and put in order, and the garden is also attended to by the estate workmen, so that a new tenant finds everything spick-and-span, instead of—as is so often the case—the house dilapidated, and the garden overrun with weeds. It is, therefore, no matter for surprise that the flower gardens in front of the cottages were in excellent order. Rose-covered porches and arches were no uncommon sight. Tall lilies, aconites, and galegas flowered profusely, and many fine phloxes, pentstemons, and dahlias were to be seen. At the foot of the village stands an old well, roofed over, the posts which support the roof being ivy-clad. Chenies church, near by, is of historic interest in that it holds the mausoleum of the Russell family, some member of which has from the days of Henry VIII. till now held important positions in the national affairs of the country.

Turning off to the right we soon came to Woodside, and from the high ground opposite obtained a good view of its extensive and well-kept gardens. We had intended walking toward Chesham, but altered our plan, and turned off to the right through lanes and meadows until we reached the river Chess. This route brought us in contact with plenty of good things. Thymus serphyllus grew in masses on a bank, its dense carpet of fragrant leaves being bespangled with rosy flowers. Achillea millefolia was abundant, and, further on, we came upon masses of hypericum. Agrimony is plentiful all round, and we found one plant bearing exceptionally large spikes of sweetly-perfumed flowers. This we believe is Agrimonia odorata, which is generally known as the Italian agrimony. The berried spikes of the cuckoo-pint were plentiful in the ditches, and we were shown a spot which in season is bestrewn with Orchis foliosa. Lotus corniculatus flowered cheerily among the grass, and the tall scabious might be gathered in armfuls. As we proceeded toward the river a different class of vegetation became predominant. The willow herb (Epilobium augustifolium) grew in a bold mass by the boundary wall of an old garden, and a spike of verbascum was also seen. Globularia vulgaris was growing on a little mound, its blue heads showing up against the white daisy-like flowers of Anthemis nobilis, which grew around. The margin of the river was a mass of moisture-loving plants. Althaea officinalis was here, Mimulus luteus spread right on to the breast of the river, the blooms being extremely large and clear. The water forget-me-not, Myosotis palustris, was found still flowering and Cardamine pratensis grew dense on the surface of the water. The tall blades of the water iris, typhas, scirpus, and the bright spikes of Lythrum salicaria mingled in this luxuriant water garden, which Nature had planted.

We trudged along, pausing now and again to watch some bird, to admire some particularly fine view, or to look up at some giant tree that waved its arms high overhead. Following the footpaths, we passed through some private grounds where are growing some handsome young trees, among them being Abies Douglassi, Cedrus atlantica, and other serviceable conifers, interspersed with red-barked willows, and golden elders.

Feeling the need of refreshment, we consulted our pocket guide, and learned of an old-fashioned hotel near by, to which we turned our steps. The guide, we may mention, is an excellent little book published by the Great Central Railway Company, entitled "Strolls in Beechy Bucks." None carrying this little book need either lose themselves, or miss a place where rest and refreshment may be obtained, and the cost of the book is but a penny. Resuming our tramp, we proceeded in the direction of Rickmansworth, and although we soon left the haunts of wild flowers, we found much to interest us in the gardens which we passed. Rickmansworth station was reached at last, and, fairly tired, but well pleased with our ramble, we boarded train for town, thinking that 'tis a pity every Londoner, and every London gardener in particular, does not take advantage of the facilities thus afforded for so enjoyable and instructive a ramble. It should surely be possible for the London branch of the British Gardeners' Association to organise a united ramble of this kind. Is it not worth consideration?

A. J. M.

SWEET PEAS.

Many inquiries have reached me for the new list of Too-much-alike Sweet Peas, and the best varieties in their respective colours, as bracketed and selected by our Floral Committee, and as it is practically impossible for me to answer these in detail, I send you the information so that it may be widely spread through the medium of your pages. At the same time allow me to thank you on behalf of my Committee for your many kindnesses to the National Sweet Pea Society.

Chas. H. Curtis, Hon. Sec.

Too-much-alike Varieties.

The National Sweet Pea Society brackets the following varieties as too-much-alike. "Not more than one of the bracketed varieties shall be shown on the same stand at any exhibition of the National Sweet Pea Society." Priority is given to the first name.

Etta Dyke
White Spencer
Paradise White

Queen Alexandra
Scarlet Gem

Her Majesty
Splendour

Duke of Sutherland
Monarch

Lottie Eckford
Maid of Honour
Ivy Miller

Black Knight
Stanley
Boreatton

Lord Rosebery
Cyril Breadmore

James Grieve
Mrs. Collier
Mrs. Felton
Dora Cowper
Devonshire Cream
Ceres
Yellow Dorothy Eckford

Captain of the Blues
Bolton's Blue

Lady Grizel Hamilton
Countess of Radnor
New Countess
Princess May

Flora Norton
Miss Philbrick

Modesty
Duchess of Sutherland

Sensation
Countess of Aberdeen

John Ingman
Paradise Carmine
Spencer Carmine
George Herbert
E. J. Castle
Rosy Morn
Rosie Sydenham
Mrs. W. King
Phyllis Unwin

Zoe
Mid-Blue

Dora Breadmore
Miss Bostock

Clara Curtis
Primrose Spencer

Evelyn Hemus
Mrs. C. W. Breadmore

Countess Spencer
Paradise
Enchantress
Pride of St. Albans
Olive Bolton
Codsall Rose

Gorgeous
Miss B. Whiley
Mildred Ward

Countess of Lathom
Coral Gem

Marbled Blue
Hester

Mrs. Henry Bell
Sutton's Queen
Kitty Lea
Romani Ronni

Mrs. Hardcastle Sykes
Princess Victoria
Pink Gem
Florence Morse Spencer
Vera Jeffrey
Bobby K.
Lorna Doone

Classification.

The Floral Committee of the National Sweet Pea Society recommends the following varieties as the best in their colours.

White.—Dorothy Eckford, Etta Dyke, and Nora Unwin.

Crimson and Scarlet.—King Edward and Queen Alexandra.

Rose and Carmine.—John Ingman.

Yellow and Buff.—James Grieve and Paradise Ivory.

Blue.—Lord Nelson and A. J. Cook.

Blush.—Mrs. Hardcastle Sykes.

Cerise.—Chrissie Unwin.

Pink.—Countess Spencer and Constance Oliver.

Orange Shades.—Helen Lewis and St. George.

Lavender.—Lady Grizel Hamilton and Frank Dolby.

Violet and Purple.—Rosie Adams.

Magenta.—Menie Christie.

Picotee Edged.—Evelyn Hemus.

Fancy.—Sybil Eckford.

Mauve.—Mrs. Walter Wright and The Marquis.

Maroon and Bronze.—Black Knight and Hannah Dale.

Striped and Flaked (red and rose).—Jessie Cuthbertson and Paradise Red Flake.

Striped and Flaked (purple and blue).—Prince Olaf.

Bicolor.—Jeannie Gordon.

Marbled.—Helen Pierce.

ROYAL BOTANIC GARDENS, REGENT'S PARK, N.W.—GREAT DAHLIA SHOW, Sept. 10th and 11th, 1908. Prizes include Gold Medals and Challenge Cup. E. F. HAWES, Hon. Sec., London Dahlia Union, address as above.

HORTICULTURAL SHOW ADVERTISEMENTS are inserted in this column at Ninepence per line, the minimum charge being Five Shillings. Offices, 148 and 149, Aldersgate Street, London, E.C.

EXHIBITIONS AND MEETINGS.

◆

Royal Horticultural Society.

SEPTEMBER 1.

The display on the above date was most interesting and extensive for the season. The dahlias and collections of fruit made an excellent show in themselves.

FLORAL COMMITTEE.

From Messrs. Jas. Veitch and Sons, Lim., Chelsea, came a large group of specimen shrubs in tubs, some fine examples of Viburnum rhytidophyllum with their clusters of scarlet berries were to be seen, while a giant plant of Buddleia variabilis superba was simply covered with flowers. A fine plant of Artemisia lactiflora was also included, while plants of Aconitum Wilsoni were in full flower. Other specimens were Rubus flagelliformis, and R. bambusarum. The giant Chinese poplar, P. lasiocarpa, was also the centre of much interest, the gigantic leaves being quite a feature. The species is not yet in commerce, but it will prove a very handsome addition to the class. The crab John Downie was literally roped with fruit, while branches of the parsley-leaved blackberry were equally good and attractive.

Foliage plants came from Messrs. W. Bull and Sons, Chelsea. The crotons and dracænas were all well coloured and nicely grown. Bertolonia Mad. E. Pynaert was also much in evidence, as were the aralias, alocasias, and similar plants. A small collection of hybrid cattleyas lent colour to the display.

A fine table of hardy flowers came from Messrs. T. S. Ware, Lim., Feltham. The chief subjects were Lilium tigrinum and its double form; Rudbeckia Newmani, and R. purpurea were also in fine condition. A number of asters were also displayed, the variety Beauty of Colwall standing out clearly as the best. Pentstemons were also a feature, the colours being bright and the flowers large.

Messrs. Jarman and Co., Chard, again placed their giant Sweet Sultans before the public. The dull day, however, did not assist the flowers to open properly, but there is no doubt they are a fine improvement on the old strains. The varieties staged were The Bride, white; Bridesmaid, pale lemon; Bridegroom, a pleasing lavender shade; and Honeymoon, a deep yellow; probably Messrs. Jarman will "invent" other varieties applicable to such auspicious occasions.

From Captain Speer, Esher, came a small collection of dahlias. The single varieties were arranged in tall tubes, while the foreground was occupied with single blooms of the giant decorative section. The varieties used were yellow Le Colosse and Souvenir de Gustav Douzon.

Messrs. R. Wallace and Co., Colchester, occupied an entire table with a collection of hybrid montbretias. The effect produced by the different varieties was delightful. The most conspicuous varieties were Norvic, Messidor, St. Botolph, King Edmund, Germania, and Lord Nelson. The same exhibitors also presented a good display of gladioli, tritomas, and phloxes.

Messrs. Carter Page and Co. occupied the end of the hall with a fine display of dahlias. These were chiefly of the cactus type, though pompons, singles, and pæony-flowered varieties were well represented. Needless to say, the whole exhibit presented a blaze of colour, which was toned down with palms, ferns, grasses, and other appropriate foliage. Early-flowering chrysanthemums came from Messrs. W. Wells and Co., Lim.

A beautiful table of phloxes came from Messrs. Gunn and Sons, Olton, Warwick. These were arranged lightly in baskets with grasses, ferns, and other foliage. All were in fine condition, but perhaps the best were Hall Caine, Paul Martin, Dr. Charcot, Violet, Le Mahdi, and Queen Alexandra, with a few promising seedlings.

Messrs. H. B. May and Sons, Upper Edmonton, had a large exhibit of perpetual-flowering carnations, arranged in blocks of colour. The plants were all in five-inch pots, and were remarkably well developed. All were produced in the open air. The best appeared to be Harlowarden, The Belle, Britannia, Enchantress, Mrs. Brooks, and Elizabeth, a really fine scarlet. A fine exhibit of ferns was utilised to separate the blocks of carnations.

Hardy flowers came in strong force from Mr. Amos Perry, Hardy Plant Farm, Enfield. A feature of the display was the second crop of single pyrethrums and delphiniums, both being good for the season. Various fine liliums, such as Lilium auratum, L. a. platyphyllum, L. a. rubro-vittatum, L. speciosum Aizoika, and L. s. rubrum were much admired. Pentstemons in variety were also much in evidence. The whole exhibit was well displayed without undue crowding.

Messrs. Bakers, Wolverhampton, displayed a fine collection of dahlias, the pæony-flowered varieties being most conspicuous, but, unfortunately, some of the most prominent seedlings were only exhibited under number; this is surely a mistake.

Gladioli came from Messrs. Kelway and Son, Langport. The exhibit occupied an entire table, and attracted much attention. The spikes were well developed, and the colours simply gorgeous. Just a few of the most striking were Golden Measure, White Cloud, Dovedale, Princess Victoria, Lord Roberts, Saltpetre, Miss Wade, and Lady Warwick.

A large exhibit of phloxes, perennial asters, and pentstemons came from Mr. F. Brazier, Hardy Plant Nursery, Caterham, Surrey. The phloxes were all arranged in tall bamboo stands. Conspicuous were the varieties F. Horning, A. Mercie, Le Madhi, Selma, Fort de France, and Lord Kelvin. Plants of Berberis Thunbergi, with its rich coloured foliage, were utilised effectively in the groundwork.

Messrs. Barr and Sons, Covent Garden, staged a nice display of annual and perennial flowers. The former included excellent strains of asters, zinnias, and antirrhinums, while in the hardy section some fine panicles of Agapanthus umbellatus albus were noted. Phloxes in large variety, with liliums were also good, while mention should also be made of Artemisia lactifolia.

Messrs. H. Low and Co., Bush Hill Park, N., displayed fine plants of Chironia ixifera in splendid form; also some excellent plants of Clianthus Dampieri, with Rochea falcata and nice decorative plants of Erica Tubæformis.

Messrs. Wells and Co. came out in a new rôle by staging an entire table of phloxes, perennial asters, and pentstemons. The latter were remarkably well grown.

Annuals in great variety came from Messrs. James Veitch and Sons, Lim. The exhibit included asters in all sections and colours, Phlox Drummondi was especially fine, as were also the zinnias, salpiglossis, dianthus, and African marigolds. These, with a display of ornamental gourds, made a fine exhibit.

A small collection of hardy ferns came from Messrs. Eggett and Son, Portsmouth Road, Thames Ditton. The varieties of scolopendriums were especially pleasing. The whole were well grown, and nicely staged.

Messrs. Watkins and Simpson, Tavistock Street, Covent Garden, sent a fine collection of asters, which included the majority of the varieties in commerce, the variety Unicum being especially worthy of note.

Mr. Charles Turner, Slough, sent pæony dahlias in variety, the best being Paul Kruger, The Geisha, Dr. Van Goorkan, and Bertha von Suttner.

FRUIT AND VEGETABLE COMMITTEE.

The collection of fruits from Messrs. G. Bunyard and Co., Lim., Maidstone, could only be described as magnificent. The pot trees in all sections were carrying heavy crops of fruit, the plums being particularly conspicuous. The finest crops of apples were Cox's Orange Pippin and Baumann's Red Winter Reinette. In pears, Triomphe de Vienne and Marguerite Marrillat were excellent, while the plums were the leading feature. These comprised Belgian Purple, White Magnum Bonum, Monarch, Burbank's Giant Prune, and President. The peaches were Sea Eagle and Duchess of York, both carrying fine crops. The baskets and dishes that formed the front of the exhibit were on a par with the trees, the finest being Gold Medal, Worcester Pearmain, Lady Sudeley, and Ecklinville Seedling in apples, while peaches, nectarines, nuts, crabs, etc., were all worthy of the highest praise.

From the King's Acre Nurseries, Lim., Hereford, came a large exhibit of fruit trees in pots. The trees were in excellent condition, and had carried their fruit wonderfully well. The collection embraced apples, pears, plums, peaches, figs, nectarines, and grapes. The best apples were Emperor Alexander, The Queen, Worcester Pearmain, Cellini, Wealthy, Gascoigne's Scarlet Seedling, and James Grieve. The fruits were large, clean, and of capital colour. The pears were exceptionally good, especially trees of Pitmaston Duchess, Doyenne Boussoch, and Durondeau. The pot-trained vines were Black Hamburgh and Ryton Muscat. Two fan-trained trees of Sea Eagle and T. Rivers' peaches were worthy of note, for they were carrying several dozens of fruit, all of good size and colour. The figs, too, were simply loaded with fruit.

Mr. W. Camm, gardener to Mr. Waldorf Astor, Cliveden, Taplow, staged six bunches of Madresfield Court grapes in splendid condition; the berries were large, and the colour all that could be desired. They were grown, too, in a half a paraffin barrel, a fine example of the grower's art.

A nice collection of fruit came from Mr. G. Reynolds, gardener to Mr. Leopold de Rothschild, Gunnersbury Park, Acton. The chief features were two dozen Queen Pines; all well developed and nicely finished. These, with fine dishes of Gladstone, Sea Eagle, and Princess of Wales peaches, Pine Apple and Victoria nectarines made a nice exhibit, while the dishes of plums were equally good.

Messrs. J. Peed and Son, West Norwood, staged a large collection of apples, with dishes of pears and plums. The apples were large and well coloured, the best being Lady Sudeley, Stirling Castle, James Grieve, and The Queen, though all were wonderfully clean and bright. The plums were quite as good, the dishes of Grand Duke, Pond's Seedling, and Gisbornes being especially fine.

From Messrs. H. Cannell and Sons, Swanley, came another collection of fruit trees in pots, also a large number of dishes. The trees were small but carried plenty of fruit, which was remarkable for its high colour. The best of the baskets were Beauty of Bath, Duchess of Oldenburgh, Lady Sudeley, and Red Quarrenden. The plums were particularly fine, especially Mirabelle, Pond's Seedling, Guthrie's Late Gage, Washington, and Jefferson's Gage. Raspberries and wineberries were also included in the exhibit. A collection of fruiting crabs came from Messrs. J. Cheal and Sons, Crawley, arranged with other foliage and berried shrubs. The most striking of the crabs were Dartmouth, John Downie, Siberian, Transcendant, and Yellow Siberian.

ORCHID COMMITTEE.

Messrs. Sander and Sons, St. Albans, staged a small but choice display of orchids, some of the best being Cattleya Davisi, Lælia elegans, Turneri var., a very fine form; Brassocattleya Madame Charles Maron, Sanders var., a much deeper form than the type. Some well-flowered plants of Vanda cærulea.

of capital colour, with Cypripediums Kubele grandis and Lady Maple.

From Messrs. Moore, Lim., Rawdon, Leeds, came a small collection, in which were noted good forms of Vanda cærulea, Masdevallia macrura, with Cypripediums bellatulum and George Hittel.

Mr. G. Day, gardener to Mr. H. S. Goodson, Fairlawn, Putney, had a nice table of miltonias, with Cattleya Robert Waverin, C. calummata, and C. fulvescens superba, while a fine plant of Cypripedium A. de Lairesse was carrying three blooms on each spike.

Messrs. Stanley and Co., Southgate, sent plants of Cypripedium A. de Lairesse, with grand flowers, also Cattleya minucia in varying shades of colour, with a good example of Cycnoches chlorochilon, var. splendens.

CERTIFICATES AND AWARDS.

First-class Certificates.—Ilex Pernyi, from Messrs. James Veitch and Sons; Brasso-cattleya Madame Charles Maron, Sanders var., from Messrs. Sander and Sons.

Award of Merit.—Gladioli Golden Measure and White Cloud, from Messrs. Kelway and Sons; Cactus dahlia Marathon, from Messrs. J. Stredwick and Son; show dahlia Tom Jones, from Mr. S. Mortimer; Montbretia Norvic and Hereward, from Major Petre; Phloxes General von Lassberg and Violet, from Messrs. Gunn and Sons; Kniphofia R. Wilson Kerr, and Gladiolus primulinus strain, from Messrs. R. Wallace and Co.; Sophro lælio-cattleya, Danae superba, from Lieut.-Col. Holford; Catasetum Russellianum, from Sir Trevor Lawrence; Cattleya Rhoda, from Messrs. Charlesworth and Co.; [illegible]. Elva var. St. Vincent, from Mr. H. F. Goodson.

MEDALS.

Gold.—Messrs. Carter Page and Co., Messrs. G. Bunyard and Co., The King's Acre Nurseries, Lim.

Silver Gilt Flora.—Mr. A. Perry, Messrs. R. Wallace and Co.

Silver Gilt Banksian.—Messrs. Kelway and Sons.

Silver Flora.—Messrs. James Veitch and Sons, Messrs. W. Wells and Co., Messrs. H. B. May and Sons, Messrs. Sander and Sons, Mr. H. S. Goodson, Messrs. Charlesworth and Co.

Silver Knightian. — Messrs. Cannell and Sons.

Silver Banksian.—Messrs. Bakers, Messrs. Gunn and Sons, Messrs. T. S. Ware, Lim., Mr. F. Brazier, Messrs. J. W. Moore, Lim., W. Waldorf Astor, Esq., Messrs. J. Peed and Sons.

Hogg Memorial Medal.—Mr. Leopold de Rothschild.

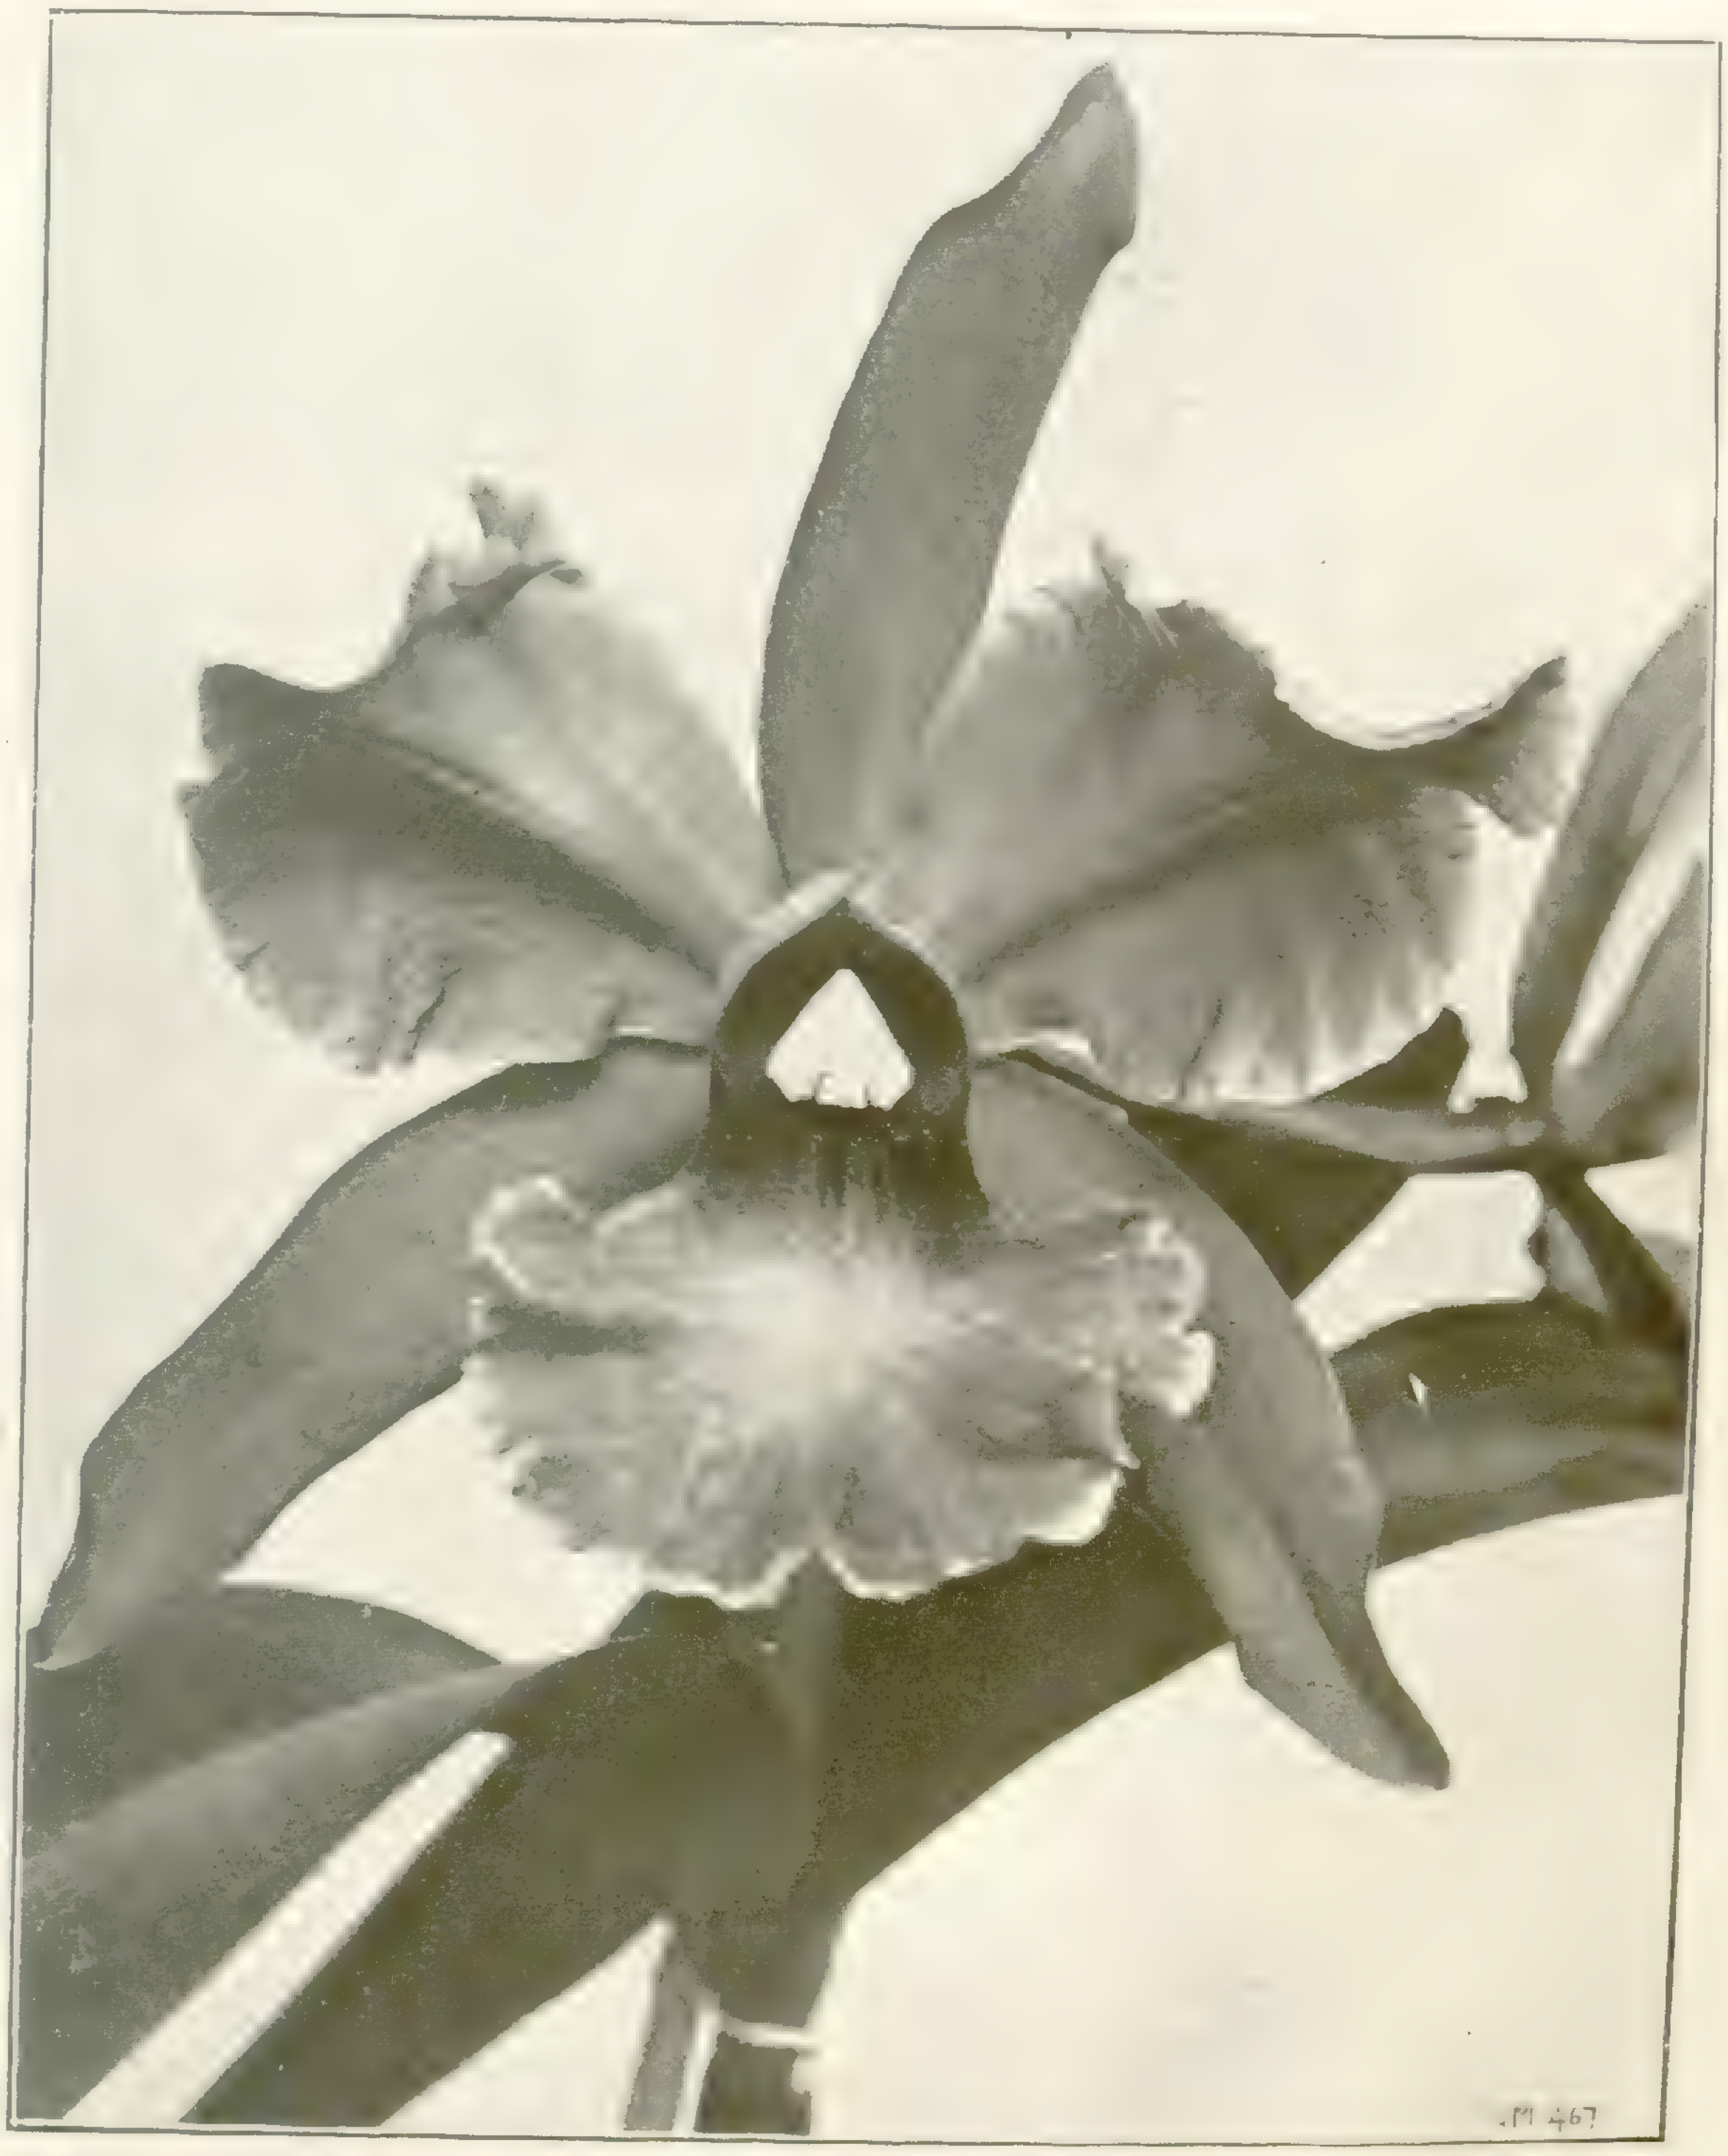
Reading Horticultural Society.

AUGUST 26.

In the Forbury Gardens, on the above date, the fifty-second exhibition was held, and it was, if not superior to any show previously held, quite equal in point of merit to the best. In most classes the competition was keen, the entries being numerous throughout. Fruit formed a specially fine feature; dahlias were remarkable for their excellence; and vegetables were numerous, but apart from the leading collections were not of superior quality. The management was all that could be desired, under the direction of an efficient committee, and Mr. C. J. Howlett, the secretary.

PLANTS.

For a group of plants arranged for effect in a space of 12ft. by 7ft., a challenge bowl was offered as first prize, in addition to a medal and a cash prize. Mr. J. Wyman, gardener to Lady Cooke, East Thorpe, Reading, was first with an arrangement of small plants, much too flatly arranged. Cannas, gloxinias, streptocarpus, and Francoa ramosa, with palms, ferns, etc., made a bright display. Mr. F. Johnson, gardener to G. B. Joel, Esq., Maiden Erleigh, Reading, was a close second with another flat arrangement of suitable plants. Ferns were fairly well shown. For four Mr. S. W. Sherlock, gardener to G. W. Tyser, Esq., Oakfield, Mortimer, Reading, won with well-grown specimens, mainly adiantums. Mr. Dagger, gardener to Mrs. Simons, Maynard, Bath Road, Reading, second. Fuchsias are always a good feature at this show, and in the class for six, distinct, Mr. J. Bright, gardener to J. Friendlander, Esq., Whiteknight's Park, Reading, was an easy first prizewinner. The specimens ranged from 7ft. to 8ft. high, were symmetrically trained in pyramidal form, and were profusely flowered. As a guide to others, the names are appended of the varieties, all of which are desirable: White Knight Gem, Western Beauty, Mrs. Julien Friendlander, Brilliant, White Queen, and Charming. Mr. F. Alexander, gardener to R. T. Darvall, Esq., Warden, Reading, was second with good specimens, although they were a long way behind the first prize set. Double zonale pelargoniums were freely flowered, Mr. F. Johnson winning with well-chosen varieties. Tuberous begonias were numerous and good in quality, and for six Mr. Dagger depended upon double varieties and won the premier award easily, Mr. Johnson coming next.



CATTLEYA RHODA,

A handsome hybrid, exhibited at the R.H.S. Meeting on September 1, when an Award of Merit was conferred upon it. Flowers rather large, the petals and sepals rose-fawn, and the lip brilliant purple.

CUT FLOWERS.

Chief among these were the dahlias, which embraced all the sections. For twenty-four show or fancy, distinct, there was but one entry. This came from Mr. J. Walker, Thame, Oxon, who staged really fine examples in size, form, and colour. The most noteworthy varieties were Golden Gem, J. Saltmarsh, Chieftain, Lord Salisbury, T. W. Girdlestone, B. Cornish, Mrs. Saunders, Mrs. Mortimer, George Rawlings, Kathleen, Mrs. P. Wyndham, and W. Rawlings. For twelve show or fancy, Messrs. J. Cheal and Sons, Crawley, were first with neat examples, the varieties including J. T. West, Black Gem, Miss Ormerod, Mrs. W. Slack, and T. W. Girdlestone. Single-flowered varieties were exceptionally fine in quality, attracting much attention. For twelve bunches, distinct, Messrs. Cheal and Son won easily with charmingly set blooms of Eclipse, Fuji San, Ferita, Snowdrop, Hector, Miss Roberts, Winona, Betty (new), Columbine, Flambeau, Kitty, and Brilliant; Mr. J. Walker was a good second. Three competed for twelve varieties, cactus, three of each, Messrs. Cheal winning again with high-class examples of J. B. Riding, Rob Roy, Mrs. H. Shoesmith, Hélene, Conrad, Ruby Grinstead, Flame, Lustre, Wm. Marshall, Ivanhoe, Mauve Queen, and Harold Pierman. Messrs. Cheal also won for twelve bunches of pompone dahlias with neat, medium-sized blooms, Daisy, Crusoe, Girlie, Cyril, Darkest of All, Dr. Jim, and Adelaide; Mr. J. Walker second. Messrs. J. Jefferies and Sons, Cirencester, had the best roses in eighteen varieties, really nice blooms for so late in the season.

Gladioli were well staged by Mr. F. Eames, Frome, who secured the first place with an unnamed set of high quality flowers; Mr. J. Walker second. The class for twelve vases flowers, distinct, arranged in a space of 10ft. by 2ft. 6in., produced five entrants. Mr. W. Barnes, gardener to A. F. Walter, Esq., Bearwood, Wokingham, was first with huge sheaves of Lilium tigrinum splendens, Bougainvillea Sanderi, Hydrangea paniculata grandiflora, and Montbretia crocosmiæflora; Mr. C. Page, gardener to J. B. Fortescue, Esq., Dropmore, second. Mr. Barnes also won first place for nine bunches of sweet peas with richly-coloured examples of leading varieties.

FRUIT.

Fruit is always a strong feature at this show, and for a collection of six dishes, distinct, Mr. G. Nichols, gardener to the Duke of Wellington, Strathfieldsaye, was first with Muscat of Alexandria and Gros Maroc grapes, Violette Hative peaches, Humboldt nectarines, Hero of Lockinge melon, and excellent Brown Turkey figs; Mr. Thomas Hatton, Badgemore, Henley-on-Thames, second with very fine Barrington peaches and Gros Maroc grapes; Mr. W. Palmer, Andover Nurseries, was third. Seven competed in the class for three bunches Black Hamburgh grapes, Mr. F. Bright winning easily with full clusters of well-ripened large berries; Mr. S. W. Sherlock second. For three bunches, any other black grape, Mr. Nichols won with Madresfield Court, very fine in every respect; Messrs. Hatton and Sherlock second and third respectively with the same variety. There were five sets in the class for three bunches of any white variety, Mr. Nichols winning with Muscat of Alexandria in fine condition. Mr. G. Ellwood, gardener to W. H. Myers, Esq., Swanmore Park, Bishop's Waltham, second with just a trifle smaller bunches, yet well finished. Peaches were few in number, yet good in quality. Mr. Dymock, gardener to G. D. Faber, Esq., M.P., Rush Court, Wallingford, won with Sea Eagle in prime condition; Mr. Nichols second with Violette Hative. Mr. Dymock was also successful in the nectarine class with Humboldt in prime order. Mr. Nichols a close second with Dryden.

Plums were numerous and good. For three dishes six competed, and Mr. Nichols was first with Washington, Transparent Gage, and large Black Imperial; Mr. Johnson second.

Dessert apples in three dishes were staged by ten exhibitors, Mr. Ellwood winning with handsomely-coloured fruit of Beauty of Bath, Lady Sudeley, and Reinette Grise; Mr. Page second. No fewer than fifteen staged three dishes of kitchen varieties, Mr. Barnes winning with a fine trio; Mr. Nichol second. The latter also won for both green and scarlet-flesh melons.

VEGETABLES.

These receive much encouragement here, and, as a rule, they are presented in excellent form. Apart, however, from the first two collections in the leading class, the quality throughout the show was but moderate.

For ten distinct kinds, for which the prizes were provided by Messrs. Sutton and Sons, the competition was limited, but the quality was high. Mr. Dymock was awarded first prize for an exceedingly fine lot, in which Ailsa Craig onion, New Red Intermediate carrot, Centenary pea, Superlative potato, Perfection tomato, and Best of All runner beans were conspicuous; Mr. G. Ellwood was a capital second; Mr. J. Hudson, Leicester, third. For six kinds, maiden class, Mr. Nichols was first with a desirable exhibit; Mr. E. Deakin, Hay Hall, Hay Mills, second. Mr. H. Keep, Aldermaston, won the premier award for six dishes in Messrs. Webb and Sons' class with an even display. Single dishes were numerous and good.

First-class certificates were awarded to Messrs. Cheal and Sons for dahlias, Lusitania and Betty, the first-named an exquisite cactus variety, very dark in colour, and the latter quite one of the best of the singles.

Chester.

AUGUST 26.

This show was held in connection with the Cheshire Agricultural Society on the Roodee, and in quality proved an advance on that of last year, especially in the groups and vegetables. The day proved favourable, and the tents throughout the afternoon were crowded with visitors.

For a group of miscellaneous plants Mr. E. Stubbs, gardener to F. B. Summers, Esq., Bache Hall, won with a well-arranged display, in which apricot and scarlet gesneras proved highly effective. Mr. W. H. Shaw, gardener to A. Ashworth, Esq., Horsley Hall, was a good second, and Mr. D. Macphie, gardener to T. G. Williamson, Esq., Arrow Hall, third. For six stove or greenhouse plants Mr. J. Breen, gardener to John Mosford, Esq., Righi, Tattenhall, led, with Mr. W. Reeves, gardener to E. Peter Jones, Esq., Greenbank, second.

In the class for four ferns the position of these two exhibitors was reversed.

In competition for the prizes for four pelargoniums the prizetakers were Mr. J. Breen, Mr. W. Reeves, and Mr. T. Dean, gardener to J. R. Darsie, Esq., Newton House, Chester. For one begonia Mr. W. Dunning, gardener to the Rev. M. W. Kinlock, Eccleston, was first.

In competition for the prizes for cut blooms Thomas Coatup, Esq., Spital, had the best dahlias, Mr. J. Breen the leading asters, Mr. W. H. Shaw, hardy annuals and herbaceous flowers, staging a capital collection; Mr. E. Jones, gardener to G. H. F. Robertson, Esq., Gresford, with a smaller collection, also for twelve vases of sweet peas. In the class for a small collection Mr. John Haycock, Wrexham, was the winner. For twelve roses, Mr. E. Jones was well in advance with medium, fresh blooms. Thomas Jones, Esq., Ruabon, scored for the bowl of roses, and E. Smith, Esq., Upton, for gladioli. For two bunches black grapes Mr. J. Clack, gardener to J. G. Frost, Esq., Boughton Hall, Chester, was first with Madresfield Court, and for two bunches of white grapes the same exhibitor with well-coloured Muscat of Alexandria. Mr. W. Pilgrim, gardener to Sir George Meyrick, Bart., had the finest peaches with Princess of Wales; Mr. N. F. Barnes, gardener to the Duke of Westminster, the finest nectarines, staging well-coloured Pine Apple; Mr. George Atken, Wrexham, good apricots; Mr. W. Dunning, the leading melon. For a collection of nine dishes, Mr. N. F. Barnes won with a grand lot, his melons, apples, and plums being especially noteworthy. The prizes in classes for vegetables were well contested, the entries being numerous and the quality high. In the three classes for collections of six distinct kinds the first-prize winners were Mr. W. S. Sharp, gardener to H. N. Gladstone, Esq., Burton Manor; Mr. W. A. Pierce, Waverton; and Mr. Charles Parker.

Messrs. Dicksons, Chester, contributed a large collection of cut flowers of herbaceous and border plants of high quality.

Cardiff Gardeners' Association.

A large number of the members of the above-named association availed themselves of the kind permission which had been granted by the Marquis of Bute to visit the gardens at Cardiff Castle on August 22. Mr. H. R. Farmer met the party at the North Road Lodge. The old gardens were first visited, where there is still remaining a great portion of the fruit and plant houses which are traditional in the horticultural world, and are still keeping up that tradition under Mr. Farmer's direction. The apple and pear trees are heavily laden with fine fruit. These trees are some of the finest in the country. Attention was next directed to the new gardens which are under reconstruction, under the superintendence of Mr. Farmer. New vineries, peach and plant houses, and pits, have been recently erected, being entirely built of teak. The newly-planted vines and peach trees have done remarkably well, and have produced an abundance of the finest fruit. The plant houses are well furnished with a grand collection of innumerable varieties of well-known plants. The chrysanthemums and winter-flowering carnations, which are at present in the open, are very fine and healthy. Too much praise cannot be bestowed on Mr. Farmer for the splendid condition of the gardens and pleasure grounds. No doubt more will be seen and heard of these new gardens, which take rank with the finest in the United Kingdom.

Before the members dispersed, Mr. S. Medhurst and Mr. D. Cory, vice-presidents of the association, proposed and seconded respectively a hearty vote of thanks to Mr. Farmer, which was carried with acclamation, Mr. Medhurst remarking that all they had seen was excellent. Mr. Farmer, in responding, thanked the speakers for their kind remarks, and hoped that it would be his pleasure to receive the members of the association another year.

R. T. W.

Bristol Gardeners' Association.

The usual monthly meeting was held on Thursday, August 27, at St. John's Parish rooms. Mr. S. Shaddick presided over a good attendance. The lecturer was Mr. Morse, gardener to Sidney Humphries, Esq., who gave a very instructive paper upon "Tuberous Begonias," which are grown so well at Eastfield Lodge.

Dealing with propagation first, Mr. Morse said the stock may be increased both by cuttings and seed. He did not advise the former unless it was necessary to perpetuate a certain variety, as it was the only reliable means of doing so, but propagation by means of cuttings weakened the constitution of the plants. Seedlings were the best for bedding out. The soil in the seed pans should, he said, not be allowed to become dry, as drought would prove fatal to the young seedlings. A gentle bottom heat was better than a strong temperature. Those required for the flower garden should be gradually hardened until they were ready for planting out. If grown in pots for greenhouses the ventilators should be open day and night through the summer months, as the cooler the condition the better. Those grown in beds are greatly benefited by mulching with cocoanut fibre refuse or peat moss manure. Mr. H[illegible] opened the discussion, and he was followed by Messrs. Curtis, House, Wakefield, Garn[illegible], and Shaddick, after which a hearty vote of thanks was accorded to Mr. Morse.

For six bunches sweet peas, Mr. Har[illegible] was first, Mr. T. Clarke second, and Mr. Dainton third. For a basket of sweet peas, juniors only, Mr. Whiting was first, Master Fred Curtis second. An ordinary certificate was granted to Mr. Pratt for a melon.

H. W.

Dutch Bulb Growers' Society, Haarlem.

The following awards have been made at the recent meetings of the Floral Committee of this society:

First-class certificates were conferred on early gladioli Gordon, lilac with white blotch, a seedling variety obtained in 1906, and Innovation, light rose with white blotches, a seedling variety of 1905; Spanish iris, F[illegible] white, shaded with lilac, and Queen Wilhelmina, pure white and deep yellow, remarkably early-flowering. Ixia Lady Helen Vin[illegible] obtained from seed in 1903; the colour is very soft rosy-pink, quite a new colour in ixias. Richardia Gloire de Hillegom: the colour is canary-yellow with a deep purple basal blotch; the foliage is mottled with white. Richardia Mrs. Roosevelt, light sulphur-yellow, a variety of American origin.

Awards of Merit were made to Anomatheca cruenta alba, a pure white variety of this lovely bulbous plant; it flowered for the first time in 1906. Anemone Comtesse de F[illegible], double variety of nice form and bright violet colour. Anemone White Lady, a fine double white variety. Early gladioli Cath[illegible], white with light-coloured blotches; and Lady Howard, white, shaded soft lilac. Spanish iris Lothair, light blue and soft lilac.

BULBS AND THEIR CULTIVATION

A Complete Illustrated Guide to the Selection, Planting and General Culture of Bulbs and Tubers in Garden and Greenhouse.

W. H. & L. COLLINGRIDGE, 148 and 149, ALDERSGATE STREET, LONDON, E.C.

ANSWERS TO CORRESPONDENTS.

TRICHOPILIA NOBILIS ALBA.—C. and Co., Bradford: The list in which Sir Trevor Lawrence is credited with having received an award of merit for this trichopilia was compiled from the official list issued by the Royal Horticultural Society. You will see that in describing the new plants in our issue of the 29th ult., the names of the exhibitors are correctly given.

NOTICE TO LEAVE.—P. T., Coventry: The notice that you have received is in order, and you must leave at the end of the month. There was no necessity for the notice to be given in writing, and the notice was given you by the head gardener acting as agent for your mistress. As you evidently do not live on the place, you could not legally claim more than a week's notice.

PACKING CARNATION BLOOMS. — R. M., Yorkshire: There is really no difficulty in so packing carnations that they will not appreciably suffer in passing through the post, although so many fail to pack them satisfactorily. As you do not give us any particulars we cannot say definitely why you have failed, but it is probable that you have selected flowers somewhat too advanced in development, and packed them loosely. It may be you have followed the practice still too common of placing the flowers in contact with dry cotton wool, which is not only difficult to remove, but absorbs the moisture. To overcome the difficulty you have had obtain a box of a suitable size to hold the number of flowers you wish to send, and have it long enough to admit of the blooms having from twelve to eighteen inches of stem. The box may be of tin, light wood, or stout cardboard, the first-named being preferable, but tin boxes are unfortunately expensive and heavy. The flowers will travel safely in boxes of thin wood or cardboard, provided the stamps are affixed to a loose label, so placed that they can be obliterated without stamping the box. In addition to the box, have at hand cotton wool and brown and tissue paper. Select flowers that are not quite fully expanded, cut them early in the day, and immediately put the stalks in water. Then lay in the bottom of the box two or three thicknesses of damp brown paper, and over this place tissue or soft thin packing paper. Then lay the flowers carefully in the box, cover them with soft paper, and over the paper place sufficient cotton wool to prevent them moving about when the lid is fixed in its place. Pack them a short time before the post leaves, and when the packages are sent into country districts the preferable course will be to post in the afternoon, and thus ensure their reaching their destination early in the following day. All flowers that are to be despatched by rail or post should be placed in a cool room or shed with their stems in water for at least half an hour before they are packed.

POST CARDS.—A. J.: We are much obliged by your letter, but there does not appear any occasion to refer to the matter further.

DISEASED CUCUMBERS.—A. E. M., Carisbrook: We have submitted the leaves you sent us to a careful examination, and as the result we have no doubt that the plants are suffering from the disease known as Cucumber Leaf Spot, which is caused by Cercospora melonis, and is so prevalent as to inflict heavy losses on growers for market. Three years ago there was considerable discussion concerning some secret remedies for this disease, but we have not heard anything further about them.

TRAINING IN GARDENING. — "K. H. M.": Such situation as that which you desire will be very difficult to obtain; and we can only suggest that you make your requirements known by means of a few advertisements. There are several colleges and schools at which women are trained in gardening, but the fees for a year's course will be found considerable.

BLACK HAMBURGH v. MUSCAT OF ALEXANDRIA GRAPES.—J. C. B. writes: "Would you please give me your opinion regarding a special prize for the best bunch of grapes? Whether you would give it for Black Hamburgh or Muscat of Alexandria, both being equal. The Muscat of Hamburgh was first in its class, and the Black Hamburgh was first in the class for black grapes. So the special prize was awarded to the best bunch in the show." Our correspondent, while stating the case fairly well, fails to say whether a bunch of the Black Hamburgh or the Muscat of Alexandria was selected for the award of the special prize. That, however, does not prevent us readily answering the question. Muscat of Alexandria is unquestionably the finest flavoured of the two grapes, and also the most difficult to grow, and therefore if we had a bunch each of the two grapes before us, and both were grown to the highest degree of perfection, we should unhesitatingly give it the prize. In the same way, if the two bunches represented the same degree of culture in their respective classes, the bunch of Alexandrian Muscat would receive the award. But we should not place a second-rate bunch of Alexandria in a higher position than a first-rate bunch of Black Hamburgh, because the "best bunch" must in such case be that which represents the highest cultural skill. Seldom in judging grapes, as of other things, is the line of demarcation so clearly defined as is here suggested, and when the two grapes here referred to come into competition, it is not easy to determine which is the best. We offer no opinion on the award made in the case cited by our correspondent, but may state, as a general proposition, that well-finished bunches of Black Hamburgh are preferable to indifferent examples of the Muscat of Alexandria.

FAILURE WITH STRAWBERRIES.—With reference to the question raised by a correspondent some time since, as to the cause of failure of his strawberries that were under galvanised wire netting, the Hon. A. H. T. de Montmorency, M.D., The Grange, Carrickmines, writes: "I have been looking over some back numbers of THE GARDENERS' MAGAZINE, and in the issue of June 6 last, I saw the question relating to failure with strawberries. I at once write to throw light on this subject, and, as this is planting time, I would suggest your publishing my note. I consider my experience is a very marked answer to your correspondent. I have grown strawberries on an extensive scale for over thirty years, and I have never had a plantation fail until last season. Thinking I would start a small fresh plot of Royal Sovereign, I sowed, after planting, some seeds of All the Year Round lettuce, and to prevent the birds eating the seeds, I put several pieces of sparrow-proof galvanised netting over a part of the plot. It was left there throughout the winter, with the consequence that I had neither lettuce nor strawberries. Most of the plants presented the appearance of having been burned, being brown and dead. The other part of the plantation was all right. There is not the slightest doubt now in my mind as to the cause of the failure. I was puzzled over it, and suspected the netting, for there was nothing else different from any other bed or the rest of that bed. In my case the netting was lying on the ground, not supported at all. I thought whether it could be electrical, for the rain water is very corrosive on zinc sheeting, and that is one reason why lead has to be used where otherwise zinc might answer, in water gutters, etc. This corrosive action of the zinc and iron might act in producing electric currents.

FRENCH GARDENING.—E. O., Marlow: We are sorry you found your visit to the market garden so disappointing, but we do not see that any good purpose would be served by the publication of your letter. We should not, indeed, feel justified in publishing it until we could verify the statements, and this there is no occasion to do under the circumstances.

SPARROW TRAPS.—W. P. P.: We appreciate your kindness in sending us the circular, but the matter contained therein is best suited for our advertisement columns.

NOTEWORTHY GRAPE VINES.—B. W., York: There are a considerable number of grape vines remarkable for their age and size, but there are six that stand out pre-eminently among their compeers. These are the Cumberland Lodge (Windsor Park) vine, which occupies a house 138 feet long by 2 feet wide, and has a stem nearly four feet in circumference; the Finchley vine, which in 1862, when only six years old, filled a house 90 feet long by 18 feet wide; Kinnell House (Breadalbane) vine, which was planted in 1832, and fills a house 172 feet long and 25 feet wide; Maresa Lodge (Roehampton) vine, which was planted in 1862, and many years ago filled a house 424 feet long; Hampton Court vine, which occupies a house 65 feet long by 30 feet wide; this was planted about the year 1770, and has a main stem 3½ feet in circumference; Sillwood Park (Sunninghill) vine fills a house 129 feet long by 12 feet wide, and the main stem has a circumference of three feet. These are all Black Hamburghs.

NAMES OF PLANTS.

W. M. B., Brighton. — The plant is the double rose-coloured form of the bramble, and its scientific name is Rubus fruticosus fl.-pl. rosea.

S. T., Kent.—1, Tillandsia fenestralis; 2, Æschynanthus longiflorus; 3, Bignonia argreo-violascens; 4, Aristolochia ornithocephala; 5, Asparagus retrofractus arboreus.

F. A., Beaumaris, Anglesey. — The sunflower is Helianthus multiflorus. We are not able to give you the name of the border carnation. There are several carnations with flowers somewhat similar in colour, although not, perhaps, equal to your variety in vigour of growth and profusion of flowering.

AMERICAN GOOSEBERRY MILDEW IN ESSEX.

In the interests of fruit-growers throughout Essex, it is expedient that the greatest possible publicity should be given to the fact that, after extensive ravages in many of the Eastern counties, the American Gooseberry Mildew has at length appeared in this county. A gooseberry mildew order will be issued by the Board of Agriculture, as a natural corollary, and growers should see that every effort is put forward to ensure the efficient working of the order on their part. The mildew, as its name implies, is a native of America, and was unknown in Great Britain till 1900, when it was found in two Irish counties; by 1907 it had spread to no fewer than 21 counties. In respect to the damage done by the disease, Dr. Pethybridge says: "As regards Ireland, it is no extreme view of the case to state that the losses have been in many cases most serious, and unless the disease is checked we are threatened with nothing less, practically, than the total loss of the profitable cultivation of the gooseberry as a bush fruit. What is true of Ireland is true also of Essex. I will gladly give any help to Essex fruit-growers who care to write me on the subject.

C. A. EALAND, B.A., F.L.S.,
Biologist to the Essex Education Committee.
County Laboratories, Chelmsford.

FORTHCOMING ENGAGEMENTS.

TUESDAY, September 8.—Woodstock Horticultural Society.
WEDNESDAY, September 9.—Royal Caledonian Horticultural Society; two days.
THURSDAY, September 10.—London Dahlia Union, at Royal Botanic Gardens, Regent's Park; two days.
North Middlesex Dahlia and Horticultural Society, at Alexandra Palace; two days.
FRIDAY, September 11.—Newart Hill Horticultural Society.
SATURDAY, September 12.—Galashiels Horticultural Society.

OBITUARY.

◆

MR. W. MITCHELL.

We much regret to record the death of Mr. William Mitchell, who for over a quarter of a century occupied the position of head gardener at Chilworth Manor, the residence of J. Willis Fleming, Esq. During the period that Mr. Mitchell had charge of the Chilworth Manor Gardens he effected many improvements, and specially distinguished himself as a cultivator of grapes, and was the winner of many prizes both in London and the provinces for these fruits. Mr. Mitchell rendered valuable aid in the management of the societies in the district that have for their object the advancement of horticulture, and for the past twelve years he was a member of the council of the Southampton Royal Horticultural Society. The services rendered by Mr. Mitchell in the management of the gardens under his charge were highly appreciated by his employers, and he was held in the highest esteem by those who served under him, and by his many friends. A striking proof of this was the large gathering at Chilworth Church on the occasion of the funeral, and among those who paid the last tribute to his memory were Mr. and Mrs. Fleming, Mr. C. S. Fuidge representing the Southampton Society, many gardeners in the district, and practically the whole of those engaged on the estate from the steward downward.

MRS. JOHN WALKER.

We regret to record the death of Mrs. John Walker, which occurred at Thame on the 24th ult. Mrs. Walker, who was in her 84th year, was the senior partner in the firm of John Walker, Thame.

MR. GEORGE BETHELL.

We have to record the death of Mr. George Bethell, which occurred at his residence, The Firs, South Woodford, on the 27th ult., in his 76th year. Mr. Bethell for many years took an active interest in horticultural matters, and was a Fellow of the Royal Horticultural Society for 38 years, and for a long period a subscriber to the Gardeners' Royal Benevolent Institution.

A New Bulb Book.—At a seasonable moment a new work on bulb culture is announced for publication next week by Messrs. W. H. and L. Collingridge, Aldersgate Street, London. "Bulbs and Their Cultivation" is the title, Mr. T. W. Sanders is the author, and the price is 2s. 6d. net (by post 2s. 10d.) The work, which is freely illustrated, is divided into three sections: Outdoor bulbs—planting in beds, borders, rockeries, grass, window boxes, etc., lifting and storing, soils and manures; Indoor bulbs—hothouse, warm house, cool and cold greenhouse bulbs, forcing, frame culture, etc.; Miscellaneous—propagation, pests and diseases, common names, etc. Tabular lists of species and varieties are also given.

HARDY BORDERS for colour effect, to give a succession of flowers for many successive seasons. Write at once with particulars of space to be filled, and (on order) selections will be prepared and posted ready for planting in September on Kelway's "Artistic" border system. KELWAY and SON, Langport.

KELWAY GARDENS,
Greenock,
26th August, 1908.

Messrs. Kelway and Son,
Langport, Somerset.

Dear Sirs,—You will be pleased to hear that the £10 or so which I have sent you in the last few years have made my garden (½ acre) one beautiful mass of colour all the year round.

This year especially the place has been a perfect picture—quite as fine as any of the pictures in Walter Wright's "Perfect Garden."

I am.
Yours faithfully.

FOR AUTUMN PLANTING.

PLANTERS OF FRUIT TREES should write for our fully descriptive catalogue and supplement of, post free and gratis to customers.

Well-ripened trees of all kinds, and our large, developed specimens of Vines, Figs, Peaches, and Nectarines, are especially good.

An inspection solicited.

GEORGE BUNYARD and CO., Ltd.,
The Royal Nurseries, MAIDSTONE.

11, 12 & 13, KING ST., COVENT GARDEN, LONDON.

DICKSON'S BULBS.

A common cause of failure in bulbs is the planting of diseased roots. It is only after the trouble of growing that your plants show disease. To guard against the heartbreaking results of careful labour, we personally visit the bulb farms of Holland and elsewhere, and only select the healthiest and most robust stock. Thus in buying bulbs from Alex. Dickson & Sons, Ltd., you can rely on securing stock which has been selected with the utmost care by a house with 72 years reputation at its back.

ANT. ROOZEN & SON'S GUINEA PACKAGE

(Delivered Entirely Free in London)

OF

CHOICE HARDY BULBS.

COLLECTION "F" FOR SPRING GARDENING

Contains **1,002** Bulbs.

48 Hyacinths, distinct colours.
50 Tulips, single early.
50 Tulips, double.
25 Tulips, single late.
20 Narcissus polyanthus.
30 Narcissus incomparable
24 Narcissus poeticus.
24 Anemones, double.
50 Anemones, single.
36 Gladiolus nanus.
300 Crocus, in four distinct colours.
100 French Ranunculi.
50 Snowdrops, single
75 Spanish Iris.
18 Scilla sibirica.
4 Lilium umbellatum
50 Eranthis hyemalis (Winter Aconite
24 Ixias, best mixed.
24 Triteleia uniflora.

HALF OF THE ABOVE FOR **11s.**

Our Bulbs are Perfect Bulbs direct from Holland—THE Great BULB LAND.

The above Package may be had from our Agents,

MERTENS & Co.,

3, Cross Lane, London, E.C.,

On Receipt of Cheque or Post Office Order.

Our Descriptive CATALOGUE OF SPLENDID BULBS (100 pages in English), containing FULL CULTURAL DIRECTIONS, will be sent post free on application to our Agents, as above, or ourselves direct at

OVERVEEN, HAARLEM, HOLLAND.

MAY-FLOWERING DARWIN AND COTTAGE

TULIPS.

GOLD MEDAL R.B.S., MAY, 1908

Our Collections contain only the finest varieties in cultivation, most of which have been awarded certificates. We offer the following selections at specially Low Rates:—

DARWIN TULIPS.

Barrone Tonnaye, rosy carmine; **Fra Angelico**, purple; **La Candeur**, white; **Landelle**, deep **Loveliness**, rosy pink; **Margaret**, pale pink; **Painted Lady**, French grey; **Phyllis**, soft heliotrope: **Prevost Exilles**, mauve: **Pride of Haarlem**, rosy crimson.

5 each of the above 10 varieties, 50 in all, **5/6**
10 " " " 100 " **9/6**
25 " " " 250 " **21/-**

MAY-FLOWERING TULIPS.

Bouton d'Or, yellow; **Didieri Alba**, white; **Eurasian**, buff; **Fulgens**, crimson; **Gesneriana Major**, scarlet; **Inglescombe Scarlet**, A.M., R.H.S., scarlet; **La Merveille**, orange terra cotta; **Parisian Yellow**, yellow; **Picotee**, white and pink; **Viridiflora**, green.

5 each of the above 10 varieties, 50 in all, **4/-**
10 " " " 100 " **6/-**
25 " " " 250 " **13/6**

Special Price Darwin Tulip Clara Butt.

The finest Darwin Tulip in cultivation. Colour Salmon-Rose. **2/6** per dozen, **16/-** per 100. For full descriptions of these and other collections see our Autumn Catalogue.

NOTES OF THE WEEK.

Movements of Plants.

Although Mr. Francis Darwin did not, in his presidential address at the opening meeting of the British Association, follow the lines that some writers assured us he would do, he presented some strong arguments in support of his views with regard to plants being highly organised individuals, keenly sensitive to external conditions; and of this sensitiveness being in a large degree due to something equivalent to habit or unconscious memory. He should, he said, endeavour to give a general idea of how the changes going on in the environment act as stimuli and compel plants to execute certain movements; and then proceed to show that what is true of these temporary changes of shape we describe as movements of plants is also true of the permanent alterations known as morphological. It would indeed be hardly necessary to insist that as the study of movement includes the problem of stimulus and reaction, morphological changes must be investigated. These two departments of inquiry should, in fact, be classed together, as this combination has had the important result of making it evident that the dim beginnings of habit or unconscious memory we find in the movements of plants and animals, must have a place in morphology. With regard to the doctrine of the inheritance of acquired characters which is by some considered a lost cause, Charles Darwin, in his book on "The Power of Movement in Plants" (1880), pointed out that "it is impossible not to be struck with the resemblance between the foregoing movements of plants and many of the actions performed unconsciously by the lower animals." In the year previous to the publication of the work mentioned, Sachs called attention to the resemblance between the irritability of plants and animals. With reference to the essential character of stimuli and of the reactions they call forth, Pfeffer has stated that an organism is a machine set going by touching a spring or trigger of some kind; a machine in which energy can be set free by some kind of releasing mechanism. The energy of the cause is, in Mr. Darwin's opinion, out of all proportion to the effect, a small stimulus producing a big reaction. Thus a plant may be made to curve by altering its angle to the vertical, by lateral illumination, by chemical agency, and so forth. The difference between cause and effect should not surprise us. "We might," said Mr. Darwin, "have guessed that big changes would result from small stimuli, since it is clear that the success of an organism in the world must depend, partly at least, on its being highly sensitive to changes in its surroundings." The permanent or morphological changes and the stimuli by which they are produced have engaged the attention of Goebel, Klebs, Vochting, and other botanists for some years past, and the morphological changes have been brought under the rubric of reaction to stimulation, and considered as essentially similar to the class of temporary movements. The first stage in development may be determined by a purely external stimulus. The position of the first cell wall in the developing spore of equisetum is determined by the direction of incident light. Stabl, to whose investigations reference was made, has shown that beech leaves developed in the shade in the middle of the tree are so different in structure from leaves in full sunlight that they might be mistaken for leaves belonging to another species. Klebs has found in the course of his investigation that the flowers of Campanula trachelium can be changed from blue to white and back again to blue by varying the conditions under which the plant is cultivated. Other interesting results of Klebs' investigations might be given, but it must suffice to state, in the words of Mr. Darwin, that "we are so much in the habit of thinking of the stable element in ontogeny that the work of Klebs strikes us as a shock." This investigator assumes that every species has a specific structure, and that this structure has certain pobrought to light by appropriate stimuli. In stating his views on the unconscious memory of plants induced by external conditions, Mr. Darwin referred to the peculiarities tentialities which may be of sleeping plants as illustrative of his arguments, or in other words, plants whose leaves assume a position at night different from that occupied during the day. This change of position is known to be produced by the alternation of day and night. But this statement by no means exhausts the interest of the phenomenon. As was pointed out, if a sleeping plant is placed in a dark room after it has gone to sleep at night, it will be found next day with its leaves in the day position, and will again assume the nocturnal position as evening comes on, although there is no alteration in the light. This Mr. Darwin regards as a habit built up by the alternation of day and night. The plant normally drops its leaves at the stimulus of darkness, and raises them at the stimulus of light, and thus we see the leaves falling and rising in the absence of the usual stimulation. Since this change of position is not due to external conditions it must, it is considered, be the result of the internal conditions which habitually accompany the movement. This is a striking characteristic of habit, namely, a capacity acquired by repetition of reacting to a fraction of the original environment. Pfeffer accounts for the behaviour of sleep-

MR. J. C. TALLACK.

ing plants principally on the more general ground that when any movement occurs in a plant there is a tendency for it to be followed by a reversal, a swing of the physiological pendulum in the other direction. The fact that the return movements occur at the same time-intervals as the stimuli is obviously the most interesting feature of the case. It would be different if the pendulum-like swing always tended to occur naturally in a twelve-hours rhythm; but Pfeffer has shown that a rhythm of six hours can be readily built up, and Mr. Darwin and Miss Pertz produced a half-hourly rhythm by alternate geotropic stimulation.

Mr. J. C. Tallack, whose portrait is given in this issue, is so widely known as one of the foremost gardeners of the present day, and so highly esteemed by those who are acquainted with the man and his work, that not a few of our readers will derive much pleasure from seeing his portrait. A Cornishman by birth, Mr. Tallack commenced his gardening career by serving five years' apprenticeship in the gardens of Porthgwidden, where orchids were largely grown, and the glass department a special feature. No doubt the early training here and the love of gardening established a special liking for the culture of New Holland and other plants too tender to be grown in the open in this country, but which succeed under glass with but little artificial heat. After serving some time in the gardens of Wynyard Park, Durham, and Looton Hoo, Beds, Mr. Tallack obtained the position of foreman at Higham Court, Gloucester, and this he occupied three years. This position was relinquished to enable him to take charge of the gardens of Prideaux Place, Padstow, and during the five years he was there he formed the main flower garden and established most of the glass department. Then, after an interval of two years, which was spent in the landscape department of Messrs. J. Veitch and Sons, Mr. Tallack received the appointment of head gardener at Livermere Park, Suffolk, where herbaceous plants, fruit, and vegetables were special features. Here he remained between eleven and twelve years, and then took charge of the gardens at Shipley Hall. During the ten years, less three months, that Mr. Tallack has been at Shipley Hall the gardens have been thoroughly reconstructed, inside and out, all the houses having been moved or remodelled, and many fresh features added. These latter include an exceptionally fine pergola, and admirably arranged lily ponds in the open and under glass. With a thorough training and varied experience, coupled with a strong affection for the garden and ability of a high order, Mr. Tallack has made himself so good a master of all departments that it would be difficult to indicate any direction in which he may be said to specialise. Once he told us that he had from the first aimed to become an all-round gardener, and in his endeavour he has achieved success of a very high order. Of Mr. Tallack's ability as a writer on horticultural subjects, we need not speak, his contributions to these pages being sufficient evidence, but we may mention that he is not less successful as a lecturer, his most recent educational work having been at, and under the auspices of, the Nottingham University College.

Colour Chart.—The Council of the Royal Horticultural Society have long felt the need of a chart for the international standardisation of colours, but the huge expense of producing it has hitherto deterred them from issuing it. Not long since a most admirable chart, containing more than 1,450 shades of colour between white and black, was published in France, at the instance of the French Chrysanthemum Society, the price in England being £1 1s. net, and by this chart it is now possible to recognise or describe to a friend or purchaser at a distance the precise colour of any possible flower. The cost of this chart, £1 1s., has been somewhat prohibitive to its purchase in the past, but by undertaking to be responsible for the disposal of a large number, the society is now in a position to offer this chart to its Fellows at the reduced cost of 14s. 6d., for which price it can be obtained at the society's offices, Vincent Square, Westminster, or it can be sent free by post for 15s.; but in all cases a cheque or postal order must be sent beforehand.

Sugar in Snowdrop Leaves.—In the course of a paper read at a meeting of the botanical section of the British Association, Mr. John Parkin gave some interesting particulars of the sugar present in the leaves of the snowdrop. His paper was entitled "The Carbohydrates of the Snowdrop Leaf and Their Bearing on the First Sugar of Photosynthesis," and at the outset he stated that his researches had been conducted with a view to extend the knowledge regarding the sugars which occur in the leaf as the direct of photosynthesis. In the course of his researches sucrose was found in considerable quantities in the snowdrop leaf in conjunction with glucose and fructose. Analyses of leaves gathered at various periods and at different hours of the day enabled him to state provisionally that the total quantity of sugar ranged from 20 to 30 per cent. of the dry weight; and that the amount of sugar increased from the apex to the stalk at the same time as the ratio of the sucrose to the glucose and fructose diminished. Leaves deprived of a considerable amount of light still contained a moderate amount of sugar. The percentage fell with some degree of rapidity during the first 48 hours and then remained nearly constant. Plants that were deprived of light for some time and then fully exposed showed a large increase of sucrose, with but little change in the glucose and fructose. In Mr. Parkin's opinion greater importance should be attached to the presence of sucrose in the leaves of the higher plants, and its probable usefulness as the chief form in which the carbohydrates passed through the tissues.

Danger of the Plane Tree.—Lord Walsingham calls attention to an unsuspected source of irritation to the respiratory organs which he attributes to the plane tree. He writes: "The globular seed catkins of the common plane tree, Platanus orientalis, are composed of slender, hard, thread-like rods, diverging from a common centre. The fruit is ripened in October, and remains on the tree during the greater part of the winter, then falling, and splitting into myriads of little fibres, which are broken into shorter lengths by road traffic, whirled along with the dust, filling the air with innumerable minute spiculæ, which enter the eyes, nostrils, mouth, and probably lungs causing irritation, and producing an inflammatory condition of the mucous membrane. I have strong reason to suspect, from more than one case that has come under my own observation, that these spiculæ give rise to many attacks of so-called pneumonia, which have hitherto been consistently attributed to other causes. Such attacks occur for the most part during the earlier months of the year, especially in dry weather, and in London are often supposed to be connected with the accumulation of polluted dust particles on the wood pavement. There is scarcely a health resort in the South of Europe where plane trees are not a common feature in the landscape. In Perpignan, where some of the finest specimens that can be found form a magnificent double avenue, I have seen on a windy day masses of dead leaves and seed fibres swept along the streets, covering the floor of every shop when the door was open even for a few minutes. On the west side of Cannes the same whirling particles are an accompaniment of every high wind: yet persons with delicate lungs flock to such places in winter and spring in complete ignorance of the danger they incur. It is enough to examine, under a microscope, any small sample of dust gathered from a road on which plane trees grow to be convinced of the probable effect that such dust must have upon the delicate breathing organs of a human subject The plane tree is not only beautiful, but, through the habit of shedding its bark, is specially adapted to cultivation in towns where other species with persistent bark become smoke-begrimed, but, having regard to its rapidly-extending culture, it seems desirable to call medical attention to it as an unsuspected source of throat and lung trouble, even at the risk of disparaging its otherwise well-deserved popularity."

Garden Design.—At the recent meeting of the Royal Horticultural Society Mr. Thomas H. Mawson, A.R.I.B.A., gave the first of a series of three lectures on "Garden Design." In this lecture Mr. Mawson defined the broad ethical principles of garden design as gathered from the great historical examples of ancient art. He said it was his practice in studying anything in the shape of visual effects, whether of a constructive or artistic character, to take into consideration the age, the racial instincts, the religion, the pervading customs, and the environment generally of the designers or producers of the work that obtained at the respective periods to which their work was always relative. Mr. Mawson passed under review the gardens of Egypt, Babylon, and other countries of the east, and in referring to some of the broad principles of garden designs, urged the importance of the garden being restful. The remaining lectures will be given at the Horticultural Hall, on September 15 and 29, at three p.m., and will be illustrated by lantern slides.

Destroying Sparrows.—With reference to destroying sparrows where they are so abundant as to be a nuisance, Mr. Oliver Anketell describes as follows the method by which he greatly reduced their numbers. "Permit me to state how I in my American home reduced the nuisance. Sparrows in town and country, where no houses are thatched, find it difficult to get a fitting location for their nests; so acting on this theory I constructed what I may call "a sparrow house," with about 12 small separate compartments, an opening to each from outside, a resting place or perch projecting from each cell; when completed, I placed the house upon a tree or pole (made fast in the ground). The sparrows, thanking me for my consideration, forthwith took possession, little dreaming what was in store for them. At night, when all in the house was still, not a creature stirring, not even a mouse, I drew a bag over the house, making it fast beneath, and in the morning removed house and contents to the nearest pond, and all in that house perished, and repeated this from day to day, until all sparrows from my vicinity vanished. This plan might appear cruel to some over-sensitive people, but it is not so cruel as poisoning."

DOG'S TOOTH VIOLETS.

Among the smaller bulbous plants there are few which have more innate beauty and grace than the erythroniums, or dog's tooth violets, which lend themselves to many purposes in our gardens, and are charming things when naturalised in the grass outside the cultivated ground. They are delightful even in grass in the more kept grounds, they are charming on rockwork, they are very beautiful in the border, and they may even be employed to form pretty edgings to beds or borders, or in still more formal spring bedding. The short life of their flowers and leaves renders them, however, less suited for the latter, and it is in association with other plants employed to carpet them, or in the grass that their real beauty is best understood. Their charm does not altogether depend upon the blooms, for the leaves of the great majority are beautifully marbled, and give in themselves attractions to the plants which would commend them to all who can appreciate such charms.

The dog's tooth violets, which are varieties of the old Erythronium dens canis, the common one, have been cultivated in British gardens from time immemorial, and many are the references to them in the gardening literature of olden days. They are very beautiful indeed, with their brightly-coloured flowers and their marbled and mottled leaves, but the newer American species and varieties have commanded universal admiration, and have speedily made for themselves a place in the best gardens, where such flowers are made welcome. The beauty of these is unquestionable, and as they present few difficulties of cultivation they are likely to grow steadily in the public estimation.

The cultivation of all the dog's tooth violets is remarkably easy, as the forms of E. dens canis will thrive in almost any soil, although not one of stiff clay; while the American forms delight in loam, leaf-soil, and a little sand. They do well enough in cold and wet localities in full sun, but the flowers and leaves last longer if they are planted in shade or semi-shade, conditions they prefer. Three inches is a suitable depth for planting, which should be done in early autumn.

European Erythroniums.

Erythronium dens canis.—Of this old dog's tooth violet, which is a native of Europe, a description seems hardly necessary. There are several varieties, including those known as E. sibiricum and E. japonicum, which are recognised to be only geographical varieties of this old species. The plants vary in colour of flower, some being pure white, others of various shades of purple or almost lilac, and others of a good rose. They are also variable in size, good stocks of large-flowered varieties being sold as E. dens canis grandiflorum. There are also several named varieties, of which La Candeur, Franz Hals, Vondel, and Rouge frappante are as good as any. All are so cheap that only the large-flowered varieties should now be cultivated.

American Erythroniums.

The classification and nomenclature of the American erythroniums are far from being perfect, and it seems a little difficult to unravel the confusion that exists regarding some species. One is safe, however, in following in the main in this respect that distinguished botanist, Mr. J. G. Baker, who has monographed the American species and varieties as a whole.

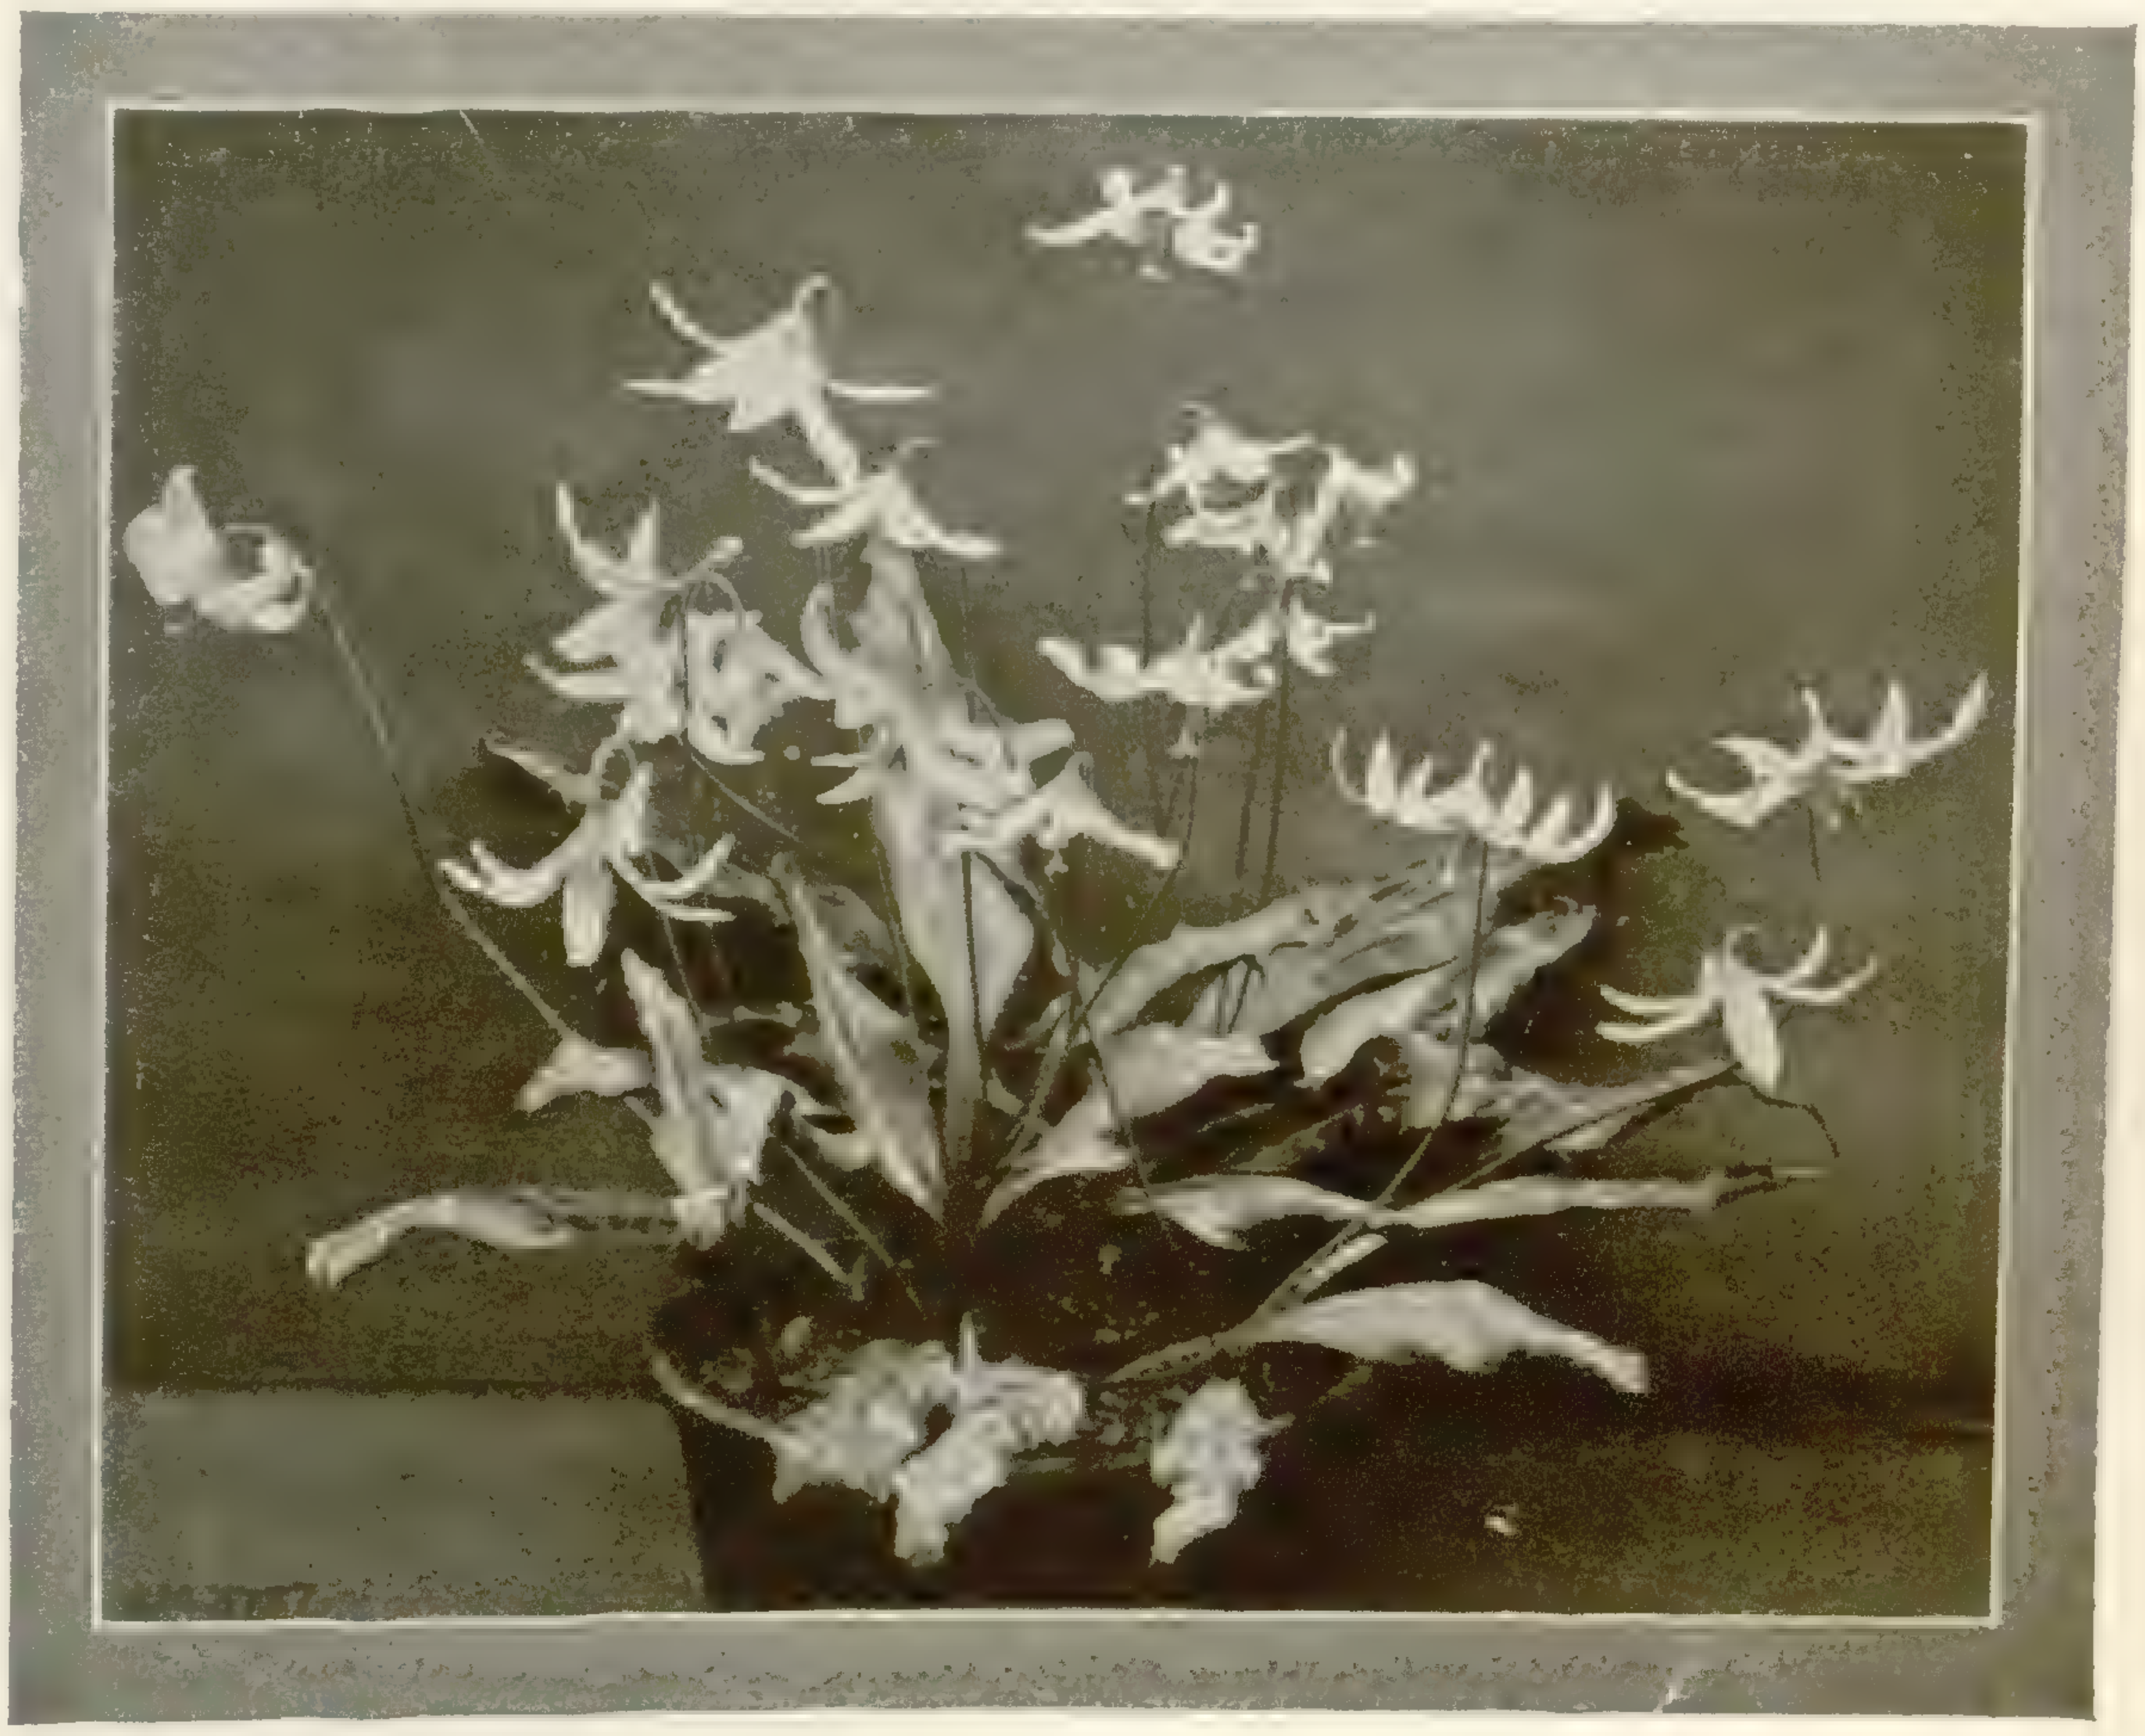
E. americanum is a handsome species, which has good yellow flowers, and prefers shade and a damp situation, but it is not satisfactory as a rule in cultivation, frequently failing to flower for many years after being planted. It is more satisfactory if it has its corms so confined that they cannot descend to any depth. A kind of box made of slate, but with holes for drainage; or planting in a part of the rock garden with stones underneath, has been found helpful in improving the flowering of E. americanum, whose corms seem to seek to go too deeply down, and often produce single leaves with no flowers. The yellow flowers of this species are sometimes tinged with purple, and the leaves are dotted and marbled with white and pale violet. It only produces one flower, and grows about four or six inches high.

E. californicum.—In referring to this one has to depart from Mr. Baker's classification of 1897, as it is not included in his monograph by this name, but appears to be his E. giganteum. It is one of the most ornamental and one of the very finest of the genus, the plant having large and beautifully mottled leaves, and producing scapes of from three to twelve flowers, of a good creamy-white or pale yellow, to a height of nine inches or a foot, or even more.

E. grandiflorum.—This handsome species suffers to some extent from the absence of the mottling on the leaves, but its flowers are so handsome that this may be pardoned, and as they are set off by the foliage being dark green, while they are of a clear yellow, the appearance of the plant is good. It comes from the West Coast of North America, from Idaho and Washington to British Columbia. Its height is generally from nine or ten inches to even as much as two feet. The variety Nuttallianum, of Regel, has smaller flowers on a shorter scape, sometimes classed as a species. It likes damp.

E. purpurascens.—A species which takes a high place among the erythroniums in cultivation is E. purpurascens, and there are among its forms quite a number of the most beautiful dog's tooth violets. I have here departed from the trade nomenclature as the form of E. purpurascens called uniflorum is sometimes sold as E. revolutum, a name not now recognised. This is a variable species, what is recognised as the type having several flowers of a light yellow, tinged with purple, which extends almost over the flower eventually, and pretty marbled or mottled leaves. E. Smithi is understood to be the same as E. purpurascens uniflorum, which has generally one flower on a scape. There are several varieties of this, but the typical one has whitish flowers passing off to purple. Some good pink varieties exist, that called Pink Beauty being among the best.

S. Arnott.



ERYTHRONIUM PURPURASCENS UNIFLORUM.

A beautiful Dog's Tooth Violet with flowers varying from yellow to pink.

DAFFODILS IN GRASS.

No apology is needed for the frequent advocacy of the practice of planting daffodils in grass, and in the wilder parts of the garden where an annual digging is not considered essential, for though the progress made in this method of dealing with some bulbous plants is great, the opportunities offered are much greater still, and there are yet large spaces in the surroundings of many gardens where the grass and other herbage is allowed to grow away at will until say mid-July, and then cut, perhaps twice over, during the remainder of the season. Such spaces are of the best in which to introduce any bulbs that ripen their foliage in time for the first cutting of the herbage.

Daffodils in their various sections cannot be surpassed for the purpose, for in such positions and such a setting they not only grow well, but, if well planted, they look at home and in every way suited to their surroundings. Personally I think they look best in informal groups containing from fifty to a hundred bulbs in each group, and planted in a more or less rounded form over an area of from twelve to twenty-four square yards, or even in larger groups still, but avoiding anything in the way of formal outline or any attempt to plant in lines. For immediate effect perhaps half-a-dozen bulbs should go to each clump, but I like to distribute them almost singly to begin with, for then there is no fear of the bulbs starving each other for many years. Moreover, where there is choice between two sites with different soils I would choose the soil of heaviest nature as, in this, bulb production is not so rapid though the individual growth is stronger and the flowers of most varieties are finer in a moist and rather heavy soil. On the other hand, for rapid increase of stock, I would choose the lighter soil, especially if it is of a sandy nature.

It will be found that a group of one variety is more effective than one containing several varieties, and whatever the quantity of stock may be, an attempt should be made to so group each variety. Certain varieties are better than others for this method of culture, but the choice is still an extensive one, so that a good and varied selection can be made while still confining the choice to varieties which succeed well in grass, and it is advisable to introduce some untried varieties when planting in case a gem may be found among them.

STAR DAFFODIL STELLA IN THE GRASS
In the Arboretum, Royal Gardens, Kew.

Most people love daffodils, and many even among those who have but limited space give up a good portion of their garden ground to them, thereby wasting room that might be utilised for other things, while at the same time they have the means to place their daffodils in positions, such as say in an old orchard among the fruit trees, where they would give the best effect without in any way encroaching on the garden proper, and where the flowers do not become splashed with soil during heavy rains, as they often do when grown on cultivated garden soil. For more than twenty years I have been carrying out this method of growing daffodils, and increasing stock each year, and during this period hundreds of thousands of bulbs have passed through my hands. In no instance has the work given any cause for regret, for though the result with a few varieties has not always been what one could wish, the labour entailed is small, the expense for the bulbs used for the purpose is not great, and the plants are quite inoffensive to such things as they may be brought into contact with. They take care of themselves in every way, being subject to few diseases, and practically immune from "basal rot" when planted in grass. The great essential is that the grass shall not be cut until the daffodil foliage has quite ripened. It is sometimes a little difficult to restrain the would-be mower, but, if the best results are to be obtained, this must be done, and for this reason I do not advocate an extensive use of the polyanthus type, though I have found some of these, notably the fine form named Grand Monarque, do fairly well and give useful spikes when the foliage has been allowed to ripen, and, of course, the various forms of the Poet's narcissus, also rather late in ripening, must be included in a representative collection.

During the past few years I have planted out many thousands of daffodils and other narcissi, which have been bought in for forcing in pots or boxes, in which, after forcing, the bulbs have been ripened off and then planted out. The position selected for planting in this case is in grass among forest trees which have been well thinned, with a view of encouraging a full development of their branches. A site of this kind proves an ideal one for the bulbs and flowers, and though the forced bulbs, as one might naturally expect, do not flower at all well during the first year, they recover themselves in the next year and continue to do well afterwards.

The method of planting is an easy one. A sod is partially lifted to a depth of from four inches to six inches with a narrow spade, the bulb or bulbs thrust in, so that the base rests firm on the soil below, and in an upright direction, and the turf is then allowed to go back into position.

Early planting is desirable and possible also with home-grown bulbs, as they commence rooting when the first rain comes, and get a start of those bought in, as the latter seldom come to hand much before September. The present is a good time to start with bought-in bulbs, but late for those which are home grown, unless the latter were lifted as soon as ripe and stored where they could not commence rooting. Bulbs left in the ground till now will have their roots far advanced, and would receive a big check if disturbed. I may add that planting is best done soon after heavy rain, as the turf can be turned up more readily when moist, and the bulb will be easier pressed into proper position under these conditions. I give below a selection of varieties that have been found most successful, but refrain from including any of the newer high-priced varieties, as these can only be tested in bulk when they become cheaper, and are not yet subjects for wholesale planting.

Among the long-crowned varieties the best are N. bicolor Horsfieldi, N. b. Empress, N. rugilobus, N. Emperor, N. cernuus, N. princeps, and N. telamonius plenus (Van Sion).

In the medium-crowned section we have many excellent varieties, notably Sir Watkin, Frank Miles, Autocrat, Minnie Hume, Barri conspicuus, Figaro, and, among the newer forms, Duchess of Westminster, grand for massing, of fine size and striking appearance, being almost white with a lemon-coloured lip. Then we also have the and forms of Double Phœnix, such as the Sulphur Phœnix, the Orange Phœnix, and the Yellow Phœnix, all of which are good for the purpose, as also are all the varieties of the Poet's narcissus, with the exception of the double form N. poeticus plenus, which is erratic and only does really well in favoured districts. This, if tried, should be planted from seven inches to nine inches deep.

J. C. Tallack.

Shipley Hall Gardens.

SPRING-FLOWERING CROCUSES.

Though these as a rule are harbingers of spring, there are several species that bloom in the autumn, and in the dull winter months, and whether grown in beds, borders, pots, frames, or planted in the grass they are alike attractive, for they bloom at a period of the year when flowers are much valued. I shall take an early opportunity of referring to them. Many of the species are but little known to the majority of gardeners, as they are seldom seen except in botanical collections. For naturalising in the grass they are most useful, as they prolong the season of flowering considerably.

Crocuses in Beds.

When planting these simply to produce a show in spring, and the corms are afterwards taken up before the foliage dies down to make room for summer bedding plants, the corms have not time to mature before they are lifted, the growth of these being then a secondary consideration; but when planted for a permanency the case is different, for unless the foliage is allowed ample room to develop the corms will not increase or grow to a respectable size, the consequence being that in a few years they would so deteriorate, if left to themselves, that they would fail to bloom. Though the crocus blooms during the winter and early spring months, the foliage does not become matured before July, for this reason the corms ought not to be lifted until it has died off. Some recommend planting the corms, deeply, out of the way of other plants, in order to avoid this annual lifting, but unless the soil is of a warm, light, sandy nature those so planted make but poor progress, and not infrequently rot.

When planted in beds simply for a spring effect, and it becomes absolutely necessary to lift them to make room for summer bedding, they should be taken up in showery weather, if possible, and carefully laid in soil in a shady place until the foliage dies off, which it soon will do, but even with all the care possible the corms deteriorate, as they have not attained their full size when lifted.

Crocuses in Borders.

When planted in borders filled with herbaceous plants the different species should be kept separate, and a label placed with each, for unless one is well acquainted with them, being somewhat alike, one is apt to forget their names, which makes them less interesting. There are numerous named varieties of Crocus vernus that are well suited for planting in bold masses, such as the large yellow, white, blue, and striped. Sir Walter Scott, Queen of White, Victoria. Sir John Franklin, Baron von Brunow, Cloth of Gold, etc.

Crocuses in Pots or Boxes.

Crocuses may be had in bloom very early in the season, provided they are planted at the right time, which is as soon as possible after the corms are ripe, that is, from the middle of August to the end of September. Those for indoor cultivation should be of the finest quality, as these give a greater wealth of bloom than the smaller ones. The soil used should be of a light, rich, sandy nature, that the roots may readily penetrate. As the corms will be somewhat exhausted by forcing, they may be planted rather thickly, as they will be of little value after flowering. When potted they should be stood on a bed of ashes, either in a cold frame or in the open; if the former can be provided so much the better, as they can remain there until the flower buds show themselves. The pots should be covered with some light material to the depth of about three inches. Sifted leaf soil, old mushroom bed, cocoanut fibre refuse and the like are useful. Some recommend sifted ashes, but this is a mistake, as it is far too heavy.

Crocuses bloom naturally in a low temperature, therefore but a small amount of artificial heat excites them into bloom. If a too high temperature be applied before the buds are well developed they fail to expand properly, therefore this should be avoided, better by far pot early and bring them on gradually than to try and rush them into flower before they are well rooted. Where very early flowers are desired potting should be done at the beginning of August, bringing them on when well rooted into heated pits close to the light, where air can at all times be freely admitted to produce well-developed flowers.

TRUMPET DAFFODIL EMPEROR IN THE GRASS

At Eaton Hall, Chester, the seat of the Duke of Westminster.

MISCELLANEOUS BULBS FOR CULTURE IN FIBRE.

In my recent contribution to the GARDENERS' MAGAZINE (page 644) on the cultivation of daffodils without drainage, such general details as the preparation of the materials, potting the bulbs, watering, and the positions most favourable for flower development, were so fully dealt with as to render further reference to them unnecessary. Therefore, in referring to the bulbs suitable for fibre culture, other than the daffodils, these notes will be limited to an enumeration of the best kinds and to such particulars relating to their culture as apply specially to them. The number of kinds that may be successfully grown in this manner is considerable, as proved by the fine examples that have been exhibited by Mr. Robert Sydenham within recent years; but my opportunities have not been such as to enable me to grow many kinds, and my notes will be more useful if they are limited to those I have grown myself, and I would add with success.

Crocuses.

Spring-flowering crocuses bloom most satisfactorily when grown in prepared fibre, and although the flowers do not retain their freshness for so long a period as one could wish, they are so effective as to justify their being included in a selection. They may be grown in the ordinary vases, but shallower receptacles are preferable, and I use bowls, some of the usual Japanese type, and some of earthenware. It is essential to success that good corms are obtained, and that they be put in the vases quite early in the autumn. There is no occasion to have a long list of varieties, and Golden Yellow, Madame Mina, white, striped with lilac; Mont Blanc, white; Purpureus grandiflorus, deep purple; and Purple Queen, blue purple, will make a good selection. The number of corms required for each vase will depend upon the diameter of the latter, and it will suffice to say that the corms should be arranged about two inches apart. The receptacles should be filled to within about one and a-half inches of the rim, and when the corms are placed in position they should be covered to a depth of about one inch.

WHITE ITALIAN GRAPE HYACINTH (MUSCARI BOTRYOIDES ALBA), GROWN IN FIBRE.

Hyacinths.

These are of much value for culture in fibre without drainage, and it may be reasonably anticipated that they will be more largely grown in this manner than has yet been the case. The varieties mentioned in the note relating to the prizes offered by Mr. Sydenham, for competition at the meeting of the Royal Horticultural Society, March 9, 1909, comprise some of the best in their several colours, and those who intend competing should, of course, select from the list. I have grown with much success Blondin, Grand Lilas, and Regulus, light blues; Charles Dickens, Grand Maitre, and King of the Blues, dark shades of blue; Fabiola, General Pelisser, King of the Belgians, and Robert Steiger, red shades. These I grow in vases five and seven inches in diameter, and in the first the bulbs are grown singly, and in the second three bulbs in each, these, of course, being of one variety. The material should not be pressed very firm, because when this is the case the bulbs will, when they commence to make new roots, be loosened in precisely the same manner as those growing in pots which rest upon firm soil.

Tulips.

The varieties belonging to the early flowering section are preferable for growing in fibre without drainage, and a selection should be made from them. Varieties that have flowered admirably with me include Boule d'Or, Duchesse de Parma, Joost Van Vondel, La Belle Alliance, Proserpine, Queen Victoria, Rose Gris de Lin, Snowflake, Scarlet Pottebakker, Tournesol, White Pottebakker, Vermilion Brilliant, and Yellow Prince. For tulips I use vases ranging from five to seven inches in diameter, and put from four to eight bulbs in each, and arrange them as near as may be at equal distances apart.

Grape Hyacinths, etc.

The Italian grape hyacinth (Muscari botryoides), and the netted iris (Iris reticulata) bloom very well when the bulbs are grown in fibre, and those who have the room should try a few. The iris may be grown in small vases as shown in the accompanying illustration, and in vases five or six inches in diameter, eight or more bulbs being put in each. I have a preference for the latter. The Italian grape hyacinths should be grown several together, in five or six inch vases. I have seen some remarkably fine vases of lily of the valley grown by the method under consideration, and I would suggest that a few vases of this fragrant flower be included. I have not as yet grown lily of the valley in fibre, but I shall do so this season. L. A.

TREE CARNATIONS.

I wish to fully endorse all Mr. Slade said in his recent letter regarding tree carnations for summer flowering out of doors. You were good enough to honour me by printing a letter on the same subject in the early spring and I hope you will be able to find space for this note. We at Messrs. Hugh Low and Co. have for the last two years carried on careful experiments to test the hardiness and summer-blooming qualities of the various varieties belonging to this section out of doors. While we have proved that almost all the varieties are hardy, yet some are much more suitable than others for summer flowering. For instance, the varieties forming the Lawson family come with too short a stem towards the autumn. Others burn in the sun. Yet an excellent collection, including all colours, can be selected.

The great advantage to be gained by growing the perpetual-flowering carnation as summer bedders is that they can be planted out in May, whereas the common border carnation must be planted in the autumn or very early in the spring to obtain any measure of success, thus putting spring bedding stock out of the question. As Mr. Slade says, old plants will give a good show of bloom from August onwards. Yet young plants specially grown for the purpose will entirely supplant border carnations because they commence flowering earlier, and continue to bloom until quite heavy frosts come.

At Bush Hill Park we propagate special batches of cuttings for this purpose; they are wintered in specially-constructed cold frames, and allowed to be frozen. By May they are bushy plants in 5in. pots, with from six to ten flowering growths, ready for bedding out. These commence to flower almost as soon as planted, and continue in bloom until the frosts spoil the flowers late in the autumn. Autumn-rooted cuttings will give good results, but we attribute our great success to early propagation and careful wintering in cold frames. MONTAGUE C. ALLWOOD.

Bush Hill Park.

THE BEST BEDDING HYACINTHS.

There is a wide difference in the decorative value of the various hyacinths as employed for bedding purposes, and while some retain their colouring and are extremely long lived others behave in very indifferent fashion when grown in the garden.

Over a long period I have annually planted upwards of 35,000 bulbs for spring display, and these have included from season to season nearly all the varieties in commerce, both in hyacinths and tulips, and I propose, in as concise a manner as possible, to enumerate a list of the very best all-round hyacinths in each shade of colour.

White Hyacinths.

If we take white varieties first La Grandesse must be given premier position, being perfect in every way. Madame van der Hoop has a wonderfully fine truss as regards breadth, but is rather short, and may well be employed for outside rows and groups near the margin, and associated with a fine crimson variety, such as General Pelissier. A powerful rival to the first-named is L'Innocence. The flowers are pure white, but, as far as my experience goes do not retain their freshness for so long a period. There is the faintest suspicion of blush colouring in Mina, but it is of great merit and must have a place amongst the best; to my mind the drooping flowers of Paix de l'Europe is a recommendation, as it certainly presents a less stiff and formal appearance than those which hold their inflorescence quite rigid. Alba maxima and Lady Derby, although good, are not equal to the foregoing.

Blue Hyacinths.

Turning to the blue varieties King of the Blues, of a dark shade, is extremely long lived when in bloom, and on this account is admirably adapted to associate with wallflowers, and is closely followed by Marie, a grand old dark variety. I must speak in praise of Grand Maitre, and if my choice was restricted to one blue variety, this would be chosen. Pienman appeals to me strongly on account of the somewhat thinly disposed flowers which does much to rid the spike of formality. Czar Peter is well known and altogether striking and distinct, but as compared to many others is short lived. It will be noted that this failing occurs in the majority of delicately tinted flowers. I have seen glowing accounts of Queen of the Blues, and it certainly is possessed of exquisite colouring, but the fact that it sometimes fails to expand, the upper portion of the spike withering away without any apparent reason, reduces its value as a bedder. The greyish blue colouring of Blondin will please most people, and for general utility and excellence it must be placed in the front rank. Magnificent amongst pale blue shades is scarcely worthy of its name, at the same time it is very reliable. Superb must be written against Grand Lilas, and once experimented with it will never be absent from the bedding arrangements. Of delicate azure blue, both spike and individual flowers being of fine proportions.

Red and Crimson Hyacinths.

As regards red and crimson shades General Pelissier is one of the most beautiful. In view of the fact that its flowers are sensitive to the sun's rays it should occupy beds in partial shade, or where the sun is obscured in the warmest part of the day. A fine effect is produced by associating it with Yellow Hammer in richest gold. Linnæus is good in the same shade, but the price is high for our purpose. Robert Steiger cannot be ignored in spite of more recent introductions. Garibaldi throws up a noble spike and yet the flowers are of quite medium size. Grand beds of this variety were seen in Hyde Park two years ago, as also of Macaulay, which is more accurately described as deep rose with a carmine stripe. The flowers are densely arranged on the spike. I was impressed with the beauty and behaviour of Victoria Alexandrina and Solfaterre in crimson and orange-scarlet respectively, in consequence I am employing them on a larger scale this season.

Rose and Pink Hyacinths.

We have some very pleasing varieties in the rose and pink shades, and here Gigantea must take first place. As seen in the company of pure white varieties the effect produced is very fine, being both soft and pleasing. The very delicate rose colouring appeals strongly to the fair sex. Norma is not a new comer, but the waxy pink flowers are very beautiful, and the only failing is that it blooms at too early a date, and cannot be relied upon to appear fresh and beautiful simultaneously with the general display. Princess of Wales cannot fail to please the most fastidious, and I would urge that it be given a trial. Extreme vigour is stamped upon Gertrude, and small wonder that it is largely employed as a bedder, seeing that in addition to this good quality it is of a fine deep pink shade. Deep salmon is seen in Cavaignac, its beauty being enhanced by rose coloured stripes.

THE NETTED IRIS (IRIS RETICULATA) GROWN IN FIBRE.

Purple Hyacinths.

The exceedingly dark or purplish black kinds do not seem to me to be worthy of attention for bedding, and perhaps are seen to best advantage when associated with tulip white Joost van Vondel, or Sutton's Golden Yellow wallflower. The great depth of colouring seen in Mon Tresor tulip will also contrast finely with them; Uncle Tom, Masterpiece, and King of the Blacks are the best.

Yellow Hyacinths.

Yellow plays an important part in the decorative scheme, and Yellow Hammer and King of the Yellows are fine indeed. Ida is spoken highly of by some, but to my mind it has a washed-out appearance, more especially after being fully expanded for a few days. Primrose Perfection, although the same shade, is vastly preferable. Obelisque and Alida Jacoba extend the list, and although there is naturally a diversity of opinion as to the merits of hyacinths and everything else, I hardly think the varieties enumerated are surpassed for beauty, longevity, and general excellence.

I may take this opportunity of saying that the season of beauty of spring-flowering bulbous plants generally is appreciably lengthened by thorough soakings of water from time to time. It often happens that we experience a period of drought, together with drying winds instead of showers in April, and this leaves light ground more particularly almost destitute of moisture, at least as far as the root system extends, hence the necessity of attention in this way.

GRAPES AND HOW TO GROW THEM.—An illustrated guide to propagation, culture, and management in vineries, greenhouses, and in the open air. By J. Landell, F.R.H.S. Price 1s. net, by post 1s. 2d.; cloth, 1s. 6d., by post 1s. 8d., from W. H. and L. Collingridge, 148 and 149, Aldersgate Street, London.

MAY-FLOWERING TULIPS.

The tulips that yield of their floral beauty during the month of May comprise four distinct groups, all of which are well deserving the attention of those who appreciate the charms of plants blooming in spring, although differing somewhat in merit for garden decoration. First we have the varieties popularly known as the cottage tulips, and remarkable for the varied forms of their flowers and their attractive colours, and for their usefulness in the production of striking colour effects. Then follow the Darwins, which have flowers differing little either in form or size, and, as a whole, quieter in colouring than the cottagers; the Rembrandts, an attractive race, having flowers that differ chiefly from the Darwins in being striped or flaked, and tulip species which afford a great diversity in the size, form, and colour of their flowers, and in their cultural requirements. These notes will be devoted to the first two sections, which are unquestionably the most generally useful for beautifying the garden in May. It might, indeed, be suggested that the cottage and Darwin varieties be selected for planting in large numbers for the production of broader colour effects; that Rambrandts be planted in a quiet, yet sunny part of the garden, where their exquisitely beautiful markings can be fully enjoyed, and that the species be planted in a border or bed where they can have their requirements complied with, and where also there will be no occasion to disturb them before their growth is fully completed.

A FINE BED OF TULIP INGLESCOMBE PINK.

This is one of the finest of the May-flowering tulips, and has large salmon-pink flowers. The illustration is from a photograph taken in Messrs. R. Wallace and Co.'s Nurseries, Colchester in May last.

The principal object of these notes is to assist readers in making selections from the large number of beautiful varieties now in cultivation; but before discussing the merits of varieties there are one or two points to which reference might be made with advantage. In the first place, it must be pointed out that the May-flowering tulips do not so readily fit into a scheme under which spring and summer displays of flowers are produced as do the early Dutch tulips. As a set off to this they are more beautiful, and they bloom at a time when outdoor flowers can be fully enjoyed. If the preservation of the bulbs is not a matter of importance they can be used, and with good effect, in the spring displays, as the beauty of their flowers will have gone before the tender bedders will have to be planted, and they can at once be lifted and disposed of in such manner as the cultivator may determine. In other cases they can be grown in the beds and borders devoted to hardy perennials, as in these there will be no occasion to disturb the bulbs until they have attained their full maturity, and not even then every year. This is a most important consideration, for unless tulips can perfect their bulbs before they are lifted they fail to bloom satisfactorily the following season.

When grown in conspicuous beds, or in geometric schemes, such as that at Eaton Hall, of which an illustration is given in this issue, each bed should be devoted to one variety. When grown in mixed borders it is a good plan to arrange them in groups containing about twelve bulbs each. If care is taken to so arrange the varieties as to obtain a good balance of colour, they produce a charming effect, and when the number of varieties is considerable afford much that is of interest. It is desirable it should be clearly understood that while tulips will produce fairly good blooms in impoverished soil, a comparatively rich root medium is necessary for their full development. The cultivator who would achieve the highest success should moderately enrich the soil and deeply stir it.

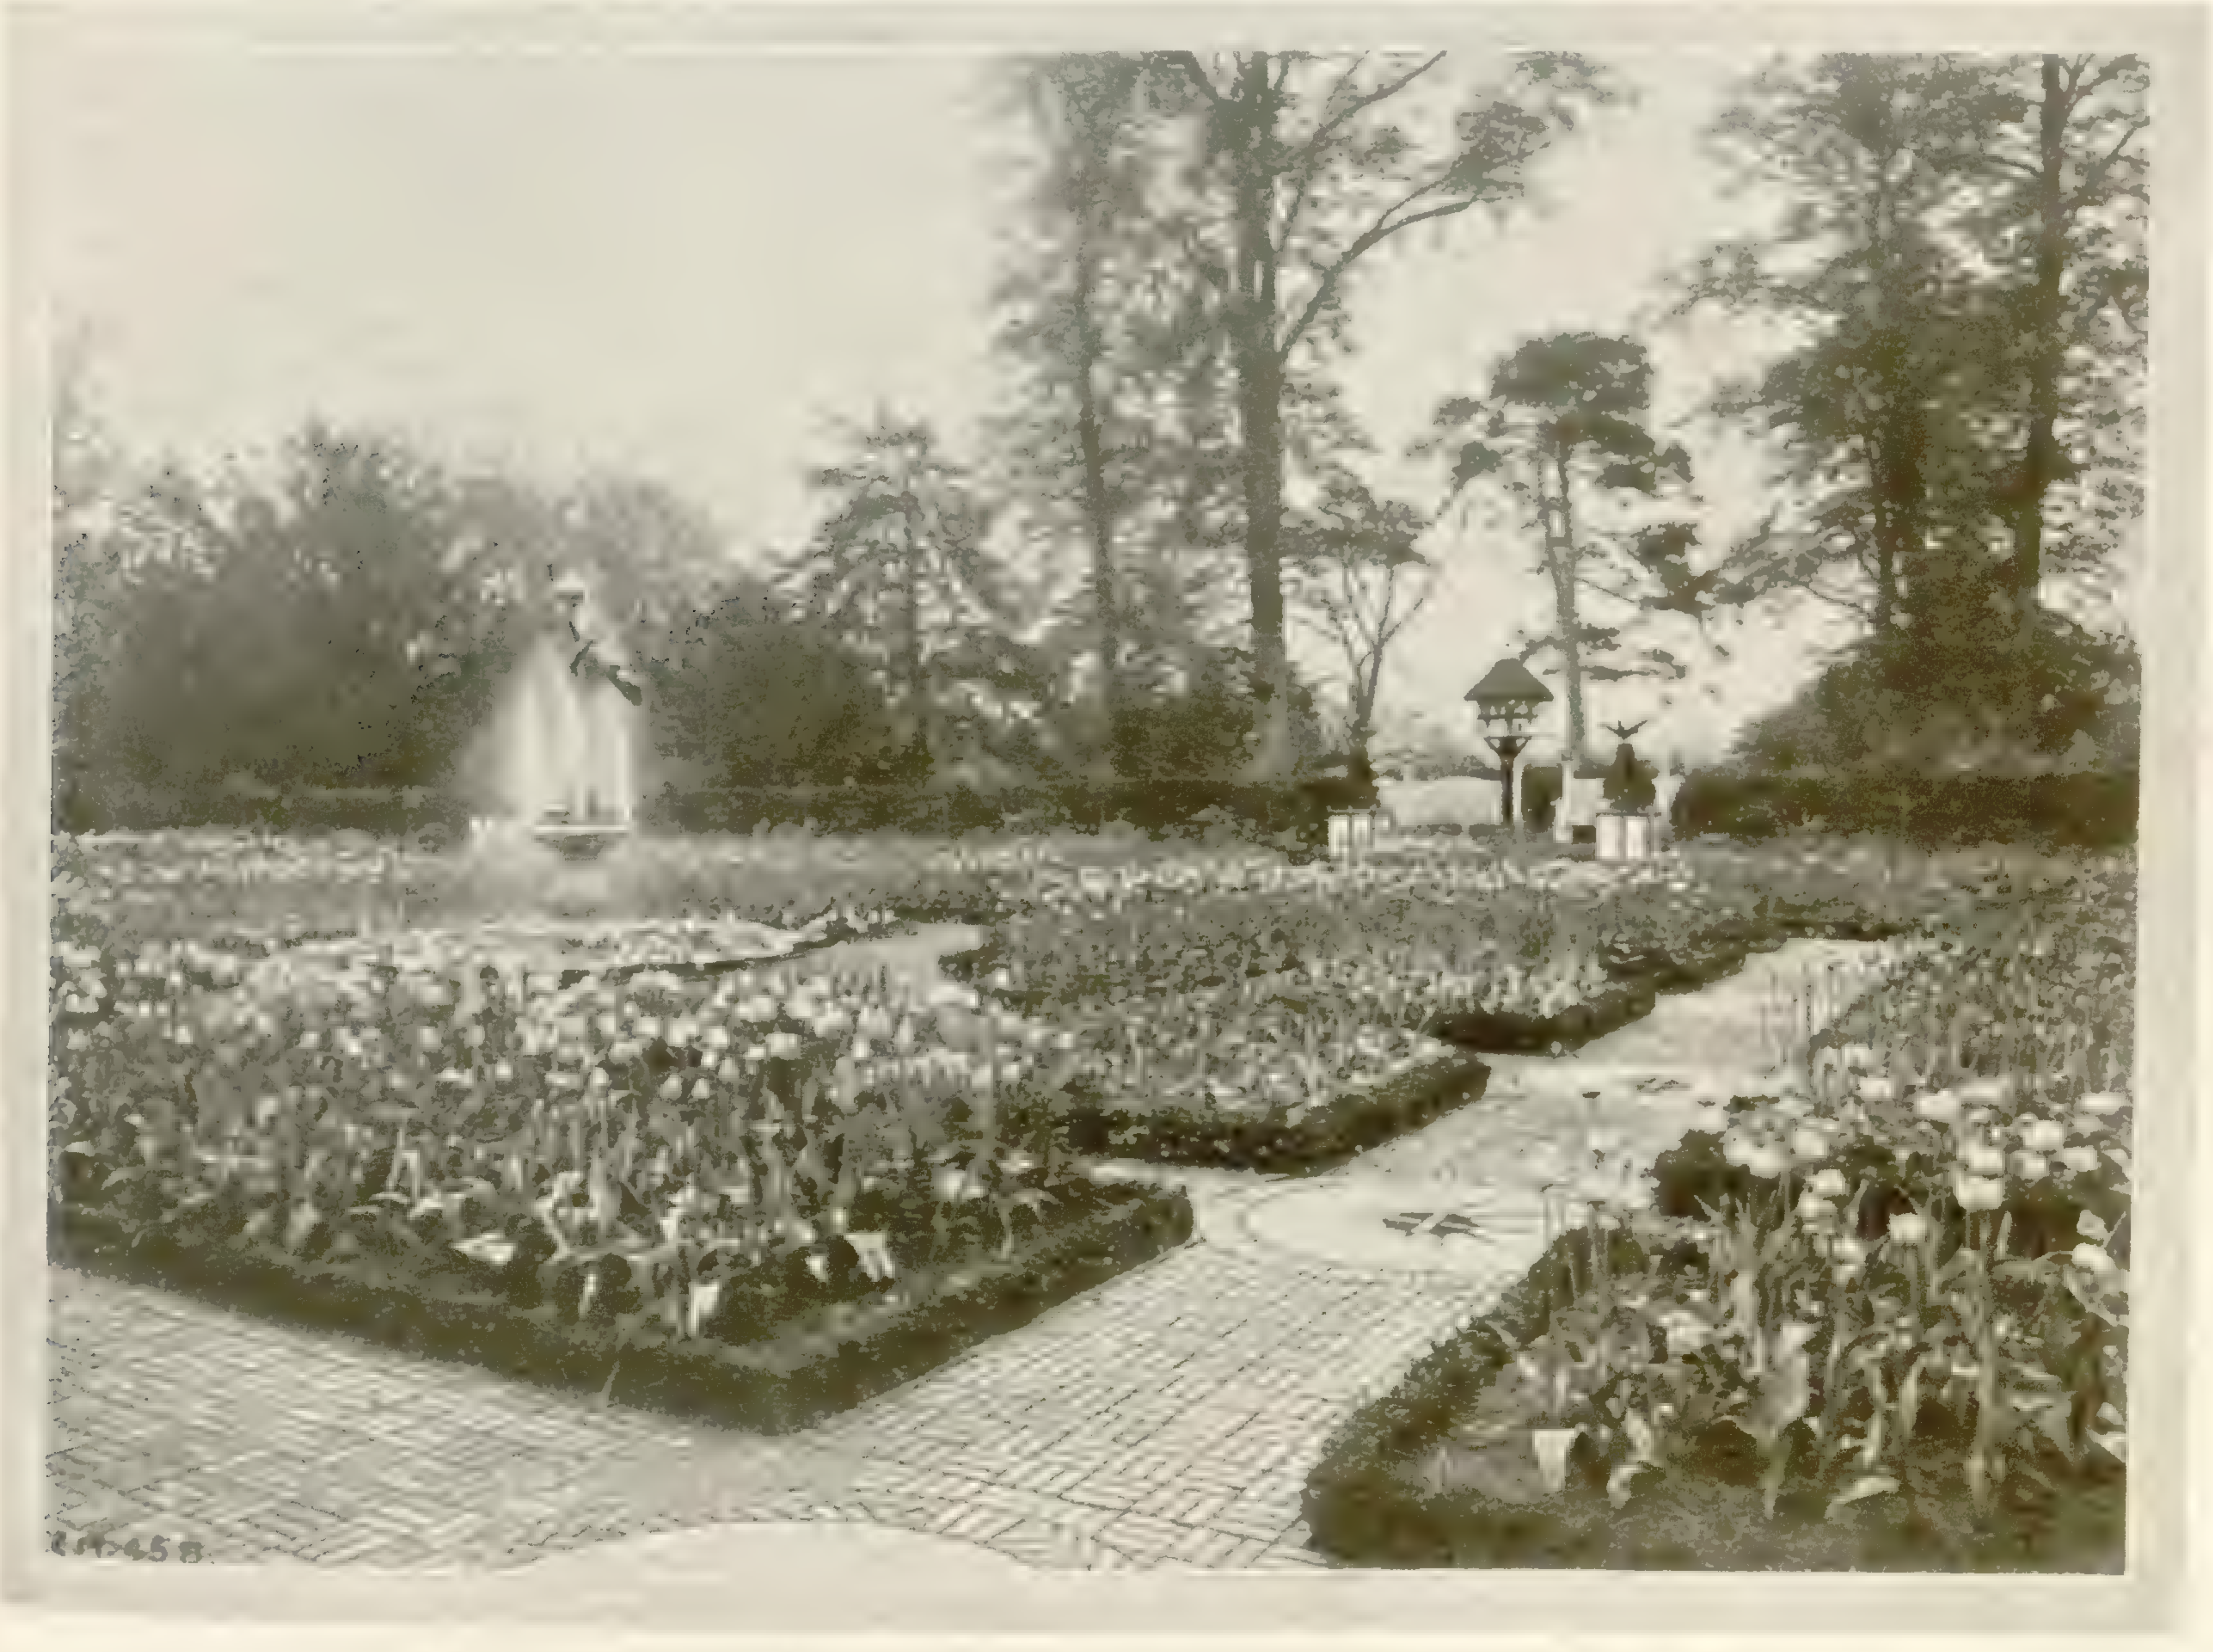
In turning to the notes on cottage tulips made last season there is considerable difficulty in making a really short selection because of the large number of really fine varieties that are in cultivation and obtainable at a price that is certainly not excessive. An endeavour will, however, be made to limit the selection to those varieties which cultivators generally should grow. Varieties with flowers of various shades of yellow are numerous, and the following are highly meritorious and quite distinct. Afterglow, a handsome variety, the flowers large deep yellow, becoming suffused with crimson when fully developed; very effective in bold groups. Gesneriana lutea, a tall-growing variety with flowers of considerable depth and a rich yellow colour. There is a pale coloured form of this known as pallida which should have the attention of those who have the space for a considerable number of varieties. Golden Spire, known also as elegans lutea maxima, is also of tall growth and has flowers remarkable for their length, the colour orange-yellow. Inglescombe Yellow, an effective variety, the flowers large, canary-yellow, and borne on stems about twenty-four inches high, one of the best. Kathleen, a pleasing variety, with pale yellow flowers of fine form. Mrs. Moon, one of the largest of the yellow May flowering, bright in colour and in every way desirable. Primrose Beauty, a charming variety, the flowers large and of the tint of the primrose. Parisian Yellow, a fine tulip for beds and large groups, the flowers of fine form and rich in colour. Retroflexa, an extremely elegant variety, the flowers large with recurving petals, the colour soft yellow.

From the several shades of crimson, red, and scarlet may with advantage be selected Coronation Scarlet, a distinct variety, remarkable for its effectiveness; the flowers of great depth and the colour vermilion. Elegans, soft crimson, the flowers large with reflexed petals, and specially adapted for indoor decorations. Flame, a fine variety with large finely formed flowers of a rich orange-scarlet hue. Gesneriana major, one of the best forms of Gesner's tulip, the large crimson flowers being of fine form and producing a striking effect. Inglescombe Scarlet, a very distinct and handsome variety, the flowers large, brilliant scarlet, and borne on tall stems. La Mer-[illegible], a beautiful red tulip with large flowers having elegantly reflexing petals. [illegible] Emperor is as yet rather expensive, [illegible] possesses so much merit that at least [illegible] group should be grown if there are no [illegible] objections to paying fifteen shillings [illegible] per dozen for the bulbs. The flowers [illegible] of the largest size, brilliant scarlet with [illegible]olden base, and are singularly effective, [illegible]ore especially when the sun is shining upon them.

The shades of rose and pink are less [illegible]rous than the others; but they are [illegible]lant among the Darwins. Briefly [illegible]ed the best are Inglescombe Pink, an [illegible]xceptionally fine variety, which, like the [illegible]ther two Inglescombe varieties, is remark[illegible]le for distinctness of character, fine form [illegible]f the flowers, and for effectiveness of [illegible]lour. The general character of the variety is well shown in the illustration of a large bed in the bulb grounds of Messrs. R. Wallace and Co., Colchester, where annually the May-flowering tulips form a fine feature. The colour is a rich shade of salmon-pink. Isabella, cream colour suffused with rose-pink, an attractive variety of high quality, and Picotee, an exquisitely beautiful flower, margined and suffused with rose on a white ground; of great value for the supply of cut flowers, as well as for the furnishing of beds and borders. When grown in comparatively shaded position the colouring is rather weak, hence the desirability of giving it an open position.

The white varieties should include Elegans alba, white, edged with rose, the flowers of rather large size and with elegantly reflexed petals. Parisian, an excellent variety both for massing and groups, the flowers pure white, of good form, and borne on stems about eighteen inches high.

The following twelve varieties will form a good selection of Darwins for those whose space is limited, and they will form a good foundation for a more extensive selection for large gardens. They are all of high quality, and it will suffice to indicate the colours. Antony Roozen, deep rose, lighter towards the margin of the petals. Clara Butt, salmon-rose; one of the very best. Farncombe Sandars, dark crimson. Henner, crimson. King Harold, vinous crimson. La Tulipe Noire, very deep maroon, the nearest approach to black in the tulips. Madame Krelage, rose pink. Millet, crimson-maroon. Pride of Haarlem, bright red. Suzon, bright pink, shading to blush pink at the margins. Van Poortvleit, deep rose, and Psyche, light pink. G. G.



AN EFFECTIVE ARRANGEMENT OF MAY-FLOWERING TULIPS

In the Geometric Flower Garden, Eaton Hall, Chester.

GOOD GARDEN LILIES.

The lilies one can recommend as good garden plants of easy culture, or, as our worthy Editor puts it, "that ordinary men can grow," are not nearly so numerous as those of another category. The wonder is, with so many diverse conditions of culture presented throughout Britain, all the species of lilium have not found suitable conditions of growth where they could thrive and multiply in the manner of the martagons and L. candidum.

Those lilies a man can plant in his garden, and expect to see year after year, are mainly European, and it is with these it is proposed to deal in the following notes, not en bloc—for each species has peculiar needs which must be fully met, and as exhaustively as the limitations of my notes will allow.

The Madonna Lily.

First and foremost in garden value stands that paragon of lilies—L. candidum, the white lily, the cottager's lily, or the Madonna lily. Blessed with a constitution above the normal, and admired by everyone, this lily has become widely scattered throughout the land. Most village gardens contain a few plants, and where a colony existed in the garden of a generous owner twenty years ago, row after row, and patch after patch, of white lilies meet one's gaze throughout the village. The success of the white lily in the comparative neglect of a village garden often puzzles the professional gardener; he may plant his hundreds, and but few will thrive! His soil is all right, his intentions better still, his skill superlative, whence comes the trouble?—from the bulbs' source. It is a certain fact that many stocks of Lilium candidum on the continent are stricken with disease; numbers of these bulbs are distributed throughout Britain annually, the cultivator gets them through his dealer, fails with them, as a matter of course, and infests his soil with botrytis. Also, as a matter of course, lily culture with almost any species becomes impossible for him for three years at least. One hears much of the frosts affecting the white lily and causing disease, but less of the fact that frosts cannot create disease. They may, and often do, injure the plants in cottage gardens, but disease does not follow in such cases.

A TASTEFULLY ARRANGED GROUP OF THE MADONNA LILY (LILIUM CANDIDUM).

One of the salient features of lily culture is protection or shade on the eastward side of the garden; protection that will temper frosts, or shade that will temper its damage. A cultural and artistic association of old-time yews and the white lily becomes possible here, and, in many instances, has proved the only way of growing the white lily in some gardens. Many happy ways of using groups of L. candidum will suggest themselves, but one particularly happy grouping is worth placing on record. It was that of a broad belt of Portugal laurel as a wind screen, margined by a long border ten feet wide, entirely filled with narcissus (April), May-flowering tulips (May and June), white lilies, and blue delphiniums (July and August), and hollyhocks (August and September). It was my privilege to see this border at various seasons, and the July grouping of delphiniums and white lily was surpassingly beautiful. Another fact in connection with the white lily is that its only period of rest is in August, a few weeks ripening of the bulbs is not harmful, or really necessary, unless they must be moved. They should be replanted, however, before the end of September in order that the autumnal leaf-growth may develop fully.

The Orange Lily, Etc.

The next lily in order of garden value is the Orange Lily (L. croceum), which also is a well-known inhabitant of cottage gardens. Its erectly-held flowers, of deep orange, often in verticils, are not admired by everyone, the colour note appearing harsh. Arranged with Lysimachia aurea the colour softens, and each of the two shades of yellow helps the other. It likes a deep, cool soil, and to be able to rear its head in full sunlight. In Irish gardens, and in Western England generally, it has become somewhat of a weed, and in King Alfred's country many a bushel of bulbs have gone down stream as garden rejects!

L. umbellatum is another cup-flowered lily, modelled on the lines of L. croceum, which proves a capital amateur's plant. It likes a deep, cool soil, and its handsome white bulbs, which always look "fit to eat," develop into huge masses eventually. A big cluster of stems, a yard through, each surmounted by a pyramid of handsome flowers, coloured deep orange-red, is characteristic of well-grown L. umbellatum. Good forms are L. Joerg, with a tongue-shaped medium patch of yellow on each petal; Sappho, tipped with old gold; and Tottenhami, a clear old gold throughout. Erectum is the commoner form of merit.

Dwarfer still, but of the same type of flower, are L. bulbiferum and L. elegans. The former, an European species, the latter an Oriental group of garden forms, of which atrosanguineum proves very attractive and long-lived. Orange Queen, an improved form of elegans, is worthy of extended culture. Its broad, spoon-shaped petals, of good finish, make up a substantial flower, and this, with atrosanguineum, are the only two forms of elegans one can expect to keep indefinitely. They like a rich sandy loam, heavily dressed with leaf-soil, and an annual mulch of decayed manure to help the stem roots develop.

Martagon Lilies.

The European martagons give us many graceful species of easy culture. The common purple martagon is practically ubiquitous; its colour note is not attractive, however, but there are forms, equally easy to grow, that would please the most exacting of tastes, notably album, which delights in the slight shade thrown by spreading fruit trees; dalmaticum, a tall and robust deep mahogany-purple flower, with whitish, woolly buds; and Cataniæ, deep wine purple, often very intensely coloured. All the martagons enjoy sunshine, a deep holding loam, and they need early planting. Bulbs planted later than September are handicapped in their first year of growth, and suffer the tax of flower production without adequate root formation. Other martagons of easy culture are L. monadelphum, a lovely soft yellow bell-flowered lily, surpassed, however, in garden value by its form colchicum. This form is very adaptive, and where the shade of a slight growing tree can be provided it will attain giant proportions, yielding twenty or more flowers on six-foot spikes. Its flowers vary in tint from straw yellow to palest orange, and are dotted low down in the tube. It inhabits mountain defiles in the Caucasus, and enjoys pure loam untouched by manure of any description.

The Greek or scarlet martagons (L. chalcedonicum) are exceedingly popular, and fairly long-lived once established; they have the characteristic turn-cap flowers, thick petalled, and very lasting, they enjoy open sunshine, and the pure loam recommended for monadelphum. A year's wait is, however, entailed before the plants flower freely, but subsequent years show increased vigour, until tall, well-leaved stems, five feet high, with two or three verticils of flowers surmounting them, annually develop for generations. I have before me as I write a colony of L. chalcedonicum, veritably a thicket of stout stems, quite thirty years old: their shapely flowers always attract, and cut stems last three weeks in water if frequently shortened and refreshed. Vars. Heldreichi and maculatum, although distinct, do show the vigour of the type, and I have not yet seen really established clumps of either form. Carniolicum, with light scarlet flowers, and the scarlet pompone, L. pomponium, both from Eastern Europe, are other attractive martagons, the latter being very noteworthy as a good thriving species of high merit. It may be effectively described as a short-stemmed, multileaved, lax chalcedonicum, that dislikes disturbance exceedingly. Pyrenaicum, often called a yellow martagon, is not a general favourite. Its flowers are greenish-yellow, suggestive in this respect of the common Pyrenean fritillary, and in another of being so heavily scented that one prefers to be "up wind" on a hot day. It is a common inhabitant of Irish gardens, and its pungent odour is noticeable even in the bulbs. The best yellow martagon is the Japanese L. Hansoni, a sturdy grower, with leafage aggregated into verticils, and heavy clusters of light orange-burnished flowers in mid July. It grows readily, but needs shelter from easterly winds, and from strong sunshine, the former crippling the too precocious growths, the latter bleaching the flowers to a dull grey.

Other Lilies.

The American martagons give us some magnificent garden plants that are all too little used in modern gardening. They need a moist soil—every one of them, and if this can be provided one may recommend all the Panther Lilies (L. pardalinum), L. parvum, and L. Roezli for association with border plants, and such fairy lilies as canadense and Grayi for the marsh and bog, with L. superbum as the nearest approach to an aquatic the lilies can afford.

A few lilies thrive well in ordinary positions, and under crude conditions of culture, provided the soil is free, light, and moderately rich. One cannot recommend them for new town gardens, with builders' rubble and excavata as rooting material, but in old-time gardens, mellowed by time and tillage, one can grow L. Marham, a martagon of cloudy amber tint: Browni, a magnificent trumpet lily with ruddy-brown exterior: L. excelsum (testaceum), nankeen yellow: Turn-cap, flowers of chalcedonicum form, and of surpassing beauty: Henryi, the newest of the speciosum section, but infinitely better developed under glass than in the open; all the Continental forms of speciosum, which precede the Japanese forms by three weeks in their season of flowering, hence are more recommendable for outdoor culture: and all the forms of tigrinum, of which Fortunei is one of the best, will grow and thrive almost anywhere, provided the soil holds good. Every lily with masses of roots issuing from the base of the stem can be helped materially by mulching with fresh soil or old manure in the summer season. The lilies whose roots issue from the base of the bulb can only be helped at the start by planting them in late summer, and in deep, well-tilled soil, that would grow a cabbage well.

Lilies I cannot grow, and never could grow, other than as annuals, or, at best, biennials, are the forms of auratum, Batemannæ, concolor, many forms of elegans, Humboldti Washingtonianum, and its forms, Leichtlini, japonicum (Kræmeri), Walkeri, rubellum, and sundry American species not noted in the text. In the matter of the cultivation of these I am still a willing learner, but of isolated, short-lived successes, I believe there are several such, not of instances that enable me to describe them as "good garden lilies that ordinary men can grow."

George B. Mallett.

SOME NEWER NARCISSI.

The object of these notes is to call attention to some of the very best of recently introduced daffodils, beginning with the scarcer ones, the prices of which will be prohibitive to the generality of buyers, and ending with some which, although moderate in price, are yet very beautiful and worthy of a place in any garden. To take the trumpet section first:—

White Trumpets.

Ailsa.—A peerless flower, pure white, with the growth and carriage of Empress. Offered at £15.

Florence Pearson.—A giant among the whites, figured in the Gardeners' Magazine July 18, 1908. If it were a shade whiter I should place this variety at the head of the list, but, unfortunately, the trumpet is not white until the flower has been cut for a few days, in fact it is just about the same as one of its parents, Mme de Graaff, but for size and form of bloom, and for tremendous vigour of growth there is nothing to beat it. £6 6s.

NARCISSUS SNOWDROP.

Mrs. R. Sydenham.—A seedling from Mme. de Graaff. A beautifully refined flower, with long white trumpet, beautifully recurved at the mouth. £9 9s.

Pearl of Kent.—A real white trumpet daffodil, opening white on the bed. Segments very broad and overlapping, trumpet long and elegantly recurved at the edge. The plant is of extreme vigour, making foliage as large as Emperor, and a bulb measuring up to eight and a-half inches round. Personally I consider this the finest of the white daffodils. Offered at £15 15s.

Peter Barr.—A very fine variety, pure white, of large size and good proportions. The segments are prettily twisted, like the screw of a steamer, which gives the flower a distinct appearance. Plant of robust habit, with broad and ample foliage. Originally offered at £50 per bulb, now to be had for £12 12s.

White Knight.—A very fine white daffodil, perianth snow white, firm, and of good substance. Trumpet pure white, long, and shapely; a finely finished flower. £20.

There are other lovely whites, notably some raised by Mr. Ernest Crossfield, such as Countess of Stamford, and others, but they are not yet to be purchased, no not with gold from Ophir!

Whites at a moderate price I would recommend are Mrs. Betteridge, 12s. 6d. each. Alice Knights, 10s. each. Mme de Graaff, about 8s. per dozen. This latter will still be a standard variety when many of the more expensive ones have been dropped out of cultivation. It has a fine constitution, increases with great rapidity and almost every little offset bears a bloom.

Yellow Trumpets.

One of the very finest of these is C. H. Curtis, a very large flower, perianth segments deep primrose, broad and smooth; trumpet golden yellow, well open at mouth; a flower of model form. £15 15s.

King Alfred.—Quite the finest of the deep yellow daffodils, exquisite in form and colour, and of great lasting quality. Where soil and situation suit it King Alfred grows very vigorously, but, unfortunately, he is particular in this respect, and where his lodgings do not suit him he refuses to pay for them, for instead of giving fine blooms and good increase, he produces but poor little flowers, and the bulbs get smaller and smaller year by year. Now offered at about 21s. each.

Hengist.—A gigantic flower on the lines of Emperor, but nearly twice the size. A perfectly smooth, well-balanced flower, without a trace of coarseness. £8. 8s.

Lord Roberts.—A much improved Emperor, larger in size and having smoother perianth. A great exhibition flower and useful for the hybridist. 21s. each.

Rising Sun.—A remarkably fine, bright yellow daffodil. The bloom is of the Tenby type, but is of large size. It is of perfect shape and brilliant colouring, blooms early and lasts remarkably well, added to which it is a strong, healthy grower. This will no doubt make its mark in the near future. £10.

Alert is a nice firm, well-formed flower. Raised from Obvallaris it retains the shape of the parent, but is larger, has a longer stalk, and much broader and more vigorous foliage, the colour, too, is distinct, the perianth being lighter than the trumpet. Very early and lasts a long time. 7s. 6d. each.

Mervyn is another of the Tenby type, a fine, bold, handsome flower of uniform soft yellow, raised from Emperor and Obvallaris. It opens a few days before Emperor and is of equally good growth and constitution. Offered at 5s. each.

Leedsi Section.

I will take the Giant Leedsis next; indeed, according to the new classification, they are made into a sub-section of the trumpet daffodils, being classed as "Short trumpets." Perhaps the finest of these as yet in commerce is—

Lord Kitchener, a real giant, having a perianth quite four inches across, and a cup about one and a-half inch. I am only speaking from memory, but do not think these measurements are far wrong. The segments are of great width and very flat and firm, the cup is wide and deep, pale yellow. Long stalk and very vigorous habit. £15 15s.

Hon. Mrs. J. L. Fremcklin is quite as perfect in shape, though perhaps a trifle smaller. The segments are as stiff as cardboard, and the flower has wonderful lasting quality. Perianth pure white, the cup, which is very long, is a pale clear yellow. Splendid habit and constitution, rather late. £10 10s.

Lowdham Beauty is another of this class of giant Leedsis, the result of a cross between Minnie Hume and Mme. de Graaff. It has more rounded segments than the two preceding varieties, is quite distinct, and a truly magnificent flower. The cup passes to ivory white with age. The plant is remarkably free, and has very long, broad foliage. £8 8s. each.

Marguerite Durand.—A flower which does not possess quite the size of the two just described, but is very distinct, being the only Leedsi I know of which has a distinctly primrose tint in the perianth. This colouring does not appear when the bloom first opens, but comes after a day or two, and develops much more on the plant than if cut young and kept in water. 20s. each.

Priscilla.—I think this is the first of this class which has given us a distinct tint of apricot in the cup. The flower is of largest size, carried on a stalk twenty inches long. The segments are broad and stout, slightly pointed at the tips. Cup large and long, beautifully frilled at the brim, the apricot tint lasts until the flower is dead. It has a delicious scent. The plant is remarkably strong in growth. £5 5s.

White Queen is now so well known that it hardly needs description, it was the forerunner of this class, and is now to be seen in nearly every winning stand at the spring shows. 30s. each.

Waterwitch.—Of the newer Leedsis (apart from the giants) nothing is more beautiful than this variety. Some people do not admire it because of its drooping habit, but that is one of its chief charms to my eye. The whole flower is a lovely glistening white. The plant is a very good doer and is remarkably free flowering. It has now reached the very reasonable price of 5s. per doz.

White Lady is another good Leedsi, having a large flat upstanding flower. Perianth white, cup shallow, and pale lemon yellow, very long stalk and abundant foliage. Increases at a great rate and flowers profusely. Late 15s. doz.

Johnstoni.

I have now to refer to that most dainty and fascinating section known as Johnstoni, artificial productions resembling the wild hybrid, known as Johnstoni Queen of Spain. These are all the outcome of crossing our garden narcissi with the beautiful litle fuchsia-like Triandrus albus, a wild Spanish species. One of the first to be exhibited was Snowdrop, see illustration herewith, and one of the best is unquestionably Bennett Poë. It is a thousand pities that this class of daffodil has a very tender constitution, and with most growers they soon die out. Miss Willmott is quite the most successful grower of them that I am acquainted with. One of my friends tells me that they like leaf-mould and partial shade. J. Duncan Pearson.

Lowdham.

(To be continued.)

GOLD OF THE GARDEN.

As summer advances and merges into autumn our gardens take on a golden splendour due to this being the predominant hue of its blossoms. There are, of course, other colours freely presented, the red of roses, for example, the cool lavender-blue of Michaelmas daisies that begin long before their name season; the white, pink, mauve, and carmine of phloxes, yet the majority of blooms are gold ones among the herbaceous plants. It seems possible, as an ancient writer poetically suggests, that "the sunshine has stored itself up in buds that are, perforce, obliged to repeat again its aureous magnificence."

Reckon the sunflower as a garden feature of August and September, and see if it does not deserve to be more honoured. Because sunflower seed is cheap, and the perennials increase as rapidly as weeds, the flower has become regarded as fit for villa and cottage pleasure grounds only: the truth is that a well-planted bed of annual sunflowers will make one of the grandest ornaments possible upon a noble velvet lawn, while collections of the best evergreen shrubs are shown off to perfection by groups among them of the perennial helianthuses. The grace of Helianthus Maximilianus is especially valuable; in this variety we have the clear pale yellow shade that is, in an artist's eye, an improvement upon orange-yellow, because offering greeny shadow tints among the petals, and the shape, all twisted, cut into narrow segments, curling marvellously, suggests the much-vaunted elegance of the single cactus dahlia.

For depth of colour nothing can surpass the effect of Helianthus multiflorus plenus, a better double than the variety Soleil d'Or, but blooming later in most localities. The semi-double Helianthus Miss Mellish ought to attain a height of seven feet when well cultivated, massed it should resemble a thicket of stem, leaf, and flower. Helianthus hirsutus is an orange sunflower. In addition to these we see the annual kinds, varying in height from a few inches to ten feet, willing to make the landscape as golden as though untold riches were spread out fresh from the mint.

Like, yet not sunflowers, are the heliopsises, four to five feet high, hardy anywhere, prolific in blossom; the four-feet H. scabra Pitcheriana is so deep an orange as to be almost vermilion, and is a true August bloomer; best of all, probably, is H. compacta floribunda, which is content to be a yard high, begins in June, and continues until frost, and gives hundreds of large deep yellow blooms.

Heleniums seem to be anxious to claim red as one of their colours, for H. autumnale cupreum has caught and imprisoned actual crimson with its shining gold, and the ground of H. autumnale Kelwayi is marked handsomely with red; H. a. Hoopesi, one of the shortest, is orange; H. a. striatum is streaked with brownish-crimson; still there are many pure yellow Helen flowers, such as Bolanderi, grandicephalum, Bigelovi, autumnale, and superbum.

The gaillardia resembles the deep gold, orange, and flaming reds of the setting rather than the midday sun; indeed, a mass of gaillardias of ordinary type, planted close to a background of gorse and broom, looks brown seen from a slight distance; exquisite clear yellow varieties are plentiful, however, of which Goldfish, Khartoum, Edouard de La Rue, Topaz, Vivian Grey, and the quainty quilled Somerset may be extra recommended.

Coreopsis grandiflora is superior to any gaillardia in the opinion of many flower connoisseurs, for its thin-stemmed elegance and upright habit of growth, as well as its fringed shape, and brightest of almost transparent yellows. The giant, five-feet high Coreopsis trichosperma is a stranger to many gardens that it might grandly embellish, while, though the blossoms of C. lanceolata are smaller and paler than those of grandiflora, its lemon tint is of rare loveliness.

Now, too, are the golden rods in full beauty, but only where they are given rich, damp soil will they show what prodigies of blossom they can be, or how easily they can surpass their advertised heights: Solidago gigantea and Solidago procera variegata, planted in sunny bogland, beside water, will reach seven or eight feet, and Solidago altissima will tower a foot more above them. How few are the gardens in which space is given to a collection of solidagos, yet there are a dozen or more of great merit; the dwarfs of the family, below three-quarters of a yard, S. vigaurea, and S. v. compacta, are among the best perennials for clothing banks.

Rudbeckias are a glory of the four last months of autumn; tree lupins and œnotheras keep them company; so do the robust telekias that thrive in almost any soil, with the bright yellow Achilleas eupatorium and augustifolia. Before these giants there may grow innumerable yellow flowers of worth, including the All-heal, St. John's wort, or hypericum, and the humble, but magnificently-hued calendulas, those flowers that were formerly designated "golds." M. H.

Campanula isophylla alba.—Where plants of a trailing or drooping habit are required there is nothing to equal this. Few things are so easily managed, and few, indeed, are so well adapted to such a variety of circumstances. Suspended in the windows of the cottage, as a pot plant, it is excellent, and the same may be said of it for the rockery, for window boxes, and for any and every position where trailing plants may be employed with advantage. Singularly enough, it thrives amazingly in either sunny or shady positions, though in the latter the blossoms are rather longer lived. I have lately seen some splendid masses of this plant in cottagers' windows, forming perfect sheets of bloom, and, to my knowledge, the same plants have been in full flower for the past six weeks. Is it not rather surprising that plants capable of making such a display should only be seen here and there? This campanula has no equal among trailing subjects, and deserves extensive cultivation.—T. B. Field.

MONTBRETIAS.

In the wave of enthusiasm that has swept over the garden-loving public of recent years in connection with hardy plants many have been the triumphs of the hybridist, and both numerous and great the improvements achieved. In no class of plants, however, has there been more remarkable advances made than in montbretias.

When we contemplate the "then" of Montbretia crocosmæflora and Pottsi, with their frequently half-opened flowers and often indifferent colouring, and contrast it with the "now" of the glorious introductions for which we are principally indebted to M. Lemoine, and, more especially to our own compatriot, Mr. George Davison, we are inclined to speculate as to where lies the limit of this progress, especially when we consider to what point a mere decade has brought us.

There is just at present with me a peculiar sense of appreciation of the unique beauty and great utility of the successes so far achieved. Generally speaking, the herbaceous borders are losing much of their early summer glory. The delphiniums are gone, the earlier phloxes have passed their best (in the south at least), irises, paeonies, poppies and eremuri are no more; perennial asters are yet in the bud state, and the montbretias come in with their yellow, orange, and crimson glow to fill the gap.

Messidor is one of the earliest, and has tall branching spikes of beautiful pale yellow flowers, changing almost to white towards the centre, and is now shedding its pristine glory, but is still beautiful. I know of no plant that furnishes more elegant sprays of flowers for table decoration than this.

Germania is the nearest approach to an antithesis in colour to Messidor yet obtained in montbretias; the flowers are rich orange, almost crimson, and widely expanded. The plant is tall, and will remain a favourite whatever fine forms the future may have in store for us.

Then we have George Davison, and closely following it is Ernest Davison, which were among the first of Mr. Davison's successes. The colouring of the first-named is perfectly lovely, and may be described as yellow with a suggestion of orange suffusion. The flowers of the second are large and flat, often attaining three inches in diameter, and the colour is deep orange with a tinge of carmine on the inner petals, and shading of crimson on the outer.

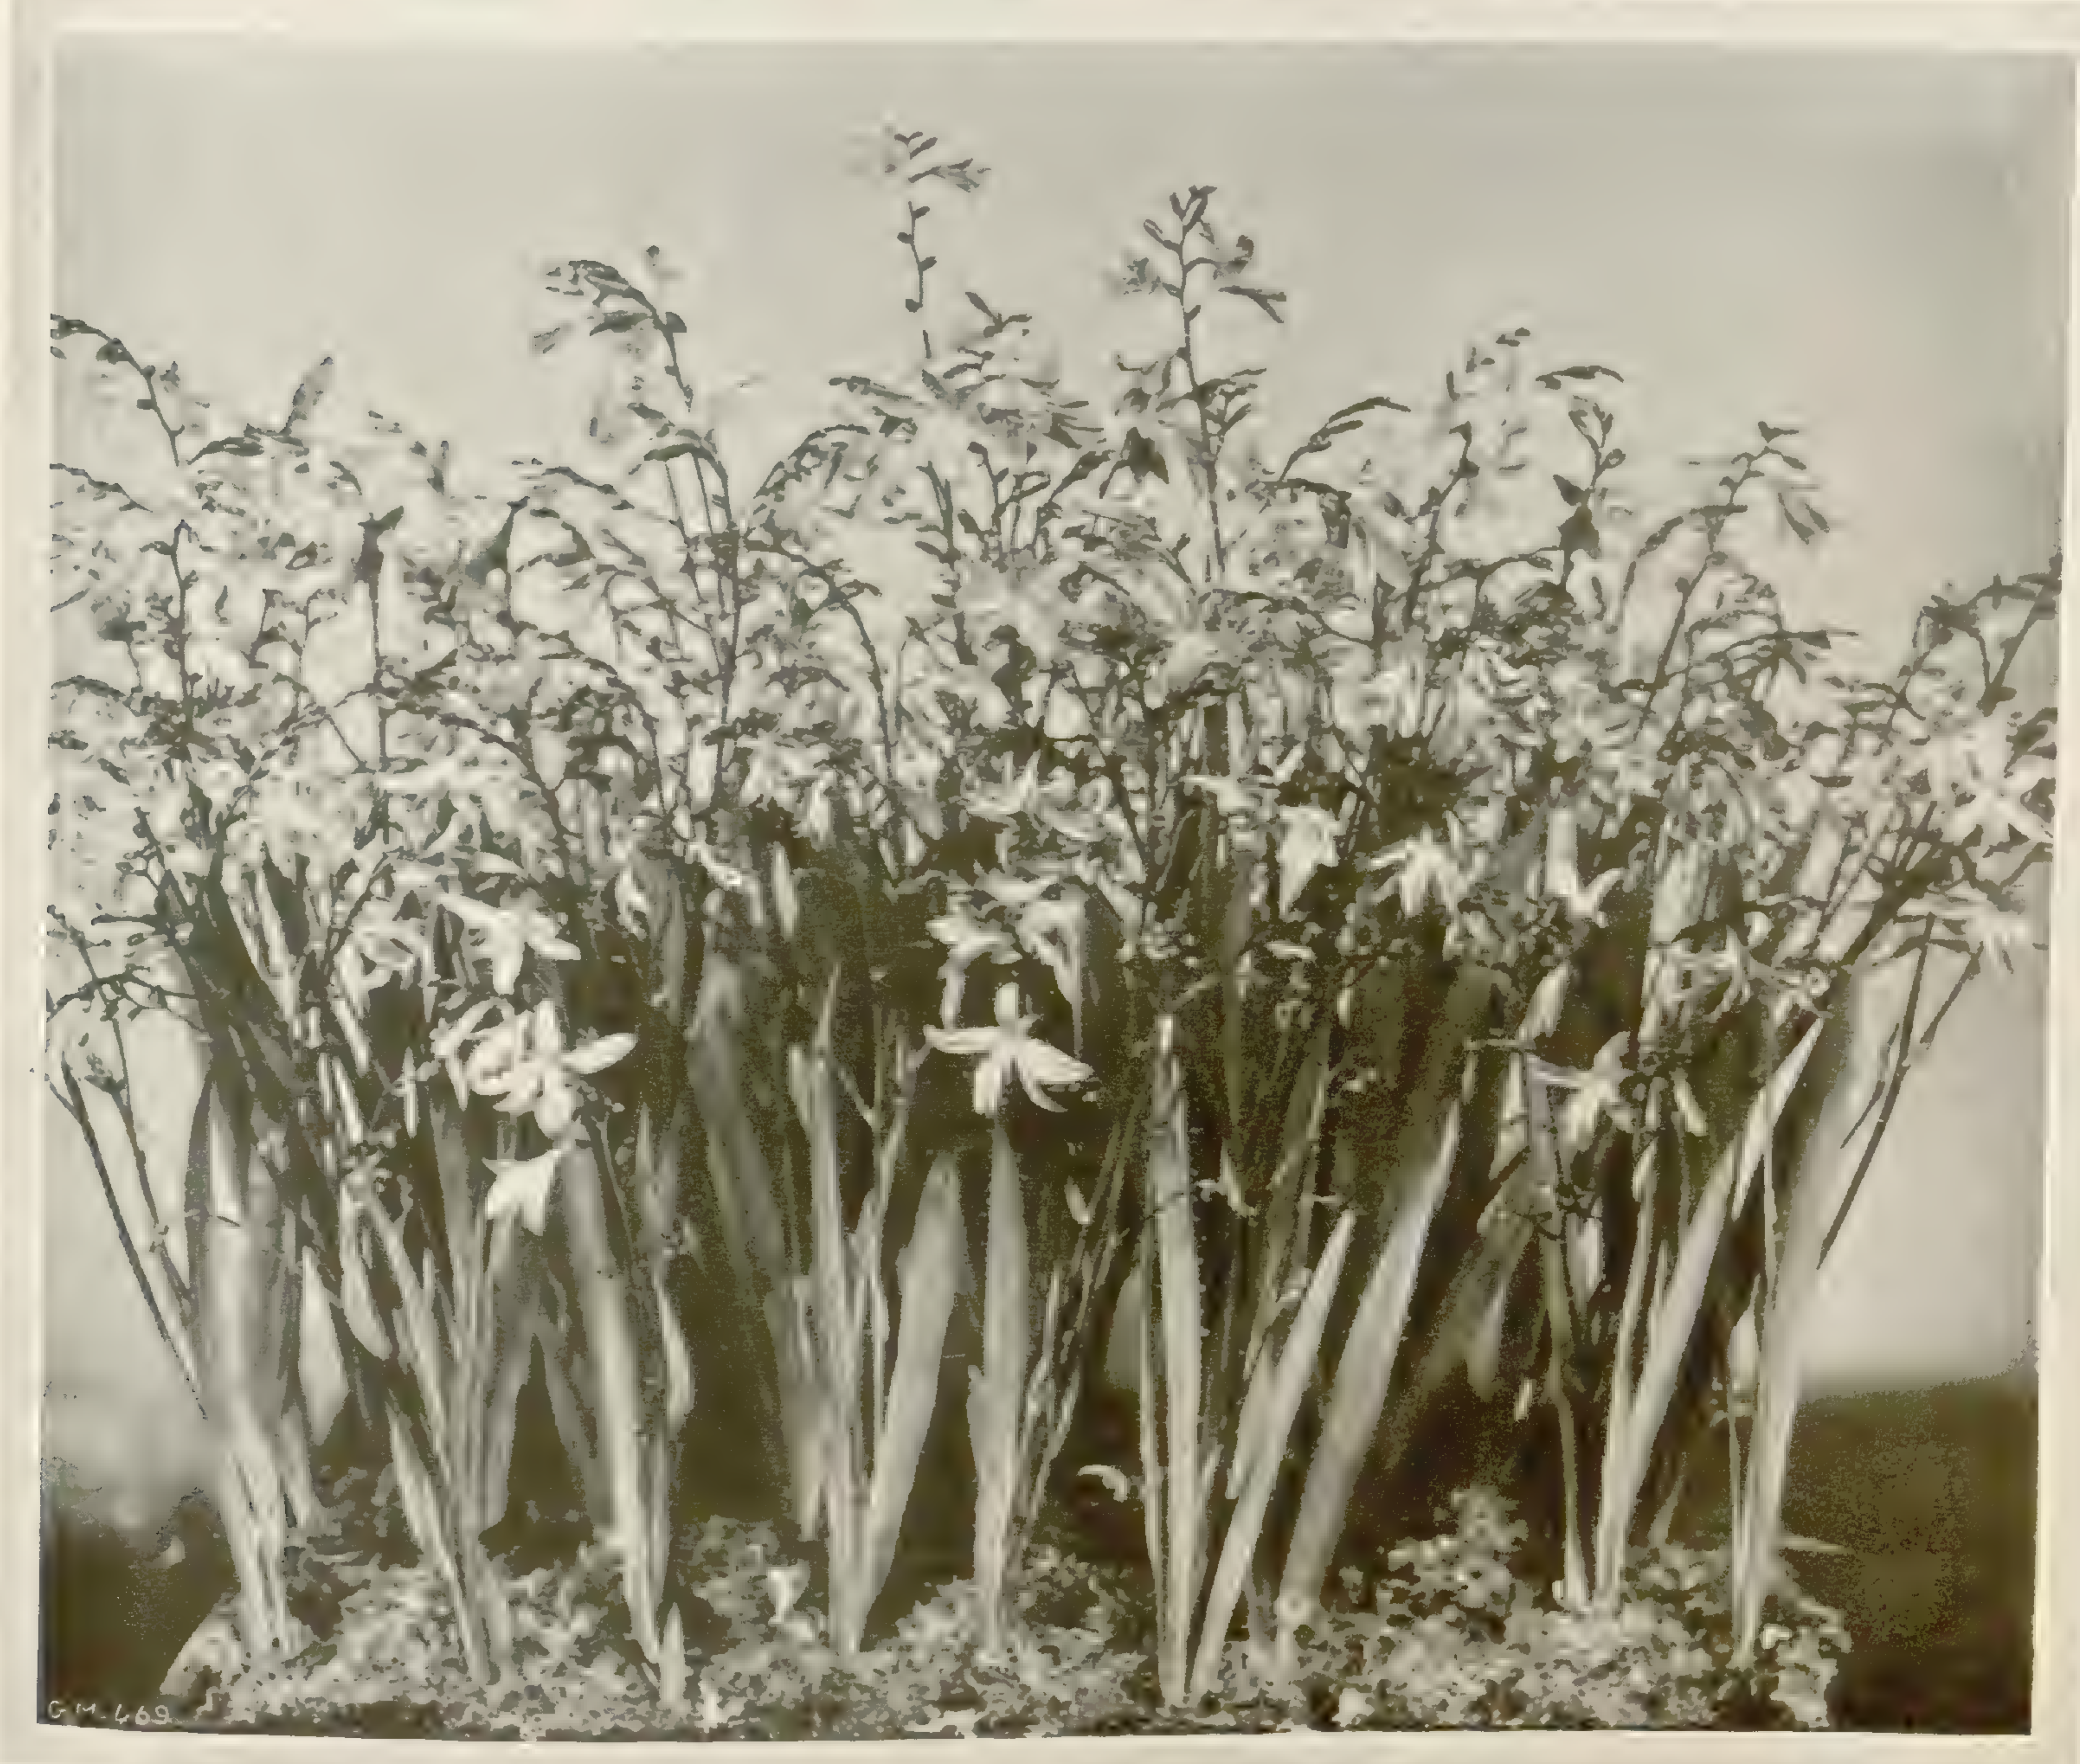
Lord Nelson blooms about the same time as George Davison, and is unique as regards colour. It is the nearest approach to crimson in montbretias we have; indeed, the exterior is crimson, but the petals internally have a beautiful orange glow that is intensified by the pronounced yellow centre. This variety often attains a height of three and a-half feet and over, and the flower stems are very dark purple.

Lady Hamilton, the companion of Lord Nelson in height, is distinctly different in colour, and, I am convinced, has "come to stay." Indeed, there is little of admiration and praise that can be given to the other varieties that cannot be given to this. The flower stems are studded with an abundance of yellow flowers.

There is now no occasion to speak in detail of Westwick, Lutetia, Etoile de Feu, Hereward, and King Edmund; all are good and serviceable varieties, and will hold their places for many years to come. But it may with advantage be mentioned that Prometheus is, in the matter of size and richness of colouring, unsurpassed. I have seen flowers that measured four and a-half inches in diameter, perfect in form and richness of colour.

One other variety, and that known as yet only to those who devote attention to the most recent of novelties, must be mentioned. This is known as Norvic. It is one of Mr. Davison's introductions, and is exceedingly dwarf, the height being about eighteen inches; very late flowering, the stems freely branched, and, what is unique, nearly all the flowers expand at once. These latter are very large, deep yellow, suffused externally with crimson towards the outer edges of the petals.

D. G.



NEW MONTBRETIA NORVIC.

Exhibited by Mr. G. Davison, at R.H.S. Meeting on the 1st inst., when it received an A.M. The plant is dwarf and free-blooming, and the flowers are rich orange and yellow.

WORK FOR THE WEEK.

THE ORCHID HOUSES.

CYPRIPEDIUMS.—There can be no question as to the popularity of the autumn and winter flowering section of cypripediums. It was long before they became popular or numerous that I first began to draw attention to their claim to more extensive cultivation in the Orchid and other columns of the Gardeners' Magazine. I still hold the opinion that they might be termed everybody's orchids. I feel that the suggestions made in the past as to their merits are now becoming more than ever realised, and nothing can illustrate the fact more plainly than the extensive exhibitions that are made of the cypripediums in London and Manchester during the whole of the autumn and winter months. The orchids are so tractable under cultivation, that the humble amateur may grow them equally as successfully as the most expert orchid grower. They are also distinctly suitable subjects for town culture and under other unfavourable atmospheric conditions, which in winter are so detrimental to plant life in general, and there can be no doubt their suitability for fog and smoke-laden districts has led to their remarkable popularity. The durability of the flowers and their usefulness for indoor decorations being appreciated in more favoured districts, and they are also now extensively grown for the cut flower trade.

In private gardens they are worthy of every consideration, as they commence flowering with such species as C. Fairieanum and C. Charlesworthi early in September. These are followed in October by C. Spicerianum, and some of the hybrids of C. Fairieanum and C. Spicerianum, while some of the early-flowering varieties of the variable C. insigne open towards the end of the month. Through the months of November and December the greater number of the species and hybrids are in bloom, and where grown in quantities they make a fine display, lasting in perfection for many weeks. Many of the plants will be now showing their flower scapes, and they must have every encouragement that will assist them to develop and expand their flowers. It is a very good plan to fix a stick strong enough to secure the flower scapes as soon as they have advanced a few inches in height.

The plants should only now be sufficiently shaded to avoid actual scorching of the foliage. A great deal depends on the treatment now as to the quality and the development of their best coloured tints when the flowers have expanded. Care must also be taken to see that with more light the plants do not remain for any length of time in a dry condition at the roots. I am frequently asked what manure we use for orchids. I find that a good supply of rain water is all that is required, and no artificial feeding of any kind is used for our plants. I do not suppose that a weak liquid made from cow manure would do any harm in cases where the plants have become root bound, but as I am convinced there is no necessity for its use where plants are properly attended to, I have no grounds for advocating the use of manures of any kind.—H. J. Chapman, Oakwood Gardens.

STOVE PLANTS.

ALOCASIAS.—Plants that have completed their season's growth should be gradually brought to a period of rest by a reduction of water and temperature. With the exception of A. Sanderi, which winters best if kept steadily growing, most of the varieties are best when kept thoroughly dry throughout the winter months, and in a structure in which a temperature of about 60 deg. is maintained. As soon as the foliage has died away, but little further attention will be required, with the exception of pot room, until the tubers are again ready for starting into growth.

ANTHURIUMS.—The varieties grown for the beauty of their spathes are now finishing flowering for the season, and the plants should be placed in a position where they will be exposed to the sun. They should be kept somewhat drier at the roots, and they may be safely wintered in a house having a temperature of 55 deg. They ought to be examined occasionally with a view to watering those becoming dry.

COLEUS.—A further supply of these ought to be raised from cuttings, as young plants stand the winter better than the older specimens. They also form useful stock for early spring decoration, and also prove serviceable for producing an early supply of spring cuttings.

EUCHARIS.—Plants of E. amazonica that are grown for blooming in autumn and winter will now be producing their flower spikes, and an occasional watering with clear soot water will be found beneficial. Careful observation must be kept upon the young flower spikes, or beetles, crickets, or such like pests will cause much damage. The foliage may be sponged with insecticide as time permits.

BEGONIA GLOIRE DE LORRAINE.—Should it be desired to have the earliest plants in bloom at the latter end of October or early in November, the pinching-out of the flower buds must be discontinued. Carefully loop all the long shoots to the centre stake, and apply regularly at intervals of about ten days some approved stimulant, for the roots are most active at this stage. As they begin to develop their flowers, reduce the temperature to about 55 deg., and keep the atmosphere of the house somewhat drier.

GENERAL REMARKS.—As the cold weather comes upon us the temperature of the stove should be gradually lowered in order to afford its occupants a short season of rest. All shading may now be removed, with few exceptions, as the sun greatly assists most stove plants in ripening their wood. Careful attention must also be given to the eradication of insect pests, by fumigating with a nicotine preparation or sponging with insecticide.—John Donoghue, Bardon Hill Gardens, Leeds.

FRUITS UNDER GLASS.

FIGS.—Those fruiting in a late house or cool orchard house should have plenty of clear water. If damp weather prevails the pipes should be warmed at night and a little air admitted by the top and bottom ventilators. Mice are very troublesome with ripe figs, and should be trapped, or they soon spoil considerable numbers of fruits. Figs at this time of the year are generally large, and should be looked to every day, and be carefully handled when gathered. As soon as the trees in the midseason house have finished fruiting, apply the syringe twice a day, and if the border is dry give a good soaking of water. Liquid manure may be given if the crop has been heavy and the wood is weak, but not otherwise. If the shoots are too thick, thin a few out, and leave the house open night and day. Pot trees that failed to give crop when being forced, generally give a few good fruits in the autumn. If the trees are strong and the fruit required they may be allowed to ripen. If not, they are best removed. Give all trees that are plunged outside plenty of liquid manure, providing the water can pass away from the pots. If they are in a windy or exposed position they should be secured with stakes.

EARLY VINES.—These in pots intended for forcing should have all laterals cut off, as this will assist them to plump up the back buds. The same with early vines in the house; these should be cut over for the same purpose. Keep the syringe in use, especially inside. If the borders are at all sour on the top from frequent waterings, a little fresh lime should be dusted over the surface, and be watered in.

MIDSEASON VINERIES just cleared of fruit should be well syringed down with clear water or some safe insecticide. To clear the house of any bunches that are still on the vines cut them and suspend them in the fruit room with the end of the laterals in bottles of water. They will keep in good condition several weeks, but it is necessary to look over the bunches occasionally for bad berries.

PEACHES AND NECTARINES.—Continue to give attention to late fruiting varieties every day. Walburton Late Admirable and Sea Eagle are good late peaches, but not to be compared in flavour with those that are gathered outside, being stringy and wanting in flavour.

LATE VINES.—These should have every encouragement to finish their crop, both in colour and size. If the laterals have been allowed to grow, and are becoming crowded, take a few out, not too many at once to give a check to them, or to start them cracking, which sometimes happens with Lady Downes. Tie the leaves back on the Gros Colmar to give all light and sun possible on the bunches, as these often fail to colour, and are generally planted in the darkest corner of the house. When properly finished, this is one of the best keeping and flavoured grapes grown. Maintain a rather dry atmosphere when the weather is dull by having a good heat in the pipes at night with ventilation at the top and bottom, running some good wasp netting along to keep out vermin. — A. B. Wadds, Paddockhurst Gardens.

THE KITCHEN GARDEN.

CABBAGE.—Plants raised from seeds that were sown during the third week of July and the first week in August should now be ready for planting in their permanent quarters. The site which they are to be grown on should have been prepared some time ago by digging the ground deep and putting in a liberal supply of manure. Lift the plants carefully from the seed beds and plant them with a dibber, making sure that each plant rests on the bottom and is made firm. Some growers prefer to dip the roots in a puddle made of lime and soot, which is a most excellent thing to do where clubbing is prevalent. Those which have been pricked out should be lifted and planted with the trowel, so that each may have a good ball of soil about them. Cabbages should have every attention, for they have to pass through the trying time of winter, and they are important early in the spring. Ellam's Early and Early Heartwell are both suitable for the first supply.

PARSLEY.—Where there are spare frames it is a good practice to prick out parsley into them, for this useful herb is always in demand through the winter. Small plants from the July sowing are the best.

WINTER LETTUCES.—Still continue to plant out good batches of these for a winter supply. Plant them in good soil, so that they may have an abundance of roots when they are removed to cold frames for the winter. It is not too late to sow some more seed, but quick-hearting varieties must be chosen, such as Tom Thumb or Commodore Nutt. If these two are lifted and planted on the fruit borders in the glasshouses before severe weather comes, they will give nice little hearts at Christmas.

MINT.—Cuttings of this herb may still be put in, either in boxes or pans; and clean, healthy growths should be selected. They will quickly form roots if dibbled into light open soil, and placed in the shade for a week or two.

TOMATOES. — Plants that are growing against walls and are now ripening their fruits should have nets placed over them, for the birds will soon destroy them if they are not protected. Where there are plenty of spare lights some might be put over the most backward plants, which will assist them to ripen their fruit.

WINTER VEGETABLES.—Keep the hoe constantly at work amongst these crops, both for the purpose of destroying the weeds and maintaining the surface soil in a loose state. This will encourage good growth, and the produce will be more abundant and of better quality.—T. W. Birkinshaw, Hatley Park Gardens, Sandy, Beds.

PRELIMINARY ANNOUNCEMENT.

THE BIRMINGHAM GREAT CHRYSANTHEMUM, FRUIT, and FLORAL EXHIBITION,
Will be held in
BINGLEY HALL, November 10th, 11th, and 12th.
Schedules and all particulars may be obtained from the Secretary,
ALFRED NOAKES,
148, Bristol Street, Birmingham.

NATIONAL CHRYSANTHEMUM SOCIETY.
EARLY AUTUMN EXHIBITION.
October 7th and 8th, 1908.
[illegible] of prizes and all particulars as to members may be obtained post free on application to [illegible] Secretary, RICHARD A. WITTY, St. James's Villa, Swains Lane, Highgate, London, N.

HORTICULTURAL SHOW ADVERTISEMENTS are inserted in this column at Ninepence per line, the minimum charge being Five Shillings. Offices, 148 and 149, Aldersgate Street, London, E.C.

EXHIBITIONS AND MEETINGS.

◆

National Dahlia Society.

SEPTEMBER 3.

The annual exhibition of this society was held at the Royal Horticultural Hall, Vincent Square, and, although it could not be classed as an average show, it was very much better than was expected after the violent gales of the previous week. The cactus section evidenced considerable advance, while the other sections keep at a good level. The competition in the amateurs' classes was very keen.

NURSERYMEN'S CLASSES.

The first of the classes in this section was for forty-eight blooms, distinct, and there were but three competitors. Mr. J. Walker, [illegible], won first prize with good blooms of T. W. Girdlestone (self), H. Clarke, Blush Gem, Colonist, Mrs. W. Slack, R. Dean, J. T. West, Eclipse, A. M. Burnie, Golden [illegible], Victor, Mrs. Every, S. Mortimer, Mrs. J. Greaves, G. Rawlings, Golden Gem, Lord Salisbury, Shirley Hibberd, Ethel Britton, Purple Prince, Daniel Cornish, John Walker, Dr. Keynes, Majestic, Wm. Keith, Marjorie, W. Rawlings, Gracchus, H. Turner, Dante, Rothesay, Duke of Fife, Duchess of York, Mabel Stanton, J. Nicholson, John Bennett, Arthur Ocock, Florence Tranter, Chieftain, T. Pendered, R. T. Rawlings, Dandy, T. J. Saltmarsh, Rev. J. Gooday, H. Keith, J. C. Vaughan, Arthur Rawlings, and Harbinger; the second prize was awarded to Mr. W. Treseder, Cardiff; Mr. Mortimer, Farnham, third. In the smaller class for twenty-four blooms, distinct, Mr. Charles Turner, Slough, was placed first with medium-sized, though well-coloured flowers. Mr. M. V. Seale, Sevenoaks, was placed second, having excellent examples of well-known varieties.

In the class for eighteen fancies, distinct, there were only two exhibitors, Mr. John Walker leading with excellent blooms of T. W. Girdlestone, W. Sheldon, Emin Pasha, Mrs. Mortimer, Goldsmith, S. Mortimer, Rev. J. B. M. Camm, Dandy, Chorister, Miss [illegible], Comedian, Lottie Eckford, Plu-[illegible], Mrs. Saunders, Prince Henry, Duchess of Albany, Edmund Boston, and Matthew Campbell. Mr. W. Treseder was a good second.

For twelve blooms, distinct, Mr. S. Mortimer won first prize with some fine flowers. Messrs. Keynes, Williams, and Co. were second, and Mr. C. Turner third.

For a dozen blooms, show and fancy inter-[illegible]; Messrs. J. Cheal and Sons, Crawley, [illegible] with a very strong stand, the varieties being T. W. Girdlestone, Gracchus, George Gordon, Emin Pasha, Dr. Keynes, [illegible], Florence Tranter, R. T. Rawlings, The Reverend, Maud Fellowes, Mrs. Saunders, and Dorothy. Messrs. W. Pemberton and Son, Bloxwich, Walsall, followed with [illegible], but not such well-finished flowers.

The keenest contest was in the class for [illegible] bunches of cactus flowers, six blooms [illegible]. Here Messrs. J. Stredwick and Son, St. Leonards, obtained first place, and won the challenge cup outright, having obtained premier honours in this class in the two previous years. The blooms were finely developed, and the varieties represented were Dorando, Wm. Marshall, Dr. G. G. Gray, Diadem, Snowstorm, Rev. A. Bridge, C. E. Wilkins, J. B. Riding, Satisfaction, Rev. A. Hall, Indomitable, Harold Peerman, Ivernia, Saxonia, Herald, Mrs. A. Dyer, Rev. T. W. Jamieson, and Evening Star. Messrs. J. Burrell and Co., Cambridge, were placed second with rather younger flowers. The best bunches were those of Crescent, Mercia, Artemis, Una, Fairy, Echo, and Brigadier. Messrs. J. Cheal and Sons, Crawley, were third with fine examples. For twelve bunches of six blooms each, Mr. S. Mortimer won the first prize with excellent blooms, and Mr. M. V. Seale was second.

The class for forty-eight blooms of cactus dahlias, distinct, must have taxed the exhibiters severely after the storm. Messrs. Burrell and Co. won well with a handsome collection, in which were noted Nelson, W. Marshall, J. B. Riding, Seraph, Una, C. E. Wilkins, Crescent, Fairy, Leda, Mrs. Baxter, Sunshine, Eveline, Laurania, Rev. A. Hall, Burletta, and Alicia. Messrs. Keynes, Williams, and Co. were winners of the second prize with fine specimens, and Messrs. Jas. Stredwick and Son were third.

There were four competitors in the class for twenty-four distinct blooms. Mr. M. V. Seale led off well with blooms of high quality of Clincher, F. McQuade, Countess of Kenmare, Imperial, Saturn, Ruby Grinstead, Edith Reynolds, Nelson, Ivernia, Rev. A. Bridge, and J. B. Riding. Mr. W. Treseder was a good second, and Messrs. W. Pemberton and Son were third.

The vase class for twelve varieties of six blooms each, with grasses, berries, and other appropriate foliage, did not present such an imposing display as usual. Mr. M. V. Seale secured the first prize with beautifully-arranged vases, but we have seen this competitor in better form. Messrs. J. Cheal and Son followed with good vases, and Mr. C. Turner was third.

Pompon varieties were well represented, and in the large class for twenty-four varieties ten blooms of each, Mr. C. Turner occupied the premier position. His flowers were all perfect, and not too large. The varieties were Corsair, Rodney, Blush Gem, Phyllis, Nerissa, Marietta, Portia, Edith Bryant, Cyril, Queen of Whites, Jessica, Clarence, Romulus, Adelaide, Tommy Keith, Donald, Bacchus, Zerlinda, Enid, Hesperus, Sybil, Adela, Lufra, and Thora. Messrs. J. Cheal and Sons were second with neat blooms; Mr. M. V. Seale was third. In the smaller class for twelve bunches Messrs. Burrell and Co., Cambridge, were first, and Mr. J. Walker second.

For twenty-four bunches of single varieties Messrs. Cheal and Sons were first with a beautiful selection, comprising well-timed blooms of Naomi Tighe, Mrs. Moreland, Leslie Seale, Miss Roberts, Vesuvius, Eclipse, Fuji San, Royal Sovereign, Victory, Darkness, Betty, Columbine, Elmira, Glencoe, Brilliant, Tommy, Kitty, Bertha, Snowdrop, Flambeau, Princess of Wales, Serita, Peggy, and Holena. Mr. M. V. Seale secured the second prize with good bunches.

In the class for twelve bunches, Mr. J. Walker was the only competitor.

AMATEURS' CLASSES.

The premier class was for twenty-four blooms, show and fancy varieties, and carried the five-guinea challenge cup. In this there was seven competitors, and Mr. Thos. Jones, Ruabon, won well, his blooms being deep and well finished. The varieties were Mrs. Ormond, John Hickling, Mrs. D. Saunders, Standard, Marjorie, Arthur Rawlings, Maud Fellowes, The Reverend, Goldfinch, Mrs. W. Treseder, Colonist, Chieftain, R. T. Rawlings, Mrs. Bartlett, George Rawlings, J. Walker, W. Garratt, Mrs. Langtry, Perfection, Victor, Mrs. McKenzie, Diadem, and Mrs. Gladstone. Mr. Sidney Cooper, The Hamlets, Chippenham, followed with a good stand. Mr. Thos. Hobbs, The Cedars, Downend, Bristol, third. The class for twelve show varieties contained eight competitors, and Mr. Thos. Haskins, Kingswood, near Bristol, won with large, well-coloured blooms.

For six blooms, distinct, Mr. E. Tanner, Staple Hill, Bristol, was the first prize winner.

For twelve fancy varieties, distinct, there were three entries, and Mr. A. P. Ironsides, 43, Park Lane, Chippenham, staged a beautiful collection for first prize. Messrs. Sidney Cooper and Thos. Haskins secured the other prizes in the order named.

The smaller class for six blooms appeared more popular, Mr. J. Cousins winning first from six competitors. Mr. Thos. Hobbs was second, and Mr. J. Haycocks, Gyfellin, near Wrexham, third.

The classes for cactus varieties were well filled, and the quality, generally speaking, was good. The silver challenge cup for six varieties of three blooms each evoked a capital competition, and Mr. W. E. Peters, Baldslow, Hastings, won the cup. Mr. J. Shoebridge, St. Margarets, East Grinstead, was a capital second, and the Rev. A. Bridge, The Rectory, Worth, Crawley, was third. For six varieties of three blooms each, Mr. W. Lockyer, gardener to the Rev. G. Twentyman, Greenhill Park, New Barnet, won first prize with excellent blooms; Mr. H. Jackson, Woburn Sands, was second; and Mr. E. Mawley, V.M.H., Rosebank, Berkhamstead, third.

The gold badge, presented by Messrs. Dobbie and Co., for twenty-four distinct blooms, was keenly contested, and Mr. J. Bryant, Salisbury, secured the award with some good flowers. Mr. A. H. Farmer, Walthamstow, was a really fine second.

For twelve blooms, distinct, there were twelve entries, and Mr. H. Brown, Luton, the Rev. A. Bridge, and Mr. H. Jackson were the prize-takers in the order of their names. For six blooms, Mr. H. L. Brousson, Thorndean, New Eltham, was placed first with a splendid board. Mr. M. W. Dance, School House, Andover, was second, and Mr. G. Davidson, Elm Lodge, Thornton Heath, third. There were four entries for twelve bunches of pompons, Mr. H. Brown leading off with neat little flowers. Mr. W. E. Pagram, Weybridge, came second, and Mr. Sidney Cooper third.

The Rev. A. Bridge led in the class for six single varieties of ten flowers each, making a very attractive stand. The Rev. S. S. Pearce, Woodstock, was a good second, and Mr. A. Brown was third.

In competition for the prizes for six varieties of six blooms each, arranged for effect with suitable hardy foliage, berries, or grasses, there were but two entries. The first prize was awarded to Mr. A. Brown, who used far too much foliage; and Mr. E. Mawley second, the latter having the most artistically arranged vases.

OPEN CLASSES.

For six varieties of pompon cactus of six blooms each there were five entries. Messrs. J. Burrell and Co. winning first prize with some pretty little specimens. They were Minima, Nairn, Tom Tit, Argus, and Lena. Mr. M. V. Seale was second; Messrs. Cheal and Sons third. In the class for six blooms of any one cactus variety, Messrs. Keynes, Williams, and Co. were placed first with fine blooms of Ruby Grinstead; Messrs. Burrell and Co. second with Midas; and Mr. W. Treseder third with Harbour Lights. A similar class for show and fancy varieties resulted in Messrs. Keynes, Williams, and Co. again securing first prize with Miss Ormond, Mr. S. Mortimer was second with Marjorie; and Mr W. Treseder third with Warrior.

DECORATIVE CLASSES.

The decorative classes did not appear to have been judged from a decorative point of view, and the result was not satisfactory. For the basket Mr. R. Edwards, Beechy Lees, Sevenoaks, won first prize with a nicely-arranged basket, lightly displayed. Mr. Thos. Jones followed with a mixture of colours, while Mr. J. Haycocks was third.

There were eight entries for the vase of twelve blooms. Here Mr. T. Jones was placed first, and Mr. E. Mawley, V.M.H., second; while Mr. G. Stevenson was third.

In the trade classes, as in the amateurs' section, the judging was generally regarded as unsatisfactory. The first prize for a shower bouquet was awarded to Mr. J. Walker, and Mr. M. V. Seale was placed second.

In the class for a basket, Mr. W. Treseder was placed first, and Mr. M. V. Seale second; and for a vase of pompon varieties Messrs W. C. Pagram, J. Emberson, and M. V. Seale were the prize-takers.

NON-COMPETITIVE COLLECTIONS.

Mr. J. T. West, Tower Hill, Brentwood, made a good representative display of cactus and pompon varieties, all arranged in sprays and backed with suitable foliage and grasses.

From Mr. J. E. Knight, Wolverhampton, came a nice display of cactus varieties, arranged in bamboo stands, while the front was occupied with the usual orthodox boxes.

Messrs. Dobbie and Co., Rothesay, staged a large collection, embracing all sections, and was arranged tastefully with ferns and other suitable foliage. Messrs. Hobbies, Lim., Dereham, were represented by an attractive display, consisting chiefly of pæony-flowered varieties.

From Messrs. H. Cannell and Sons, Swanley, came a fine bank of cactus, giant-flowered and singles. The same firm had also a good collection of cut cannas. Mr. J. Emberson, Grove Road Nursery, Walthamstow, contributed a collection of the cactus and pompon varieties. A large collection of finely-developed blooms of cactus and pæony-flowered varieties came from Messrs. T. S. Ware, Lim., Feltham, who also staged good varieties of singles and pompons.

MEDALS.

Gold Medal.—Messrs. Dobbie and Co.

Silver-Gilt Medal.—Mr. J. T. West.

Silver Medal.—Mr. J. Emberson, Messrs. Hobbies, Lim., Mr. J. E. Knight, Messrs. H. Cannell and Sons, Messrs. T. S. Ware, Lim.

Royal Horticultural Society.

SCIENTIFIC COMMITTEE.

Present: E. A. Bowles, Esq., M.A., F.L.S. (in the chair); Messrs. C. T. Druery, E. M. Holmes, W. Cuthbertson, G. Gordon, W. Fawcett, H. T. Güssow, J. Douglas, G. S. Saunders, and F. J. Chittenden (secretary).

ALIENS IN GARDEN SOIL.—Mr. John Fraser, F.L.S., showed a specimen of the alien weed, Amoranthus retroflexus, a North American plant which had appeared in a garden at Kew, though no seeds or plants had been received from there and planted in the garden. He thought that the plant had possibly arisen from a seed introduced with merchandise either from North America or from the Continent, where also the plant has become a weed. He had noticed other instances of plants which had probably been introduced in a similar way, and had become weeds in gardens, viz., Datura stramonium, Euphorbia esula, and Sisyrinchium angustifolium, while Papaver somniferum, Œnothera biennis grandiflora, and Oxalis corniculata rubra, originally cultivated, had quite frequently become garden casuals, and certain British wild plants, e.g., Chenopodium rubrum, Epilobium roseum, E. hirsutum, Lychnis alba, and Silene cucubalus often behaved in a similar fashion.

RUBUS LACINIATUS.—Mr. Fraser also showed a specimen of a seedling form of Rubus laciniatus which he had collected on West End Common, Esher, where the seed had been deposited in all probability by a bird. The origin of this form appeared doubtful, but it seemed to differ only in the laciniated leaves (the sepals and petals also being cut) from Rubus villicaulis var. Selmeri.

ROSE CANKER.—Mr. H. T. Güssow showed specimens of a disease of roses which was very prevalent in Ireland, and which started in the form of reddish spots on the shoots, which soon died, the dead tissue contracting and cracking. A callus formed around the edges of the wound, and this was frequently damaged by frost, etc., until a large cankerous growth was produced. He attributed the beginning of the injury to the fungus Coniothyrium Fuckeli, Sacc., the conidial form of a Leptosphæria.

DOUBLE GENISTA TINCTORIA.—Mr. Bowles showed specimens of double flowers of Genista tinctoria from Canon Ellacombe's garden, and others having numbers of bracts below the inflorescence. This had apparently arisen from the presence of a small dipteros larva belonging to the Cecidiomyidæ, which Mr. Saunders reported as that of Aspondylia genistæ. This species is known to attack and form galls on the ends of the shoots of Genista germanica in exactly the same manner as in the shoots exhibited. Another species, A. ulicis, forms galls resembling flower buds on U. europæus. There appears to be no record of G. tinctoria being galled by a fly, but some of the galls in the present specimens contained no less than fifteen or twenty grubs feeding upon the leaves forming the gall, particularly at their base.

ABNORMAL ORCHID. — From Messrs. Hugh Low came an orchid, Rodriguezia crispa, showing an abnormal condition in the spike, the bracts were much longer than the flowers, and very closely grouped at the end of the inflorescence.

MUTATIONS IN SHIRLEY POPPIES.—Mr. Chittenden showed, on behalf of a correspondent, a number of dried flowers of the Shirley poppy, all of which had bracts just under the flower or where the flowers should be, some two, others three, four, five, or six bracts without flowers; while others produce bracts with semi-double or quite double flowers. Neither Mr. Wilks nor any member of the committee had seen bracteate flowers in this plant. It would be interesting to know what was the origin of the seed, and whether the phenomenon came true from seed.

FERN GROWING IN BOTTLE.—Mr. Druery exhibited in a pickle jar, hermetically sealed, with a glass and rubber stopper, wired on to prevent removal, a mass of vegetation consisting of a Hart's-tongue, two Lastreas, and a dense tangle of confervoid growth, the whole of which had arisen from a small piece of the base of a Hart's-tongue frond, bearing a minute bud, which had been placed in the jar fully four years ago, and the spores and animal eggs, etc., which had gained entrance with it at the time when it was sealed and secured. About an inch of clean-washed coarse silver sand was first introduced, and upon the damp surface the base and bud in question were simply dropped. The jar is about 8in. high and 3in. square, and from the commencement the growth has been healthy, the fronds of the Hart's-tongue fern reaching the stopper, while the confervoid growth is dense in the centre, and has spread half way up the sides. The two seedling Lastreas have remained small, but have produced new fronds this season, while several healthy green fronds of the Hart's-tongue spring from the centre from amid the debris of the old ones of the three previous years' growths. The question raised by this exhibit is, whence has the material for all this growth been derived? The originally enclosed air could only have contained a three-thousandth part of carbonic acid gas, i.e., a minute atom of carbon, altogether out of proportion to the debris of dead fronds, and the volume of cellular growth of the living ones which have been generated in the jar since its closure four years ago. If it be assumed that the glass is porous, and thus permits air circulation, and consequent fresh supplies of carbonic acid gas by the laws of gas diffusion, how is it that aqueous vapour has not also been transferred, and the quantity of water reduced during so long a period to nothing? Carbonic acid, too, is not the only food required, and the amount of assimilable salts contained in well-washed quartz sand, freed from all vegetable admixture by such washing, save perhaps confervæ or other spores, can hardly be regarded as adequate for such results, and for persistent growth, such as is shown. A small worm has also been noticed inside the jar. While expressing interest in the experiment, the members of the committee greatly doubted whether the bottle was really hermetically sealed.

Royal Caledonian Horticultural Society.

SEPTEMBER 9 and 10.

On September 9 the weather was not kindly disposed towards the executive of the Scottish Society, as rain fell more or less throughout the opening day of the great autumn show, held in the Waverley Market, Edinburgh. The big market was well filled with exhibits, and a high standard of excellence marked almost every section of the show. Special interest centred round the grape and other fruit classes, the vegetables and the cut flowers, but plants and groups were not of special merit, save those in the trade displays. Altogether this was one of the best shows the society has held.

GRAPES.

The championship grape class was again a great attraction, and there was a keen competition for the splendid silver trophy presented by Mr. W. H. Massie. First prize was won by Mr. A. Kirke, gardener to J. Thomson Paton, Esq., Norwood, Alloa, with a total of 57 points out of a possible 70. He had beautiful, shapely, and, on the whole, finely coloured bunches of Madresfield Court, Muscat of Alexandria, Gros Maroc, and Directeur Tisserand, two bunches of each. The berries of Madresfield Court were of wonderful size. We may mention that the judges did not err on the side of high pointing. Mr. J. H. Goodacre, Elvaston Castle, Derby, was second with 55 points out of a possible 74 points, and he had heavy bunches of Muscat of Alexandria and Muscat Hamburgh; Mr. J. Beisant, gardener to Lady Armitstead, Castle Huntley, third, his set containing a huge bunch of Seacliffe Black, a round-berried variety.

Mr. W. G. Pirie, gardener to C. W. Cowan, Esq., Dalhousie Castle, Bonnyrigg, won first place for four bunches of grapes with Alicante, Cooper's Black, Muscat of Alexandria, and Black Hamburgh, in good condition, gaining 27 out of a possible 35 points; Mr. J. Highgate, gardener to the Marquis of Tweeddale, K.T., Yester, second, with 26½ out of a possible 35 points; Mr. W. Galloway, Gosford, third, with 25 out of a possible 30 points. Mr. Galloway led for a pair of bunches of Muscat of Alexandria, with large-berried, well-finished clusters; Mr. H. E. Hughes, second, and Mr. J. Beisant third.

Mr. Millar, Cartside, Millikin Road, Paisley, scored for Black Hamburgh, followed by Mr. J. Macdonald, gardener to Mrs. Bremner, Streatham House, Morningside. Mr. Hughes had the best single bunch of Muscat of Alexandria; Mr. T. Ireland second. Mr. Millar was first for one bunch of Black Hamburgh, and Mr. F. Macrae, gardener to J. A. Clyde, Esq., K.C., Briglands, Kinross, second.

Mr. J. McNeil, gardener to Major Thorburn, Peebles, led for Alicante, and Mr. J. Highgate was second in a keen competition. Mr. Ireland had the best bunch of Gros Colmar, Mr. Hughes scored for Lady Downes, and Mr. J. H. Goodacre led for Madresfield Court. For one bunch of a white grape, Mr. M. Matheson, gardener to the Dowager Lady Kinross, Glasclure, North Berwick, scored with a very fine bunch of Buckland Sweetwater. A bunch of Appley Towers won first prize for Mr. J. McNiell, in the class for "the finest bloom."

CHOICE FRUIT.

In the class for a decorated table of dessert fruit, not more than sixteen dishes, arranged on a space 10ft. by 4ft. 6in., the Edinburgh Corporation provided substantial prizes. There were but two competitors, and Mr. J. H. Goodacre, gardener to the Earl of Harrington, Elvaston Castle, Derby, was the chief prizewinner with Thos. Rivers and Bellegarde peaches, spendid Marguerite Maillat and Souv. du Congres pears, Pineapple and Early Rivers nectarines, Ribston Pippin and Cox's Orange Pippin apples, Brown Turkey figs, two seedling melons, Kirke's plum, Black Hamburgh, Muscat of Alexandria, Madresfield Court, and Muscat Hamburgh grapes. The decorations consisted of Francoa ramosa.

montbretias and schizanthuses. Mr. D. Kidd, gardener to Lord Elphinstone, Carberry Towers, came second with good fruit, and a charming decoration of Sunrise roses and Gloriosa superba blooms.

Mr. J. Goodacre was the only exhibitor of a collection of twelve dishes of dessert fruit, and he was awarded the first prize; he had Muscat of Alexandria and Madresfield Court grapes, splendid Peasgood's Nonsuch and Emperor Alexander apples, Triomphe de Vienne and Dr. Jules Guyot pears, Bellegarde and Thos. Rivers peaches, Pineapple and Elruge nectarines, Countess melon, and Negro Largo figs. Mr. Goodacre led in the class for a collection of orchard house fruit, and here he had enormous Marguerite Marillat pears; Mr. G. Mackinlay second.

Plums were wonderfully well shown. Mr. Searle led for a dozen fruits with Oullin's Golden Gage; Mr. Mackinlay led for yellow plums with large Magnum Bonum; Mr. H. MacFadyen, gardener to F. Brüitmayer, Esq., [illegible]kfield Park, Sussex, scored for red plums with Pond's Seedling, and he was first for purple plums; Mr. Searle led for a collection of dessert plums with Kirke's, Jefferson, Early Transparent Gage, and Washington; Mr. J. H. Goodacre second, and Mr. W. Galloway, gardener to the Earl of Wemyss, Gosford, third. For culinary plums Mr. Searle led with Pond's Seedling, President, Goliath, and Victoria, with Mr. Mackinlay second, and Mr. Goodacre third. Mr. Thos. [illegible], gardener to Lady Chermside, Newstead Abbey, led for peaches with brilliant examples of Dymond, and Mr. B. Ness, gardener to the Earl of Stair, Oxenfoord Castle, Dalkeith, had the best apricots—Moor Park.

APPLES AND PEARS.

These were a fine feature. Mr. R. M. Whiting, Credenhill, Hereford, had the finest collection of twelve varieties of apples, showing heavy specimens all through; Mr. Caddick second, and Mr. MacFadyen third. A very good class was the one for a collection of twelve varieties of apples grown in Scotland, and here Mr. J. Duff, gardener to Colonel Gordon, Threave House, Castle Douglas, scored with good specimens of Peasgood's Nonsuch, The Queen, Hawthornden, Lord Grosvenor, Emperor Alexander, King of the Pippins, Gascoigne's Scarlet, Lord Suffield, Duchess of Oldenburgh, Lady Sudeley, King of Tompkin's County, and Ecklinville. Mr. M. Stewart, gardener to J. Neilson, Esq., [illegible], Castle Douglas, second, and Mr. D. Murray, gardener to the Marquis of Ailsa, Culzean Castle, Ayr, third.

Mr. Whiting was first and Mr. Lee second in the open class for six varieties, while Mr. [illegible] was first, Mr. J. Gibson second, and Mr. D. Murray third for orchard house trees, four dishes; the first prize set were excellent examples of Emperor Alexander, Gascoigne's Scarlet, Peasgood's Nonsuch, and James Grieve—all grandly coloured. Mr. Goodacre scored for a dish of dessert apples with Cox's Orange Pippin.

In the single dish classes the premier awards fell as follows:—Mr. R. M. Whiting, Credenhill, Hereford, for Allington Pippin; Mr. G. Mackinlay, Wrest Park Gardens, Bedford, for Blenheim Pippin; Mr. J. Lee, [illegible], Cheshire, for Chas. Ross (fine); Mr. J. Gibson, Welbeck Abbey, for Cox's Orange Pippin; Mr. Whiting for Coronation; Mr. G. Mackinlay for Gascoigne's Scarlet; Mr. Whiting for Irish Peach, beautifully coloured; Mr. A. Searle, gardener to the Marquis of Northampton, Castle Ashby, Northampton, for James Grieve, in very fine condition; Mr. E. W. Caddick, Caradoc, Ross, Hereford, for Lady Sudeley; Mr. Caddick, for Ribston Pippin; Mr. Caddick, for Worcester Pearmain.

Mr. J. Lee led for Alfriston, Mr. A. Brydon, Tweedbank, Innerleithen, for Bailie Nielson, a roundish, green apple; Mr. Lee, for Beauty of Kent, for Bismarck, and for Bramley's Seedling; Mr. R. Grindrod, gardener to Captain Clive, M.P., Whitfield, Hereford, for Cellini; Mr. Caddick for Cox's Pomona, very good; Mr. Whiting, for Duchess of Oldenburgh; Mr. Lee, for Ecklinville; Mr. Caddick, for Emperor Alexander; Mr. Mackinlay, for Golden Noble; Mr. Lee, for Golden Spire and Grenadier; Mr. W. Clanachan, gardener to J. S. Crawford, Esq., Thorpe Satchville Hall, Melton Mowbray, for Keswick Codlin; Mr. Caddick, for Lane's Prince Albert, Lord Derby, and Lord Grosvenor; Mr. Lee, for Lord Suffield; Mr. Caddick for Mère de Ménage; Mr. J. Gibson, for Newton Wonder; Mr. Lee, for Peasgood's Nonsuch, fine examples; Mr. Caddick, for Pott's Seedling, Stirling Castle, The Queen, and Warner's King; Mr. Jas. Duff, for Dumelow's Seedling.

In the pear classes Mr. R. M. Whiting scored for a collection of twelve varieties, with Marie Louise, Beurre Superfin, Marguerite Marillat, Beurre Baltet Père, Triomphe de Vienne, Beurre d'Amanlis, Pitmaston Duchess, Dr. Jules Guyot, Chas. Ernest, Beurre Bachelier, Beurre Alexandre Lucas, and Doyenne du Comice; Mr. Jas. Gibson, Welbeck Abbey, second; and Mr. H. MacFadyen third.

Mr. W. Galloway and Mr. R. Greenlaw gained equal firsts for six dishes of pears; Mr. Mackinlay led for Beurre Diel; Mr. A. Hogg, for Beurre d'Amanlis; Mr. Mackinlay, for Beurre Superfin; Mr. Macfadyen, for Conference; Mr. J. Macdonald, for Doyenne du Comice; Mr. P. McAndrew, for Durondeau; Mr. Mackinlay, for Jargonelle and Marie Louise; Mr. Greenlaw, for Pitmaston Duchess; Mr. Mackinlay for Souv. du Congres; Mr. Searle, for Williams Bon Chretien; and Mr. Ross, for Catillac. Mr. J. Gibson led for four dishes of pears, with Souv. du Congres, Doyenne du Comice, Durondeau, and Marguerite Marillat; Mr. W. Nicoll, second.

PLANTS AND GROUPS.

The plant classes do not seem to be taken seriously at Edinburgh, as there is never a very keen competition, and little trouble is taken in the disposal of the exhibits. Mr. A. McMillan, gardener to the Earl of Home, Douglas Castle, Lanark, had the best six foliage plants, winning with large examples of Anthurium crystallinum, Phyllotænium Lindeni, Dieffenbachia magnifica, Alocasia metallica, Maranta zebrina, and M. Portiana; Mr. A. Knight, Brayton Gardens, second. In another class for foliage plants Mr. McMillan and Mr. Knight were again first and second, and Mr. Bell, gardener to the Earl of Home, K.T., Bothwell Castle, was third.

The best four stove and greenhouse plants were from Mr. D. Mackay, Viewbank, Lasswade, Mr. E. Hughes, gardener to Sir Duncan Hay, Bart., King's Meadows, Peebles, second, and Mr. McKenna, gardener to Sir Robt. Usher, Bart., Norton, Ratho, third. The best single plant was a fair sized statice from Mr. W. Hogarth, gardener to Robt. Thorburn, Esq., Springwood, Peebles, Mr. McKenna coming second. Mr. W. Sharp, Freeland, Forgandenny, had the best four orchids—Vanda suavis, Cattleya gigas Sanderiana, Lælio-cattleya Bletchleyensis, and Cattleya Loddigesi; Mr. D. Mackay second. Mr. W. Pirie, gardener to C. F. Cowan, Esq., Dalhousie Castle, Bonnyrigg, had the best specimen orchid, a Cypripedium insigne Sanderæ, with nine beautiful blooms. Mr. Sharp scored for three cypripediums with C. Curtisi, C. œnanthum superbum, and C. Harrisianum, all large plants; Mr. A. Findlay, gardener to A. Dryburgh, Esq., Gogar Park, second.

In the fern classes there were some splendid adiantums, and Mr. L. Moodie, gardener to Miss Carse, Musselburgh; Mr. A. Findlay, Gogar Park; Mr. A. McMillan, Douglas Castle; and Mr. W. M. Bruce, gardener to Mrs. P. Neill Fraser, Rockville, Murrayfield, were the leading prizewinners. For hardy ferns Mr. Turnbull, gardener to A. Cowan, Esq., Valleyfield, Penicuik, was successful, and for selaginellas Mr. W. M. Bruce led the way.

For a large group, Mr. J. Davis, gardener to Colonel Stewart Richardson, Ballathie, Stanley, won first prize, using well-grown crotons and abutilons round a massed central cone of crotons and liliums; Mr. A. Knight, Brayton, Cumberland, second.

CUT FLOWERS.

This was one of the finest sections of the show. In the rose classes Messrs. W. and R. Ferguson, Dunfermline, had the best twelve bunches of garden roses, their Richmond, Mdme. Abel Chatenay, and Gruss an Teplitz being very good. Messrs. Dicksons, Edinburgh, scored for a dozen vases of roses. Messrs. Jas. Cocker and Sons, Aberdeen, led for thirty-six blooms, and they staged well, though some of the blooms showed the effects of recent bad weather; Messrs. D. and W. Croll, Dundee, second. The latter firm led for eighteen blooms, Messrs. Adams and Craigmile, Rubislaw, Aberdeen, following closely. The Aberdeen firm reversed the order of things in the class for eighteen tea roses, though both showed well. The Messrs. Croll had the best twelve pink roses—Mrs. J. Laing, and Messrs. Dicksons and Co. had the best dozen white roses—Frau Karl Druschki.

The Hugh Dickson Memorial Cup for twenty-four roses was won by Mr. A. Hulton, gardener to G. Keith, Esq., Montrose, with a handsome set of finely-coloured flowers, a trifle over-dressed; Mr. W. Parlane, gardener to Mrs. Dennistoun, Rosslyn Row, second, and Mr. J. Russell, Newton Mearns, third.

For a group of cut roses Messrs. J. Cocker and Sons, Aberdeen, were to the fore with a lovely arrangement of beautiful blooms, but they had a dark corner for their exhibit; Messrs. W. and R. Ferguson, Dunfermline, second.

For two dozen gladioli spikes Messrs. George Mair and Son, Prestwick, gained first prize, with massive spikes of shapely and large blooms; Messrs. A. E. Campbell and Son, Gourock, came a good second. Mr. John Smellie, Busby, secured the chief award for two dozen cactus dahlias, six blooms of each, but none of the varieties were named until some good while after judging was finished; the blooms were fine; Messrs. M. Campbell and Son, High Blantyre, second; Mr. J. Paul, Drumbeg, Kilbearn, scored for six vases of cactus dahlias, and he had handsome flowers; Mr. Sutherland, Victoria Nursery, Lenzie, second; and Mr. G. Bowness, Busby, third. The wiring and binding of the stems in this class were painful to see.

Hardy herbaceous flowers were well shown, Mr. C. Pattison, Linwood, Paisley, leading for twelve bunches; Mr. Adam Brydon, Innerleithen, second; and Dr. McWatt, Morelands, Duns, third. Mr. T. M. Whitehead, Selkirk, had the finest set of twelve bunches of carnations, and he showed fine selfs and fancies.

Mr. J. D. Kerr, gardener to the Hon. Mrs. Baillie Hamilton, Duns, was a good and easy first for nine bunches of sweet peas, with lovely flowers of John Ingman, Prince of Asturias, Helen Lewis, Etta Dyke, Mrs. Hardcastle Sykes, Primrose Spencer, Evelyn Hemus, Miss M. A. Linzee, and Frank Dolby; Mr. Thos. Hender, Coltoquhar Gardens, Crieff, second; and Mr. J. Kennedy, gardener to W. Russell, Esq., Abernethy, third. For six bunches, Mr. J. D. Kerr was again first, followed by Mr. Thos. Smart, gardener to Colonel C. T. Menzies, Kames, Greenlaw; and Mr. Kirkwood, Coltoquhar, Crieff.

Early chrysanthemums were beautifully shown by Mr. G. Bowness, Riverside, Busby, who won first prize for eighteen bunches, his set containing splendid bunches of Elstob Yellow, Holmes' White, Well's Scarlet, Goacher's Crimson, Polly, Parisiana, and Improved Masse; Mr. J. Smellie, Busby, second; and Mr. J. Sutherland, Linzee, third.

FLORAL DESIGNS.

Messrs. Perkins and Sons, Coventry, annexed the premier award for a floral design with a star and crescent done in white chrysanthemums and tuberoses, with cattleyas standing out therefrom; Messrs. Gunn and Sons, Olton, second, with a large floral harp composed of white chrysanthemums, odontoglossums, Vanda cœrulea, and Cattleya Loddigesi; this was a graceful design, whereas the first prize one was rather heavy. Messrs. Perkins and Sons led for a coloured hand bouquet with gorgeous oncidiums and cattleyas. Mr. A. Knight, gardener to Sir Wilfred Lawson, Bart., Brayton, Cumberland, led for an epergne, with a rather poor effort in oncidiums and yellow cannas; Messrs. M. Campbell and Son, High Blantyre, second, with Francoa ramosa and montbretias. For a cactus dahlia bouquet Messrs. Perkins and Sons were again to the front, and they also led for a white hand bouquet, using odontoglossums, roses, lily of the valley, and phalænopsis blooms; Mr. A. Holmes, gardener to A. Campbell, Esq., Helenburgh, second; the latter was first in another class for a white bouquet.

For a table decoration Mr. A. Knight, Brayton, was first prizewinner with pink oncidium sprays; Messrs. M. Campbell and Co., High Blantyre, second with pink sweet peas, carnations, and francoa sprays; and Mr. W. P. Bell third.

VEGETABLES.

Very keen was the competition and the interest in the class for a collection of eighteen dishes of vegetables, not less than twelve kinds. There were four competitors, and Mr. Jas. Gibson, gardener to the Duke of Portland, Welbeck Abbey, Notts, won the chief award with some of the finest produce he has ever staged. His set consisted of Early Giant and Autumn Mammoth cauliflowers, 7 points each; Solid White and Superb Pink celery, 6½ and 6¼; Ailsa Craig and Globe Onions, 6½ and 6½; Prizetaker leeks, 6½; New Red Intermediate carrots, 5; Gladstone and Centenary peas, 5 and 5; Tender and True parsnips, 4; Matchless cucumbers, 4; Princess of Wales and Perfection tomatoes, 6 and 6; Sutton's Black beet, 4½; Supreme and Superlative potatoes, 6½ and 6½; and Best of All runner beans, 5; a total of 104 points. Mr. R. Stuart, gardener to Lord Lauderdale, Thirlestone Castle, Lauder, came second, with 81 points, and he also had fine leeks and cauliflowers; Mr. W. Harper, gardener to J. Ramsey Richardson, Esq., Tulliebelton House, Perth, third.

In another class Mr. W. Galloway led, and Mr. J. Highgate was second; this was for twelve dishes also. Mr. J. Gray, Middlewood, Uddington, had the best six dishes; and Mr. R. Watson, Crossford, Carluke, was second.

Potatoes were very fine, as usual, and Mr. Gibson won for twelve varieties, with Mr. J. Brown, gardener to Major Balfour, Collesie, second. Mr. Gibson was first for onions, and Mr. Fleming, Galashiels, second for leeks; Mr. Gibson also led for beet and for parsnips.

NON-COMPETITIVE.

Messrs. Storrie and Storrie, Glencarse, Perthshire, put up a splendid group of plums, apples, and pears in pots, all finely fruited, and below the trees they had begonias and narrow-leaved crotons. Mr. Henry Eckford, Wem, Salop, was forward with a big display of sweet peas, showing good bunches of popular, as well as newer, varieties; he had Constance Oliver and The King in good form, and Queen of Spain was very pretty. A very handsome and charmingly arranged exhibit of Lilium auratum, L. speciosum, Hydrangea paniculata grandiflora, and early chrysanthemums of the Masse type, was set up by Messrs. Thos. Methven and Sons, Edinburgh; crotons, palms, etc., lent grace to the beauty of the flowers.

Mr. John Forbes, Hawick, contributed a wonderfully bright and interesting exhibit of his famous pentstemons and phloxes, together with an assortment of herbaceous flowers, dahlias, and carnations. Pentstemon Crimson Gem, a real beauty, was the great attraction in this display. Messrs. Dobbie and Co., Rothesay, had a mixed display of choice pansies and violas, a fine selection of cactus, show and pæony-flowered dahlias, early chrysanthemums, and marigolds; they also set up some good leeks and a small collection of early potatoes. Messrs. Cunningham, Fraser, and Co., Comely Bank, Edinburgh, set up a table of herbaceous plants.

Messrs. Sutton and Sons, Reading, were large exhibitors; their circular group of fine seedling tuberous begonias, gloxinias, nicotianas, and streptocarpuses was a great feature of the show, and practically every plant was a seedling of the present year. Behind this group they had a long group of asters, showing all the types and a wonderful range of colouring. A few choice vegetables, including a wonderful dish of Sutton's Centenary pea, completed a splendid display. Messrs. W. Cutbush and Son, Highgate, had a large and pretty display of hardy flowers grouped in fine masses round a pool of lovely water lilies. Meconopsis Wallichi, pentstemons, and kniphofias and montbretias, were especially good.

Messrs. J. Mason and Co., Jamestown, sent pansies and violas. Sundries were contributed by Mr. J. Don, Glasgow, and Messrs. Alex. Cross and Co., Glasgow. Mr. J. Wilson, Hereford, showed a grand lot of fine bulbs of Cranston's Excelsior onion. Messrs. W. Wells and Co., Merstham, Surrey, contributed early chrysanthemums and pentstemons, while early chrysanthemums were also largely shown by Mr. D. McOmish, Crieff.

From the Horticultural College, Swanley, came some very fine culinary and dessert apples. Mr. J. Downie, Shandwick Place, Edinburgh, put up a group of bright crotons, with a large central mass of liliums. Messrs. Macrimmon and Fulton, Leicester, contributed sweet peas in variety. Mr. Robert Bolton, Warton, Carnforth, had a delightful exhibit of splendidly-grown sweet peas, setting up, among other things, splendid sheaves of Mrs. Henry Bell, Clara Curtis, Mrs. Chas. Foster, and Mrs. Hardcastle Sykes. Messrs. Gunn and Sons, Olton, Birmingham, had a grand lot of phloxes, and they showed the dwarf white Tapis Blanc finely. Mr. Thos. W. Darlington, Warton, Carnforth, had sweet peas in plenty.

Messrs. Austen and Macaslan, Mitchell Street, Glasgow, put up a large and interesting collection of well-grown vegetables. Messrs. Clibrans, Altrincham, showed vegetables largely and well, and arranged them in a most admirable manner; the tomatoes, onions, and beet were unusually good. Mr. D. W. Thomson, George Street, Edinburgh, contributed large apples, and a few gladioli spikes. Messrs. Hugh Low and Co., Bush Hill Park, Enfield, staged a few orchids, Cattleya Loddigesi and Stanhopea oculata being conspicuous in their group. Mr. D. McLeod, Chorlton-cum-Hardy, contributed a few cypripediums and cattleyas.

Messrs. R. B. Laird and Sons, Lim., Pinkhill Nurseries, Edinburgh, were responsible for a very artistic exhibit of flowering shrubs, greenhouse plants, crotons, dracænas, etc., arranged around and on a rockery design. Messrs. Thos. S. Ware, Lim., Feltham, Middlesex, put up a very attractive group of fine single and double tuberous begonias, showing such splendid varieties as Mrs. A. Tweedie, Rhoda Pope, The Queen, May Pope, Samuel Pope, Miss Strower, and Marchioness of Bute.

MEDALS AND AWARDS.

Gold.—To Mr. James Gibson, gardener to the Duke of Portland, Welbeck Abbey, Notts, for his first prize collection of vegetables.

Silver-Gilt.—Messrs. Sutton and Sons, Reading; Messrs. Dobbie and Co., Rothesay; Messrs. Clibrans, Altrincham; Messrs. T. Methven and Sons, Edinburgh; Mr. J. Forbes, Hawick; Messrs. R. B. Laird and Sons, Pinkhill, Edinburgh; Messrs. Thos. S. Ware, Lim., Feltham, Middlesex.

Silver. — Messrs. W. Cutbush and Son, Highgate; Mr. Robt. Bolton, Warton, Carnforth; Messrs. Cunningham, Fraser, and Co., Edinburgh; Messrs. Austen and Macaslan, Glasgow.

Bronze.—Messrs. Gunn and Sons, Olton; Messrs. A. Lister and Son, Rothesay; Messrs. M. Campbell and Son, High Blantyre; Mr. J. Downie, Edinburgh.

First-class Certificate. — Rambling rose, Christian Curle, from Messrs. Jas. Cocker and Son, Aberdeen; Michaelmas daisy (double), Beauty of Colwall, from Messrs. T. S. Ware, Lim., Feltham.

Award of Merit.—Sweet pea Rose Spencer, from Mr. A. Malcolm, Duns; early chrysanthemum Rob Roy, from Mr. W. Robinson, Pilrig; croton-leaved coleus, from Messrs. Storrie and Storrie, Dundee; chrysanthemum D. W. Thomson, from Mr. [illegible] Thomson, Dean Nursery, Edinburgh; chrysanthemum Abercorn Beauty, from Mr. Alex. Brown, Abercorn Nursery; Acalypha Clibrani (yellow-white variegated sport from A. macrophylla), from Messrs. Clibrans, Altrincham; dahlia Sentinel, from Messrs. Dobbie and Co., Rothesay.

NEW BOOKS.

POT CULTIVATION OF ROSES.

By William Paul, F.L.S. (Simpkin, Marshall,
Hamilton, Kent, and Co., London, E.C.)
Price, 1s.

The appearance of the ninth edition of this popular handbook of the cultivation of roses in pots is sufficient evidence that the general body of cultivators are well acquainted with its distinctive features, and highly appreciate the immense amount of information it contains. We need not, therefore, refer to it with the fulness of detail that would be necessary were the work a new one, or, indeed, say much beyond directing attention to the publication of a new edition. It is now many years since the late Mr. William Paul recognised the need cultivators of pot plants had for information on the more important details, and placed at their command a book that was at once thoroughly practical, clear, and concise in its treatment of the various details, and so inexpensive as to be within the reach of all concerned with pot roses. Mr. Paul achieved so high a degree of success in planning the original edition that there has been no occasion to change the arrangement of the contents in the preparation of the subsequent editions, and the ninth issue may well be described as a model of what such handbooks should be. If there has been no change in the general plan, there has been much alteration in the contents, as the author has been careful in the preparation of the several editions to keep the work thoroughly up to date, and to keep his readers fully informed as to the most popular of the various types of plants and the most recent methods of procedure. In this edition the cultivation of the Wichuraiana and other of the rambling roses in pots receives special prominence, and the reader is able to obtain the fullest information on the points essential to success in the cultivation of these popular roses for the decoration of the conservatory, and the embellishment of the home on festive occasions. As in the case of previous editions, the whole of the chapters have been revised, and to the several lists of varieties the names of such of the new roses as are superior to those of earlier introduction have been added. The revision has indeed been so thorough that the book have the freshness one only looks for in a quite new book, and we may heartily congratulate Mr. Arthur Paul on the success he has achieved.

WITH GOD IN THE GARDEN.

By Leonard E. Dowsett. (H. R. Alle[illegible]
Lim., 7, Racquet Court, [illegible]
E.C.) Price 2s. 6d. net.

A highly interesting book, consisting [illegible] addresses that have been delivered to c[illegible]dren on Sunday mornings as part of [illegible] regular church worship. The whole of [illegible] lessons which the author has sou[illegible] teach have been drawn from the ga[illegible] The addresses are admirable in their o[illegible] and style, and the book is one that [illegible] placed in the hands of the young with [illegible]tage. It should certainly receive [illegible]tion of those engaged in teaching [illegible] in Sunday schools.

ANSWERS TO CORRESPONDENTS.

Editorial Communications should be addressed to the Editor of the Gardeners' Magazine, 148 and 149, Aldersgate Street, E.C.

Secretaries of horticultural societies are invited to send early notification of forthcoming exhibitions and meetings, and are requested to advise us concerning changes of dates.

NITROGENOUS MANURES.—T. Smith, [illegible]: You have been wrongly informed. Quick-acting manures, such as nitrate of soda and sulphate of ammonia ought not to be applied in the autumn for the purpose of enriching land that is to be cropped in the spring. As your soil is light much of the fertilising properties of these quick-acting manures will be washed away before the crops will be in a condition to derive benefit from them. A short time before planting or sowing will be quite early enough to apply these quick-acting manures, and in some cases it is an advantage to apply them in the form of top-dressings when the crops have made some little progress.

BEDDING PELARGONIUMS.—W. W. F., Lancashire: You might greatly improve the appearance of your large beds of zonal pelargoniums next year, as compared with this year's effect, by keeping over the winter a sufficient number of plants to fill them. The plants will be somewhat taller, and they will bloom more freely, especially if the weather should be rather wet. If you can spare the room, we suggest that you put them singly in five-inch pots when they are removed from the beds, and that when potted they be placed in a light and airy structure. The shoots should not be shortened now because of the risk of the cut portion decaying and the decay spreading through the tissues. The leaves as they show signs of decay should be removed, and very little water be given until there are signs of new growth at the beginning of the year. They will then require additional attention, and the first step will be to shorten the shoots to within two or three inches of the base. In due course, new growths will be produced, and when these are about an inch in length repot, using six-inch pots, and a substantial compost. When they have recovered from the check received in repotting, water more liberally, and from that stage until they are turned out of doors preparatory to their being planted out, give them a position in pit or frame where they can enjoy uninterrupted light, and be safe from frost. It is a good plan when large beds have to be filled with zonal pelargoniums to grow a few standards with stems ranging from 20 to 30 inches high, and plant them with the dwarfs, as they relieve the flatness in a marked manner. The flowers of the standards should be of the same colour as those of the dwarfs, or of a tone that the two will harmonise.

POT CULTURE OF FIGS.—F. B., Wilts: The span-roof house, twenty feet long by twelve feet wide, which you are desirous of using for figs instead of ornamental plants, is large enough to enable you to have sufficient pot trees to give you a good supply of figs in the course of the summer. The culture of figs in pots is an interesting method, and one from which large returns of highly-flavoured fruit may be obtained. With a suitable selection of varieties growing in the same structure, you will find it possible to have a continuous supply of fruit from the middle of June until October is well advanced. Unlike most other fruits commonly grown in this country, some of the varieties of figs will produce two crops during the season, and occasionally a third crop; and as some ripen their first crop earlier than others, you will readily understand how continuous supplies can be obtained over a long period. If you decide to act on this suggestion, we shall be pleased to give you a selection of varieties, and, indeed, any other information of which you may be in need.

PACKING APPLES AND PEARS.—W. T., Herts: These fruits are, owing to the hardness of their texture, less liable to be injured in transit than other kinds; but we would impress upon you the importance of care in packing, so that the fruits may reach your employer's table in the best possible condition. Both apples and pears are frequently damaged in transit, and one of the chief causes of injury is the failure to pack with sufficient firmness to prevent the fruit moving about in the course of the journey. Shallow boxes are best for both classes of fruit. We advise you to provide for choice dessert apples and pears boxes of thin deal, about eighteen inches wide, twenty-four inches long, and six or seven inches deep. These will have a sufficient depth for one layer of large fruits and two layers of those of medium and small size. A greater depth than six inches is not desirable, nor is it necessary for the purpose of economy in carriage, it being an easy matter to cord several boxes together. Care should be taken to dispatch pears before they are quite ripe, for when kept in the fruit room until they are nearly ready for the table there is a probability of their being past their best when received, and, moreover, a risk of their being so soft as to be damaged in transit. First cover the bottom of the box with a layer of rather fine wood wool, about an inch in thickness, and also line the sides with the same material. Wrap the fruits in soft paper, and so place them that they will, as far as practicable, fill the whole of the spaces. Pears of pyriform shape should be arranged alternately, with stalk and eye in different directions to more fully utilise the space. A little of the wood wool should be thrust into the vacant spaces, and where necessary, sufficient must be thrust down the side of the box to prevent the fruits moving in the slightest degree. Over the fruits should be put a sufficiently thick layer of wood wool to render some amount of pressure necessary when the lid is fastened down. The procedure in packing apples will not materially differ from that advised for pears. A rather stouter and cheaper kind of paper may be used; ordinary kitchen paper is in every way suitable, and the apples should all be placed with their stalks downwards.

TULIPS IN SMALL GARDENS. — Subscriber: In gardens in which tulips can be given positions where they can enjoy full exposure to light and air, and have the advantage of moderately rich soil, such, for instance, as that in which hardy perennials can be successfully cultivated, the bulbs will multiply and attain the degree of maturity essential to the production of finely-developed flowers. The advice to which you refer was given to a correspondent who has a small garden in a suburban district which is surrounded by large trees growing in his neighbours' gardens. In his case the borders are impoverished by the roots of the trees, and the plants growing in them are also deprived of much of the sunlight.

CHERRIES.—W. M. K., Hants: Bedford Prolific, Beurre de Hedelfinger, Black Tartarian, Early Rivers, Frogmore Early, Bigarreau, Governor Wood, and May Duke are all of great excellence and form a good selection for a garden of moderate dimensions, such as the one you have under your charge.

UNHEALTHY CATTLEYAS. — M. B., Yorkshire: If the small plant you send is representative of the condition of the whole of your stock of cattleyas, measures of a somewhat drastic character will be necessary. The pots were not, in the first place, efficiently drained, and the peat used was not of a quality suitable for orchids. We advise their being repotted forthwith, for, although this is not the best time of the year for repotting cattleyas generally, it will be better to do so than allow the roots to remain through the winter in the same material in which they now are. Provide pots of the same size, or one smaller, than those now occupied, let them be perfectly clean, and in their preparation fill them to one-half or two-thirds their depth with crocks, which also must be quite clean. Turn the plants out of the pots, carefully remove the material from about the roots, then well wash the latter and cut away those that are dead or are showing signs of decay. Repot in the usual way, use fibrous peat, from which much of the finer part has been shaken, and as the peat is being packed about the roots, work in nodules of charcoal and small crocks. Very little moisture will be necessary until new roots are being produced, and subsequently water must be sparingly applied.

IF THIS ISSUE OF "THE GARDENERS' MAGAZINE" INTERESTS YOU PLEASE ORDER THE PAPER REGULARLY.

SUBSCRIBER'S ORDER FORM.

Every Saturday THE GARDENERS' MAGAZINE. Twopence.

To W. H. and L. COLLINGRIDGE,
148 and 149, Aldersgate Street, London, E.C.

I request you to send me the GARDENERS' MAGAZINE by post every week until countermanded, and I enclose ______ for ______ months in advance.

NEW PLANTS, ETC.

◆

LÆLIO-CATTLEYA ELVA VAR. ST. VINCENT.

A very distinct hybrid between L.-c. Ingrami and C. gigas. The sepals and petals are deep rosy mauve, and the large lip deep purple with large yellow blotches. A.M., R.H.S., September 1. Mr. H. S. Goodson, Putney.

CATTLEYA RHODA.

A fine hybrid obtained from a cross between C. Iris and C. Hardyana. The sepals and petals creamy buff suffused salmon, the lip a bright purple with lighter edges. A.M., R.H.S., September 1. Messrs. Charlesworth and Co., Bradford.

SOPHRO-LÆLIO-CATTLEYA DANÆ SUPERBA.

A pleasing form, the flowers large, the sepals and petals creamy-white edged purple rose, the lip golden-yellow margined with purple. A.M., R.H.S., September 1. Lieut.-Colonel Holford, Westonbirt.

BRASSO-CATTLEYA MADAME CHARLES MARON, SANDERS' VARIETY.

A remarkably fine hybrid between Brassavola Digbyana and Cattleya Warscewiczi, and far superior to the original form. The flowers deep purple rose, with a pale-yellow blotch at the base of the lip. F.C.C., R.H.S., September 1. Messrs. Sander and Sons, St. Albans.

TRITONIA R. WILSON KER.

A handsome variety, having a large spike, and flowers of bright shining crimson. A.M., R.H.S., September 1. Messrs. Wallace and Co., Colchester.

GLADIOLUS PRIMULINUS HYBRIDS.

A series of hybrids obtained from a cross between G. primulinus and G. Gandavensis. The flowers have the characteristics of the first-named species, and are exquisitely coloured orange, lemon, and pink. A.M., R.H.S., September 1. Messrs. R. Wallace and Co.

MONTBRETIAS.

Norvic.—A fine dwarf variety. The spikes are nicely arranged, the flowers are large, and the colour yellow, heavily flushed on the outside of the segments with red and crimson. A.M., R.H.S., September 1. Mr. G. Davison, Westwick Hall, Norwich.

Hereward.—A very handsome variety. The flowers are large and borne boldly on the spike; the colour rich orange. A.M., R.H.S., September 1. Mr. G. Davison.

GLADIOLI.

Golden Measure.—A fine yellow variety, self coloured, with the large and finely-formed flowers evenly disposed on the spike. A.M., R.H.S., September 1. Messrs. Kelway and Son, Langport.

White Cloud.—A beautiful variety with large flowers of fine form, and well set on the spike. The colour creamy-white. A.M., R.H.S., September 1. Messrs. Kelway and Son.

CATALOGUES RECEIVED.

WM. CUTBUSH AND SON, HIGHGATE, N.—A useful and freely illustrated catalogue of bulbous plants, and a further and very interesting catalogue of Malmaison, Perpetual, and Border carnations, pinks, etc.

LITTLE AND BALLANTYNE, CARLISLE.—This catalogue is chiefly devoted to bulbs, but it contains good lists of fruits, roses, and flowering shrubs.

M. HERB, NAPLES, ITALY.—A general catalogue of bulbs, including many rare kinds, and seeds for autumn sowing.

Sweet Peas.—An Irish correspondent writes as follows: Your little manual—"Sweet Peas and Their Cultivation"* is admirable. Any person who reads, marks, learns, and inwardly digests it, and then afterwards fails to make his garden like Paradise restored is a duffer."

* "Sweet Peas and Their Cultivation." By C. H. Curtis, F.R.H.S. Price 1s. net, by post 1s. 2d.; cloth, 1s. 6d., by post 1s. 9d., from "The Gardeners' Magazine" Office.

FORTHCOMING ENGAGEMENTS.

TUESDAY, September 15.—Royal Horticultural Society. Meeting of Floral, Fruit, and Orchid Committees at noon, and Scientific Committee 4 p.m.; General Meeting at 3 p.m., lecture by Mr. T. H. Mawson, on Garden Design.

THURSDAY, September 17.—National Rose Society's Autumn exhibition at the Horticultural Hall.

A New Book on Bulbs. — If you want to know anything about bulbs and how to grow them, which to plant, and where to plant them, we would direct your attention to the new book, "Bulbs and Their Cultivation," by T. W. Sanders, F.L.S., issued this week. In its pages will be found all that it is necessary to know in the culture of indoor and outdoor bulbs, corms, tubers, and the miscellaneous plants broadly classed as bulbs and tubers. The selections at the end should be of much value at the present time as an aid to the unknowing what to choose for their beds and borders, windows and greenhouses. The book, which is freely illustrated with plates and other illustrations, is published by W. H. and L. Collingridge, at 148, Aldersgate Street, London, E.C., and can be had direct and post free for 2s. 10d. The price at booksellers is 2s. 6d.

KELWAY GARDENS,

Greenock,
26th August, 1908.

Messrs. Kelway and Son,
Langport, Somerset.

Dear Sirs,—You will be pleased to hear that the £10 or so which I have sent you in the last few years have made my garden (¼ acre) one beautiful mass of colour all the year round.

This year especially the place has been a perfect picture—quite as fine as any of the pictures in Walter Wright's "Perfect Garden."

I am,
Yours faithfully,

FOR AUTUMN PLANTING.

PLANTERS of FRUIT TREES should write for our fully descriptive catalogue and supplement, 6d., post free; and gratis to customers.

SUCCESSFUL BULBS . .

The secret of our success as Bulb Merchants is in the buying. Owing to the tremendous sale our Bulbs have year after year, we are in a position to select from only the best stock. The world's finest selections are offered to Alex. Dickson & Sons, Ltd., but before these are sold to the public every Bulb is carefully examined, so that when buying from us you may rely with the utmost confidence on having made a purchase which will be satisfactory to you and a credit to us.

Write to-day, mentioning this paper, for new Illustrated List, showing all classes of Bulbs at prices which will be a revelation to you.

Holland in IRELAND.

Custom and tradition alike suggest your buying Bulbs in Holland. Why continue to do so? "Holland in Ireland" has amply proved the superiority of Irish grown Bulbs.

Tulips, Narcissi, Iris, Anemones, etc., from the Bulb Farms of Messrs. HOGG and ROBERTSON, equal and even surpass, the Dutch Bulbs in their exquisite form and beauty of colouring.

The Booklet "Holland in Ireland" fully illustrates and describes them; it is free on request.

NOTES OF THE WEEK.

Rural Education.

Educational questions received a full share of attention at the recent meeting of the British Association at Dublin, and special prominence was given to the all-important subject of the education of children attending the elementary schools in country districts. While all the matters brought forward were well deserving of the most careful consideration, and, therefore, had our sympathy, we were especially interested in the papers and discussions on the system of education best suited to the needs of rural districts. This question has long been regarded by us as having an important bearing upon the prosperity of rural industries, and during the past thirty years or so we have consistently advocated a system of education that would place children in the possession of a knowledge of the common objects of the country, and thereby interest them in their surroundings and more fully equip them for the duties they have to perform in after life. We have also strongly urged again and again that such education must, to be thorough, be of a more or less practical character. While acknowledging the usefulness of textbooks we have pointed out that to interest children in plants or insects we must place specimens in their hands, describe their destructive characteristics, and encourage them to ask questions about their peculiarities of structure and functions with a view to quicken an interest in the subject and develop their powers of observation. Holding these views we have been much interested in the fact that both readers and speakers without exception advocated a system of rural education in close accordance with the lines laid down in these pages. In the course of a paper by Sir Philip Magnus, that well-known authority on educational matters pointed out that, while an immense improvement had been made within recent years, the true aim and purpose of elementary education did not appear to have been fully realised, and its relation to the pupil's life-work seemed to have been greatly neglected. The methods of teaching had, in his opinion, been, and in many respects still were, deficient owing to so much importance having been attached to the value of book-learning and oral instruction unaccompanied by experimental work on the part of the pupils. He also stated that he regarded the scheme of education as incomplete owing to the want of correlation between the subjects taught, and to the neglect and the failure to appreciate the necessity of adaptation to the requirements of actual life. The larger part of the school lessons had, he felt, failed to stimulate observation, to encourage initiative, and to create those habits of self-reliance which were as essential to success in the garden and field as in the workshop or office. The discussion on rural education was an important contribution to the problem of the best means of educating those likely to be engaged in rural life to fit them for their duties, but much had to be accomplished before a satisfactory and complete solution could be effected. Professor Miall, who was president of the education section, expressed the opinion that in the near future the practical application of biology would receive far more consideration than it received to-day. The raising of crops, the management of gardens, and the prevention of insect pests were obviously of great importance, and a good supply of naturalists competent to advise upon such matters would be regarded as essential to the national welfare. In like manner natural history, which was often treated as mere recreation, would be considered one of the great and permanent interests of mankind. Professor Miall also insisted upon the necessity of the teaching of natural history being thorough, and of it being conducted with a practical object in view. In his opinion such labour-saving appliances as pictures and lantern slides, ready-made preparations, printed descriptions, and museum lectures were far too freely used. These things diverted the minds of the children from active inquiry, and lessons were of but little value unless the teachers encouraged the children to think for themselves and cultivate their powers of observation. Mr. George Fletcher was of the opinion that reform was necessary, but he contended that it was less a question of the introduction of a new subject into the curriculum than the infusion of a new spirit into the system. So long had they continued to run in the academic groove that primary education seemed to have become a thing somewhat remote from the lives of those receiving it, and especially was this the case in rural schools. The commonest things in everyday environment could be made to serve an educational end, and if every school could be made to fully utilise its surroundings in teaching there would be hope for the solution of the problem. As proof of the readiness with which children adapt themselves to practical teaching, Mr. C. H. Bothamley, the director of education in Somerset, stated that it did not usually take more than four or five days to settle down to work at botany or practical science without the use of books. What is essential in the teaching of either plant or insect life is not setting pupils tasks in botanical or biological terminology, in accordance with the practice which has so long obtained, but the studying with them, as it were, the form and functions of the plant or insect, and using live specimens. We have urged this on many occasions in these pages, and we are much gratified by the knowledge that there is now a strong trend of opinion in the same direction.

DR. DOUGLAS L. FREELAND.

Dr. Douglas L. Freeland, whose portrait adorns our front page this week, is one of the keenest members of the younger group of amateur rosarians, and if, in course of time, his opportunities for growing and showing should increase, he will prove a very difficult competitor to defeat. Dr. Freeland lives at Delamere, Snodland, Kent, where what spare time he can snatch from professional duties is devoted to the flowers he loves so well. Roses and sweet peas are prime favourites at Delamere, but the roses take first place, and right well are they grown. Dr. Freeland is not wanting in pluck, for he competed for the Sherwood cup at the recent Holland House Show, and though the cup was not awarded, his display, put up at no small cost and trouble, was evidence of his love of the flower, and his sportsmanlike qualities. Dr. Freeland is also keenly interested in horticultural teaching in his locality, and anyone who visits the Snodland district for the purpose of instructing the residents in matters horticultural is always the recipient of abundant hospitality at Delamere.

Roses and Rose Planting.—Our issue of September 26 will be devoted chiefly to roses. It will contain a full report of the Autumn Rose Show of September 17, and a number of special articles dealing with the New Roses, Arches of Roses, Single Roses, Roses for Rock Gardens and Rooteries, and Planting Roses, etc. The issue will be freely illustrated, and promises to be of unusual interest to rosarians of every class. As the demand is certain to be a very large one readers who desire extra copies should place their orders with the publisher without delay. The price will be 2d. as usual.

Annual Dinner of the U.H.B.P.—The annual dinner of the United Horticultural Benefit and Provident Society will be held on Thursday, October 15, at the Waldorf Hotel, Kingsway, W.C., at 6.30 p.m. Dr. Robert Boxall, of Ingleside, Abinger Common, Dorking, will preside. An excellent programme of music has been arranged, under the direction of Mr. Thomas Winter, and, as the function is to take place during the evening of the first day of the Royal Horticultural Society's Fruit Show, a large attendance is anticipated. Tickets, 5s. each, may be obtained from Mr. William Collins, 4, Martindale Road, Balham, S.W.

Fruits of Foreign Growth were sent to British markets last month in smaller quantities than for some time past, and had it not been for considerable increases in the imports of apples and pears the decrease in the total would have been very large. In the imports of apples there was an increase of 39,945 cwt., the total having been 88,603 cwt., of the value of £47,726. Bananas dropped from 705,478 bunches, of the value of £198,383, in August, 1907, to 624,897 bunches, of the value of £174,946 last month. In the imports of cherries there was a decrease in quantity of 16,615 cwt., and in value of £17,278, the aggregate having been 760 cwt., of the value of £689. The decrease in the imports of currants also was very large, the total having been 3,711 cwt., of the value of £3,707, against 10,988 cwt., of the value of £11,359, in August, 1907. The imports of gooseberries were, on the other hand, rather larger, the total having been 937 cwt., of the value of £468. There were increases in the imports of the several kinds of nuts, and decreases in the imports of oranges and lemons. Pears were imported in large quantities, the total having been 210,295 cwt., of the value of £217,323. Very large also were the imports of plums, these aggregating 244,657 cwt., of the value of £246,676. Strawberry imports dropped from 937 cwt., of the value of £1,000, in August, 1907, to 92 cwt., of the value of £71, last month. The value of unenumerated fruit was £179,256, or a decrease of £1,985. The total value of the fruit imports for the last month was £922,449, or a decrease of £1,985.

Colour Chart for Florists.—Mr. C. Harman-Payne writes: With reference to the short note on p. 690 of the Gardeners' Magazine, may I point out that the proper name of the work referred to is the Répertoiré des Couleurs." It is essential to bear this in mind, as there is another French colour chart, entitled "Code des Couleurs," which is intended to be referred to as the "C.C." by those who use it. The arrangement and numbering of the colours are quite different in the two works; hence the necessity for using the proper title.

Colour Changes in Tropæoleums.—Colonel H. E. Rawson recently stated at the British Association, he had produced startling changes in the colours of tropæoleums by protecting the plants from the direct rays of the sun. The means he used are not clearly defined, but we gather he changed scarlet and orange varieties to a mauve variety, with the exception of one carmine, blue-marked one. He further states that the mauve variety has proved a veritable mutation, and seed from it, after the second year, comes true, though sown in different climates and aspects. We saw some of the flowers and plants at York Gala last June, and were not specially attracted by them. We know how wide is the colour variation of tropæolums, and how the floral colours vary in different aspects and under different conditions, and we are, therefore, not prepared to accept at once the statement that adaptation to external influences will result in fixity in one or two years.

Franco-British Exhibition Awards.—On Tuesday the International Jury commenced the important task of making awards to the multitudinous contributions to this exhibition. The members of the Jury, to the number of about four hundred, assembled in the Congress Hall at 11 a.m., where they were received by the Exhibition authorities. A few short speeches were made by British and French members of committee, and at the close the Jury adjourned to the Garden Club for the purpose of completing the organisation of the several sections, and this having been accomplished, commenced their duties. Among the British horticulturists who are members of the sections of the Jury entrusted with making the awards in the classes devoted to botany, horticulture, and forestry, are: Mr. W. Barr, Mr. George Bunyard, V.M.H., Mr. H. J. Elwes, V.M.H., Mr. George Gordon, V.M.H., Mr. H. B. May, Lt.-Colonel Prain, and Mr. H. Somers Rivers.

Horticultural Societies and Public Parks.—The edition of the "Gardening Year Book" for 1909 is about to go to press, and we shall be greatly obliged by secretaries of horticultural societies sending in particulars in regard to their societies, with dates of exhibitions, etc. We shall also be pleased to receive from superintendents of public parks and gardens their full name and address, with particulars of the title and extent of the open spaces under their charge. We shall be obliged if these particulars are in each case sent at the earliest possible moment to the Editor of the "Gardening Year Book," 148 and 149, Aldersgate Street, E.C.

Classification of Daffodils.—At the request of the Daffodil Committee, made on April 28, 1908, the Council of the Royal Horticultural Society recently appointed a committee to consider the way of avoiding the confusion, and consequent disputes, likely to arise from recent multitudinous crossing, recrossing and intercrossing of the old Divisions Magni- Medio- and Parvi-coronati. The committee, consisting of the Rev. W. Wilks, Rev. J. Jacob, and Messrs. J. Bennett-Poë, J. W. Barr, E. A. Bowles, and C. H. Curtis, have delivered their report, instituting an entirely new system of classification, which the council have (with slight modifications) adopted and confirmed, and ordered to be used at all the society's shows. The report contains a list of every daffodil known to the committee, together with the name of the raiser, so far as it could be discovered, each flower known being allotted to its appropriate class. The report has been printed in handy book form, and can be obtained from the society's office, Vincent Square, at a cost of 1s.

Princes Street Gardens, Edinburgh, always one of the features of the Scottish capital, are just now very interesting by reason of the extensive display of liliums they contain. The tall spikes and flowers rise well above the summer-flowering occupants of the beds, and they are now yielding beauty, grace, and fragrance in no small measure. Mr. McHattie has almost converted the place into a lily garden, for there are thousands of Lilium speciosum, representing a considerable range of varieties from deep red to white, Lilium longiflorum and L. auratum. Early chrysanthemums also add their attractions to those of the lilies.

The Horticultural Trades Association of Great Britain and Ireland has just completed its annual congress, the meeting taking place this year in London. The gathering was a record one as regards numbers, over 100 leading members of the nursery and seed trades attending from all parts of the United Kingdom. The three days allotted were devoted to excursions round London, and the evenings to business meetings and the discussion of topics of trade interest. Among the nurseries visited were those of Messrs. Hugh Low and Co., Enfield; Paul and Son, Cheshunt; W. Paul and Son, Waltham Cross; Thos. Rochford and Sons, Lim., Turnford; and Jas. Veitch and Sons, Lim., Coombe Wood. The generous hospitality shown by the proprietors to the visitors added much to the pleasure of the outing, which was marred only by the miserable weather experienced during the last day.

National Chrysanthemum Society.—The regular autumn and winter work of this long-established society commenced on Monday, when the Floral Committee met at Essex Hall in the afternoon and the General Committee at Carr's Restaurant in the evening. The society's exhibitions will be held at the Crystal Palace on October 7 and 8; November 4, 5, and 6; and December 2 and 3. The Floral Committee meets on September 28, October 26, and November 16, at 3 p.m., at Essex Hall, Strand, and on October 7, November 4, and December 2, at the Crystal Palace at 12 o'clock. The Executive Committee meetings are arranged for October 26, November 16, December 7, and January 11 (1909), at Carr's Restaurant, Strand. All correspondence concerning subscriptions, membership, etc., should be sent to Mr. Richard A. Witty, St. James Villa, Swain's Lane, Highgate, N.

TULIP SPECIES.

As is the case with other flowers, so with tulips, species is the term used to describe those varieties that are found growing wild in various parts of the world, and cultivated in the same condition in our gardens.

Everyone knows the prominent place that cultivated tulips occupy in the history of flowers, because of the mad tulip mania of the Dutch in the years 1634—1637, but few are aware of the vastly interesting questions which arise, and still wait for a solution, out of the strange, sudden appearance of new forms in well-known hunting grounds of botanists, or how in the fourth quarter of last century, and even up to the present year of grace, that unknown land of Central Asia has given us some of the most gorgeous flowers in the world, e.g., Tulipas Greigi, Eichleri, Tubergeniana, Fosteriana, Ingens, Micheliana, Kaufmanniana coccinea, and the small, but equally bright linifolia and Wilsoniana.

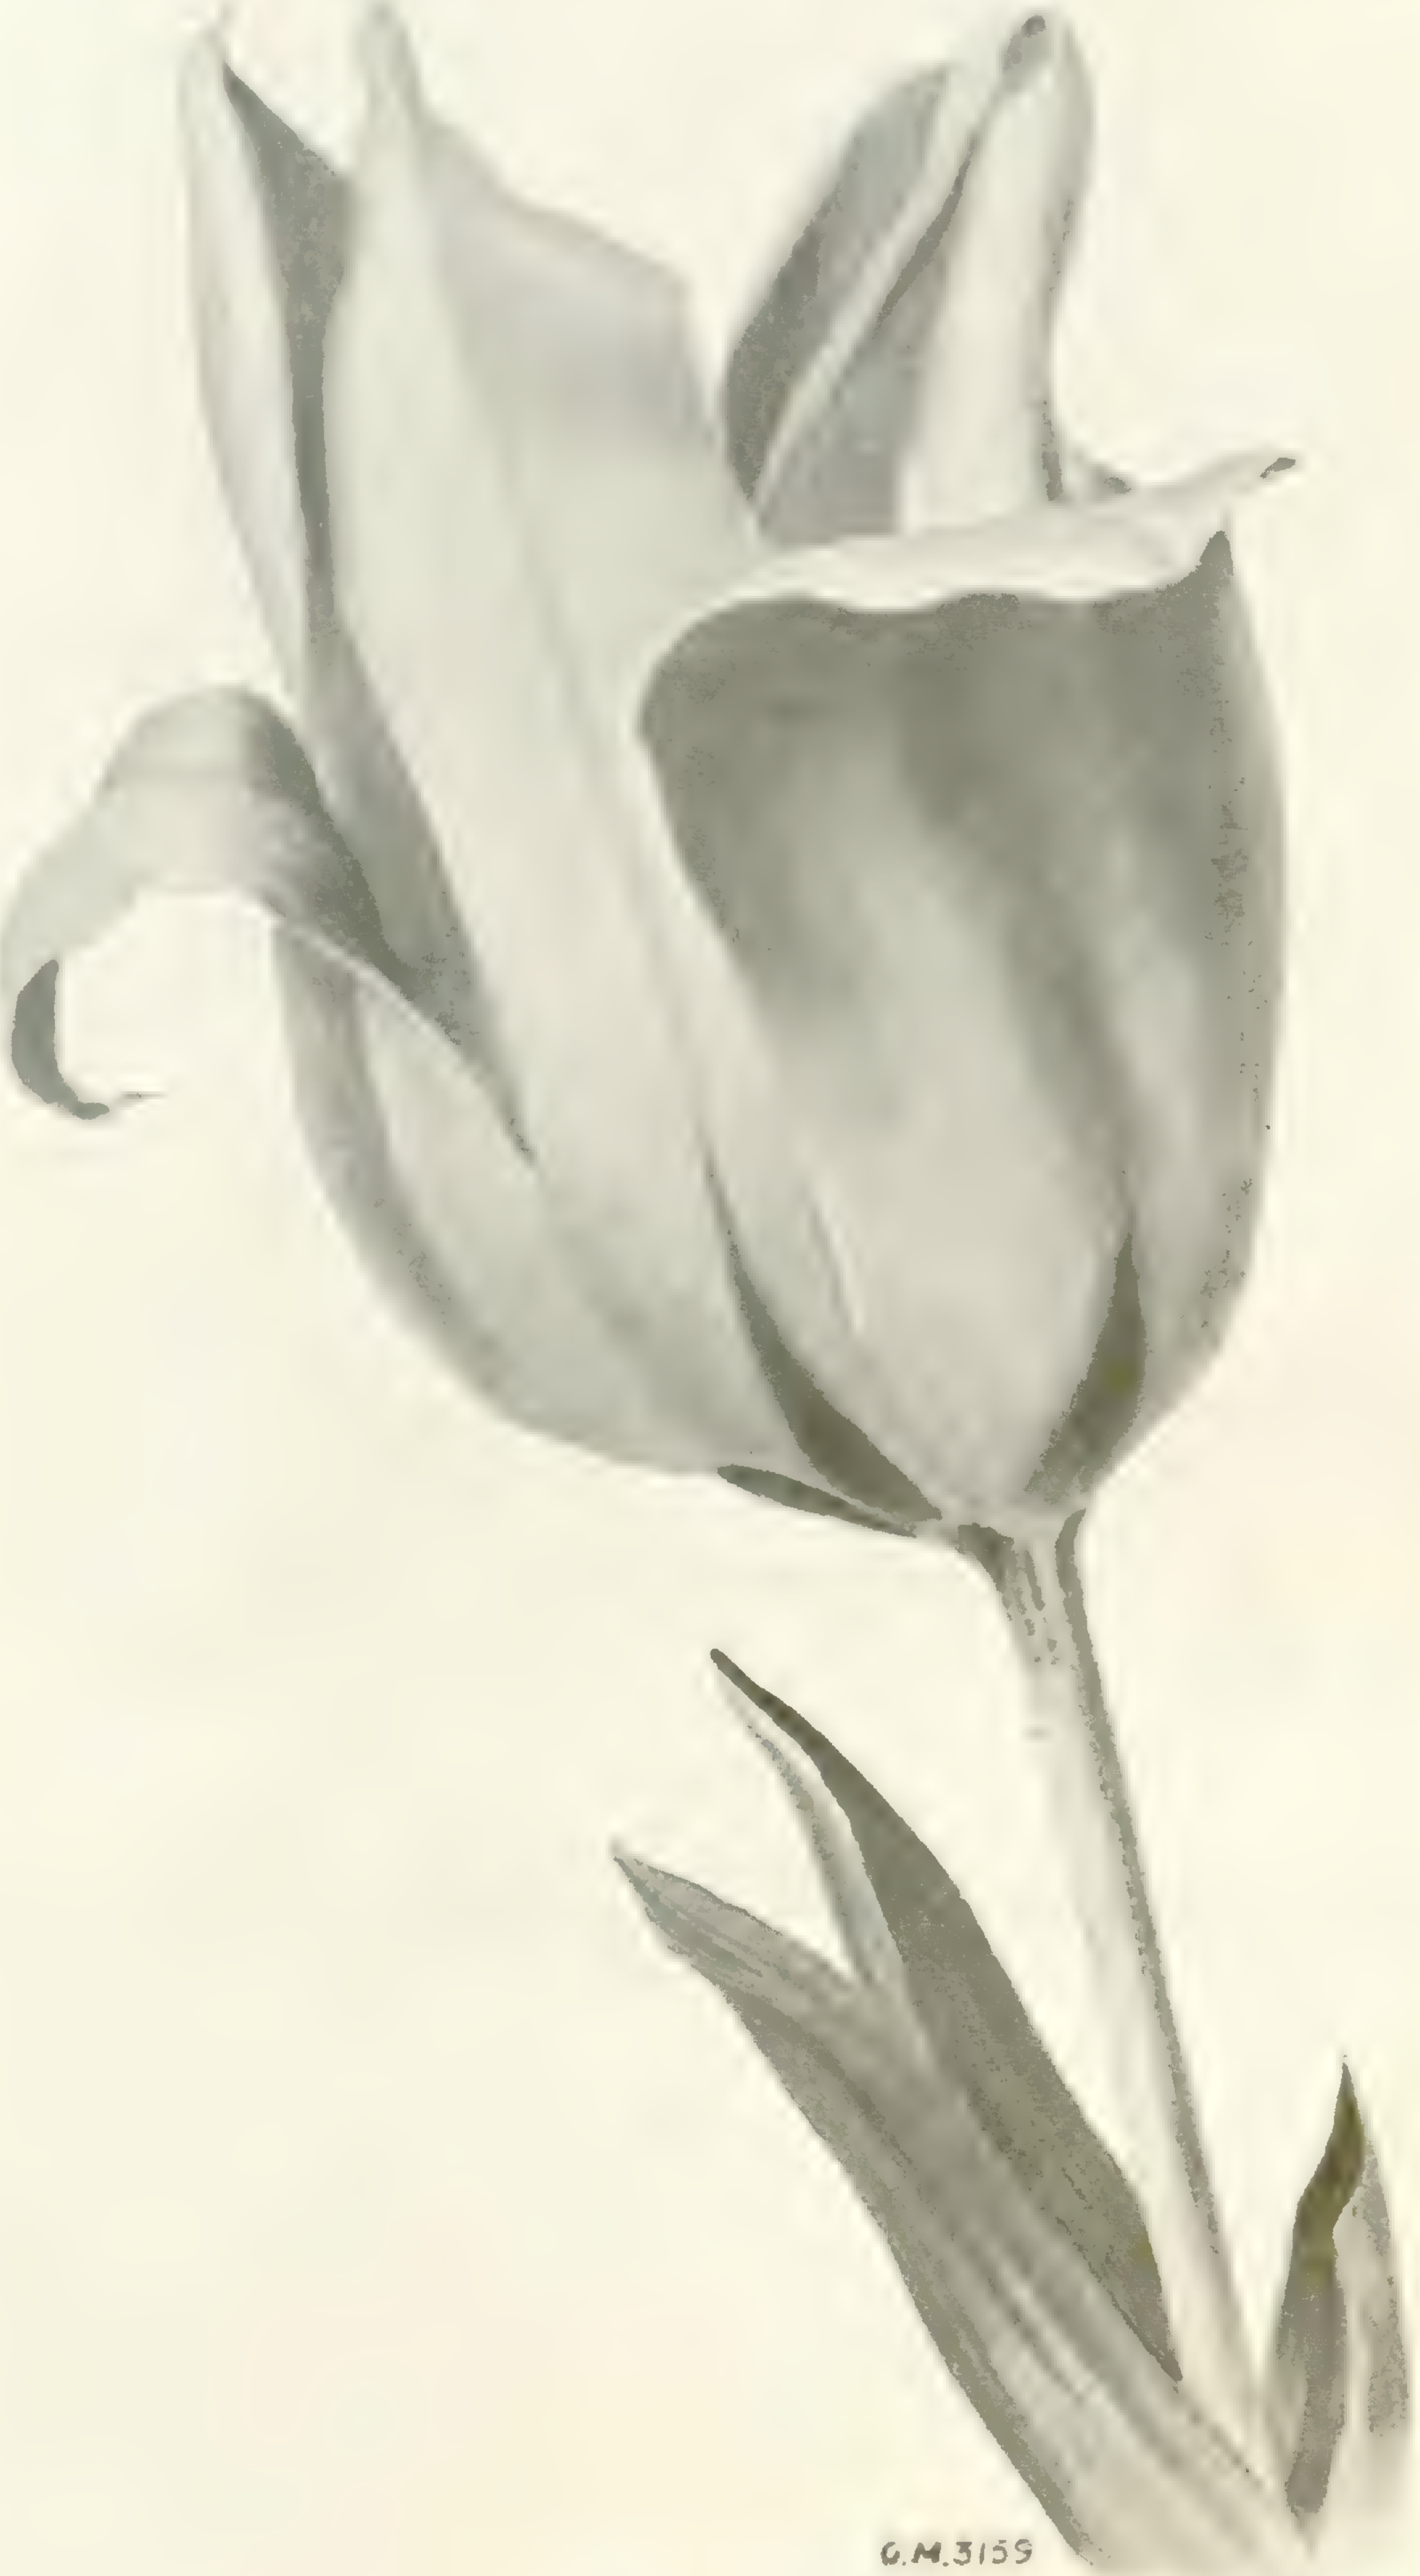
The honour of introducing the major part of these new species belongs to Mr. C. G. van Tubergen, jun., of Haarlem, and a visit to the large oblong enclosure at the back of his offices when they are in flower is a sight indeed. Picture a solid mass of real vermilion-red, some three yards by eight or ten, and you have his stock of Fosteriana as I saw it this last spring; then add to that other patches smaller, but equally as bright, and you get an idea of what that bit of ground is like when these tulips are in bloom.

These easterners, together with a few other varieties, such as Clusi and sylvestris, constitute one of the two divisions into which, for convenience, I may divide the species.

The others which form the second have been appropriately called næo tulips, from the fact that they have been found in more or less cultivated ground in quite recent times, and yet are quite distinct from the older inhabitants of our gardens. Such are Billietiana, Didieri, Marjoletti, Mauriana, and undulatifolia. These, with the exception of the last, are fairly well known, and thrive and increase with ordinary treatment just like ordinary garden forms. Mauriana is a handsome scarlet with a golden centre. It received an award at the Temple Show in 1901, and time has confirmed the opinion of the judges, for it is one of the most useful and lasting of all tulips. Billietiana, which was only found as recently as 1880, is a yellow, flushed and edged with varying degrees and depths of red. Mr. Hartland has selected some charming varieties of this type, Cloth of Gold and Sunset being two of the best.

The small and slender crimson Didieri, with its dark basal blotch, edged with pale primrose, and its white variety, "alba," are a delightful change from the larger and more showy varieties. While another of much the same habit is Marjoletti, with its long stems and primrose-yellow flowers, each petal of which has a rosy-red patch on its exterior. These three—the two Didieris and Marjoletti—are excellent for cutting. So, too, is the reputed, but rather doubtful, native species Sylvestris. It is one of the few sweet-scented kinds, and its yellow flowers are borne on stalks which, not being too stiff, lend themselves to graceful arrangement in vases. The Strangulata group belong to this division certainly as far as being good doers in the border. The pick of the bunch is undoubtedly S. primulina, a particularly lovely pale yellow self, and as it is much dwarfer than all the Gesneriana and other "cottage" yellows, is just the thing for a front place in the herbaceous border.

When we come to the other division we get simply magnificent flowers, but, alas! they have not the same constitution nor the power of increasing by offsets that characterises most of the other division, and also most cottage tulips. They seed freely enough, and from what I saw at Mr. van Tubergen's I should say that in Turkestan, Bokhara, and in their native haunts generally, this is the way that they propagate themselves. I used to consider T. Greigi, with its broad, brown-spotted foliage and handsome orange-scarlet flowers, as the tulip of the world, as far as magnificent colouring went, and so it was once upon a time—but that was before we had T. Tubergeniana and T. Fosteriana. When these were sent home from Bokhara, from four to seven years ago, King Greigi was deposed, and in his place they reigned as joint monarchs. They are both immense flowers, with reflexing petals, eight to ten inches across, and of a gorgeous vermilion, with a black base in Tubergeniana, and a yellow one in Fosteriana. Both do fairly well in ordinary borders if lifted every year. What I find about them, and all this type, is that their foliage so soon feels our variable climate, and becomes affected with what the Dutch call "fire." If only



TULIPA TUBERGENIANA.
A handsome species from Bokhara; the flowers large and finely formed, the colour vermilion with a black base.

we could devise some means of avoiding this, it would be a great impetus to their extended cultivation. Præstans is fine red, and often bears two to four flowers on a stem. Ingens is another good thing. It is much more of a crimson than Fosteriana, and has a decided white flame on the outside of its petals, which is very noticeable in its unexpanded state.

I must not forget the early "Water Lily" Tulip, T. Kaufmanniana. It does very well in ordinary borders, and may be left undisturbed for two or three years. When the clump is taken up careful search must be made at some distance below the old bulbs for "droppers." This mode of giving offsets is very characteristic. It is a dwarf grower, and has long primrose-coloured flowers, often with red flames on the exterior. In the sun they open very wide and become almost flat, and it is then that they have very much the look of a mass of white water lilies. A variety of this tulip, Kaufmanniana coccinea, is a brilliant scarlet self, and, as I believe it is just as good in constitution as the type, should be a very great acquisition when the somewhat prohibitive price of 60s. per twelve becomes lower. Among these species we have some splendid dwarfs, which are suitable for nice sunny and well-sheltered positions on a rockery or in the very front of a border.

The old Clusi, with its solid white petals marked externally with cherry-red, and having in the middle of the flower a rich ruby-violet base, is one kind that might well be given a trial. Linifolia and Batalini, the former a sealing wax red with a black base, and the latter a lovely pale primrose self, are two that do well. Both are real dwarfs, only growing five or six inches high, with narrow, deeply channelled, undulating leaves, that lie close upon the ground. Pulchella should not be omitted. It is fairly at home with us, and its small crocus-shaped carmine-rose flowers are bright and attractive. The last that I will mention is T. persica. This makes an excellent edging for beds, and is a gem for the rock garden. It has usually two or more flowers on each stem. They are a brilliant yellow inside, with an outside of golden-bronze. Once planted they take care of themselves for a long time. There are, of course, many other forms, which space forbids me to mention, but they do not surpass, even if they rival, the ones that I have mentioned, all of which together would form a collection of which anyone might be proud.

Whitchurch. JOSEPH JACOB.

Rose Paul Transon.—This beautiful rambler proves itself one of the best for arches and other purposes to which the ramblers may be put. Its shining foliage makes it as distinct as Dorothy Perkins in that respect. The blooms are wonderfully sweet, most freely produced, and, in colour, are a beautiful shade of pink. The individual blooms have more substance than is usually found among the rambler section, while the growth is of the strongest.—T. H. SLADE.

Cucumbers.—The house having been made in readiness, as advised last month, there should be no delay in planting out cucumbers intended for furnishing winter supplies, to ensure their being well established before the dull days. The ridges should be formed well up to the lights, as this will keep the soil sweet, and the plants will reach the trellis sooner. If very bright weather prevails after they are planted, they will perhaps require a very slight shade till they become established. Maintain a temperature of 70 deg. at night and 75 deg. during the day. Close the house early in the afternoon on bright days, and well syringe the walls.—A. B. W.

FLOWERS AT LOCAL FLOWER SHOWS.

Village flower shows have done much to raise the standard of gardening amongst cottagers, working amateurs, and allotment holders, and, though too much must not be expected from the people who exhibit in the cottagers' section at these gatherings, there are many curiosities to be observed in addition to those referred to in the article which recently appeared in the GARDENERS' MAGAZINE on this topic, and various directions in which departure from old methods might reasonably be asked for. We are inclined to overlook the shortcomings of the cottager, and smile at them simply because the exhibitor is but a cottager; but should not an attempt be made to educate him up to better things by encouraging him to display the things he invariably grows so well in a more pleasing and natural manner?

I have no word but one of praise for the enthusiasm of the exhibiting cottager, and the way in which he grows his vegetables and flowers reflects great credit on him, and so far as vegetables are concerned he generally displays them on the show board in a way that leaves little room for criticism, when we consider that things have generally to be done in a hurry on flower show days. It is, however, with the flowers that our friend mostly stumbles, and the way these are exhibited at many village shows is perfectly ludicrous. People who know better see these "curiosities" of the cottager, and smile at his crude ideas, but they rarely help him by pointing out his errors and encouraging him to alter his ways. As for the exhibitor, he is a slave to custom; he always has shown his flowers in a certain way, just as his father did before him, and as he wins prizes, he assumes that it is all right, and that no departure from the old order of things is necessary. A very essential part of the stock in trade of the cottager who exhibits flowers is a show board, but it would be doing the show a good turn if he were deprived of it, because he would then be reduced to the necessity of adopting some fresh and more original method of exhibiting his flowers. I will allow that the show board is essential for the cottager to exhibit his cactus dahlias on, but when one sees, as I did the other day, half a dozen stocks stuck into the holes on a board intended for twenty-four chrysanthemums and towering up with an expanse of ugly bare timber beneath them, one may be forgiven for wishing that show boards could be abolished for ever. When the cottager does not possess an orthodox board, and is unable to borrow one, he secures the nearest possible substitute in the shape of something with a flat surface that he can bore holes through. I had a demonstration of this recently in the case of a man who was exhibiting zinnias, but he had no board, so he fell back on a starch box, and stuck the stems of the flowers through holes made in the lid. To make the thing a bit more ludicrous the name of the starch maker was printed in big letters on the top of the box underneath the flowers.

It is curious what a prevailing idea there is amongst cottagers to add some form of artificial adornment to flowers, but yet the fact remains, and at a show I visited this summer one ambitious exhibitor set up half a dozen very nice roses, but every bloom was encircled with a neat white paper collar. Fancy the queen of flowers being staged with a paper collar round the neck! If such a thing happened at one of the exhibitions of the National Rose Society how people would laugh, but because it was a cottager who did this there was no comment. On the other hand, the judges gave the first prize to the collared roses, and were in a measure right, as they were the best blooms, but they said nothing about the paper adornments, and the exhibitor went home, perhaps thinking that his brilliant idea of putting his flowers in paper collars had helped him to win premier honours. No one told him different, and doubtless he will do the same next year, but these are the directions in which the officials of local horticultural societies should endeavour to educate the exhibitors up to better things.

Sweet peas are now exhibited at every village show, and I am pleased to say that I have never seen them staged on a board, but always in glasses or jars, and probably the reason for this is that the sweet pea as an exhibition flower, is a modern acquisition, and no one has ever thought of staging it except in the way for which it is best adapted. A better understanding, however, is wanted as to what shall be shown with sweet peas in the way of foliage. Some exhibitors use nothing, and cram their flowers down into the receptacles without any suspicion of taste in arrangement, while others employ the orthodox gypsophila, or the light foliage of the sweet pea plant, than which there is nothing better; but there are other methods as well, and at a show quite recently I saw a collection of sweet peas set up with maidenhair fern. Needless to say, the combination was neither pleasing nor in character. At the same show another exhibitor used carrot tops, which were preferable to the fern; but why, in the name of all that is reasonable, should anyone hunt about for greenery to accompany sweet peas when the light tendrils and young shoots of the plant itself are so suitable?

Stocks are often a bone of contention at village shows. The schedule asks for six stems or spikes, and some exhibitors remove the side branches from the stems and show the central spike, while others cut the plant off above the ground and show the stem with its side branches intact, though both parties are in doubt as to whether they are doing right. I overheard a very heated argument a short time ago on this point, and an advocate of showing merely the central spike was very much upset that he did not get a prize, but he quickly disappeared when someone removed a stem from one of his jars, and revealed the fact that he had carefully removed the branchlets, and ingeniously wired them on to the central spike. After seeing this ruse, opinions generally veered round to the direction of showing the whole plant with its side branches intact, but the point is an interesting one, and I should like to hear other opinions on it.

In conclusion, let me urge a protest against the way collections of annuals and perennials and bouquets and baskets of flowers are staged at village shows. Be it basket or vase the idea seems to be to cram as many flowers into the receptacle as possible, with little thought about the arrangement of colour, and no consideration for beautiful flowers that are crushed out of recognition in order to cram them in. Surely the time has come when a different state of things should exist even at village shows, but year after year one has the same old complaint to make, and improvement seems a long time in coming. It should be remembered also that, just as the sale of an article is governed by the way in which it is displayed, so also are judges influenced by the manner in which a floral exhibit is set up. This is just as it should be, but if some means were provided by which judges could express their disapproval of the unnatural and even absurd way in which flowers are often exhibited, this would lead to improvement. Cottage exhibitors have got into a habit which has become like second nature to them, and they do not get out of it because it is the business of no one to point to a better way and act as guide.

G. H. H.

SOME NEWER NARCISSI.

(Concluded from page 699.)

◆

Incomparabilis Section.

We will now turn to that very large and important section, the Incomparabilis. One of the very finest of these which has been lately sent out is—

Bernardino.—It is a large flower with a large, well-expanded cup, prettily frilled at the edge with orange and apricot shading, segments creamy white. It has a long stalk and is a strong grower. £4 4s. each.

Brilliancy.—Best described as a much enlarged Barri conspicuus; may it become as popular as that fine old favourite. The size and brilliant colouring of this flower make it very attractive. £10 10s.

Gipsy Queen.—Is a very fine variety, it has only been exhibited once or twice, but attracted a great deal of attention on those occasions. It is a fine, well set up flower, with creamy white segments, broad and well formed. Cup large and expanded, yellow with broad edging of orange. £5 5s. each.

Heroine.—Best described as a glorified "Albatross." A very large flower, with pure white perianth and large cup, yellow with broad edge of orange scarlet. A fine plant, of good constitution and free-flowering habit. £8 8s. each.

Homespun.—This is an absolutely perfect flower of large size and beautiful clear uniform yellow, a firm, lasting flower. Our Cornish friends grow this to perfection; with me it has proved a fairly good doer, but is given to producing too many little offsets. £2 2s. each.

Scarletta is one of the very best of the red-cupped incomparabilis. It is not a large flower, but the cup is very brilliantly tinted with bright orange. It has come with good colour every year I have grown it, and the flower is a rare one to last. The segments are deep cream on opening, passing to white with age. 15s. each.

Gloria Mundi.—We must not overlook our old friend, for with all the new red cups there is nothing to beat it when well grown. The late Rev. Eugène Bourne and Mr. Young, a near neighbour of his, have from time to time exhibited glorious blooms of this fine variety at Birmingham.

Steadfast is a very fine incomparabilis, the segments are white, very firm and overlapping, retaining their shape until the flower is quite dead. The cup is almost cylindrical, bright rich yellow. Opens very late, and helps to prolong the season. 7s. 6d. each.

Will Scarlet, of which an illustration is given, possesses the largest and richest red cup of any variety I know of, and makes a very telling effect in a bunch; unfortunately the perianth is somewhat rough and irregular, nevertheless it is worth growing for its colour only. 20s. each.

Cossack.—This among the small cups (Parvi coronati) is one of the newest and brightest, with broad overlapping segments of a creamy white. Well formed crown of deep red. Very brilliant in effect. £5 5s.

Furnace is a quite remarkable flower, the segments are well expanded, colour light yellow, crown nearly flat and of brightest orange scarlet. It is rather an unusual combination of colouring and very effective. I have not the price at hand to quote, but know it to be a stiff one.

Englehearti.

Of the Englehearti section those having flat disc-like crowns, Incognita and Egret, are good, but I have found all of this section difficult to grow on my strong soil; they would no doubt succeed better on a lighter and drier soil.

Burbidgei.

The Burbidgeis are as a class rather small and not very showy, but there are some gems among them all the same. Cresset, Firebrand, Hyacinth, Scarlet Eye, are some of the very best.

Double Narcissi.

Doubles have not received quite so much attention from the hybridists as the single varieties, but we have in Argent, Plenipo, and Dubloon, three which are a distinct advance upon the older ones, such as the three Phœnix. The feature of these newer ones is the great improvement in stalk, which enables them to stand upright in any ordinary weather, and even to withstand gales of wind; they are all moderate in price.

NARCISSUS WILL SCARLET.

Poets.

The poeticus family has been immensely enriched of late years, and we now have improved flowers of all degrees of earliness and lateness. Some of the best to be had at a moderate price are Cassandra, Epic, Homer, Horace, Juliet, Virgil.

Buying Daffodils.

I fear, Mr. Editor, that this list rather resembles a trade catalogue, but I thought your readers would like descriptions given to the newest varieties, for they are no doubt still strangers to many daffodil lovers. I have added the prices because experience has taught me the wisdom of it, for if a person sees a fine flower, or reads a taking description of one, and places an order for say half a dozen, and then finds they are £10 10s. each, the said person is apt to look foolish when the bill comes in! I think many amateurs make a mistake in not trying some of the newer varieties. Buying new narcissi is not like buying some expensive bulbs which are flowered once and then thrown away; but providing the novelty has a decent constitution it will soon increase, and the garden gradually gets filled with choice things, instead of becoming filled up with weedy varieties which are hardly worth the room they occupy. Of course there are many of the older kinds which will never be driven out, or at least will hold their own for many a year to come; still, a few new things added from time to time gives a greatly added interest to one's garden. It is quite an excitement to visit one's beds in the spring and look out for the first open blooms of one's latest purchases.

I would advise amateurs to grow the more expensive daffodils in nursery beds in the kitchen garden, rather than attempt to grow them in a mixed flower border, where they are closely surrounded with strong growing plants, or exposed to the attacks of slugs which are harboured by the said plants; while, if the label should chance to get lost or displaced, what more annoying thing can happen than to stick a fork into the group and disturb it when the roots are in full activity; perhaps even spearing one of the treasures as well!

J. Duncan Pearson.

Lowdham, Notts.

Pigmy Narcissi.—Remember when planting such dainty bulbs as Narcissi minimus, corbularia, and triandrus that their flowers, though extremely beautiful, are also very delicate. Of foliage they have really none to protect their gay spring blossoms from inclement weather and consequent soil splashing. Give them a carpet of some close-growing plant, through which they will push their blossoms, and their flowering season will be prolonged, and their beauty remain unsullied. Arenaria balearica, or Thymus serphyllum in several varieties is just the carpet they want.—Thomas Smith, Walmsgate Gardens.

Pears in Pots.—These are carrying a good crop at the time of writing. The trees of Williams Bon Chretien are ripening good fruit. Owing to the dry weather birds are making a raid on pears inside, and netting has to be resorted to. The trees should have plenty of clean water, and be well supported with stakes. Other varieties carrying good crops are Durondeau, Doyenne du Comice, one of the best of croppers in pots, but requires to be well thinned. Beurre Superfin makes a good pot variety, and will soon be ripening. Marie Benoist is a good late pear, but too large for dessert. Beurre Giffard is another good early pear for pot culture. The same may be said of Beurre de Jonghe. Trees plunged outside should be well supplied with water and syringed when the weather is dry.—A. B. Wadds.

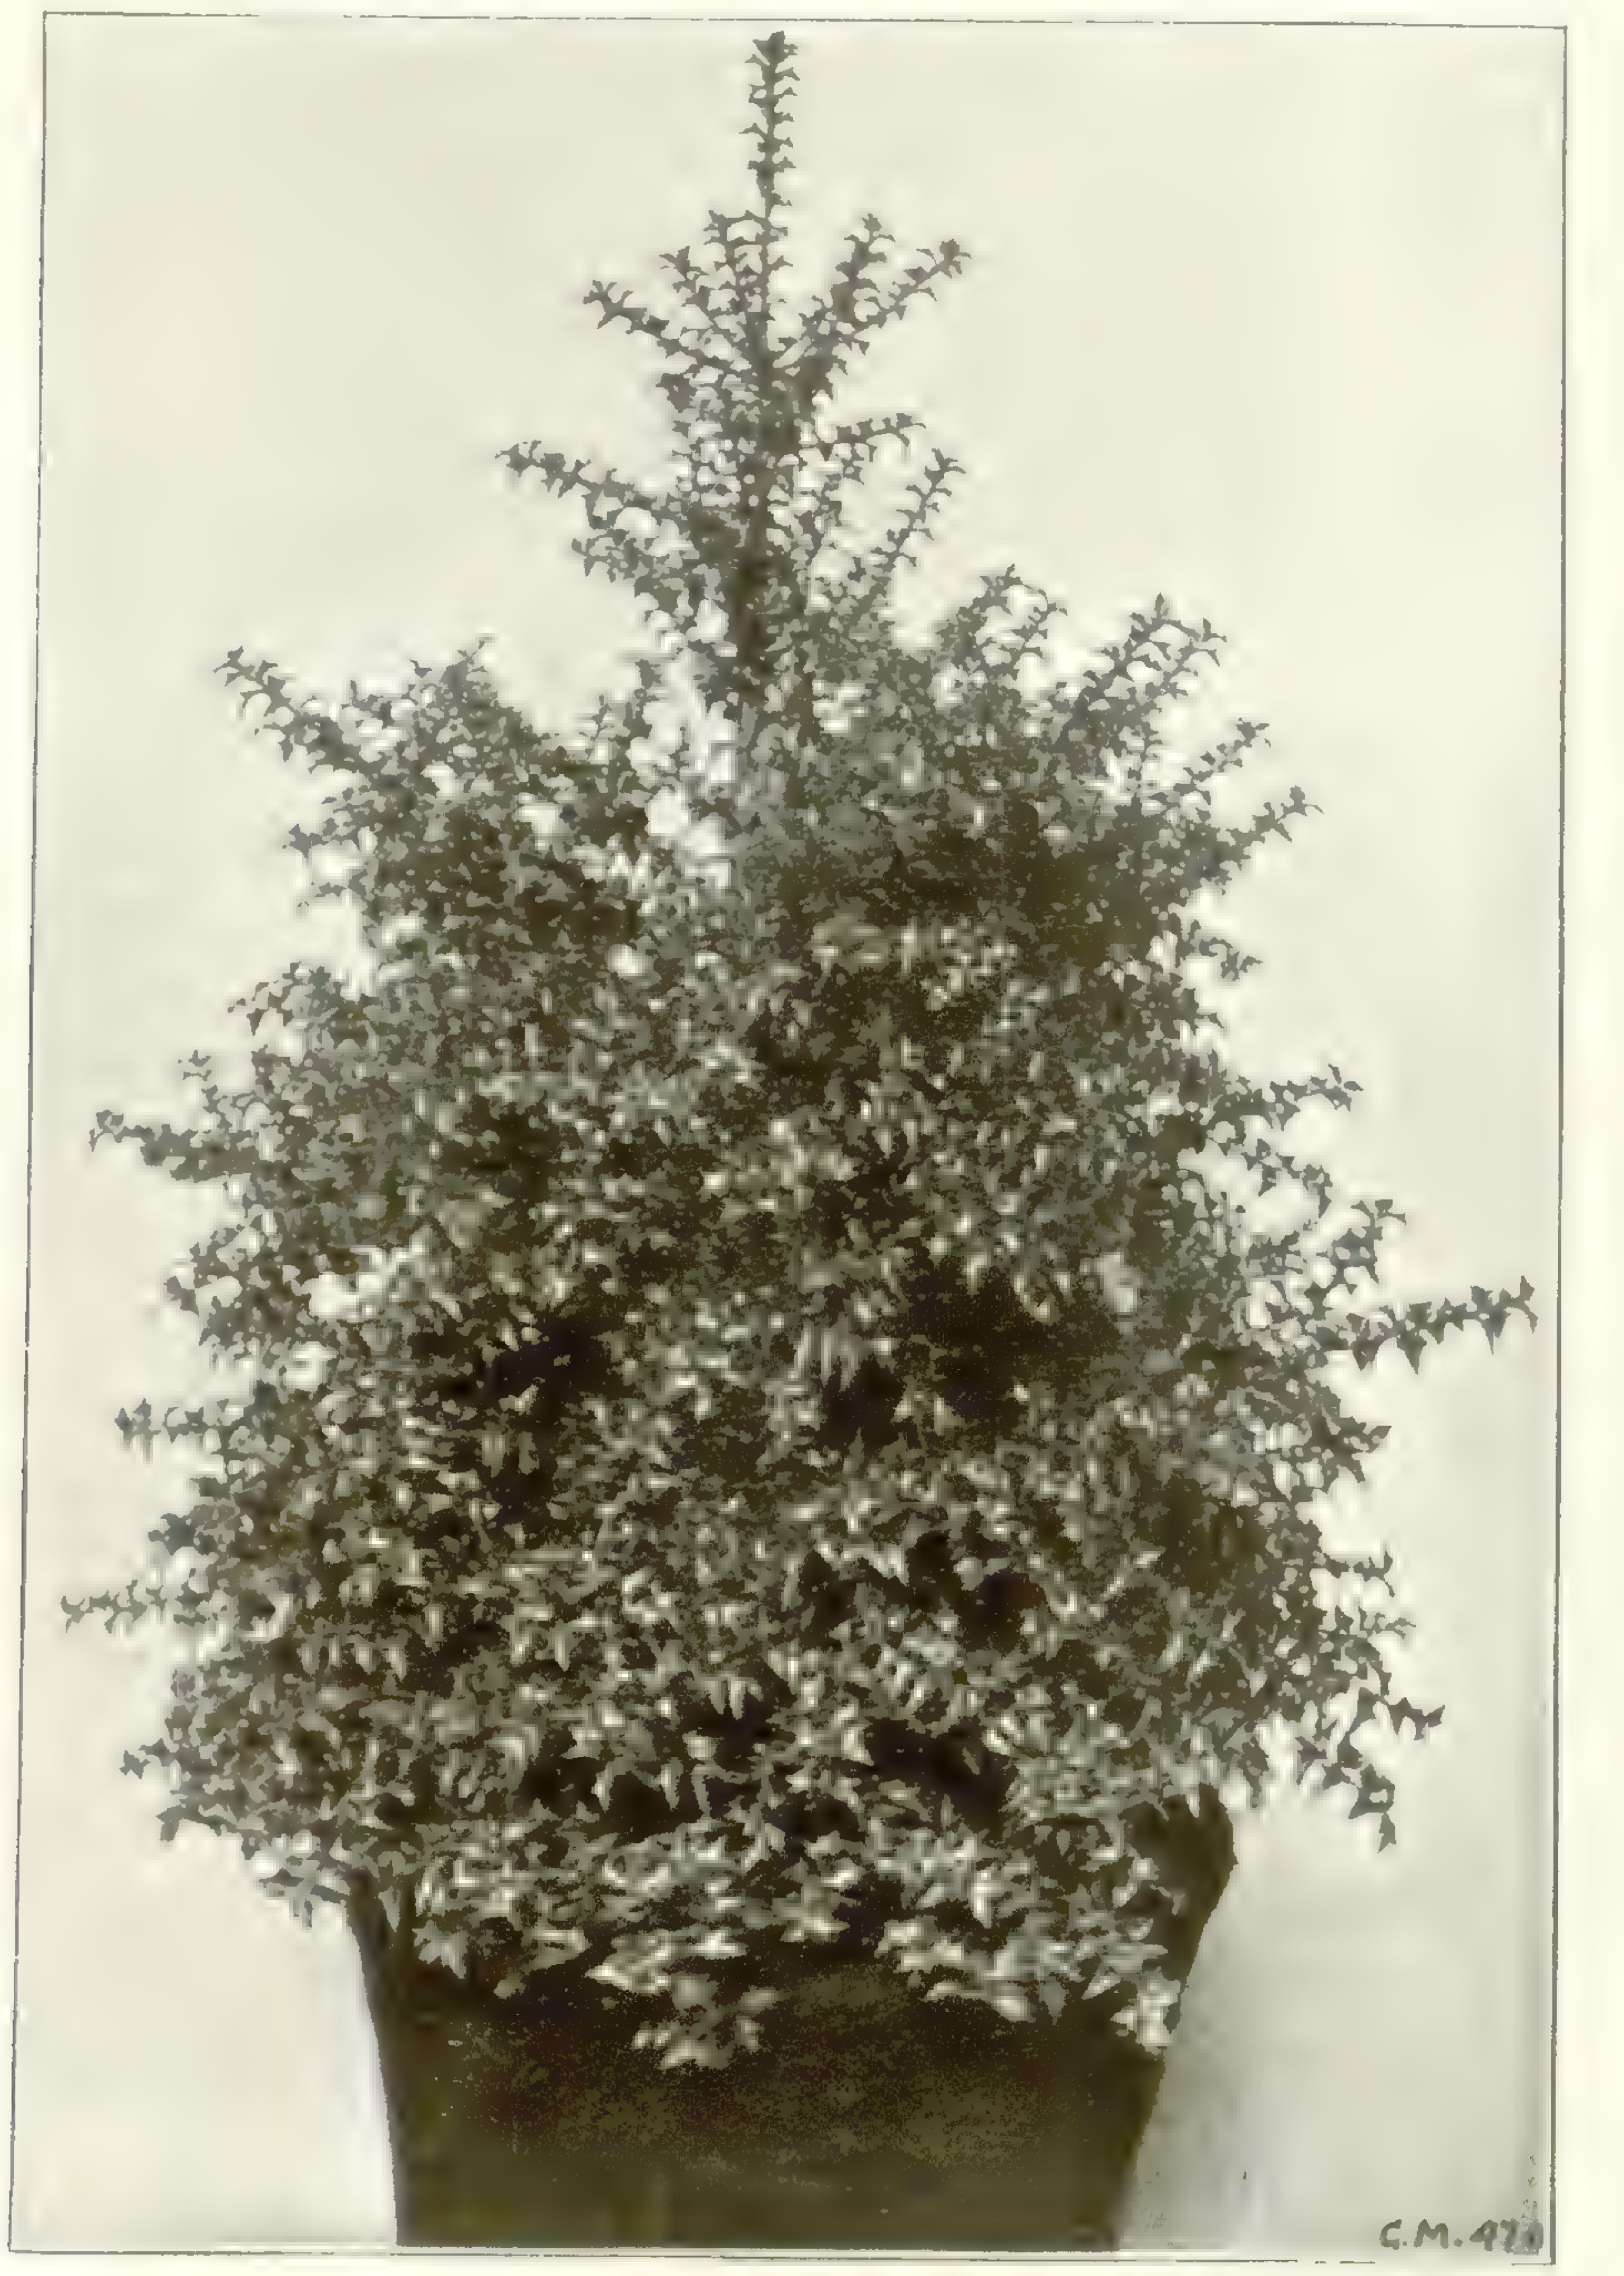
NEW PLANTS, ETC.

ILEX PERNYI.

A remarkably distinct species of dwarf growth introduced from Western China. The leaves are very small, spiny, and of a deep shining green colour. It has the promise of proving valuable for the front of shrubberies, rockeries, and similar places. F.C.C., R.H.S., September 1. Messrs. Jas. Veitch and Sons, Chelsea.

PTERIS AQUILINA NICHOLSONI.

A very elegant form of the bracken fern, and evidently very free growing. It was exhibited as a basket fern, the long trailing fronds being most effective. The fronds were about three feet in length, and finely divided. A.M., R.H.S., September 1. Messrs. H. B. May and Sons, Edmonton.



ILEX PERNYI.
A dwarf-growing holly from Western China with small dark green leaves. Exhibited by Messrs. J. Veitch and Sons, at R.H.S. Meeting on September 1, when it received a F.C.C.

PHLOXES.

General Von. Lassberg. — A pure white variety, of medium height and high quality; the spikes are large and the individual flowers are equally conspicuous. A.M., R.H.S., September 1. Messrs. Gunn and Sons, Olton, Birmingham.

Violet.—A very fine variety, the flowers large, the colour rich violet. The spikes are large and well arranged. A.M., R.H.S., September 1. Messrs. Gunn and Sons.

ROSE MRS. LITTLETON DEWHURST.

An extremely beautiful rambling rose, obtained as a sport from Lady Gay. The flowers are white with a slight suffusing of pink, and, as in the case of the parent, are borne in great profusion. A.M., R.H.S., September 1. Messrs. J. R. Pearson and Sons, Lowdham, Notts.

CATASETUM RUSSELLIANUM.

A pretty species, the flowers pale-green with deep green veins. A.M., R.H.S., September 1. Sir Trevor Lawrence, Bart., Burford Lodge.

DAHLIAS.

Marathon.—A large cactus variety with long florets, the colour being the centre of the flower, pale-yellow, shading off to rosy carmine, should make a good exhibition bloom. A.M., R.H.S., September 1. Messrs. Jas. Stredwick and Son, St. Leonards.

Tom Jones.—An excellent show variety of fine form and build, rich creamy white, heavily edged and flushed rosy lilac. A.M., R.H.S., September 1. N.D.S., F.C.C., September 3. Mr. S. Mortimer, Farnham.

Jasper.—A fine show variety, blooms of full size, and a rich rose-purple colour. N.D.S., F.C.C., September 3. Mr. S. Mortimer.

Minima.—A delightful little pompon cactus of a rich claret colour. N.D.S., F.C.C., September 3. Messrs. Burrell and Co., Cambridge.

Una.—A new break in the cactus varieties, and extremely beautiful. The blooms are large, and the petals are forked at the tips, giving the flower a full and unique appearance. The colour bright pink. N.D.S., F.C.C., September 3. Messrs. Burrell and Co.

Mrs. W. W. Merry.—A single variety, the flowers scarlet, shading to orange at the edges of the petals; very good form. N.D.S., F.C.C., September 3. Rev. S. Pearce.

Adela.—A pure white pompon variety, good in form and petal. N.D.S., F.C.C., September 3. Mr. Chas. Turner, Slough.

Rev. T. W. Jamieson. — A fine cactus variety, the blooms large, and of good form; yellow, deeply edged with lilac rose. N.D.S., F.C.C., September 3. Messrs. Jas. Stredwick and Son.

Betty. — A beautiful single variety, the blooms of medium size, the colour deep lilac rose, with a broad belt of crimson round the disc. N.D.S., F.C.C., September 3. Messrs. J. Cheal and Sons, Crawley.

Mrs. Alfred Dyer. — A pleasing cactus variety, the centre pale lemon, shading to rosy pink. N.D.S., F.C.C., September 3. Messrs. Jas. Stredwick and Son.

Debutante. — A large exhibition cactus variety. Pale pink, tipped with white. The petals are long, and twisted. N.D.S., F.C.C., September 3. Messrs. Jas. Stredwick and Son.

GLADIOLUS PRIMULINUS.

It is yet early to fully estimate the effect this lovely species of gladiolus from the Zambesi will have upon the future of the race of gladioli in general.

The distinct character and the lovely yellow colouring of G. primulinus marks it for especial notice in the near future. A great point in its favour is the light arrangement of the blossoms upon the tall spikes, giving it a grace and a balanced elegance that one does not meet with in the massive-flowered hybrid gladioli that are now so widely known.

The fact that this species has hitherto done well both here in England and in the Channel Islands, may reassure intending growers as to its suitability for general culture in the garden. What is of more importance, however, is the fact that it is proving most amenable in the hands of the hybridist, and those who thought that the range of colouring displayed in hybrid gladioli had almost reached its limit will be agreeably surprised to hear of the possibilities of varieties raised from primulinus.

Some of the loveliest shades of colour it is possible to imagine have been produced upon seedling varieties, and they are colourings which in delicacy and charm will prove well-nigh unsurpassable. These primulinus forms defy description. The soft, yet rich rosy-salmons, orange, old gold, terra-cottas, soft apricot, and a wealth of other shades, mark a great advance in the gladioli family.

Much yet remains to be done, but the results already obtained are sufficient to establish the merits of the new types, and to indicate that they will become popular favourites in the near future. The general character of the seedlings in natural grace, well-formed spikes and blossoms, and their exquisite colourings, marks them as ideal decorative garden subjects.

P. S. H.

ERANTHIS HYEMALIS.

Conjure up in your mind a plant that luxuriates under the heavy canopy of beech foliage, maintaining its existence, successfully fighting the hungry surface roots of this tree, and bathing the ground in a blaze of living gold during February, and whose luxuriant dark-green leaves clothe the ground with a dense carpet of foliage long after the flowers have gone. For less than a sovereign you can buy a thousand winter aconites, and, if planted now, they will unfold the bright buttercup-yellow flowers in prodigal profusion, and increase from year to year in a surprising manner. Eranthis hyemalis grows freely in any moderate soil; the leaves are often the only reward in rich soils, and it succeeds to perfection upon our thin chalk soil.

Thomas Smith.

Walmsgate Gardens.

EARLY TULIPS IN THE GARDEN.

No other plant flowering early in the spring can equal the tulip for brilliance and variety of colouring, either in the flower garden or as forced under glass. It has, moreover, the merits of being hardy, easy to grow, and cheap, as bulbs go, consequently it is an almost universal favourite with those who have to provide displays in the garden or in the house during the late winter and spring months. The annual importation of early tulip bulbs to this country must be immense, for although bought in bulbs can be depended on to bloom satisfactorily almost anywhere, and in any kind of soil, the soil of most gardens in the United Kingdom is not favourable to the good growth and increase of the bulbs, and we are, to a large extent, dependent on the growers in Holland and elsewhere for the great majority of our bulbs.

There are limited areas in our own country, such as the sandy soils of parts of the eastern counties, in which very good bulbs can be grown, and I have myself grown bulbs in a certain district in Suffolk equally as good as the imported bulbs, and with a considerable annual increase of stock. This is sufficient to prove that they might be grown commercially, given the right treatment and soil, but these favoured districts are not sufficiently well known to commercially-inclined growers. Here, in a part of Derbyshire where the soil is naturally heavy, and the early season too cold to permit of good ripening, the tendency is towards deterioration, and home-grown stocks of most bulbs have to be frequently added to by purchasing from more favoured districts or countries, consequently it is far better to leave the matter of bulb production in other hands, and only to save the best of the home-grown bulbs for future planting.

Planting in Beds and Borders.

Certainly the growth is finer and the flowers better from well-prepared ground, and to provide this a goodly quantity of well-rotted manure should be dug in, say, early in October, and with this, if the soil is heavy, should be incorporated a plentiful dressing of sand or road grit, and a sprinkling of freshly-slaked lime. The bulbs of early-flowering tulips should be planted at the end of October or early in November, at a depth of about four inches, and the same distance apart. Each bulb should be so planted as to rest firmly on its base, and if the surface can have a mulching of cocoanut fibre or leaf-mould and sand when the growth appears above the soil, this will be of great assistance to the development. Cocoanut fibre is perhaps better than any other material for this purpose, as it prevents the flowers from becoming splashed with soil.

Tulips may be planted in a number of ways to suit various tastes. They look magnificent when massed in their colours, or with two or three well-blended colours together. In the latter case it is necessary to take care to select varieties that not only associate well as to colour, but that are also suited to each other in the matter of height and time of flowering. A good bulb catalogue will give the necessary particulars in these matters, and should be studied by the novice to prevent errors. The Duc van Thol varieties should be planted by themselves, as they are earlier than the others. Besides massing, there are other pleasing ways of growing tulips, one of which is to use them as "dot" plants over a foundation of snowdrops, crocuses, scillas, or chionodoxas, all of which flower in advance of the tulips, but produce good foliage to make them a good setting. Another way is to plant the bulbs in turf near the fringes of the lawn or any other such suitable spot, but this method is not suited for bulb production, and no practical result beyond the embellishment of the sward should be expected from bulbs so planted.

Lifting the Bulbs.

Early-flowering tulips may be lifted in time to clear the ground for the general

AN ATTRACTIVE EARLY-FLOWERING TULIP, ROSE GRIS-DE-LIN.

Flowers of large size, the colour rich rose with white margin.

run of summer bedding plants. One need not wait till the growth has died down before lifting, though it is better to wait until the stems are tough enough to allow them to be tied in a loose knot—an old-fashioned way of testing the near approach of ripeness; but they may be lifted even earlier if care is taken not to damage the tops, and to pack the bulbs carefully into boxes with just a little soil round them, and stand them in an open place, as under these conditions they will complete the swelling and ripening of the bulb almost as well as if left later in the ground. When the bulbs are dried off they should be stored in a dry, airy shed, and before planting they should have much of the outer scale removed, as these scales are then useless, and often contain fungoid germs that may spread to the growth during the ensuing year.

Effective Varieties.

The number of good varieties is so great that any short list must be incomplete, and the better way to choose is to study a good catalogue for heights, colours, and descriptions, but I may say that in growing Keizers Kroon, red and yellow; Couleur Cardinal, crimson scarlet; Rose Gris-de-Lin, rose and white; White, Yellow, and Scarlet Pottebakker; Wouverman, purple; Yellow Prince, yellow with red streak as the flower ages; Vermilion Brilliant, rich scarlet, Thomas Moore, apricot; La Reine, white and rose; Chrysolora, yellow; Violet Queen, purplish carmine; Ophir d'Or, golden yellow; Dusart, vermilion; Princess Ida, white and yellow; Stanley, rich rose; Crimson King; Princess Marianne, white and rose; and Artus, scarlet, no one will be disappointed, though there are other newer varieties, some of which may be found improvements on the above well-tried varieties.

J. C. TALLACK.

Shipley Hall Gardens.

THE STORY OF THE DAHLIA.

Ask nine gardeners out of ten how the dahlia was introduced into England first, and they will answer that we are indebted for this to the Swedish botanist, Dr. Andrew Dahl, who gave the flower its name. As a matter of fact, however, the dahlia is said to have been discovered by Baron Humboldt, in 1789, whereas Dr. Dahl did not obtain it from Lady Holland until 1804. Baron Humboldt brought it to England the same year as that in which he found it, but the plant was neglected and died out of British cultivation, more shame to us, though it flourished meanwhile in the Royal Gardens of Madrid, a carefully guarded speciality that the Spaniards refused to share with other lands.

FIRST PRIZE BASKET OF DAHLIAS
Exhibited by Mr. W. Treseder, Cardiff, at the National Dahlia Society's Show, and described in the report which appeared in our issue of the 5th inst.

Next a Frenchman, Count Lelieur, contrived, we do not learn how, to obtain one of those roots from Madrid, and then his florist countrymen entered so enthusiastically into dahlia culture that, when a general peace was proclaimed in 1814, there were found to be many beautiful varieties in existence that English horticulturists were able to see and covet. Presumably, therefore, Lady Holland and Professor Dahl, who had been in possession of the dahlia since 1804, had not done as well with it as had French floriculturists.

What was the dahlia's original name. That seems to be an unanswered question. Certainly Dr. Dahl does not quite d to have it as a perpetual memorial countries. When Baron Humboldt covered the plant in Mexico, it was gr ing in sandy meadows several hundre above sea-level. Some amusing proph combined with historical facts, are to be found in an old volume, republished in 1864, and entitled "The Kitchen and Flower Garden," by Eugene Sebasti Delamer. This author states: "D variabilis is a floral upstart, the whole course of whose rise to fame and fortune is within the memory of many persons now living. The original single-flowered plant, from Mexico, first claimed the attention of horticulturists as an edible root, whose repulsive, nauseous, peppery taste insp equal disgust to man and beast. The single dahlias were thought fine things, and various gay colours were obtained from seedlings. Then came the phenomena double dahlias, which were taken favour by enterprising florists, and proved, and improved, till they be what we see them now. The dahlia essentially a made flower; its cultivators proposed to themselves a certain model, as to form and furnishing of petals, which they determined to perfect, and by skill in hybridising, by outlay in sowing enormous numbers of seeds, and, above all, by patient perseverance, they have perfected it. One great point, however, they have not attained—the production either of a blue, or of an agreeably-scented flower. No attempt will be made here to name any of the choice varieties of dahlias, which, at the moment of this present writing, may chance to be the favourites of the day. The existence of this little book may be durable than most of theirs, and it wou be of little service to print a list that wou soon become obsolete by the intrusion fresh candidates for the public applau . . . Perhaps, though not probably, blue perfumed dahlia will start from the earth; in which case, those which now figure in the parterre will have to hide their diminished heads, for a time at least Many old-esteemed varieties have completely disappeared, while the mercan horticulturists, both of Great Britain the Continent, annually inundate market with a copious flood of novelties, many of which are inferior to their predecessors."

Having relieved his mind by abusing this plant, the writer goes on to detail the troublesomeness of its culture. "Both the leaves, stem, and root are killed by frost; the latter, consequently, must be kept in a place of safety during winter. The stem is fragile, and apt to be blown down or snapped short by high winds; it is, therefore, best supported by a stake inserted into the ground at the time of planting the root or cutting. The young shoots, in their early growth, are apt to be eaten off by slugs and snails, which must be driven off or destroyed by circles of lime and ashes, or by waterings with lime-water. The blossoms are apt to be bitten and spoiled hungry earwigs, to obviate whose onslaug traps of hollow bean-stalks, to be inspect once or twice a day, are hung at enticing intervals amidst the foliage, or circular earthen pans, to be filled with water, placed at the foot of each plant in the early stage of its growth, so as to keep the enemy at bay by a miniature kind of encircling ditch. Choice blooms for exhibition are shaded and protected in various ways."

After describing the methods of planting tubers and rooted cuttings, similar to the culture pursued to-day, the author deals with another branch of the subject.

"In the climate of England, dahlias are unable to complete the entire circle of their vegetation. In October they are in full force, and the slightest frost destroys them then. In order to prolong the duration of their blooming they are sometimes planted in large pots, which are plunged in the border during summer, but are lifted and removed to a greenhouse or conservatory as autumn advances. The forward buds are thus enabled to expand in safety. But plants so treated display only a short-lived beauty; to flower well, dahlias must have the open air. The tubers ought to be left in the ground some time after the autumnal frosts have destroyed the foliage; they still find nourishment there, complete their ripening, and are consequently less difficult to keep. About the middle of November is the usual time for taking them up, an operation which ought to be carefully performed, avoiding wounding the roots, and choosing, if possible, a bright, calm day. They may be left a few hours to dry in the open air, to be thence removed to any place secure from frost, where neither the excess of dryness or moisture is to be feared." In conclusion, Mr. Delamer remarks: "The dahlia derives its principal value from its filling the void left by the disappearance of summer flowers, as well as from displaying its finest blooms at the season when our aristocracy return from town to their country seats. It is a gay, flaunting, showy plant, which has the great merit of usefulness in its way; but it is far from possessing all that can be wished for in a flower, and no doubt many of its early worshippers will now confess that they prostrated themselves too blindly before their idol." But everyone has, and ought to have, his taste. We have no right to blame, though we may not sympathise with, the amateur who prefers a dahlia to a rose.

A smaller species, D. cosmæflora, which has not yet started off into varieties, is of dwarfer habit, and produces flowers with a purple disk and lilac rays.

Lastly, we may remember that the emblem of the dahlia is pomp, surely one most unfitting to the classic elegance of the single cactus, or the tiny rosette beauty of the pompone?

M. H.

A Spring Picture.—There is a pretty spring picture which occurs when Dog's Tooth violets and fritillarias spring in hundreds from grassy banks or lawns. The native species and their progeny—e.g., Erythronium Dens-canis, and Fritillaria meleagris, are partial to limestone soil, but none of the others seem to succeed where there is an excess of this substance. Plant the bulbs six to nine inches deep, according to soil, the maximum depth obtains on light, warm soils.—Thomas Smith, Walmsgate Gardens.

Climbers should be given good attention. Where the growths have become too dense and crowded, remove all surplus shoots, regulate and secure the remaining. Where it is desired to protect the fruits or berries of Pyracantha Lelandi from birds it may be necessary to hang light fish netting over them. Where Tropæolum speciosum thrives this should now be in its glory; a cool, partially shaded position is best for it. The old wood may be removed from many climbers, though nothing in the way of a general uning should be attempted, and in the case ampelopsis in variety and a few other umn-tinted ones, as far as possible, a careless profusion should be allowed until after the foliage has fallen. In suitable positions the beautiful vitis in variety give easing effect, especially when the leaves ve assumed their autumn tints.—E. F. Hazelton, Knowsley Gardens.

WORK FOR THE WEEK.

◆

CONSERVATORY AND GREENHOUSE.

LIFTING PLANTS.—Where such plants as bouvardias, solanums, marguerite carnations, and the like, have been planted out for the summer months, there should now be no further delay in lifting them that they may become established in their pots before winter. The difficulties of guarding against a serious check at a time when the plants are in full vigour prevent this system from being generally adopted. If the positions and soil are suitable, they make satisfactory progress with little trouble to the grower compared with those kept in pots. In re-establishing the plants, it is necessary to keep them for a time in a cool and somewhat close atmosphere, so that there shall be no great drain on their resources in the way of evaporation until the roots have resumed activity. In husbanding these resources, shade plays an important part, and should be utilised more or less until the plants are able to bear full exposure without flagging. The syringe, too, may be used, except in the case of the carnations, as a means of applying moisture to the foliage and the atmosphere. Great care should be taken in lifting the plants, so that they may carry as much of the soil and as many roots as can be conveniently transferred to the pots, and in potting care must be taken not to disturb the ball by ramming or jolting.

HARD-WOODED PLANTS.—Azaleas and such other hard-wooded plants standing outdoors should now be taken under cover. Examine the azaleas for thrips, and give them a vigorous syringing with a good insecticide, laying them on their sides, and turning them so as to reach every part with the insecticide while still outdoors. Heaths, which are subject to mildew, should have a light dusting with sulphur, and should not be crowded in the house. Camellias may safely be left out for a week or two longer, unless they are wanted to flower early, for they are less liable to injury from frost or wet than are many other hard-wooded plants.

IXIAS.—We obtain a great variety of colours in these, and they are easily grown. They should be potted early in the autumn. Use a compost consisting of sandy loam and leaf-mould. If protected from frost it is better not to use any extra covering on the surface of the pots. They may be taken in and placed on a shelf or in any light position, and will come into bloom in time to succeed some of the earlier flowering bulbs.

FIRST PRIZE BOUQUET OF DAHLIAS

Exhibited by Mr. J. Walker, Thame, at the National Dahlia Society's Show.

LACHENALIAS.—These are very pretty for spring flowering, and come into bloom quite early without forcing. After they have done flowering they may be gradually dried off, and later on repotted, selecting the largest bulbs, and about six in each pot make a nice show. The varieties are not numerous, and all are pretty; but Nelsoni is the finest for pots, having long spikes of rich yellow flowers.

LEUCOJUM VERNUM, OR SPRING SNOWFLAKE.—The bulbs, if potted in the autumn and kept in a cool frame or pit during the winter, will soon start away when placed in a sunny position in the greenhouse in the spring, and are never out of place.

DAFFODILS.—The ordinary varieties are most showy for the greenhouse, and all the newer and choicer varieties may be grown, but such as Emperor, Bicolor, Horsfieldi, Princeps, Obvallaris, Telamonius plenus make a good show. Potted now, and kept in a cool pit until they are well rooted, they may then be taken into warmth as required. —T. B. FIELD, Ashwellthorpe, Norwich.

THE ORCHID HOUSES.

CALANTHES.—The deciduous calanthes are unusually forward in growth with us this season, and, although there is no sign as yet of the foliage fading, the flower scapes are rapidly advancing. To produce satisfactory conditions and the development of the proper colour of calanthes, I consider they must be thoroughly matured and ripened before the flowers commence to expand. I do not wish to convey for one moment that it is necessary the plants should lose their foliage before flowering, but it is to the proper ripening of the pseudobulbs to which I allude. Care should now be taken to afford all the light available during the next few weeks, and it is often at this stage when the pots have become filled with roots that one is considering the necessity of feeding. We do not "feed" any kind or class of orchids here. We have a plentiful store of rain water, and even with a very dry season like the present, we have never run short. I consider that where this is so one has at hand all that is required for the successful culture of orchids. I do not wish to condemn those who feed calanthes and other orchids with liquid cow manure, etc. If such methods are found successful under the particular circumstances, then by all means continue them.

PHAIUS.—The species and hybrids are now in full growth, having become well established after the repotting of a few weeks ago, consequently they should now have every encouragement. The temperature at night should be kept at about 60 degrees for the next few weeks. I do not advise a higher temperature at this season, as this would result in too early flowering to give good results. If the plants are not required until April and May, the cooler they can be kept at this season of the year the better. I consider 55 degrees at night ample under such circumstances. As the season advances, and with cooler conditions prevailing outside, it is advisable to keep the atmospheric moisture within bounds, especially at night. Damping should be done sufficiently early in the day to permit the excess of moisture to disperse before the evening temperature is reached.

SPATHOGLOTTIS.—The few species and hybrids of this genus are most interesting and desirable. There seems to me to be a great possibility of the production of bigeneric hybrids from the intercrossing of these with some of the allied genera, such as bletia and phaius. The spathoglottis will at the present season be rooting freely from the newly developing growths, and any repotting necessary should be attended to without delay. The pots used should be clean and well-drained. The potting compost we find suitable is a mixture of equal parts fibrous peat, turfy loam, and chopped sphagnum, with sufficient sand or broken crocks added to render the compost porous. The plants that are repotted should be kept shaded from strong light for a time, and the atmosphere should be constantly moist about the plants. Where the plants are grown in a stove or hot-house, constant observation is necessary to prevent attacks from thrips and red spider. Spraying and sponging is the best means of keeping these pests in check.—H. J. CHAPMAN, Oakwood Gardens.

THE FLOWER GARDEN.

SUMMER BEDDING.—As the beds lose their effectiveness, they should be cleared and prepared for autumn planting. All hard-wooded dot or other plants that are used from year to year must be lifted very carefully to avoid unnecessary damage. If they were retained in pots and only plunged there will be no danger, but with those bedded out great care will be necessary. Old, soft-wooded plants, of which there may be any scarcity of stock, should also be carefully lifted, and either potted or boxed up. In most cases the tops may be reduced in size. Zonal geraniums, if not cut back, may have a large number of their old leaves removed. This will relieve the plant somewhat, and also help to prevent decay later on. If kept moderately close and partially shaded a short time after potting they will soon make new roots. A number of old plants that may now be lifted are very useful for vases and the centre of beds the succeeding year, being rather more floriferous than young plants. Liliums, gladioli, Galtonia (hyacinthus) candicans, and any other bulbs may also be lifted and sorted. Lilium bulbs should not be allowed to remain exposed to become dry and shrivelled, but placed in boxes in a cool frame. Gladioli corms and Galtonia bulbs, if not well ripened, should be placed in damp soil in sunny positions, where they can gradually mature and be dried off. Bulbs that have become divided and have formed a number of small ones, are not worth troubling about, as good strong flowering bulbs can now be procured so cheaply. After clearing beds cut the verges, and if soil is naturally cold and wet, a dressing of old mortar rubbish, wood ashes, or road grit will be very helpful, especially if wallflowers, silene, aubrietias, saponarias, myosotis, or arabis are to be the next occupants.

ANTIRRHINUMS, PENTSTEMONS, AND CALCEOLARIAS should now be propagated from cuttings. An unheated frame is the best suited for the cuttings, but sufficient protection must be given to keep severe frost out. Place from four to six inches of good soil in the frames, and give a good sprinkling of sand on the top. The soil should be made smooth and firm, make the cuttings about four inches long, remove the lower leaves, and then dib them in four or six inches apart. Keep them nicely damp, but not saturated. Shade in bright weather, and keep the frame quite close, except on calm, mild mornings, when the lights may be removed for about three-quarters of an hour. Calceolarias take rather longer to root than some other plants, and must not be given much air until it can be seen that they are rooting.

BORDER CARNATIONS.—As the layers of these become rooted, they should be lifted and either potted up or planted direct into quarters for flowering next season. In localities where climate and soil are suitable it is best to plant them direct, as by early planting they become well established and pass through the winter unharmed. If due attention is given them in spring they make a strong growth and give satisfactory results. In other places it may be more desirable to pot them up singly, using three or three and a-half-inch pots, and winter them in cold frames. The Nidd Hall variety of the old clove has done well with us here this year, though, unfortunately, it is not as strongly scented as the old form, which will not succeed with us; neither will the Limber variety, although in appearance, colour, and scent it seems very much like Nidd Hall. Before planting deeply dig, but do not heavily manure the ground. A good dressing of sharp material on heavy soil and well-decayed leaf-soil on light soils will be most helpful. Wood ashes or burnt refuse may with advantage be applied to both. Lift the rooted layers with very great care to avoid damaging the roots. Plant firmly in the ground, and, should weather be dry, keep the soil in a moist condition. A dusting of soot and lime, or fine wood ashes, at intervals will tend to ward off slugs and sparrows. —E. F. HAZELTON, Knowsley Gardens.

HARDY FRUITS.

PEACH TREES.—Although too early to commence planting, it is none too soon to commence preparations where planting is anticipated on a large scale. At one time it was considered almost useless to plant peach and nectarine trees on the open walls with the hope of being rewarded with success; but if given good position and planted in well-prepared borders, and the trees carefully attended to during their growing season, the trees will in most districts produce excellent crops. The best varieties only should be planted, and they should be selected to suit different districts. Late varieties can be satisfactorily grown in the south, but in the colder parts probably the early and mid-season kinds only should be planted, and the borders which must be thoroughly drained and the soil raised several inches above the surrounding land, should have a decided slope.

BORDERS FOR PEACHES AND NECTARINES.—If it is intended to plant peaches and nectarines on a south aspect, as soon as convenient the borders should be prepared, so that when the time comes for planting the trees the soil may have become settled. Although peaches delight in a sweet, moderately rich soil, the roots require a firm grip —a border to each—and to support fruitful trees for many years should be two feet deep, and should rest on six inches of drainage. If the land is of a stubborn character small drain pipes ought to be laid crossways at intervals along the border, and a larger drain along the front to carry off the water. After the drainage has been made perfect, cover the rough material with turf, grassy side downwards, and then fill up with a mixture of loam, wood ashes, old brick mortar, a few crushed bones, and well-decomposed manure, the latter rather sparingly. If this mixture is turned over about twice, and then when filling up the borders rammed rather firm, more or less according to the nature and condition of the soil, the trees ought to produce good fruit. The width of the borders for a few years need only be four to five feet, but as the trees increase in size, a few feet wider should be afforded them.

REGULATION OF WOOD.—Keep all sub-laterals removed from the trees of those bearing fruit, and as fast as each tree has been cleared of its crop a little thinning out may be done. Shoots which have borne fruit, and are not wanted for another year should be cut out and replaced by the young wood preserved for next year's crop. Peach trees require careful attention, both at the top and at the roots, the aim being to furnish each tree with medium, well-ripened wood, not too thickly trained. Earwigs have been rather troublesome of late, and a great many have been caught and destroyed. Short pieces of bean stalks were placed behind the branches and examined three times weekly, and when taken from the trees they were blown through over a pail containing paraffin and water. I have also heard, though I have not yet practised it, that smearing along the bottom of the walls with grease will prevent them from doing much harm. A strip of smeared paper placed round the stem will prevent earwigs going up the tree by way of the trunk.—H. MARKHAM, Wrotham Park, Barnet.

BULB DONT'S FOR BEGINNERS.

Don't conclude that big bulbs must necessarily mean big spikes of blossom; small, firm, well-ripened bulbs are where the hyacinth hides its treasure.

Don't leave bulbs in unopened packages indefinitely, spread them out in single layers in a cool cellar, but

Don't delay planting longer than you can avoid, and

Don't follow this advice with liliums; these will remain in the grower's package with perfect safety for several weeks, should the ground not be ready for them. Liliums deteriorate if kept in dry rooms unpotted, and they are equally susceptible of moisture, showing premature growth in cellars or outhouses that are over damp; therefore, avoid extremes, but plant at the earliest opportunity.

Don't plant when the ground is sticky.

Don't plant shallow; twice the depth of a bulb from root to apex is a safe guide.

Don't use either dirty pots or wet soil.

Don't—and this has often been paid for—

Don't think for one moment that low-priced bulbs are always cheap.

THOMAS SMITH.

Walmsgate Gardens.

NATIONAL CHRYSANTHEMUM SOCIETY.
EARLY AUTUMN EXHIBITION.
October 7th and 8th, 1908.
Schedule of prizes and all particulars as to mem-[illegible] may be obtained post free on application to [illegible] Secretary, RICHARD A. WITTY, St. James's, Swains Lane, Highgate, London, N.

HORTICULTURAL SHOW ADVERTISEMENTS are inserted in this column at Six-[illegible] per line, the minimum charge being Two Shillings and Sixpence. Offices, 148 and 149, Aldersgate Street, London, E.C.

EXHIBITIONS AND MEETINGS.

◆

Royal Horticultural Society.

SEPTEMBER 15.

The exhibition held on the above date was a good one, and distinctly characteristic of early autumn. Dahlias were in great plenty and beauty, and, though there did not seem to be any very marked enthusiasm over them, their absence would have resulted in a meagre display. Orchids were moderately-well represented, and there was a bright show of hardy autumn flowers.

FLORAL COMMITTEE.

Mr. Amos Perry, Enfield, showed a splendid group of hardy flowers that was one of the features of the show. Liliums were splendid, and the delphiniums were a revelation for so late a date. The Kniphofias nobilis, McOwani, Corallina, and excelsa were magnificent, and Michaelmas daisies, pyrethrums, and poppies added their quota of effect. Messrs. Wm. Cutbush and Son, Highgate, had a good batch of the new brilliant Coleus Cordelia, a very handsome lot of the popular winter-flowering carnations, in large vases, and a selection of especially fine pentstemons. The Guildford Hardy Plant Company, Guildford, submitted a small collection of hardy flowers.

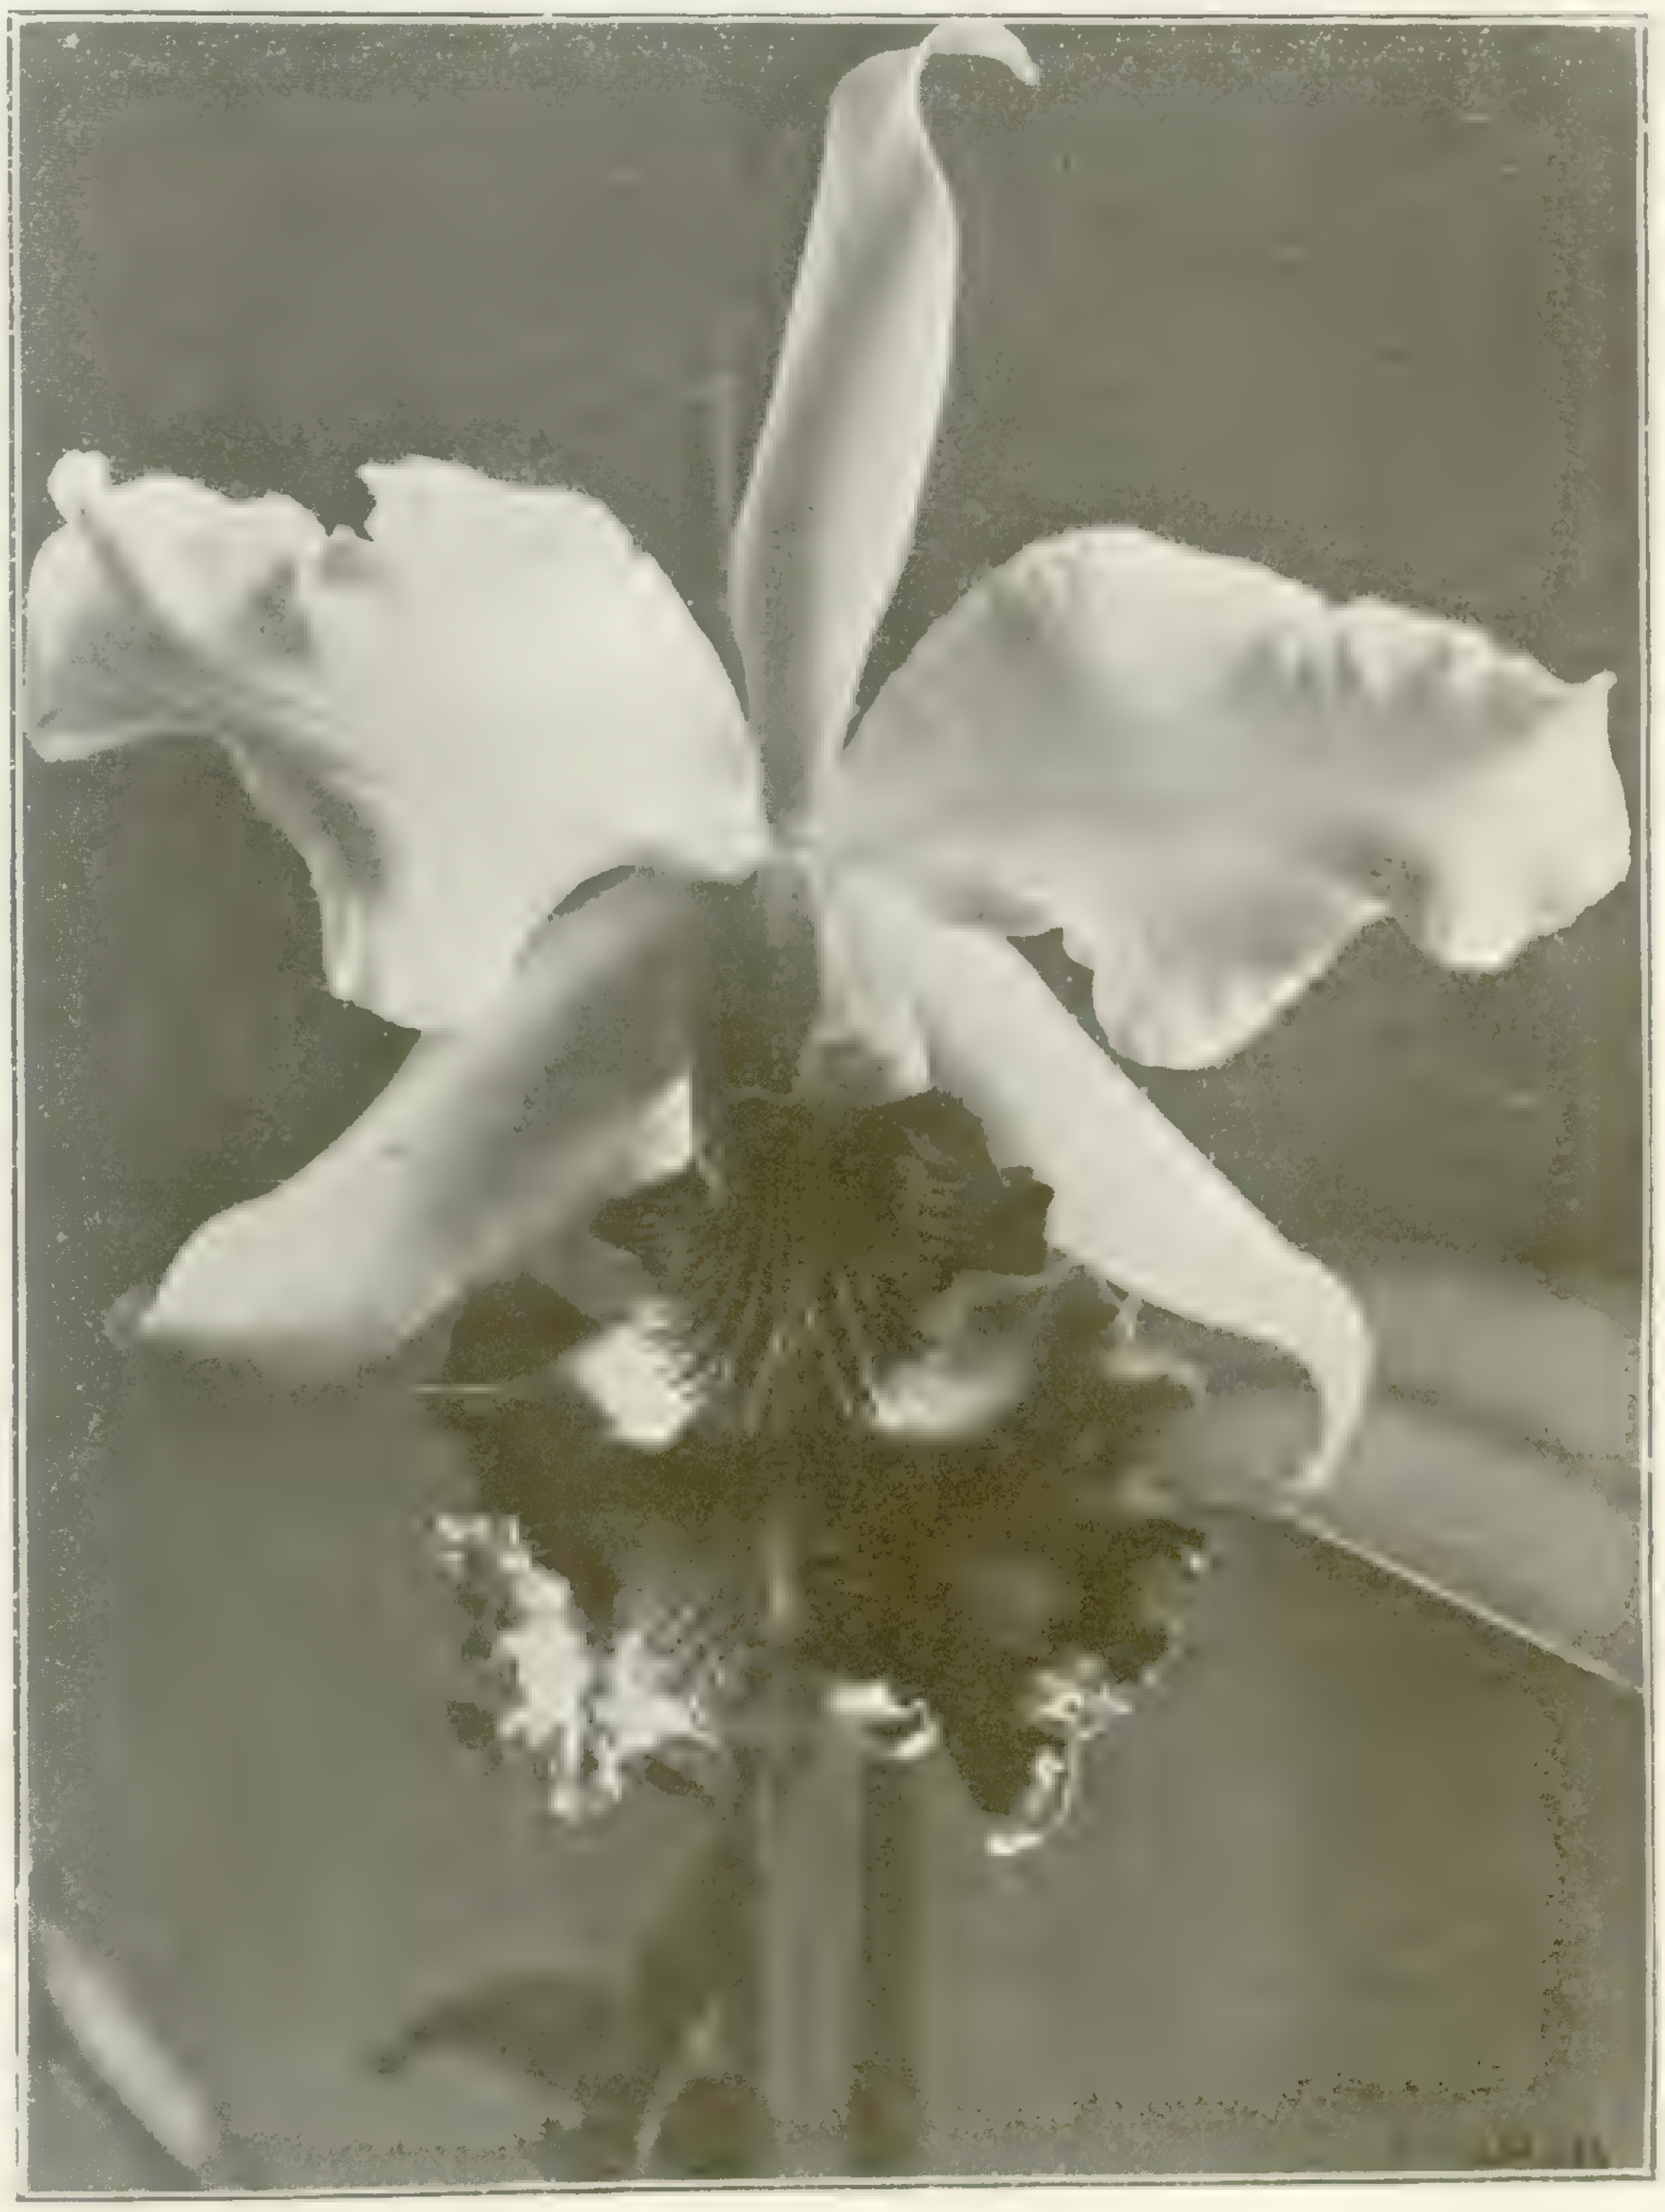
Messrs. Jas. Veitch and Sons, Chelsea, were extensive exhibitors of ornamental trees and shrubs, in sprays, and among a very interesting collection we were especially attracted by the berried sprays of Viburnum rhytidophyllum, pernettyas, hardy heaths in variety, Cornus alba Spathi, Acer palmatum sanguinea, Sambucus canadensis, Clerodendron trichotomum, Ceanothus Gloire de Versailles, and Spiræa Anthony Waterer. On the opposite table the Chelsea firm had a group of grandly-flowered nerines, carrying a host of spikes of vivid blooms, and a group of Golden Fleece abutilon, and the interesting Æschynanthus Lobbianus.

The fine new variegated Hedera dentata variegata was well shown by Messrs. Pennell and Sons, Lincoln: this is a very fine [illegible] plant. Early-flowering chrysanthemums were extensively exhibited by Messrs. Wells and Co., Merstham, Surrey, and with these useful flowers were staged phloxes and Michaelmas daisies. Zonal pelargoniums, notably the free-flowering [illegible] that are useful for autumn flowering, were shown well by Messrs. H. B. May and Sons, Edmonton, who also had bouvardias, the fine heliotrope Mdme. de Bussy, and plumbagos.

Messrs. Barr and Sons, Covent Garden, had a very bright display of hardy flowers, notably kniphofias, liliums, phloxes, and Michaelmas daisies, autumn crocuses, colchicums, etc. Clematises, as shown by Mr. L. R. Russell, Richmond, were very pretty. Messrs. G. and A. Clarke, Dover, had, in their group of hardy flowers, a bold lot of kniphofias, Gilia coronopifolia, gaillardias, and gladioli. A grand display of gladioli, [illegible] spikes all finely developed, and the flowers of fine size and substance, was staged [illegible] Messrs. J Burrell and Co., Howe Nur-[illegible] Cambridge. This very fine exhibit [illegible] a great attraction.

Mr. A. L. Gwillim, Eltham, contributed [illegible] and single begonia blooms of fine quality. Messrs. Thos. S. Ware, Feltham, [illegible] bright bank of hardy flowers, staging the new double Michaelmas daisy Beauty of Colwall largely, with heleniums, pentstemons, phloxes, etc. The Misses Hopkins, Shepperton, sent a few alpines. Messrs. Robt. Veitch and Son, Exeter, showed the scarlet-leaved Euonymus yeddœnsis, Nerine Bowdeni, the sweet-scented Dahlia coronata, Colletia horrida, Cleome spinosa, and Clematis grata.

A very bold and brilliant group of dahlias was admirably set up by Mr. J. T. West, Tower Hill, Brentwood, who had a background of choice cactus dahlias, faced with pompones and flanked with pæony-flowered varieties; Nelly Riding, Sunbeam, and Royal Scarlet are three fine new cactus varieties Mr. West has raised, and the latter is the most brilliant scarlet variety we have seen.



CATTLEYA MARONI AUREA.

A.M., R.H.S., September 15; shown by Sir Trevor Lawrence, Bart., Dorking. Flowers, yellow, rose, and purple. The illustration represents the flower two-thirds of natural size.

Messrs. Eggett and Son, Thames Ditton, brought up a few hardy ferns, chiefly lady ferns and polypodies. Messrs. Paul and Son, Cheshunt, set up a group of very interesting shrubs that included Spiræa Aitchisoni, Rhus typhina laciniata, Euonymus latifolia, purple-leaved peach, Magnolia trifoliata, and the curious Rosa sericea pteracantha. Messrs. Carter Page and Co., London Wall, were responsible for a very big exhibit of cactus dahlias, set up in large baskets of a variety; Australian, Miss F. C. Stoop, Mr. Carter Page, Flame, Primrose, Francis Graham, White Lady, and Wm. Marshall were especially fine.

A wonderfully fine exhibit of dahlias was made right across the top end of the hall by Messrs. Dobbie and Co., Rothesay and Marks Tey. It was a very bright and effective, as well as elegant exhibit. At the back the tall stands of self-coloured cactus varieties stood well above the lower vases, and smaller stands. The front consisted of boards of show and cactus dahlias, while at one end pæony-flowered varieties were grouped, and at the other pompone varieties were very much in evidence. A few cactus dahlias that attracted special attention were Britannia, Dreadnought, Iris, Wm. Marshall, Lucifer, Faunus, Mabel Needs, Conrad, White Swan, J. B. Riding, Ruby Grinstead, and Hilda Shoebridge. Mr. Frank Brazier, Caterham, had a large variety of Michaelmas daisies, and early-flowering chrysanthemums and phloxes. Messrs. H. Cannell and Sons, Swanley, showed the brilliant begonia Washington, double scarlet, as well as the pink Rosebud, the white Queen of Spain, and the yellow Mr. J. Burden. Messrs. J. Stredwick and Son, St. Leonards, contributed a number of fine new cactus dahlias, and Mr. S. Mortimer, Farnham, was also an exhibitor of new cactus and show dahlias.

Messrs. J. Cheal and Son's contribution of dahlias included excellent bunches of Fugi San, Miss Morland, Alice Castle, Winona, Elmira, Serita, Glencoe, Flora, and Sunrise single varieties, in addition to excellent representations of cactus varieties. Winter-flowering carnations were well shown by Messrs. Hugh Low and Co., Enfield, who had Britannia and Mrs. Burnett in excellent condition.

ORCHID COMMITTEE.

Messrs. Stanley and Co., Southgate, sent up a plant of Cattleya Harrisoniæ alba Stanley's var. (F.C.C.), that carried a pair of beautiful white blooms with a faint lemon mark on the lip. Cattleya Angela, a cross between C. intermedia nivalis and C. labiata Cooksoniæ, came from Mr. H. J. Chapman, gardener to N. C. Cookson, Esq., Oakwood, Wylam-on-Tyne. Mr. Black, gardener to R. G. Thwaites, Esq., Chessington, Christchurch Road, Streatham, put up a small group of well-grown hybrid orchids, chiefly of Cattleya granulosa parentage; C. Pittiana J. M. Black was very good, and C. Adula in several forms was also fine. Mr. W. H. White, orchid grower to Sir Trevor Lawrence, Bart., Dorking, showed Cattleya Maroni aurea (A.M.), a handsome form; and the quaint Cirrhopetalum pipillosum. Mr. H. G. Alexander, orchid grower to Lieut.-Colonel Holford, Westonbirt, Tetbury, Gloucester, showed Sophro-lælio-cattleya Medea superba, a deep dark purplish maroon, a neat flower with purple lip; Cypripedium Rosetti magnifica, and Lælio-cattleya Elva superba, very rich and bright purple. Messrs. Sander and Sons, St. Albans, showed Brasso-lælia Helen var. amabile, with spidery sepals and petals of yellow and pink colouring, and a big lavender lip, fringed with a pale-yellow throat.

Messrs. Charlesworth and Co., Heaton, Bradford, had a very interesting group of choice orchids. Old favourites included Vanda Sanderiana, V. cœrulea, and Houlletia Brocklehurstiana, while more modern subjects were represented by Brasso-cattleya Thorntoni, B.-c. Digbyana-gigas, Cattleya Aliciæ, C. Enid, C. Rhoda, Sophro-cattleya Marathon, and several forms of a pretty new and unnamed hybrid from C. Mrs. Pitt and C. Hardyana. C. Lord Rothschild delicata was also conspicuously good.

Mr. Day, gardener to H. S. Goodson, Esq., Fairlawn, West Hill, Putney, showed a group of cypripediums and lælio-cattleyas arranged with a few odontoglossums and oncidiums, and the plants were prettily set amid maidenhair ferns. Messrs. J. Cypher and Sons, Cheltenham, had a fine Cattleya Pittiana among various cypripediums, Miltonia Bleuana, Cattleya Ashtoni, Zygopetalum rostratum, and Dendrobium phalænopsis. Messrs. Stanley and Co., Southgate, had a group of Cattleya Loddigesi, C. Gaskelliana, Cypripedium A. de Lairesse, and other things.

Messrs. Sander and Sons, St. Albans, had a fine Vanda cœrulea, Cattleya Gaskelliana alba, Brasso-cattleya Chas. Maron, the rare and interesting Cœlogyne Micholitzi, Odontoglossum grande, etc. Messrs. Moore, Lim., Rawdon, Leeds, showed the quaint Cycnoches chlorochilon, richly coloured Vanda cœrulea, Cattleya Mrs. Pitt, C. fulvescens, and a very dark Odontoglossum Harryanum.

Cattleya Pittiana figured largely in the group of orchids exhibited by Messrs. Hugh Low and Co., Enfield; with these were Vanda Kimballiana, Cattleya Loddigesi, Stanhopea oculata, etc. Messrs. Wm. Bull and Sons, King's Road, Chelsea, had a large number of varieties of the cross between Cattleya velutina and Cattleya aurea, set amid a variety of stove foliage plants.

FRUIT AND VEGETABLE COMMITTEE.

A collection of vegetables, contributed by Messrs. Jas. Veitch and Sons, Chelsea, attracted a good deal of attention; it comprised leeks, beet, cabbages in variety, carrots, Veitch's Maincrop onion, Hackwood Park Success bean, fine Early Rose celery, Hackwood Park tomatoes, etc. Mr. Joseph Goatley, gardener to Lady Northcliffe, Sutton Place Gardens, Guildford, showed two dozen excellent specimens of Hero of Lockinge, The Peer, and Sutton's A1 melons.

Tomatoes in great variety, from the small cherry and pear-shaped varieties up to the big American Ponderosa, were exhibited by Messrs. Carter Page and Co., London Wall; Superlative, Golden Jubilee, Sunrise, and Dobbies' Champion were very attractive smooth varieties. Mr. G. W. Miller, Clarkson Nurseries, Wisbech, sent up a handsome soft red apple that appeared to be a cross between Emperor Alexander and Gascoigne's Seedling; it was named Red Victoria. (A.M.).

CERTIFICATES AND AWARDS.

First-class Certificate. — Cattleya Harrisoniæ alba Stanley's var., from Messrs. Stanley and Co., Southgate; Populus albus lasiocarpa, from Messrs. Jas. Veitch and Sons, Chelsea.

Award of Merit. — Apple Red Victoria, from Mr. G. W. Miller, Clarkson Nurseries, Wisbech; Cattleya Maroni aurea, from Mr. White, orchid grower to Sir Trevor Lawrence, Bart., Burford Lodge, Dorking; single dahlia Betty, from Messrs. J. Cheal and Sons, Crawley; cactus dahlias Brigadier and Monarch, from Messrs. Burrell and Co., Cambridge; cactus dahlias Snowdon, Teutonic, and Satisfaction, from Messrs. J. Stredwick and Son, St. Leonards; cactus dahlias Flora and Nellie Riding, from Mr. J. T. West, Brentwood; pompon dahlia Adela, from Mr. Chas. Turner, Slough.

MEDALS.

Silver-gilt Flora.—Messrs. Burrell and Co., Cambridge; Messrs. Dobbie and Co., Rothesay.

Silver-gilt Banksian.—Messrs. Carter Page and Co., London Wall; Messrs. Jas. Veitch and Sons, Chelsea.

Silver Flora.—Mr. Amos Perry, Enfield; Messrs. W. Cutbush and Son, Highgate, N.; Mr. J. T. West, Brentwood; Messrs. H. B. May and Sons, Edmonton; Messrs. Paul and Son, Cheshunt; Mr. G. Day, gardener to H. S. Goodson, Esq., West Hill, Putney.

Silver Banksian. — Messrs. J. Cheal and Sons, Crawley; Mr. A. L. Gwillim, Eltham; Messrs. W. Wells and Co., Merstham, Surrey; Messrs. H. Cannell and Sons, Swanley; Messrs. Hugh Low and Co., Bush Hill Park, Enfield (2), carnations and orchids; Messrs. Carter Page and Co., London Wall, for tomatoes; Messrs. J. Cypher and Sons, Cheltenham; Messrs. Sander and Sons, St. Albans; Messrs. Moore, Lim., Rawdon, Leeds; Messrs. Stanley and Co., Southgate.

Bronze Flora.—Mr. J. Brazier, Caterham; Messrs. G. and A. Clarke, Dover; Mr. L. R. Russell, Richmond; Messrs. T. S. Ware, Lim., Feltham; Messrs. Barr and Sons, Covent Garden.

Silver-gilt Knightian.—Messrs. Jas. Veitch and Sons, Chelsea, vegetables.

Silver Knightian.—Mr. Goatley, gardener to Lady Northcliffe, Sutton Place, Guildford.

WISLEY TRIALS.

The trials that are being conducted at the Royal Horticultural Society's Gardens at Wisley this year include one of cactus dahlias, arranged with a view to bring into prominence the varieties best suited for garden decoration. The trial is extensive, and is of interest for the evidence it affords of the necessity of so improving the habit of the varieties comprised in the section that the flowers will stand clear of the foliage. At the recent visit of a joint committee, composed of members of the R.H.S. Floral Committee and the National Dahlia Society, the following varieties received three marks each.

Emily Habgood.—A rather robust growing decorative variety; the blooms are pure white, large, of good form, and borne on stiff, erect stalks well above the foliage.

Brightness.—An excellent cactus variety, the flowers of medium size, and freely produced on erect stalks, the colour brilliant rose-crimson. The plant is dwarf and erect, with wiry growths.

Avoca.—Brilliant crimson, the blooms produced on long stalks, and slightly drooping. The growth is comparatively thin, and the plants, by reason of their freedom of flowering, are very effective.

Miss Willmott.—The flowers large, rich yellow suffused fawn. The growth tall, but thin, and the flowers are freely produced.

Stalwart.—The flowers brilliant crimson, and stand clear of the foliage, although the stalks are rather short; medium height.

These are all useful additions to the dahlias of value for the production of colour effects in the garden.

Phlox Comtesse de Jarnack.—An attractive variety with variegated leaves, also received three marks. The growth is vigorous, and the leaves are broadly margined with cream-yellow, this colour in many cases extending over the whole of the leaf. It is a distinct advance upon the phloxes with variegated leaves, and appears to have great possibilities for garden decoration.

Zea quadricolor.—A distinct and attractive maize of much value in the garden. It is robust in growth, attaining at Wisley a height of six or seven feet, and the leaves are of large size, stout, and marked with broad stripes of white, pink, and rose on a green ground. This also received three marks.

SCIENTIFIC COMMITTEE.

Present: Mr. Chas. T. Druery, F.L.S., V.M.H. (in the chair), with Messrs. Jas. Douglas, J. W. Odell, W. Fawcett, J. Fraser, H. T. Güssow, George Gordon, and J. T. Bennett-Poë.

MILDEW ON OAK LEAVES.—Mr. Güssow reported that the fungus on certain oak leaves sent for inspection is probably a form of a nucimula; it is in its conidial stage Erysiphe commune.

GALL ON WILD ROSE. — Mr. Douglas showed specimens of the rose gall, Cecidomyia rosarum.

STREPTOCARPUS. — Mr. J. W. Odell showed streptocarpus having (a) in a light-flowered variety a regular peloric corolla with six segments, the whole flower being campanulate; and (b) in a dark-flowered variety the peduncle branched and the bracts foliaceous instead of very small, as is normal.

ABNORMAL FLOWERING OF LABURNUM.—Mr. George Gordon mentioned that at the present time a laburnum was flowering freely in his garden at Kew. The tree had occupied its present position some fifteen or sixteen years, and owing to it occupying too much space the whole of the branches were cut back to within three or four inches of the main stem after it had flowered last spring. The tree produced new shoots from the stumps of the branches, and of these about two-thirds produced terminal racemes of flowers, these being of a much larger size than the racemes previously produced in the usual way.

VICTORIA PLUM. — Mr. C. T. Druery showed a Victoria plum upon which was a group of insect eggs on a stalk, which had at first sight an appearance of a fungus, but it was determined to be something like the stalk and eggs of the lace-wing fly, than which they were, however, somewhat smaller.

TOMATO WITH ENLARGED CALYX.—Mr. F. Fellows Wilson, of Alveston, Chobham, Surrey, sent a tomato with an extraordinarily large calyx, the segments measuring about 3in. in length. It is not uncommon for the calyx to extend to this extent, particularly if the tomato plants are allowed to bear but few fruits on one branch.

DISEASED APPLES.—Mr. J. G. Howlett, of 36, Bracondale, Norwich, submitted some Green Beaufin apples which were diseased. Mr. Güssow undertook to investigate the matter.

YEW BLIGHT.—A few diseased sprigs of yew were submitted from Mrs. F. Lyell, of Ruckmans, Oakwood Hill, Surrey; the matter was left with Mr. Güssow to report.

DAFFODIL POISONING. — Dr. C. B. Plowright sent the following interesting note: "Cases in which the handling of daffodil flowers by the gatherers has caused poisoning is one often heard of, but how many are really due to the flowers themselves and how many to incipient eczema or other skin disease on the part of the gatherer is not so clear. Cases in which the bulbs themselves are partaken of as food are not nearly so frequent. The following note may, therefore, be of interest. A gentleman in King's Lynn purchased in the month of December, 1907, a number of bulbs. These were, for security, placed in a paper bag upon a shelf in the kitchen. By some mischance the daffodil bulbs became mixed with the household stock of onions, and eventually were sliced up together with them and used in the preparation of soup, which was partaken of by the whole family. Shortly after the meal all the members were sick, they vomited freely, and suffered more or less from nausea, but they had neither abdominal pain nor diarrhœa. Recovery took place in from six to eight hours. The actual number of daffodil bulbs used could not be ascertained. The remainder of the soup was used on the following day with the same result. This led to the investigation of the onion-stock. That the illness was not due to ptomaine poisoning is shown by the complete recovery in eight hours, and by the absence of pain and diarrhoea."

ALIEN PLANTS, ETC.—Mr. J. Fraser, F.L.S., showed a specimen of Erysimum Altissimum L., a plant previously recorded as occurring spontaneously in Britain in the "Journal of Bot.," vol. x., under the name of Erysimum pannonicum, and in the "Flora of Surrey" (1863) as being found as an introduced plant at Battersea Fields. Mr. Fraser had himself found it at East Ham in 1900, at Greycoat Place, Westminster, 1907, and on Putney Common, and on the new Kingsway and Aldwych sites this year. The specimen he showed had its petals reduced to the claw, as if resorting to self-fertilisation. In addition to this plant he had found upon the Kingsway and Aldwych sites the following British plants: Epilobium angustifolium, E. hirsutum, Senecio viscosus, Pyrus malus, Brassica rapa, Carduus arvensis, C. lanceolatus, Sonchus arvensis, Pteris aquilina, and Centaurea cyanus; and the following aliens: Erysimum altissimum, Salvia verticillata, Erigeron canadensis, Fragaria chiloensis, Eschscholtzia californica, Cucurbita Pepo, Helianthus annuus, [illegible], and Papaver somniferum.

London Dahlia Union.

This society held a successful exhibition in the Royal Botanic Society's Gardens, Regent's Park, on September 10 and 11. The competition was fairly good throughout, and the flowers were better than the recent stormy weather had led people to expect.

OPEN CLASSES.

The best three vases of cactus dahlias, the blooms arranged with foliage and grasses, were from Mr. Chas. Turner, Slough, who had bold, tasteful arrangements of Wm. Marshall, Ruby Grinstead, and Mrs. McMillan; Messrs. J. Cheal and Sons second, and Mr. M. V. Seale third. Premier award for six bunches of pompon cactus dahlias was won by Messrs. J. Burrell and Co., Cambridge, with neat flowers of Minima, Lena, Olivine, Butterfly, Argus, and Tom Tit. Messrs. J. Cheal and Sons, Crawley, came second; and Mr. M. V. Seale, Sevenoaks, was third.

Mr. S. Mortimer, Rowledge, Farnham, was placed first for two dozen show dahlias, and he won with a handsome lot of blooms that seemed to have defied the weather. His best flowers were Queen of the Belgians, Wm. Powell, Pleasaunce, Mrs. Saunders, W. H. Williams, Mrs. Langtry, and J. B. Service. Mr. Chas. Turner, Slough, took second place, Mr. John Walker, Thame, was third, and Messrs. Keynes, Williams, and Co., Salisbury, fourth. Mr. J. R. Tranter scored for a dozen show blooms, and he had a very even set of fair-sized flowers, Wm. Powell, W. Rawlings, and Queen of the Belgians being very good; Messrs. J. Cheal and Sons second, and Mr. M. V. Seale third.

There were four competitors in the class for a dozen varieties of cactus dahlias, six blooms of each, and here Messrs. J. Stredwick and Son, Silverhill Park, St. Leonards, were once more first, showing beautiful blooms of H. Peerman, Rev. T. H. Jamieson, Sunstorm, Evening Star, Rev. A. Hall, Mrs. Alfred Dyer, Durando, C. E. Wilkins, Satisfaction, Diadem, J. B. Riding, and Mrs. Grinstead; Messrs. J. Burrell and Co., Cambridge, occupied second place; and Messrs. J. Cheal and Sons, and Mr. M. V. Seale were third and fourth respectively.

For two dozen cactus dahlias, single flowers, arranged on boards, Messrs. J. Burrell and Co. secured the chief award with a fine set, in which Girton, Monarch, Mercia, Leslie, Rival, and Wm. Marshall were finely presented; Messrs. J. Stredwick and Sons came second; Messrs. Keynes, Williams, and Co., third; and Mr. J. Walker fourth. Mr. M. V. Seale scored a first for a dozen cactus dahlias, on boards, and he won fairly easily. Mr. S. Mortimer came second, and Messrs. J. Cheal and Sons third.

Four competitors each staged three vases of cactus dahlias, nine flowers in each, suitable foliage allowed, and here Mr. J. Walker, Thame, Oxon, was a very creditable first with fine blooms, well arranged; Mr. M. V. Seale was second, and Messrs. Keynes, Williams, and Co., third. Messrs. Keynes, Williams, and Co. led for six blooms of any one cactus dahlia, with Glory of Wilts, a pleasing new yellow variety; Mr. S. Mortimer second with Wm. Marshall, and Mr. J. Walker third with Mercury.

Messrs. J. Burrell and Co., Cambridge, won the premier award for a dozen pompon dahlias, ten flowers of each, with very clean examples of Girlie, Kitty Barrett, Darkest of All, [illegible], Montague Wootten, Violet, Nerissa, Ganymede, Bacchus, Emily Hopper, Tommy Keith, and Midget; the Dean Memorial Medal was awarded for this exhibit; Mr. M. V. Seale came second, and Mr. Chas. Turner was third.

The best set of twelve single dahlias, six blooms of each, came from Messrs. J. Cheal and Sons, Crawley, who showed very clean, bright blooms of Eclipse, Brilliant, Fugi San, Leslie Seale, Victoria, Miss Morland, Darkness, Flora, Winona, Kitty, Snowdrop, and Princess of Wales; the Rev. Spencer Pearce, Combe Vicarage, Woodstock, secured the second place; and the Rev. A. Bridge, Worth Rectory, Crawley, came third. First prize for one vase of paeony-flowered dahlias was won by Mr. Chas. Turner, Slough.

Mr. S. Mortimer led for six blooms of a show or fancy dahlia not in commerce, winning with Tom Jones, pink-tipped cream; Messrs. Keynes, Williams, and Co., second, with Cruso, a pretty lavender variety. Mr. M. V. Seale gained first prize for a set of six bunches of decorative dahlias, three blooms in each, and his selection of varieties was Delicatissima, J. C. Newbery, Mrs. Seale, Gladiator, Amos Perry, and Britannia.

First prize for a table decoration in dahlias was won by Mr. M. V. Seale, who used the neat pompon cactus variety Mary. Miss E. B. Sell, Kempton Villa, Luton, second with pompon and single varieties, and Messrs. J. Cheal and Sons third with pompon cactus flowers.

AMATEURS' CLASSES.

The Hobbies' Challenge Cup and first prize for nine varieties of cactus dahlias were won by Mr. W. E. Peters, The Hospice, Baldslow, St. Leonards, who lost the cup to Mr. Stephens last year. Mr. Peters showed splendid flowers of Victorian, Rev. A. Bridge, C. E. Wilkins, Lustre, Ruby Grinstead, H. Peerman, Wm. Marshall, Mrs. W. H. Raby, and Iverleam. Mr. W. Lockyer, gardener to the Rev. G. Twentyman, Greenhill Park, New Barnet, came second; Rev. A. Bridge, Crawley, third, and Mr. E. C. Barton, Brand Street, Greenwich, fourth. For a vase of a pink or white cactus dahlia Mr. E. Mawley, V.M.H., Rosebank, Berkhamsted, won Mr. Sydenham's vase, as first prize, with Mrs. W. H. Raby; Mr. W. H. Brown, Havelock Road, Luton, second, and Mr. E. C. Barton third.

Mr. H. Jackson, The Leys, Woburn Sands, Bedfordshire, was to the fore in the class for six cactus dahlias, three blooms of each, showing Wm. Marshall, Caradoc, Recam, Rainbow, Ruby Grinstead, and Flag of Truce; Mr. E. Mawley second, and Mr. S. H. Cooper, The Hamlet, Chippenham, third. Seven competitors entered in the class for twelve cactus dahlia blooms, in four varieties, on boards, and here the Rev. A. Bridge led with Victorian, J. B. Riding, T. A. Havemeyer, and Rev. A. Bridge; Mr. W. E. Peters second, and Mr. H. Brown third.

For a dozen cactus dahlias, distinct, Mr. W. E. Peters was once more successful with a very clean set of popular varieties; Mr. W. Lockyer came second, and Mr. H. Brown was third. There were eight competitors. Mr. J. Hicks, Bersham Manor Road, Thornton Heath, was first for six cactus dahlias, and Mr. E. Mawley second.

The Rev. S. S. Pearce, Woodstock, led for six bunches of single dahlias with charming flowers of Mikado, Kitty, Columbine, Darkness, Rosebank Cardinal, and Leslie Seale; the remaining awards fell to Mr. E. Mawley and the Rev. A. Bridge. Mr. A. Brown was first, and Mr. E. Mawley second for a bunch of single dahlias. Mr. Mawley had the best vase of cactus dahlias—Dr. G. G. Gray and Mr. E. C. Barton gained second place.

Mr. S. H. Cooper, Mr. H. Jackson, and Mr. A. P. Ironsides, Park Lane, Chippenham, were placed in the order of mention for a dozen show dahlias, and Mr. G. Davidson, Elm Lodge, Thornton Heath, was first, and Mr. E. C. Barton second for six show dahlias. In the classes for pompon dahlias Mr. H. Brown led for six varieties with Nellie Broomhead, Jessica, Distinction, Darkest of All, Queen of Whites, and Phoebe, and he was awarded a Dean Memorial Medal; Mr. A. Brown, Frederick Street, Luton, second; and Mr. S. H. Cooper third.

NON-COMPETITIVE.

A very large exhibit of cactus and paeony-flowered dahlias was set up by Messrs. Hobbies, Lim., Dereham, who had the varieties set up in tall stands and pyramids, and associated them with foliage and palms. Messrs. J. Burrell and Co., Cambridge, brought up a splendid lot of gladioli and some autumn roses. Messrs. Dobbie and Co., Rothesay, showed cactus, pompon, single, and paeony-flowered dahlias in variety.

Messrs. S. Spooner and Sons, Hounslow, contributed a large collection of dessert and cooking apples, all very clean and bright, and also a few plums and a dish of the strawberry-raspberry. Mr. J. T. West, Tower Hill, Brentwood, showed a large and very interesting collection of cactus, pompon, and paeony-flowered dahlias, the pompon varieties being exceptionally good. Messrs. G. Van Waveren and Kruyff, Sassenheim, Holland, had a large exhibit of paeony-flowered dahlias in vases, King Leopold, Queen Wilhelmina, Dr. Von. Gorkom, and Sneeuwitze being conspicuously good. This firm also showed these dahlias in pots.

National Chrysanthemum Society.

The first meeting of the Floral Committee for the season was held at Essex Hall, Strand, on Monday, September 14. After passing the minutes, the committee proceeded to elect its chairman for the season 1908-9, and Mr. D. B. Crane was once again re-elected to the post.

Messrs. D. B. Crane, E. F. Hawes, D. Ingamells, and C. H. Curtis, with Mr. J. B. Riding as reserve, were elected to act as judges of the non-competitive displays at the October, November, and December exhibitions.

Mr. Witty, Highgate Cemetery, N., sent a collection of early-flowering chrysanthemums to show the usefulness of the section for London gardens. Mr. W. J. Godfrey, Exmouth, sent up a new incurved Japanese variety of considerable beauty and size, provisionally named Golden Glow; it was soft canary-yellow, and the committee wished to see it again grown in free style.

The Executive Committee met during the evening, and Mr. Thomas Bevan presided. A letter was read from the Royal Agricultural and Horticultural Society of Guernsey applying for affiliation, which was granted. It was announced, in reply to an inquiry, that there would be no chrysanthemum show held by the authorities of the Franco-British Exhibition.

The interim financial statement was presented, showing receipts and payments to date. A report on the question of holding the N.C.S. shows at the Horticultural Hall, Vincent Square, was submitted, and it was resolved the subject could not be entertained at present. It was also announced that the Market Show would not be held this year. Subject to the convenience of the president, the annual dinner will be held at the Holborn Restaurant on November 26. The committee agreed that miscellaneous exhibits at the October, November, and December shows should be judged by the gentlemen selected by the Floral Committee, as above. The judges for the October show, six in number, were then elected, consisting of Messrs. Howe, Wells, Cull, Such, Emberson, and Ewer, with reserves.

The election of new members brought the meeting to a close.

Woodstock.

SEPTEMBER 8.

The Agricultural and Horticultural Association held its annual competitions in Blenheim Park on the above date. There was a large attendance, although rain fell three hours during the afternoon. The sections were horses, roots, corn, butter, eggs, and honey; jumping and driving; a large poultry and pigeon show, dogs, and other live stock. About eighty classes were devoted to horticulture, this section being largely aided by non-competitive exhibits, the most extensive collection being a group of plants arranged for effect, covering about 150 feet superficial, by Mr. F. Hunter, Blenheim Palace Gardens, who had successfully harmonised palms, ferns, lilies in variety, clustering spikes of gladioli, hydrangeas, perennial asters, bright crotons, yuccas, tuberous begonias, and a large number of scarlet nerines. At the back of the palms was a table of fruit, comprising some fifty dishes of grapes, peaches, plums, melons, apples, pears, and figs, the specimens of Peasgood's Nonsuch apples turning the scale at from eighteen ounces—the noblest examples yet seen at an Oxon show; a silver medal was awarded. Other extras included some high-class floral devices from Messrs. Field and Jacob, The Market, Oxford, and also from Messrs. R. Tucker and Sons, Magdalen Street, Oxford; and from Mr. John Johnson, Garsington Nurseries, Oxon, some eighty or ninety bunches of herbaceous perennials. The last three exhibits were awarded certificates of merit. One fine arrangement of roses was evidently overlooked, viz., the display by Mr. W. T. Mattock, Barton End Nursery, Headington, who had a back line of six bamboo stands, each furnished with two dozen specimen blooms, and about forty bouquets of garden, decorative, and tea roses in variety, very effectively posed. A small collection of garden flowers by Messrs. P. J. Perry, Bampton, were recognised by a certificate of merit.

In the competition Mr. W. T. Mattock scored a premier with a group of plants; his arrangement was largely lilies, francoas, and gloxinias set amid bright crotons, palms, and ferns; the second award went to Mr. D. Curtis, Iffley Road, Oxford, for an arrangement scarcely so full of colour. The only other class for plants was for three specimens in flower, the awards going to fuchsias, geraniums, and a plumbago.

Cut flowers were somewhat extensively shown, fairly liberal prizes being offered for displays of roses, cactus dahlias, and dinner-table decorations. For roses, Mr. John Mattock was placed first for a very attractive show of some forty varieties, all named; each of his back line stands held forty flowers and were faced by four dozen beautifully posed bouquets, the edging being clusters of buds resting on depending foliage of the white Wichuraiana rose; Messrs. Francis Taylor and Sons, Kingham Nurseries, Oxon, were second, their central stand being a massing of Frau Karl Druschki, five other stands, and fourteen bouquets—the varieties were not named. The displays of cactus dahlias were a very attractive section, the first prize going to Mr. J. Walker, Thame, Oxford, who had a back line of five stands, each with thirty blooms, and twenty-six baskets and vases filled with high-class flowers, also four dozen varieties on boards, named, and as a whole the posing was most effective; Messrs. Taylor were second. Mr. Walker was also first for a dozen cactus, and a dozen single dahlias, in triplets; also for double zinnias.

The only collection of perennials on 36 feet came from Mr. J. Cooper, Hardy Plant Nursery, Chipping Norton. Mr. Mark Benden, Stanton Harcourt, Oxon, led in the two classes for asters and annuals. Mr. J. Mattock had the premier collection of gladioli, and Mr. W. T. Mattock was the only exhibitor of a bride's bouquet.

Fruit was well shown; the collection from Mr. J. M. Bush, gardener to F. J. Myers, Esq., Charlton Lodge, Banbury, was awarded first prize and silver-gilt medal, setting up a back line of neat crotons and palms, faced by well-finished clusters of Muscat of Alexandria, Gros Maroc, Black Hamburgh, and Madresfield Court grapes; Ringleader and Hero of Lockinge melons, Pineapple nectarines, Morello cherries, Kerry Pippin and Lady Sudeley apples, Williams Bon Chretien pears, and Jefferson plums. Mr. R. Wadham, gardener to Mrs. Bradshaw, Steeple Aston, was second. For grapes, Mr. Bush led with Muscat of Alexandria; Rev. Dr. Wilson second with an immense cluster of Alicante, and one of Black Hamburgh. The dessert apples winning awards were generally Lady Sudeley, Beauty of Bath, and Worcester Pearmain.

Vegetables made an excellent though not an extensive show, Mr. R. Wadham securing the first prizes for Messrs. Suttons' and Webbs' special collections, and he further staged a collection of potatoes, in which the dozen varieties were clean, shapely, and bright—a certificate of merit being awarded. The cottagers (although a wide area is given) do not make a large display, there being but four classes allotted to them for vegetables.

United Horticultural Benefit and Provident Society.

The monthly meeting of this society was held at the Horticultural Hall, Vincent Square, Westminster, S.W., on Monday evening last, Mr. Charles H. Curtis in the chair. Four new members were elected, making a total of 52 this year to date. The amount of sick pay since the last meeting was £39 13s. Mr. A. Hemsley resigned his seat on the committee, through pressure of business and inability to attend the meetings, and his resignation was accepted with regret, and a vote of thanks was accorded him for valuable services for several years past. The annual dinner will be held this year at the Waldorf Hotel, Aldwych, W.C., on Thursday, October 15, at 6.30 p.m. Dr. Boxall, of Dorking, has kindly consented to preside on this occasion.

East Anglian Horticultural Club.

This club, with its membership of over 300 active professional and amateur gardeners, still continues to increase its membership, thanks to the exertions of the energetic secretary, Mr. W. L. Wallis, 11, Royal Arcade, Norwich. The September meeting held on the 9th inst., at the Boar's Head Hotel, Norwich, was largely attended, and, although the members were somewhat disappointed in not having a paper from Mr. G. Davison, of montbretia fame, upon "Hybridisation," as promised, owing to unforeseen circumstances, enthusiasm did not flag. A discussion was started upon "Cucumber Growing," and brought out a fairly good debate, Messrs. J. Powley, C. H. Fox, H. Goude, and R. Watson taking the leading points. The exhibition tables were well filled with choice subjects, apples and plums in the fruit section being very fine. For colour the fruits of Worcestershire Pearmain, staged by Mr. G. Moore, gardener at Hethersett Hall, Norwich, were quite a picture. Mr. W. Shoesmith, gardener to F. W. Harmer, Esq., Cringleford, exhibited some spikes of Erythrina Crista-galli, grown in the open, these being grand in colour, and the foliage exceptionally healthy.

Turf that has become much worn or damaged during the season should now be repaired or relaid; it will soon become established. Should a spell of dry weather follow well water the newly-laid turf. All large plantains that, owing to pressure of work, may have been allowed to grow, should be removed.—E. F. HAZELTON.

ANSWERS TO CORRESPONDENTS.

Editorial Communications should be addressed to the Editor of the GARDENERS' MAGAZINE, 148 and 149, Aldersgate Street, E.C.

Secretaries of horticultural societies are invited send early notification of forthcoming exhibiti and meetings, and are requested to advise us cerning changes of dates.

Specimens of plants, flowers, and fruits for or opinion should be sent to the Editor GARDENERS' MAGAZINE, "Eadsleigh," Priory Kew, Surrey, and as early in the week as All parcels must be sufficiently prepaid.

The Editor will be glad to receive photographs gardens, plants, flowers, trees, fruits, etc. reproduction in the GARDENERS' MAGAZINE. He will also be greatly obliged by correspondents sending early intimation of interesting local events relati to horticulture. In sending newspapers containing matter to which they wish to draw attention, correspondents are requested to distinctly mark t paragraph.

MALFORMED PEAS.—J. F., Bir ham: The malformation is due to an att of mildew followed by an attack of thri the points of growth. This malforma frequently occurs when a bad attack of th is followed by moist conditions.

ROOT PRUNING OF FRUIT TREES.—Amateur, Colchester: Root pruning is necessary when fruit trees are making strong a growth as to render them ductive. When the trees make a mod growth, flower freely, and produce good in favourable seasons they do not requir their roots to be shortened or disturbed i any way. In your case the apple and pea trees are decidedly too luxuriant, and, as there is no other means by which excessively luxuriant trees can be brought into a fruitful state as by root-pruning, we advise you to shorten the roots this autumn, the third and fourth weeks of October being as good period as any in which to perform the operation. You will not find any great difficulty associated with root-pruning. First draw circle at a distance of three feet from the stem, and outside this dig a trench to depth of two feet. Then work the soil fre about the roots for twelve inches or so wi a fork, and with as little injury to th as possible. When this has been done all round the ball to the depth of the trench, tie the roots into bundles, and well work the spade under the ball and sever any tap roots there may be. In refilling the trench, work the soil under the ball, untie the roots, spread them out regularly as the filling proceeds, and tread the soil firmly. As the result, you will find that the trees will be much less vigorous next year, and bear freely in the year following, provided the weather is favourable.

RULES FOR JUDGING.—A. T., Suffolk: Yes: there is a very useful booklet entitled "Rules for Judging, with Suggestions to Schedule Makers and Exhibitors." This is sent post free for 1s. 6d. on application to the Secretary, Royal Horticultural Society, Vincent Square, Westminster, S.W.

GRAPES.—F. R., Devon: We are glad to find that, as a result of following the advice we gave some time ago, the grapes and vines have so materially improved. If the border is dry it must be watered, and advantage should be taken of a bright, fine day to apply the necessary moisture. Be careful to avoid over-watering just now; sufficient water to just moisten the soil will be enough. An excess of moisture would cause the berries to crack, and produce undue growth. Ventilate freely according to the weather, and keep the pipes comfortably warm during the night and early morning, as this will keep the atmosphere dry and permit plenty of ventilation. After the crop has been gathered and the leaves have fallen, you should proceed to clean the house thoroughly, as well as prune and clean the vines. Having this work finished, remove the top soil from the border, and in its place put sound turfy loam with a little bonemeal added. As the vines have responded so well to the treatment we do not advise an entire overhauling of the border, as previous failures appear to have been due to cultural errors rather than to faulty borders.

DESTROYING WASP NESTS.—Mr. W. [illegible], of Brympton House Gardens, Yeovil, writes us as follows concerning the destruction of wasps' nests: "Your correspondent, 'East Sussex,' recently recommended the destruction of wasps' nests by night because the wasps return late to their nests, and all should be in before steps are taken to kill them. I have proved, however, that it does not matter in the least what time of the day one proceeds to destroy wasps and nests, providing cyanide of potassium is used, and a piece about the size of a hazel nut, or a teaspoonful of powder, is sufficient, if placed well in the nest mouth. Every wasp inside will be killed, and every one that is outside and returns home will drop dead as soon as it enters. If anyone is afraid of being stung, he should use a veil when putting the cyanide into position. Two years ago I destroyed thirty nests within a quarter of a mile of our garden; these were all located by daylight, and dug out the following morning. The cost was about a penny per nest."

DUTIES OF TREASURER AND SECRETARY.—S. S. G., Sussex: The duties of treasurer and secretary vary very much in different societies. In some societies the secretary does all the work, getting in the subscriptions, receiving all moneys, and paying the same into the society's account at the bank. The treasurer in such a case signs the cheques for the payment of accounts conjointly with the secretary, and keeps his own brief accounts of income and expenditure. In some societies all financial matters are in the hands of the treasurer, who attends to subscriptions, appoints persons to take money at the gates on show days, receives moneys paid in to the secretary for entrance fees, etc., and pays all bills. There must always be some amount of overlapping of the duties of treasurer and secretary in a go-ahead society; but if the two officers possess the confidence of the committee, and work amicably together for the benefit of the society, there should never be any difficulty other than can be overcome during a moment's conversation. When one officer distrusts another, or when one is so horribly afraid of doing too much that he ends in doing too little, then difficulties are certain to arise, and the society suffers. On the whole, we favour leaving the work entirely with the secretary, who should furnish the treasurer and committee with a financial statement at each meeting; the treasurer would sign the cheques, and do his best to secure new members, and he should be a man of substance, able and willing to render financial assistance when such is necessary.

MARKET GARDENING.—Veg.: The question you have submitted to us is extremely difficult, and cannot be answered in a definite manner, as in the case of a question relating to cultural matters or to the health of plants. We know nothing as to your tastes, your capacity for work, your business ability, or the capital at your command, factors which should have consideration before your capital is invested in market gardening. The cultivation of fruits, vegetables, and flowers will give a very good return to those who have a thorough acquaintance with the practical work, and also possess the business ability to dispose of the produce to the best advantage. With this knowledge you would be able to purchase land that would be suitable for the production of crops of high quality and in a district where they could be despatched to market without any special difficulty. Without this knowledge you would probably lose a considerable proportion of your capital through the land not being suitable for the crops, or being inconveniently placed for the disposal of the produce. Supposing you could purchase land of the right kind in the right place, the engaging of a manager to carry out the practical work and market the produce, has a strong element of speculation associated with it. He may or he may not be well fitted for the position, and should he be all that could be desired, there is a risk of his being hindered in his endeavour to make the business profitable by your not understanding why this or that expenditure may be necessary. Naturally you would not want to expend a larger amount than would be absolutely necessary, and without considerable knowledge would not be able to determine whether the expenditure would be advisable or not. If you knew an expert cultivator for market from personal acquaintance extending over several years, the case would be different, as you would then be able to place full confidence in him, and allow him the latitude essential to success. Several cases in which an arrangement similar to the one you suggest have come under our notice, and of these some have been successes, some moderately so, and some complete failures, and the latter have not been wholly due to the managers. Moreover, it should be understood that market gardening imposes a rather heavy strain upon both physical and mental faculties. It might probably be well were you to spend a year or so with some large fruit grower for market, and obtain an insight into the practice of growing and marketing fruit, as fruit growing appears to us more suitable for anyone whose health renders an outdoor occupation necessary. You would not be able to become proficient in so short a period, but you would be able to determine whether you would like such occupation. We would certainly strongly advise you not to invest your capital in either market gardening or fruit growing until you have obtained at least an elementary knowledge of the subject.

LIFTING DAFFODILS.—H. C. H., Belfast: Daffodils continue to flower well for many years if undisturbed, but in most cases the flowers produced from these undisturbed groups lack the size and substance of those produced from annually lifted and early planted bulbs. From the point of view of effect alone, where large areas are planted, the undisturbed bulbs are a great success.

BUY OSMUNDA FIBRE

from the Pioneer Importers of recent years, who consequently hold the LARGEST STOCK of FINEST SELECTED QUALITY, in 3 GRADES:—FINE, MEDIUM, and COARSE.

NO DUST. BUNCHES of DURABLE RICH FIBRE. GOES 4 TIMES as FAR and LASTS TWICE as long as PEAT.

As supplied by us to
Mr. Mackellar, Windsor Castle Gardens.
Mr. Alexander, Westonbirt Gardens.
Mr. Bound, Gatton Park Gardens.
Mr. Ballantine, The Dell Gardens.
Mr. Fletcher, Ashlands Gardens.
Mr. Dalgleish, Haslingdon Gardens.
Mr. McLean, Arddarroch Gardens, etc., etc.

PRICE—
10/6 per 3-bushel Bag.
OR
13/6 per 4-bushel Bag.
The larger size, being cheaper, is sent unless otherwise instructed.

YELLOW FIBROUS LOAM.

2 QUALITIES. A.1. Loam.—Virgin Soil from an ANCIENT Deer Park.

Direct from our exclusive Cutting Grounds. NORTHANTS.—Well-known all over the country as the best quality before we introduced our A.1., which has more FIBRE.

SAMPLES & PRICES CARRIAGE PAID to your Station by return of post.

☛ Wasp-proof Nettings, Fruit Bags, and Wasp Destroyers kept in stock in large quantities. All orders executed same day; sample by return.

WM. WOOD & SON, Ltd., Royal Horticulturists, Wood Green, London.

TELEGRAMS—"FUNGHETO, LONDON." TELEPHONE—10 TOTTENHAM.

but even under such conditions it is a good plan to lift, sort, and replant the best bulbs every few years. Some varieties do much better than others when left undisturbed, but all choice varieties should be lifted annually and planted in early autumn in new soil, to secure the best results.

LONG ROSE GROWTHS.—F. E., Heston: Secure the long growths to stout stakes, and also make the bush secure from which they spring, or the wind and rain storms of autumn may wrench the growth from its point of connection with the main stem. If very tall and unsightly, cut off a foot or two of the top of the growth, as this will do no harm, because, should new growths push from the apex, these will be a long way beyond the pruning point, even if the shoot is to be pegged down.

NAMES OF PLANTS.

H. R., Scratby.—Maxillaria luteo-alba.

A. C., South Devon.—Benthamia fragifera.

W. F., Berkhamsted.—1, Rosa rubrifolia; 2, Zauschneria californica.

W. H. N.—Not recognised; probably a seedling oak of some kind.

M. D. L., Bray.—1, Exacum affine; 2, Rondeletia speciosa; 3, Ixora macrothyrsa.

N. S. H., Huntingdon.—1, Gaultheria Shallon; 2, Polygonum cuspidatum; 3, Bambusa Metake.

B. C., Henbury.—1, Buddleia variabilis; 2, Fuchsia Riccartoni; 3. F. gracilis; 4, Galtonia candicans.

S. J. B., Horsham.—1, Asclepias currassavica; 2, Clematis flammula; 3, Galtonia candicans; 4, Pentstemon Newbury Gem.

C. M. C., Doncaster.—1, Abies concolor; 2, Juniperus chinensis; 3, Sedum arachnoideum; 4, Lilium speciosum rubrum; 5, Selaginella cœsia.

C. M., Rochester.—1, Hibiscus syriacus; 2, Olearia Haasti; 3, Cyrtomium falcatum; 4, Anthericum liliago; 5, probably a piece of Colutea arborea.

D. L., Beaumaris. — Specimens badly smashed up; so far as we can make them out they are—1, Helianthus rigidus; 2, H. multiflorus; 3, H. decapetalus. The carnation we do not recognise.

GARDENING ENGAGEMENTS.

Miss Kitson, the daughter of the Rev. J. B. Kitson, Lanreath Rectory, Cornwall, has been appointed Vice-Principal of the Country and Colonial Training School at Arlesey, near Hitchin.

Mr. W. B. Little has been appointed as horticultural instructor on the staff of the Armstrong College, Newcastle-upon-Tyne, and in that capacity has charge of the horticultural education in the counties of Cumberland and Westmoreland. Mr. W. B. Little was previously at the Royal Gardens, Kew.

WORK IN FLORISTS' WORKSHOPS.

The Secretary of State for the Home Department, in pursuance of the powers conferred upon him by section 49 of the Factory and Workshop Act, 1901, directs that the special exception in the said section relating to the hours of employment of women shall be extended to certain non-textile factories and shops. These include shops in which "the making of bouquets or wreaths or similar articles from natural flowers or leaves is carried on; or in which flowers or leaves are otherwise adapted for sale. With reference to employment inside and out on the same day, the Secretary of State grants in pursuance of section 46 of the above Act to florists' workshops, a special exception that women and young persons may, on a day on which they are employed in the workshop before and after the diner hour, be employed in the business of the workshop, outside the workshop, before or after the period of employment appointed for such persons for that day by the notice affixed in the workshop in pursuance of section 32 of the above Act, for a further period not exceeding two hours which shall not begin before 6 a.m. or end later than 10 p.m. This special exception shall be subject to the following conditions: (1) To every person employed in pursuance of the special exception an additional interval at least equal to the further period as aforesaid, shall be allowed during the period of employment, on the same or following day. (2) No person shall be employed continuously, whether inside or outside the workshop, for more than five hours without an interval of at least half an hour. (3.) On each occasion of employment in pursuance of the special exception, the full particulars relating thereto must be entered forthwith in the general register. The Secretary of State has also granted a special exception authorising the occupier of a florist's workshop to allow all or any of the annual whole holidays or half-holidays on different days to any of the women and young persons employed therein, or to any sets of the women or young persons, not on the same days. Further permission is given for women and young persons employed in florists' workshops to have the times allowed for meals at different hours of the day, and for these persons to remain during their meals in the room in which the work is being done. It is stipulated that those who avail themselves of this permission must affix a notice showing the names of those employed and the times allowed to each of them for their meals.

Lilium Harrisi.—One frequently hears of want of success attending the culture of this lily when needed for early flowering. Much of this, I feel confident, arises from the fact that it is left out of the ground too long before potting. The evil effect of lily bulbs being kept out of the ground and in a dry atmosphere for a lengthened period is now generally recognised, but the fact that in Bermuda Lilium Harrisi ripens much earlier than the different lilies in Holland, Japan, or in this country, is frequently overlooked, with the result that the bulbs have spent some time perhaps on warehouse shelves, or some such place, before they are obtained from the seedsmen. Consequently, they are more or less withered, with a corresponding loss of vitality, and the results then are not so satisfactory as they might be. Nearly all bulbs from Bermuda reach here by the end of August; it will be at once apparent, that, where needed for early flowering, nothing is gained by any delay in purchasing the bulbs after the present time; while, if this is not done, a considerable amount of vigour is needlessly lost. If bulbs are potted as soon as received, they may be allowed to become gradually established in a cold frame, which is much better than taking them into heat at once.—T. B. Field, Ashwellthorpe Gardens.

Mr. A. MITCHELL, Corrour R.S.O., writes us Mar. 5th, 1908:—

"Kindly send on another pair of your splendid Boots. The last pair has worn me over two years, and when I mention my house stands **1,350 feet above Sea level,** you can imagine the awful weather, we have nothing but snow and slush the greater part of the year. When I state I never had a wet foot it speaks well for your Boots. Enclosed P.O. 16/-.
